The churches of Derbyshire contain some very ancient portions. Repton church has under the chancel a very curious Anglo-Saxon crypt, which there is reason to suppose was a part of the conventual church destroyed here by the Danes in 874. The rest of the church is of a later period; the architecture is varied, partly Norman, partly early English, and partly decorated English; the tower and spire, which are very lofty and of fine outline, are in the perpendicular English style. Melbourne church, near the border of Leicestershire, is a fine example of early Norman architecture, and is nearly in its original state. It has been conjectured, but without sufficient reason, to be as ancient as the 7th century. Brassington and Streetly churches also contain some interesting features of early Norman date. The desecrated chapel at Streetly is a Norman edifice, perfect, with the exception of the windows, which have been enlarged, and the roof: the ornaments are elaborate and well executed. The remains of early pointed architecture in Derbyshire are few, and by no means remarkable; the best are perhaps All Saints church at DERBY, and the parish churches of ASHBOURNE, BAKEWELL, CHESTERFIELD, and Dronfield.

Of the monastic establishments of Derbyshire there are very few remains. Some remains of Repton priory may be seen in the school at Repton and in the master's house. After the old Saxon priory was destroyed by the Danes, a monastery of Black (or Augustinian) Canons was founded here by Mand, widow of Ranulph, second earl of Chester. There are at Yeaveley, 4 miles south of Ashbourne, some ruins of a chapel, formerly a preceptory of the order of St. John of Jerusalem. Of Dale Abbey, 6½ miles east from Derby, founded in 1204, for Premonstratensian Canons, there only remains the arch of the east window of the church. Beauchief Abbey, Norton, near Sheffield, is just within the boundary of Derbyshire: it was founded in 1183 for Premonstratensian or White Canons. The only part of the abbey now remaining is the west end of the conventual church, which is used as the chapel of the extra-parochial district of Beauchief. The architecture is plain, but the situation amidst woods and hills is delightful.

The principal historical events connected with Derbyshire since the Reformation occurred during the civil war of Charles I. The county at first declared for the king, who after setting up his standard at Nottingham marched to Derby; but it was soon brought over to the side of the Parliament by the activity and influence of Sir John Gell, who marching from Hull into Derbyshire (October 1642) with a regiment of foot, consisting of only 140 men, raised 200 men at Chesterfield, and proceeding to Derby garrisoned that town. South Wingfield manor-house was also garrisoned for the Parliament. In 1643 Sir John took Bolsover Castle, which the Earl of Newcastle had fortified for the king; and his brother, Colonel Gell, took Sutton House, near Chesterfield, which had been also garrisoned for the king by Lord Deincourt. The Earl of Newcastle for the king took South Wingfield manor-house; and the Royalists possessed themselves of the northern parts of the county. In the summer of 1644 Sir John Gell took South Wingfield manor-house, and defeated the forces sent to relieve

it; and General Crawford, another parliamentary commander, took Bolsover Castle and Staveley House.

Derbyshire is both an agricultural and manufacturing county, but its population has for some time been more decidedly manufacturing and mining than agricultural. In 1851 the county had ten savings banks, at Alfreton, Ashbourne, Bakewell, Belper, Chapel-en-le-Frith, Chesterfield, Derby, Eckington, Glossop, and Wirksworth. The amount owing to depositors on the 20th of November 1851 was 419,752*l.* 13*s.* 5*d.*

DEREHAM, EAST, Norfolk, a market-town in the parish of East Dereham and hundred of Mitford, is situated in 52° 40' N. lat., 0° 56' E. long., distant 16 miles W.N.W. from Norwich, 100 miles from London by road, and 125 miles by the Eastern Counties and East Anglian railways, via Lynn. The population of the town in 1851 was 3372. The living, a vicarage with the curacy of Hoo and a sinecure rectory annexed, is in the archdeaconry of Norfolk and diocese of Norwich.

The town of Dereham is pleasantly situated, and has a clean and neat appearance. The streets are wide, lighted with gas, and paved with pebbles. The parish church is a spacious cruciform building of ancient date, and has a nave with side aisles, transepts, and a choir, with a tower rising from the intersection of the nave and transepts. The font in the church is rich and handsome; it was placed here in the 15th century. A monument to the poet Cowper, who is buried here, is in the north transept. The Independents, Baptists, and Wesleyan and Primitive Methodists have places of worship. There are National and British schools and a mechanics institution. Numerous gardens and orchards are in the vicinity of the town. Agricultural machines are manufactured at East Dereham. There are malt-houses and breweries. The market is held on Friday for cattle, provisions, and grain. There are two yearly fairs, in July and September. Petty sessions are held fortnightly.

(Blomefield, *Norfolk; General History of Norfolk*.)

DERG, LOUGH. [DONEGAL.]

DERRY, with Raphoe, a bishop's see in the archdiocese of Armagh, in Ireland. The diocese of Derry and Raphoe embraces the greater part of the counties of Londonderry, Donegal, and Tyrone, and a small portion of Antrim. It contains 62 benefices in Derry and 35 in Raphoe. The income of the united dioceses is 8000*l.* a year. The chapter of the diocese of Derry consists of a dean, archdeacon, and three prebendaries; that of Raphoe of a dean, archdeacon, and four prebendaries.

Derry signifies 'a place of oaks.' In Pagan times the eminence on which the city and cathedral now stand was known as Derry-Calgnaich, or the Oak Grove of Calgaich. Towards the end of the 6th century Columba came hither from Iona and founded a church. From this period down to the plantation of Ulster it was called from him Derry-Columbkil, and was famous for its abbey and religious foundations. In 1118, when the council of Rath-breasil was held, this district seems to have been included in the ancient diocese of Ardstraw or Rathlury. The see of Derry was established in 1158, when Flahertach O'Brolchain, the then abbot of the monastery, was raised to the dignity of bishop. This see remained unreformed, together with those of Raphoe and Clogher, down to the time of the plantation of Ulster. The first Protestant bishop was George Montgomery, nominated to the succession in 1603. There is a very full account of the history and antiquities of this see in the first part of a 'Memoir of the Ordnance Survey of Ireland,' 4to., 1837. [LONDONDERRY.]

DERWENT. [DERBYSHIRE.]

DERWENT-WATER. [CUMBERLAND.]

DESAGUADERO. [BOLIVIA.]

DESENZANO. [BRESCIA.]

DESMOND. [KERRY.]

DESSAU, the capital of the duchy of Anhalt-Dessau, in Germany, is situated on the left bank of the Mulde, about two miles from its junction with the Elbe, in 51° 48' N. lat., 12° 18' E. long., at a distance of 80 miles by railway S.W. from Berlin, 54 miles N. from Leipzig by railroad through Halle and Cöthen, and has about 12,000 inhabitants, of whom some 800 are Jews. The town is about half a league in circumference; three sides of it are inclosed by a wall, and the fourth, towards the east, is bounded by the Mulde, which is crossed by a handsome bridge. Dessau has six gates, and is divided into the Altstadt, Neustadt, and the Sand, and three suburbs: it contains seven public squares, and thirty streets, which upon the whole are well and regularly built. The Cavalier-street would be an ornament to any capital, and some of the public buildings are handsome. The ducal palace, which is a noble edifice, contains a picture-gallery and collections of art; the chapel contains a chef-d'œuvre of Lucas Cranach, the Last Supper, in which he has introduced portraits of Luther, Melancthon, and others. Among the other buildings may be mentioned the town-hall; four churches, two of which belong to the Reformed Lutherans, one to the Lutherans, and one to the Roman Catholics; one synagogue, two hospitals, a poor-house, orphan asylum, infirmary, an elegant theatre with concert-room attached, and the riding-school. The public cemetery is laid out with great taste, and embellished with an elegant entrance in the Roman style. Dessau is well supplied with schools of public instruction. Among them are the Franz school for the education of

Jews; the gymnasium consisting of an elementary, a commercial, and a classical school; the seminary for school-masters; and the school of industry for the spinning of flax and cotton. The manufactures are unimportant; they consist principally of woollen cloth, stockings, hats, tobacco, spirits, and beer: the retail trade is almost exclusively in the hands of the Jews. The town however carries on a considerable trade in corn. In the environs are the ducal villas of Louisium and Georgium, the gardens about which are much admired, as are also the gardens of Wörlitz, about six miles from the town. The Drehberg, which is the burying-place of the dukes of Anhalt-Dessau, is planted with shrubs, and surmounted by a building with a lantern and cupola. On the Stieglitzberg near the Elbe, is a monument to the Duke of Dessau, who fell at the battle of Torgau.

DETMOLD. [LIPPE.]

DETROIT, the principal city and port of Michigan, United States of North America, stands on the right bank of the Detroit River, or Strait, which connects lakes St. Clair and Erie, in 42° 19' N. lat., 83° W. long., 526 miles N.W. from Washington. The population in 1810 was 770, in 1820 it was 1442, in 1840 it was 9192, in 1850 it had increased to 21,019.

The city occupies a convenient site, rising from the river, along which it extends for a mile and a half with a depth of nearly a mile. The streets are laid out upon a somewhat elaborate plan, that of a rectangle for 1200 feet from the river, while farther back it forms a triangle. Eight principal streets, each 200 feet wide, diverge from a spacious open area called the Grand Circus, and divide the back part of the city into triangular portions; the secondary streets are 120 feet, the others 60 feet wide, and they usually intersect at right angles. The private houses are mostly of wood; the public buildings, many of which line a main avenue which runs parallel with the river, are generally substantial edifices of brick or stone. Of these the chief are the United States land-office, the old state-house, the state buildings, law courts, and penitentiary, county and city courts and markets, the Roman Catholic cathedral, &c. Detroit contains four Roman Catholic, two Episcopalian, three Methodist, two Presbyterian, and two Baptist churches, and a Congregational, a German Lutheran, and a sailors' church; a branch of the State university, several public and primary schools, a Protestant and a Roman Catholic orphan asylum, and numerous other religious and benevolent institutions; a museum, and historical, medical, and literary institutes; and supports thirteen newspapers, three of which are published daily. Several of the churches are large and handsome buildings. The city is well supplied with water, but badly drained and paved; there are several public squares and open spaces; the most noted is known as the Campus Martius.

Detroit is a rapidly increasing place, being admirably situated for the purposes of commerce and manufactures. The river is above half a mile wide opposite the city, and has a depth varying from 12 to 48 feet; the harbour is secure and accessible at all seasons. Steamers ply regularly every day from all parts, and the inland traffic is greatly facilitated by the Michigan Central, and Detroit and Pontiac railways. Most of the agricultural products of Michigan are shipped from Detroit. The coast trade is very considerable, and an extensive trade both legal and contraband is carried on with Canada. The shipping belonging to Detroit amounts to about 25,000 tons, a large proportion being propelled by steam. Ship-building is an important branch of the industry of the place. In the town are five large steam saw-mills, which are said to cut 9,000,000 feet of lumber and 4,000,000 laths annually. There are besides several foundries, steam-engine and boiler-factories, iron-works, brass-works, nail-factories, sash-works, steam flour-mills, tanneries, breweries, potteries, &c. There is also a large wholesale trade for the supply of the interior of the state. The town contains four banks, with a capital (Dec. 31, 1851) of 761,228 dollars, and a circulation of 607,588 dollars.

Detroit was founded by some French from Canada in 1683. It was taken by the English in 1759. After the declaration of American independence, Detroit was twice taken by English troops. It has been once entirely destroyed, and several times severely injured by fire. In 1802 it was incorporated, but the act of incorporation was repealed in 1810. Its present charter of incorporation as a city was granted in 1815; since which date its population has multiplied more than twenty-fold. Until 1847 Detroit was the capital of Michigan, but in that year the seat of government was removed to Lansing; Detroit however is by far the largest and most important place in the state.

(Colton, *Statistical Gazetteer of the United States*, 1853; Haskell and Smith, &c.)

DEULE. [NORD.]

DEUXPONTS (Germ. *Zweibrücken*), formerly a duchy but now a bailiwick in the south-western part of the Bavarian Palatinate, is bounded S. by France, and W. by the Prussian Rhine-Province. It has an area of about 1181 square miles, and a population of about 150,000. The general character of the country is mountainous, with many gentle eminences, whose declivities and lowest parts are rich in woods, corn-fields, pastures, and vineyards. The principal river is the Blies, into which flow the Erlbach, Hornbach, Schwoib, and other small streams. Deuxpontos produces rye, barley, oats, and other grain; rapeseed, flax, and hemp are cultivated in large quantities. Much

attention is paid to the rearing of horses and cattle, and to the breeding of sheep. There is abundance of wood. The minerals are iron, copper, and freestone. There are few manufactures. The duchy formerly belonged to the crown of Sweden; but came by inheritance to the kings of Bavaria.

DEUXPONTS, a town in the Bavarian Palatinate, capital of the former duchy of Deuxpontos, situated in 49° 16' N. lat., 7° 20' E. long., is a pretty town on the Erlbach, 50 miles W. from Spire, 5 miles S. from the Hornburg station on the railway from Speyer to Paris through Saarbrück and Metz: population, 7300. It is very prettily situated among gardens and luxuriant meadows, encircled by eminences and woods. The town, which consists of the Old and New Towns, is surrounded by a wall, has a pleasant suburb, and is regularly built. The dukes of Zweibrücken resided in the old palace, which was partially destroyed by the French; part of the remains have been converted into a Catholic church. There are two Protestant churches, a gymnasium and lyceum, an orphan asylum, an hospital, and a school of industry. The inhabitants are engaged in agriculture, sheep-farming, and in the manufacture of woollen cloth, linen, cotton, leather, oil, tobacco, and steel-ware. The Bipont edition of the Greek and Latin classics was printed here from 1779. Deuxpontos is the seat of the judicial tribunals for the bailiwick as well as of its local government. Close to the town is Schifflück, a country-seat built by Stanislaus Leszcinski, king of Poland, which has been converted into an establishment for breeding horses.

Deuxpontos, Zweibrücken, or in its Latinised form, Bipontium, derives its name from the site of its old castle between two bridges. Its origin is unknown, nor is it mentioned in history until the year 1197, when it was the property of the counts bearing its name. On the extinction of the direct line, in 1394, the earldom fell into the possession of Ruprecht, the elector-palatine, who divided it among his three sons in 1410, all of whom being dukes, the country itself was thenceforward denominated a duchy. During the 'Thirty Years' War it was besieged by the Imperialists. Deuxpontos suffered also severely during the campaigns of Louis XIV., and the French held it until 1697. As the duke in the meantime had died childless, it fell to the next heir, Charles XII. of Sweden, and, upon his decease, to the count-palatine; this prince also dying without children in 1723, the duchy reverted to the house of Brakenfeld, the ancestors of the family who now occupy the throne of Bavaria. In 1793 Deuxpontos was taken possession of by the French, but it was restored to Bavaria in 1816, when other adjacent territories were added to it, and the whole was annexed to its dominion by the name of the Palatinate or the Province of the Rhine.

DEVENTER, a fortified town in the province of Overijssel, in Holland, is situated on the right bank of the Yssel, at the point where that river is joined by the Schipbeek, 9 miles S. from Zwoll, 50 miles E. by S. from Amsterdam, and has about 15,000 inhabitants, including the garrison. Deventer was formerly a free imperial city, and a member of the Hanseatic league. The town is surrounded by a wall flanked with numerous towers, and defended by a broad deep ditch. The cathedral is a fine gothic building, with an excellent set of bells. There are six other churches in the town, which has also a handsome town-hall. The athenæum or college contains a well-chosen and extensive library. An observatory was founded here in 1839. The industrial products of Deventer are iron-ware, hosiery, carpets, and linen. It is famous for its gingerbread called Deventer Koek, many thousands of pounds of which are exported. The town trades largely in cattle, corn, butter, cheese, beer, wool, and turf. The environs are fertile and well cultivated; the banks of the Yssel are dotted with pretty country-houses. Assize courts are held in the town.

DEVIZES, Wiltshire, a borough and market-town, having separate jurisdiction, and the seat of a Poor-Law Union, in the hundred of Potterno and Cannings, in 51° 20' N. lat., 1° 58' W. long., 22 miles N.W. by N. from Salisbury, and 89 miles W. by S. from London. The borough is governed by 6 aldermen and 18 councillors, and returns two members to the Imperial Parliament. The population of the borough in 1851 was 6554. The living of St. John, a rectory with the vicarage of St. Mary attached, is in the archdeaconry of Wilts and diocese of Salisbury. Devizes Poor-Law Union contains 28 parishes and townships, with an area of 59,396 acres, and a population in 1851 of 22,236.

In ancient records this place is called *Dovissa*, *De Vies*, *Divisia*, &c. In the reign of Henry I. a strong fortress was erected here by Roger, bishop of Salisbury, which his nephew Nigel, bishop of Ely, garrisoned with troops, but he was obliged to surrender the fortress to Stephen, together with 40,000 marks, the bishop's treasure. The castle was afterwards seized by Robert Fitz-Herbert for Matilda, but on her arrival he refused to deliver it up, and was subsequently hanged as a traitor to both parties. About the end of the reign of Edward III. the castle was dismantled.

Devizes was besieged by Sir William Waller in the Parliamentary war, but just as the Royalists were preparing to capitulate, Lord Wilmot, who had been dispatched by the king from Oxford, appeared on Roundaway Hill with 1500 horse and two pieces of artillery. Sir William withdrew his forces from the town, and attacked Lord Wilmot, but was totally discomfited.

The first charter of incorporation was by the Empress Matilda,

granting to her burgesses 'De Divisis' freedom of toll throughout all England and the ports of the sea. Devizes returned members to the parliaments of Edward I., to two of Edward II., and constantly since the 4th of Edward III. The summer assizes for the county are held at Devizes. The quarter sessions of the county are held here in rotation with Salisbury, Warminster, and Marlborough. A county court is held in the town.

Devizes is situated nearly in the centre of the county, on the Kennet Canal: it consists of several streets well paved, and lighted with gas, and contains many good houses. Being built on an elevated site, the town is well drained. The town-hall is a handsome modern building, in the basement of which a cheese-market is held.

St. John's church is built partly in the Norman and partly in the perpendicular style of architecture, with a square embattled tower, and consists of a nave, transept, chancel, and two chantry chapels. Of St. Mary's church the chancel is supposed to have been built soon after the Conquest, but nearly all the rest of the structure was rebuilt by William Synth, who died in 1436. There are chapels for Wesleyan Methodists, Baptists, Independents, Presbyterians, and Quakers. There are a church charity school, a British school, a literary institution, a savings bank, and a dispensary.

The woollen manufacture, once of considerable importance, is now extinct. The silk manufacture, malting, and the manufacture of snuff, afford employment. The market is on Thursday, and is the largest in the west of England for corn. A large cross, erected in 1815 by Lord Sidmouth, is in the market-place. Fairs are held on the 4th of February for horses; Holy Thursday and April 20th, for cattle; and June 13th, July 5th, and October 2nd and 20th, for cattle, hops, cloth, &c. Richard of Devizes, a Benedictine monk of the 12th century, who wrote a chronicle of English history, was a native of this place.

(Hoare, *Wiltshire*; *Communication from Devizes*.)

DEVONPORT. [PLYMOUTH.]

DEVONSHIRE, a maritime county in the south-west part of England. Its form approximates to that of an irregular quadrangle, having for its angles—on the west Hartland Point on the Bristol Channel; on the north the boundary of Devonshire and Somersetshire, near Oare, on the coast of the same channel; on the east the boundary of Devonshire and Dorsetshire, on the coast of the English Channel, near Lyme Regis; and on the south Prawle Point, near the Start Point, on the coast of the English Channel. Devonshire lies between 50° 12' and 51° 15' N. lat., 2° 54' and 4° 33' W. long. The county is bounded N. and N.W. by the Bristol Channel; N.E. by Somersetshire; E. by Dorsetshire; S.E. and S. by the English Channel; and W. by Cornwall, from which it is separated along part of the boundary-line by the river Tamar. An insulated portion of the county is inclosed between Dorsetshire and Somersetshire, and the boundaries as given above include an insulated portion of Dorsetshire which is entirely surrounded by Devonshire. The length of this county from north to south is about 71 miles; the breadth from east to west is about 68 miles. The area of the county is about 2590 square miles. The population in 1841 was 532,959; in 1851 it was 567,098, being an increase of 6·4 per cent.

Coast-line, Islands.—The coast of the Bristol Channel which bounds Devonshire to the north and north-west is for the most part steep and rocky. On the side towards Somersetshire the coast-line runs nearly east and west for about twenty-two miles, measured in a straight line from the border of Somersetshire to Bull Point, west of Ilfracombe: along one part of this line there are cliffs, in the other parts the coast though steep is not broken or precipitous: there are no marked headlands. From Bull Point to Morte Point the coast forms a small bay bounded by cliffs; from Morte Point to Buggy Point it forms a larger and deeper bay, with cliffs at each extremity and a low shelving beach in the middle. From Buggy Point to Hartland Point the coast forms the deep bay, Barnstaple or Bideford Bay, into which the united stream of the Torridge and the Taw empties itself. From Buggy Point to the estuary of the Taw and Torridge the coast is shelving and sandy, with a multitude of sand-hills, called Braunton Barrows; from the estuary of the rivers to Hartland Point the coast is lined with steep cliffs and rocks. From Hartland Point the coast, still lined with cliffs, runs south or south by west to the border of Cornwall. This coast presents in several places very picturesque views, especially about Lynmouth (the mouth of the river Lynn), on the border towards Somersetshire, and at Clovelly in Bideford Bay.

The coast of the English Channel, which bounds the county on the south, runs west-south-west from the neighbourhood of Lyme Regis (in Dorsetshire), 22 miles measured in a direct line, to the mouth of the river Ex. This coast is lined with cliffs throughout its whole extent, and is marked by one headland, Boer Head, at the western extremity of Scaton Bay. The rivers Axe and Otter enter the sea in the course of this line. From the mouth of the Ex the coast, lined with cliffs, runs south-south-west 6 miles to the mouth of the Teign, and thence 5 miles south or south by east to the headland called Hope's Nose, at the northern extremity of Tor Bay. Tor Bay is a deep bay bounded on the south by Berry Head, having a shelving beach at the bottom of the bay, interrupted by a bluff headland called Roundham Head, and an abrupt coast towards each extremity. Berry

Head appears to have been the Promontorium Hellenis of the ancients (Richard of Cirencester.) From Berry Head to Plymouth Sound the general character of the coast is rocky. In this part of the coast-line there are several bays. About two or three miles of coast on the west side of Plymouth Sound belong to Devonshire. Plymouth Sound is three miles wide and extends many miles inland. It receives from the north-west the Tamar (united with the Lynher or St. German's River), upon the estuary of which, called Hunoaze, is the town of Devonport, formerly 'Dock,' the royal dockyard of which ranks next in importance to that of Portsmouth; and from the north-east the Plym, the estuary of which is called Cutwater. Mill Bay and Sutton Pool are small inlets at the bottom of Plymouth Sound; the latter is almost encircled by the town of Plymouth. [PLYMOUTH.] The Devonshire coast may be estimated at from 155 to 160 miles; 55 to 60 miles on the Bristol Channel, and about 100 miles on the English Channel.

Lundy Island, in the Bristol Channel, 10 to 11 miles N.N.W. from Hartland Point, is a mass of granite, except the extreme southern end, which is grauwacke, 2½ miles long from north to south, and about 1 mile from east to west. Its area is about 1000 acres. It is surrounded on every side with rocks; the landing-place, up which two men can scarcely walk abreast, is on the eastern side. The southern point is occupied by a lighthouse. The northern part of Lundy Island rises considerably above the level of the sea, the highest part being 200 feet high. There is an abundance of puffins and rabbits, and the island is much infested with rats. The number of inhabitants in 1851 was 34. Their principal business is shooting rabbits for their skins, and puffins for their feathers. The island was sold in 1840 for about 9870*l*. St. Nicholas Island, which is fortified, is in Plymouth Sound.

Surface, Hydrography.—Devonshire is more uniformly hilly than any other of the large counties of England. The principal ranges of hills may be considered as offsets from the elevated districts of Dartmoor, Exmoor, and Blackdown. Dartmoor is a granitic table-land of irregular elevation, having its greatest elevation towards the north, and containing the highest ground in Devonshire. The highest part of Dartmoor is Yeo Tor, which attains a height of 2050 feet above the sea. Other hills in different parts of Dartmoor vary in height from 2000 feet down to 658 feet.

Dartmoor extends nearly 22 miles from north to south (from Belston, near Okehampton, to the Plymouth road between the rivers Erme and Avon or Anne); and 14 miles from east to west, from the neighbourhood of Moreton Hampstead to that of Tavistock. This immense waste is thus described by Dr. Berger ('*Geol. Trans.*' vol. i. p. 119):—"From Harford church (near the southern limit of Dartmoor) the country assumes quite a bare and alpine appearance, presenting a vast plain, extending beyond the visible horizon. The face of the country is formed by swellings and undulations gradually overtopping each other, without ever forming distinct mountains. There is neither vegetation nor any human dwelling; we tread upon a boggy soil of very little depth, and scarcely affording sufficient food to support some dwarf colts as wild as the country they inhabit." The area of Dartmoor Forest has been estimated at from 80,000 to 100,000 acres. Part of the waste is appropriated by the surrounding parishes, the freeholders of which possess the right of common, or as it is termed the right of venville, on these appropriated parts. The rest of Dartmoor, to which the name of Dartmoor Forest (frequently given to the whole waste) strictly applies, and which belongs to the duchy of Cornwall, has been found by survey to contain 53,644 acres. It was on this part that the prison was built during the last war for the prisoners of war. The highest part of Dartmoor Forest, in which some of the most important rivers of the county (the Taw, the Dart, the Teign, &c.) have their rise, consists of a succession of morasses formed by the decay of the successive crops of aquatic plants with which this part teems: these morasses are in some parts 40 to 50 feet deep, in others not more than 5 feet. In several places there have been land-slips, owing to the over-accumulation of marshy soil: these slips would be more frequent but for the granite rocks or 'tors' which continually rise to the surface. Peat is dug in this forest; and many sheep are pastured there in summer, and some all the year round. The elevation of Dartmoor Forest causes it to have a much lower average temperature than other parts of the county. The average difference of the temperature at Ilfracombe, on the north coast of the county, and Okehampton, just on the northern border of Dartmoor, is 10° 5' of Fahrenheit: in summer the difference is small, but in winter it rises to 16° or 18°. Numerous stone circles, cairns, maenhirs or rude upright stones, cromlechs, stone circular huts, and other antiquities of the earliest period abound in various parts of the forest, and the whole district is full of interest. Dartmoor has been excellently described and its natural history and antiquities illustrated by the Rev. Samuel Rowe, in his '*Perambulation of the Ancient Forest of Dartmoor*.' Anicombe Hill, Okement Hill, and others, are elevated parts of Dartmoor. Brent Tor (802 feet, according to Dr. Berger) and Blackdown, both near Tavistock, border upon Dartmoor, but are not composed of granite.

Dartmoor has been described as an elevated plain: the descent to the lower country all round is rapid. From Dartmoor several ranges of hills, composed chiefly of rocks of the transition series branch off

one from the north-west part of it, near Okchampton, runs in the direction of Hartland Point, dividing the basin of the Tamer from that of the Torridge, and sending out branches which separate the valleys of the various feeders of the Tamer. Another branch running northward separates the valley of the Okement and afterwards of the Torridge from that of the Taw, and terminates near the junction of these last two rivers. Another branch runs eastward towards Exeter, turns to the south-south-east near that city, and separates the valleys of the Ex and the Teign. A branch which this range sends off soon after leaving Dartmoor runs north-eastward, separates the basin of the Ex from that of the Taw, and connects the heights of Dartmoor with those of Exmoor. Another range running south-east from Dartmoor separates the valleys of the Teign and the Dart.

Exmoor is a tract of high land, having its greatest elevation towards the north. It is composed of rocks of the transition class, and is chiefly included in Somersetshire, but extends into the north and north-east parts of Devon. Its highest point, Dunkerry Beacon, Somersetshire, attains to the height of 1668 feet, according to the Ordnance Survey; on the west Chapman Barrows attains a height of 1540 feet. A range of hills extends from Exmoor along the north coast of Devonshire to Morte Bay; some of the summits are probably 1000 feet high. The ridges of Exmoor Forest and the branches which it sends off towards the south separate the valleys of the upper waters of the Ex.

A third system of hills consists of Blackdown, in the eastern part of the county, on the border of Somersetshire, between Taunton and Honiton; and of the ranges of hills which it sends off, chiefly to the southward, separating the basin of the Otter from those of the Ex on one side, and the Axe on the other, and dividing from each other the valleys watered by the several affluents of the Otter and the Axe. These hills have flat tabular summits; their steeper side is toward the west. This line of high lands varies in height from about 600 to 750 feet.

The rivers of Devonshire are numerous, and some of them are important. The *Ex* rises at Exhead in Exmoor, Somersetshire, and flows south-east to Exton, where it turns to the south, and reaches the border of Devonshire about 18 or 19 miles from its source. For about 2 miles it divides Devonshire from Somersetshire, being joined in this part by the river Barle, which also rises in Exmoor, and has a south-east course of 22 to 24 miles through Somersetshire before it falls into the Ex. A little below the junction of the Barle the Ex enters Devonshire, and flows in a southerly direction, but with a very circuitous course, to Tiverton, receiving in its way several feeders, of which the chief are the Batham, which flows from the border of Somersetshire past Bampton, and falls into the Ex on its left or eastern bank; and the Loman which flows from the hills on the Somersetshire border, near Bampton, and joins the Ex on its left bank at Tiverton. From Tiverton the Ex flows still southward, 13 miles, to the junction of the Culin, receiving by the way, on its right bank, the Dart from the moors between Tiverton and South Molton; and about 2 miles lower down, on its right bank, the Creedy, which passes near Crediton, and is joined by the Yeo below that town. From the junction of the Creedy the Ex flows southward to Exeter, and then south-east to Topsham, where it receives the Clist: just above Topsham the Ex becomes a tide-river. The tideway of it is about 5 miles long and about a mile wide at high water. A sand-bank, dry at low-water, divides its mouth into two channels. The whole length of the Ex is 54½ miles. A canal, formed in the reign of Henry VIII., runs by the side of this river between Exeter and Topsham: this canal, which was originally more than 3 miles long, has been lengthened so as to enter the tideway lower down. By this canal and the tideway of the river vessels can get up to Exeter.

The *Culm*, mentioned above, rises near Church Stannton, in the Blackdown hills, just within the border of Somersetshire, and flows westward to the village of Uffculm; thence south-west to the town of Collumpton, or Cullumpton, and thence south-west into the Ex. The total length of the Culm is about 25 miles.

The *Torridge* rises on the borders of Devonshire and Cornwall, at the Ditchen hills near Clovelly, and not far from the head of the Tamer [CORNWALL], and flows eastward to the neighbourhood of the villages of East and West Putford; it then turns to the south-east, and runs to Bradford Mill, where it receives the Waldon on its right bank. From Bradford Mill it runs eastward past Sheepwash, or Shipwash, to the junction of the stream which passes Hatherleigh; and thence north-east to the junction of the Okement, which is formed of two brooks (East and West Okement) that rise on Dartmoor and unite at Okchampton. From the junction of the Okement the Torridge has a very sinuous course in a north-west direction, past Torrington to Bideford, where it becomes a tide-river. The tideway from Bideford to Appledore, where the Torridge and the Taw unite, is 3 miles, the whole course of the Torridge being 53 miles. The Torridge is navigable for vessels up to Bideford, and for boats to Wear Giffard, 4 or 5 miles higher up.

The *Taw* rises at Taw-Head, Dartmoor, on the slope of Okement Hill, and has a northward course to below the mill and village of Brushford: thence it has a winding course in a north-north-west direction to the junction of the Little Dart, which rises in the range of hills connecting Dartmoor with Exmoor, and flows westward past

Chumleigh into the Taw. From the junction of the Little Dart the Taw flows northward to the junction of the Mole, which rises on North Molton ridge, Exmoor, on the border of Devonshire and Somersetshire, passes North and South Molton, and after receiving the Bray, which also rises on Exmoor, joins the Taw on its right bank. After the junction of the Mole the Taw flows north-north-west to Barnstaple, where it becomes a tide river. The tideway is about 5 miles in length from Barnstaple to the junction of the Torridge, and the total length of the Taw is 48 miles. It is navigable for small vessels up to Barnstaple, and for boats to New Bridge, 3 or 4 miles higher. The estuary of the united rivers Taw and Torridge is not two miles long.

The *Dart* rises at Dart-Head on Dartmoor. The head of the East Dart, which may be considered as the true head, is on the southern slope of Okement Hill, near the springs of the Okement and the Taw. It flows south-east to the junction of the West Dart at Dartmeet Bridge, between Ashburton and Tavistock. From Dartmeet Bridge the river flows south-east past Buckfastleigh and Totnes, to its outfall just below Dartmouth. Its whole course is 36 miles. The tide flows up to Totnes 10 or 11 miles from the mouth of the river: above this place the river is not navigable. The navigation is chiefly used to convey coal and shelly-sand manure to Totnes and the neighbourhood, and to export the produce of the tin, lead, and copper-mines, worked on the border of Dartmoor Forest. The entrance to the river forms a good harbour.

The *Teign* (the North Teign) rises near Siddaford Tor, Dartmoor, at a little distance from the head of the Dart, and after flowing to the north turns eastward and flows to Dunsford, between Exeter and Moreton Hampstead. It then runs south to near Chudleigh, receiving by the way the West Teign or Bovey River from North Bovey to the neighbourhood of Newton Bushel and Newton Abbot; below Newton Bushel it has an eastward course (chiefly tideway) into the sea at Teignmouth. Its whole course is 33 miles: it is navigable up to Newton Bushel, 5 miles from the mouth.

The *Otter* rises on the southern slope of Blackdown, near the village of Otterford, and flows south-south-west past Honiton, Ottery St. Mary, and Otterton, into the sea about 5 miles east of the mouth of the Ex. It is not navigable, and has no tributary worthy of note. The *Axe* rises in Dorsetshire, not far from Beaminster, and has a circuitous course (north-west, west, and south-west) of 16 miles, through Dorsetshire, Somersetshire, and Devonshire to Axminster. Below Axminster it flows 7 or 8 miles south-south-west into the sea at Axmouth, receiving the Yart from the hills adjacent to Blackdown. Its whole length is 26 miles.

The *Arvon*, or *Aune*, the *Erme*, and the *Yealm* rise on the southern side of Dartmoor, and flow southward into the sea between Plymouth Sound and Bolt Head. They are respectively 23, 14½, and 14 miles long. The Aune and the Yealm have each a navigable tideway of 3 miles, the Erme of 2 miles. The *Plym* rises near the Erme, and flows south-south-west 16 miles into Plymouth Sound at Plymouth. Its tideway, Catwater, is 3 miles long. The Tamer, which divides Cornwall from Devonshire, has been already described. [CORNWALL.] Its principal Devonshire feeders are the Deer (9 miles long), which flows past Holsworthy; the Carey (13 miles long), and the Lyd (13½ miles long), which rises on Dartmoor; both these join the Tamer near Launceston; and the Tavy, or Tay (23 miles long), which rises on Dartmoor, and flows past Tavistock. The Tavy joins the tideway of the Tamer, and has itself a tideway of more than 3 miles. The Lew Water (9 miles long) and the Thistle Brook (10 or 11 miles long) are feeders of the Lyd; and the Walcomb (13 miles long) is a feeder of the Tavy. There is a picturesque fall on the Lyd, near Lifford, 4 or 5 miles from its source. The other rivers of the county are too small to require particular notice. It will suffice to mention the Lynn (11 miles long) on the north coast, and the Sid (6 miles long) on the south coast. Salcombe harbour, between Bolt Head and Prawle Point, is the estuary of several small streams to which the maps do not assign a name. This estuary is navigable up to Kingsbridge, 4 miles from the mouth.

Communications.—The Bude and Holsworthy Canal, with which is connected the Bude and Launceston Canal, enters this county from Cornwall, near the head of the Tamer, and proceeds in a very circuitous course of more than 15½ miles to Thornbury on the river Waldon, where the canal terminates. It has two inclined planes in Devonshire and two in Cornwall: part of its course is through a tunnel. A short canal extends from Torrington along the valley of the Torridge for about 4 miles, and opens into that river at Wear Giffard, between Torrington and Bideford, where the navigation of the river begins. The Stover, or Teigugrace Canal is connected with the Teign at Newton Bushel, and extends about 4 miles up the valley of that river towards Bovey Tracey. The Tavistock Canal extends 4 miles from Tavistock to the tideway of the Tamer; it has a tunnel one mile and a half long, and a branch 2 miles long, to Millhill slate-quarries. The Exeter Canal has been noticed. The Grand Western Canal from Taunton in Somersetshire extends to Tiverton, and thence to Exeter where it joins the Exeter Canal.

The Bristol and Exeter railway, a continuation of the Great Western line, enters the county 3 miles west of Wellington, and runs in a south-west direction to Exeter, about 20 miles. A branch of about 5 miles

runs off from it to Tiverton. The main line is continued by the South Devon line, which runs along the valley of the Ex to its mouth, whence it is carried by the coast to Teignmouth, then up the valley of the Teign to Newton Bushel, where a branch 5 miles long runs off to Torquay, while the main line proceeds by Totnes to Plymouth: its whole length is 53 miles. A short line runs from Exeter to Crediton. [CREDITON.] There is a railway from Dartmoor, near the prison, originally built for prisoners of war, to the river Plym near Plymouth: a branch from Catdown and Sutton Pool, close to Plymouth, joins this railway at its termination on the Plym. The length of the railway and branch together is about 25½ miles. A tram-road, 8 miles long, formed of granite blocks, extends from the Haytor quarries to the Teigngrace Canal.

There are four roads between London and Exeter, which were prior to the construction of the railways traversed by the mails. The Devonport, Exeter, and Bath mail-road enters this county between Wellington and Collumpton, and passes south-west through Bradninch to Exeter, and thence by Chudleigh, Newton, and Totnes to Devonport. The Exeter mail-road enters Devonshire between Chard and Honiton, from which place it runs to Exeter. The Penzance, Falmouth, and Exeter mail-road enters Devonshire between Bridport and Axminster, and proceeds by Honiton to Exeter, and thence by Okehampton, skirting the north side of Dartmoor, to Poulton Bridge, where it crosses the Tamer into Cornwall. The Falmouth, Devonport, and Exeter mail-road enters the county between Ilminster and Honiton and runs to Exeter, and thence by Chudleigh and Ashburton to Plymouth and Devonport, whence the mail is conveyed across the estuary of the Tamer into Cornwall. There are several other roads of inferior importance.

Geological Structure.—A few spots occur in the eastern portion of the county and along the coast between Sidmouth and the border of Dorsetshire, which are occupied by outlying portions of the chalk formation. The sections of these portions on the coast present the last chalk cliffs toward the west. In the cliffs eastward of the Axe, the chalk occupies only the upper portion of the cliff; the central part of the cliff is composed of green-sand and the lower part of the lias: for the chalk and green-sand in their extension westward overlie the other formations, which elsewhere are found beneath them and rest immediately upon the lias. Westward of the Axe, where the chalk cliffs reappear, the chalk dips rapidly towards the west: a portion of the upper part of the cliff has been detached and has subsided toward the beach, the shattered mass of chalk exhibiting a variety of picturesque forms.

The green-sand formation presents on the confines of Dorsetshire and Devonshire many outlying masses forming considerable hills. To this formation belong the flat-topped hills of Blackdown, the range connected with them which separates the valleys of the Otter and the Axe, and the branches of this range which separate the smaller valleys watered by the tributaries of the Axe and by the Sid. A range extending westward from the Blackdown hills, and bounding the valley of the Culm on the north, also belongs to the green-sand formation: and beyond Exeter the range of the Haldon hills, divided only by the valley of the Teign from the granite of Dartmoor, is capped by green-sand; thus affording a remarkable instance of the approximation of primitive rocks and those of much later formation. The green-sand heights in Devonshire are for the most part in the state of unreclaimed heath.

On the eastern side of the Blackdown and connected ranges, the green-sand rests upon lias, the lowest of the oolitic series of formations. Lias occupies the valley of the Axe above Axminster, and the upper part of the valley of the Yart. On the western and southern sides of Blackdown the green-sand overlies all the oolitic formations, and rests immediately upon the red marl, which, with the accompanying sandstone and conglomerate, constituting the formation designated the new red-sandstone, occupies the tract from the Blackdown hills westward to the valley of the Loman and the Ex: it constitutes the bed of the Loman, but extends not quite to the bank of the Ex, which flows for the most part over a bed of transition rocks. Between Silverton and Exeter the red marl is found extending westward across the Ex and the Creed, and along the valley of the Yeo, nearly to the valley of the Taw. It extends southward from the Blackdown hills along the valley of the Otter, and across the country between the Otter and the Ex to the coast; crosses the Ex immediately below Exeter, and extends along the coast with some interval to Torbay; it forms the valley of the Sid and the Coly, and the lower part of the valleys of the Axe and the Yart, and the picturesque cliffs about Babbacombe Bay. The green-sand which caps the Haldon hills rests chiefly on this formation.

The district occupied by the various formations enumerated above is small, compared with that which consists of the rocks of the transition class. These, the carbonaceous series of De la Beche, the Devonian system of Sedgwick and Murchison, occupy all the county northward and westward of the new red-sandstone, except the primitive district of Dartmoor. The western side of Great Haldon (green-sand) rests upon the transition rocks. These transition rocks consist of an argillaceous slate, grauwacke, which in the neighbourhood of Dartmoor does not attain to an average elevation of more than 500 feet; except on the western flank of the moor, where it

forms a steep eminence of more than 1100 feet. In the north of Devon it rises considerably higher, and the heights of Exmoor (which are in some parts 1800 feet high) consist of it. In this part of the county the rocks which compose the formation differ materially in their mineralogical characters: they have for the most part the structure of sandstones, and are essentially composed of quartz and clay, but in different proportions; quartz predominating in the coarser and clay in the finer grained varieties; these last graduate into a fine slate, the laminae of which are as thin as paper. The strata of grauwacke near Clovelly incline in every direction, and describe the most capricious and picturesque forms. The undulating surface of the country may be partly ascribed to the predominance of the argillaceous slate, which is, of all the rocks of earlier formation, the most subject to decomposition. These slate rocks are quarried for roofing-slates; they are metalliferous, affording ironstone and veins of tin, copper, and lead; the veins or lodes which yield tin or copper, run, as in Cornwall, from north-east to south-west (approaching more or less to east and west), and those which afford lead run nearly at right angles to these. The strata in the mining field about Tavistock which yields tin, copper, lead, and manganese, are traversed by porphyritic (granite) beds, bearing nearly east and west. A few lead and copper mines are wrought in North Devon: the lead is combined with silver. In many parts of the transition district, beds of limestone and masses of greenstone occur. The limestone rocks in the vicinity of Plymouth, Tor Bay, Ashburton, Newton Bushel, and Chudleigh, as containing organic remains and alternating with argillaceous slate, may be referred to the transition series; the limestone is quarried for building and burnt for manure; beautifully veined marble is worked in different places. The limestone of the north of Devon which crosses the county in parallel courses east and west, may be referred to the same series.

It is in the transition district that the imperfect coal or lignite, called Bovey coal, is found. It occurs at Bovey Heathfield, on the right or south-west bank of the West Teign or Bovey River, in a plain where the strata of it rise to the surface. It lies in parallel seams from 4 to 16 feet thick, at 6 or 8 feet distance from each other, to the depth of 60 feet, and exhibits a gradation from the most perfect igneous texture to a substance nearly approaching the character of bit coal. Potters'-clay and pipe-clay are found in the same neighbourhood. These various substances are of a later formation, and are deposited with intermingled beds in a basin formed of older rocks. The Bovey coal is used for fuel in the potteries on Boven heath, and by the poorer people of the neighbourhood; but its difficult and imperfect combustion, and fetid gas, render it unfit for domestic use.

Mica and chlorite slate form the bold rocky coast from Start Point to Bolt Tail. Granite forms the mass of Dartmoor. Numerous rifted rocks, called tors, are scattered over the surface of this moor: they appear to occupy their primitive sites and to owe their present figure to the resistance which their more perfect crystallisation has enabled them to offer to the influence of the atmosphere. The Dartmoor granite is remarkable for the size of the felspar crystals which it contains; it is much valued for its durability, fineness of texture, and the size of the blocks; it is quarried and exported to a considerable extent, especially to London. It is metalliferous, containing veins of tin, even the rock itself being sometimes impregnated with this metal. (Conybeare and Phillips's 'Outlines of the Geology of England and Wales'; 'Geological Transactions'; De la Beche's 'Report on the Geology of Cornwall and Devon'; Murchison's 'Silurian System'; 'Geological Map of the Society for the Diffusion of Useful Knowledge'.)

Climate, Soil, Agriculture.—The climate of Devonshire is generally humid; the temperature however varies considerably in different parts of the county. Along the south coast it is mild and equable, and this part of the county is in consequence much resorted to by invalids, especially such as have a tendency to pulmonary diseases. The south coast is moist, being very subject to light misty rains, known as the 'Devonshire drizzle'; it is also liable to gales. Myrtles and other tender plants grow freely in the open air; and snow seldom lies long on the ground. On the north coast the winds are very keen, and the climate is generally colder. The moorland country about Dartmoor is also cold and very bleak, but healthy.

The lower hills which occupy so large a part of the surface of this county are covered with grass; the higher with moor and rock. The county contains along its numerous rivers many fertile meadows, some of which are only imperfectly irrigated, and others not at all. Grass seems to be the natural product of a mild moist climate, like that of Devonshire, in which corn is everywhere a secondary object. The improvements in the cultivation of arable land which have been rapidly introduced into other counties, especially in the north, have not been so generally received in Devonshire. The oldest system of Devonshire cultivation is a rude species of convertible husbandry, very different from what is called by that name in the north of England and south of Scotland. When grass land begins to wear out by injudicious management, or from a natural defect in the soil, the surface is pared thin, and the sod when dried is burnt in heaps. The ashes thus produced stimulate the soil and enable it to bear a few crops, frequently three corn crops in succession. When the land is thus nearly exhausted, it is laid down again in grass, and is

pastured for eight or nine years, when the same process is repeated. This system has been so commonly adopted in Devonshire, that the operation of paring and burning is frequently called 'Devonshiring,' or as contracted, 'Denshiring.' It is now however less practised than formerly, and no doubt will in time be confined to land abounding in vegetable matter in that state in which it is not fertile, as in peat or turf.

The soil of Devonshire consists of the substance of the rocks of which the hills are composed, which are granite, grauwacke, red-sandstone and slate, and marble. The decomposed slate gives the argillaceous part, which binds the siliceous and calcareous sand produced from the other rocks. The waters have mixed these substances in every proportion; but the best and most fertile soils are composed of a mixture in the proportions which form a good sound loam very favourable to the growth of wheat and of potatoes. A great part of North Devon is of more than average fertility: and portions of the southern part of the county are highly productive. Considerable wastes and heaths have been gradually brought into cultivation; and although many wastes and commons still remain, and there are extensive moors and bogs scarcely susceptible of improvement, the quantity of land which is productive in grass or corn is very considerable for so hilly a country. The grass land occupies more than four-fifths of the soil under cultivation. Some of the lands on the hills are so steep that the crop must be brought home upon horses, which carry a pack-saddle with large hooks on each side, in which the sheaves are laid. A horse so loaded looks at a distance like a little moving stack, being almost entirely covered with sheaves.

A considerable quantity of potatoes is raised in Devonshire and sent to London, where they obtain good prices. They were formerly planted in lazy-beds, as in Ireland, but the superior method of single rows moulded up is now generally adopted. The rich brown loam on a rocky subsoil, which gives a dry sound bottom, especially if it has been for some time in grass, whether pared and burnt, or only ploughed and well worked, produces an abundant crop of very good potatoes.

Grass land being far more abundant in Devonshire than arable land, the chief articles of agricultural produce for exportation are butter, cheese, and live stock. The finest and richest meadows are situated on the alluvial borders of the principal rivers. The upland meadows are less productive, and require occasional manuring.

The clouted or clotted cream of Devonshire is a well-known delicacy. It is made by heating the milk on the hearth, or by means of a stove, to a degree a little below the boiling point, when the clouted cream rises to the top like a thick scum, and is taken off when cooled. This cream being merely stirred briskly with the hand or a stick, is converted into butter. The butter thus produced is inferior to that made from cream which has risen slowly and spontaneously. In the largest and best dairies in the vale of Honiton the cream is never clouted, except to be eaten in that state as a luxury.

The cows used for the dairy are almost exclusively of the breed of the county, and of a red colour. They are handsomely shaped, and some of them give much good rich milk. In general however they have too great an aptitude to become fat to be good milkers. Cheese is made of skimmed milk, and is consequently inferior in quality. Where porkers are in request, as in the neighbourhood of great towns, they are profitably fattened on the skim-milk, or on the whey, with the addition of meal.

A great many oxen are reared and annually exported from all parts of Devonshire, but chiefly the northern parts. About Barnstaple and South Molton the best breeds are met with. The North Devon oxen are famed for their docility and activity at work, and especially for their great aptitude to fatten. The cows of the pure North Devon are chiefly kept to breed; for the dairy they are improved by a cross with a short-horn. Some very fine cows of a mixed breed may be seen in the vale of the Ex: they are fine in the coat, horn, and bone, and short in the legs.

The sheep fed on the hills and wastes of this county are distinguished by fine wool and excellent flesh. The Exmoor sheep are extremely hardy, and well adapted to cold bleak mountains. In the valleys some remarkably fine sheep have been produced by crosses of the native sheep with the Leicester. In consequence of the wet state of the low meadows the higher pastures are resorted to for breeding flocks, but it requires a hardy race to withstand the wet and cold winters on the Devonshire hills; for frost is not so hurtful to lambs as continued rains. The pasture on Dartmoor Forest is very good, and the rot is almost unknown there.

The race of pigs in Devonshire is very good generally; and in some districts, where care has been taken to select the best animals and cross the breeds with judgment, as fine hogs are fattened as in any part of England.

The farm buildings in Devonshire are frequently very inconveniently situated with respect to the farm. The object seems to have been to choose a sheltered spot, without regard to the situation of the land attached to the farm. The materials of which the buildings are constructed are stone or earth, made into a species of mortar, and

formed into thick walls, which dry and harden gradually, and are called by a provincial term, 'cob walls.'

The farms are not so extensive as in the more level parts of England; 150 to 200 acres, of which at least three-fourths are pasture, are considered a large farm. There are also in this county many more small proprietors and lessees for 99 years, which is nearly the same, than in most other parts of Britain. They are mostly frugal and industrious, and if they do not cultivate their land in the most approved manner, they at least contrive to live comfortably. This is chiefly owing to the rearing of cattle, which requires constant attention and the eye of the master much more than the cultivation of the soil, and in which small occupiers are generally more successful in proportion than large farmers.

The chief beverage of the Devonshire people is cider; the cider made in this county is considered to be superior to any other in England. The soil on the slopes of the hills is peculiarly adapted to the growth of fruit-trees, especially on a loose rocky bottom, where the roots may insinuate themselves and find moisture at all times.

The progress of cultivation has greatly diminished the timber which formerly abounded in Devonshire, and except in sheltered situations trees do not thrive and acquire so great a size as they seem to have done when they sheltered one another. Coppice-wood however is plentiful, most of the steep sides of hills towards the banks of the rivers being covered with this growth, which adds considerably to the beauty of the valleys. The best of the coppice-wood is used for fencing, hurdles, and hop-poles. In some parts there are extensive furze brakes, which are usually cut every five years for fuel. The wood grown in Devonshire is chiefly oak, but beech, ash, and elder are interspersed, according to the soil and situation.

Trees planted on the summit of the hills in Devonshire seldom thrive owing to the violence of the winds; but on the slopes of the hills they succeed well, and as they ascend they protect each other; and thus in time the tops may be covered. Where the Scotch fir and larch have been planted in sheltered situations they grow well.

Divisions, Towns, &c.—In the Exon Domesday (a description of the five western counties, Wilts, Dorset, Somers. t, Devon, and Cornwall, which is supposed to contain an exact transcript of the returns made by the Conqueror's commissioners at the time of the general survey from which the great 'Domesday' itself was compiled), which is preserved among the records belonging to the Dean and Chapter of Exeter, mention is made of at least 33 hundreds into which Devonshire was then divided. In the hundred roll, a document of the time of Edward I., 33 hundreds (including that of Lovetot, incidentally mentioned as co-extensive with the manor of Fremington) are noticed. The present number is 33. The county is divided into two parts, the northern and the southern divisions, for the purpose of parliamentary representation: each division sends two members.

Devonshire contains 40 market-towns. Of the most important we subjoin a list, adding the locality of each:—

ASHBURTON, a parliamentary borough on a small feeder of the Dart; AXMINSTER, on the Axe; BAMPTON, on the Bathern, a feeder of the Ex; BARNSTAPLE, a parliamentary borough on the Taw; BEER ALSTON, between the Tamer and Tavy; BIDEFORD, on the Torridge; BRIGHAM, near Berry Head, the southern extremity of Tor Bay; South Brent, on the Aune; Chagford, on the Teign; CHUDLEIGH, on the Teign; Chulmleigh, on the Dart; COLLUMPTON, on the Culm; COLYTON, on the Coly, a feeder of the Axe; CREMOR, on the Creedy; Culmstock, on the border of Somersetshire; DARTMOUTH, a parliamentary borough on the Dart; Devonport, formerly called Plymouth Dock, or colloquially Dock, on the estuary of the Tamer, near Plymouth, a parliamentary borough; EXETER, a city, and the county town, on the Ex; Hatherleigh, on the Torridge; HOLSWORTHY, on a feeder of the Tamer; HONITON, a parliamentary borough on the Otter; ILFRACOMBE, on the Bristol Channel; KINGSBRIDGE, near Star Point; Modbury, on a feeder of the Erme; SOUTH MOLTON, on the Mole; Moreton Hampstead, on the eastern edge of Dartmoor; NEWTON, on the Teign; OKEHAMPTON, on the Okement; OTTERTON ST. MARY, on the Otter; PLYMOUTH, on Plymouth Sound, a parliamentary borough, and one of the great naval ports of England; PLYMPTON, on the Tavy, a feeder of the Plym; SIDMOUTH, on the English Channel; Stonehouse, between Plymouth and Devonport; TAVISTOCK, a parliamentary borough on the Tavy; TEIGNMOUTH, at the mouth of the Teign; TIVERTON, on the Ex, a parliamentary borough; TOISHAM, on the Ex; TORRINGTON, on the Torridge; TOTNES, a parliamentary borough on the Dart; and Uffculme, on the Culme. The towns which have their names printed in small capitals will be found described under their respective titles; the remainder we notice here, with the population of each in 1851. Devonport and Stonehouse will be found described under PLYMOUTH.

South Brent, population of the parish 1203, is a small town on the road from Exeter to Plymouth, and on the river Avon or Aune, 26 miles S.S.W. from Exeter by road, and 36 miles by the South Devon railway. The town is situated near the south east corner of Dartmoor Forest. The market is on Friday; and there are two fairs in the year.

Chagford, population 1557, is an ancient stannary town, situated near the right bank of the Teign, and not far from the border of Dartmoor Forest at its north-eastern angle, 16 miles W. by S. from Exeter. This small town lies in a picturesque situation at the foot of some rugged and lofty hills. The houses, irregularly arranged, are of antique appearance. A brook flows through the middle of the street. The church is an ancient structure of the native granite. There is a bridge of three arches over the Teign, half a mile above the town. Many of the population are engaged in agriculture. A few are employed in the woollen manufacture. The market is on Thursday, and there are four fairs in the year. There are places of worship for Wesleyan Methodists and Calvinistic Baptists. Towards the close of the 17th century the town was partly destroyed by fire.

Chulmleigh, or *Chumleigh*, population 1711, is a small town on the right bank of the Little Dart, just above its junction with the Taw. It is on the road from Exeter to Barnstaple, about 21½ miles N.W. from Exeter. Many of the population are engaged in agriculture. The church, dedicated to St. Mary Magdalen, was much damaged by lightning in 1797. It has a fine tower, and contains some ancient screen work. The church was formerly collegiate. There are two chapels for Dissenters, two Endowed Charity schools, and a British school. The manor of Chulmleigh once belonged to the Courtenays, earls of Devon, who had a castle here. The market is on Thursday; there are three fairs in the year.

Culmstock, or *Columstock*, population 1224, is on the border of Somersetshire, on the upper part of the river Culm, 19 miles N.E. from Exeter. There is a market-house. The market is held on Friday. There are two fairs in the year. The clothing trade, which once flourished in this place, has much decreased. The church contains a fine stone screen, and a rich doorway, canopied with foliage. There are places of worship for Quakers and Wesleyan Methodists.

Hatherleigh, population 1710, situated about 28 miles W.N.W. from Exeter, is on the right bank of a branch of the Torridge, a short distance from its junction with the Okement. Most of the inhabitants are engaged in agriculture; a few are employed in the manufacture of woollens. The town is very irregularly laid out, and the houses have a mean appearance. The market is on Friday; there are four cattle fairs in the year, and a large cattle market on the Friday nearest the 21st of March. Petty sessions are held here. There are five almshouses and a Free school in the town.

Modbury, population of the parish 1858, is on a rivulet whose waters flow into the Erme: 34 miles S.W. from Exeter. The population is chiefly engaged in agriculture. The town consists principally of four streets crossing each other at right angles. The houses are in general fronted with slate. The church is spacious and handsome, the spire is 134 feet high. There are meeting-houses for Baptists, Independents, Quakers, and Methodists. Some ruins are left of the ancient mansion of the Champenounes, who held the manor of Modbury, and lived here in great splendour in the reign of Edward II. Modbury is a borough, though without a charter of incorporation: it sent representatives to Parliament in the reign of Edward I. There was an alien priory of Benedictines here as early as the reign of Stephen; it was suppressed by Henry VI. and its revenues given to Eton College. The market is on Thursday: there is a great market the second Tuesday in every month; also a fair in the month of May. There are here a Charity school, a British school, and two infant schools. A barrack stands in the outskirts of the town.

Moreton Hampstead, population of the parish 1858, is 11 miles W.S.W. from Exeter, near the eastern border of Dartmoor Forest. The town is romantically situated on a gentle eminence bounded on almost every side by lofty hills. The principal street runs for about half a mile along the Exeter and Plymouth road. Besides the church, which is ancient, there are meeting-houses for Independents, Baptists, Methodists, and Unitarians; also a Free school, a school partly supported by endowment, and infant schools. There are several tan-yards, a rope manufactory, and some granite quarries in the neighbourhood. The market is on Saturday; and there are two great markets and two cattle fairs in the year. The townspeople are in general strong and healthy, and remarkable for singularity of dialect and manners, owing probably to their secluded situation. In the vicinity are a rocking stone, a cromlech, and the remains of a Druidical temple.

Uffculm, or *Uffculme*, population 2098, is on the right bank of the river Culm, a feeder of the Ex, 16 miles N.E. by E. from Exeter. Many of the inhabitants are engaged in agriculture. Uffculm was until towards the close of the last century, a considerable manufacturing town; a great quantity of serge was made and exported to Holland by the Tiverton merchants. Flannels were afterwards made, but these manufactures have ceased. The market is on Wednesday: there are three fairs in the year, but the fairs have declined. The church, dedicated to St. Mary, contains some ancient monuments and a richly-carved wood screen. There are places of worship for Independents and Baptists. The Grammar school, founded in 1701, has an income of 46*l.* 10*s.* 6*d.*, and had 10 scholars in 1851, of whom one was free.

The following are some of the more important villages, with the

population in 1851, and a few other particulars:—*Axmouth*, population 680, is situated at the mouth of the river Axo, 21 miles E. from Exeter. The mouth of the river has, by means of piers, been converted into a harbour capable of receiving vessels of 100 tons burden. About a mile E. from Axmouth occurred some very remarkable land-slips on the 26th of December, 1839, which caused a chasm 200 feet in width and 250 feet in depth, extending for a distance of three-quarters of a mile parallel with the shore. At Whitlands, a little more than a mile farther to the east, occurred a second but much smaller landslip on the 3rd of the following February. *Beer*, 19 miles E. by S. from Exeter, population 1281, a small cove and village, inhabited by fishermen, and celebrated formerly for smuggling, is situated in a narrow glen through which a stream runs and falls into the sea in a beautiful cascade. A small church and an Independent chapel are in the village; the sum of 7000*l.* was left by the late Lady Rolle for the purpose of founding and endowing various charitable institutions. About a mile from the village is a large cavern extending a quarter of a mile under ground; its depth is about 300 feet from the surface. *Berry Pomeroy*, 23 miles S. by W. from Exeter: population of the parish, 1038. The church is a fine structure, and contains a handsome screen and several monuments. On an elevated rock in a narrow valley are the picturesque and ivy-covered ruins of Berry Pomeroy Castle, the oldest part of which was built in the reign of William I. by Ralph de la Pomeroy. The ruins are of great extent, and have a very impressive appearance. *Bovey Tracey*, 13 miles S.S.W. from Exeter: population of the parish, 2086. The church is ancient, and contains a coloured stone pulpit. In an open space in the village are the shaft and steps of an ancient cross. Close to the village is a pottery, established in 1772. In the vicinity are found sands and clays suitable for the manufacture of fine porcelain. It is here that the lignite, known as Bovey coal, which is used for fuel, is found. The market has been discontinued: there are two fairs, one in March and one in November. *Bow*, 16 miles E.N.E. from Exeter, population of parish 994, a small town; many of the houses are cob-built, and the place has a poor appearance. A great market is held in March, and fairs are held in May and November. *Branscombe*, 18 miles W. by S. from Exeter, population 1017, is beautifully situated at the junction of three valleys, through each of which a stream descends, and uniting here flow together into the sea at Branscombe Mouth. In the neighbourhood are numerous petrifying springs. *Buckland Monachorum*, 32 miles S.W. by W. from Exeter: population, 1518. The church, a very handsome building, contains a monument by Bacon to Lord Heathfield, the heroic defender of Gibraltar. A little to the south of the village is Buckland Abbey, the favourite residence of Sir Francis Drake. *Budleigh Salterton*, 12 miles S.E. from Exeter, population included in East Budleigh, is a small but favourite watering-place. The village is built along the bottom of a valley running to the sea, and the buildings extend on both sides up the hill: a small brook of water runs through the main street, over which are placed at intervals rustic wooden bridges. About a mile to the north is the cob-built village of *Budleigh East*: population of the parish, 2447. In this parish is Hayes Barton, the birthplace of Sir Walter Raleigh; it is now a farmhouse. *Clovelly*, 47 miles N.W. from Exeter, population 937, a picturesque little fishing village on the side of a steep rock adjoining the sea. The church is a boat building. Clovelly is celebrated for its herring-fishery; as many as 9000 herrings have been taken off here at a haul. Above the village is Clovelly Court, the seat of the lord of the manor. *Combe Martin*, 42 miles N.N.W. from Exeter: population, 1441. The church is in the perpendicular style, constructed of light red stone, and is distinguished by a very handsome tower. There is a chapel for Wesleyan Methodists. The trade of Combe Martin is inconsiderable. Welsh coal is imported, and corn and bark are exported. The market formerly held here has been long discontinued. In the neighbourhood are several silver-lead mines, which have been worked at various times since the reign of Edward I. *Drewsteignton*, 12 miles W. from Exeter: population, 1232. This village is chiefly remarkable for its numerous Druidical remains. Besides these there are some remains of British camps on the river, and some other antiquities in the neighbourhood. *Hartland*, 54 miles N.W. from Exeter: population of the parish, which is extensive and contains several villages, 2183. A market is held on Saturdays, and there are two cattle fairs in the year. The church stands about a mile from the town, near the sea. At Hartland quay corn is exported, and coal and limestone imported. The Independents have a chapel here. Hartland Abbey was founded by the wife of Earl Godwin for secular priests; some portions of the cloisters still remain: they are in the early English style. *Hemyock*, 20 miles N.E. from Exeter: population, 1185. The church has been lately rebuilt; it contains an old font of Purbeck stone in the early decorated style. There are some slight remains of a Norman castle in the neighbourhood. *Kenton*, 6½ miles S. by E. from Exeter, population 2067, anciently a borough town: a market and fair were formerly held here, but have long been discontinued. The church appears to have been built in the reign of Edward III.; it is a handsome building constructed of red stone; the tower is 100 feet high; the church contains a fine screen. *Lidford*, 31 miles W. by S. from Exeter: population, 271. During the Saxon Heptarchy this was one of the principal towns in Devonshire; it consists now of merely a few small cottages. In the village are the ruins

of an old castle and the weather-beaten church. Lidford castle was formerly used as the stannary prison for the Devonshire mining districts. A bridge extends by a single arch of only a few feet span over a dark and deep chasm, under which the river Lid is heard falling 50 or 60 feet beneath. There is also a very beautiful waterfall at Lidford, 200 feet in height, and the scenery in the neighbourhood is very grand. *Linton*, or *Lynton*, 48 miles N.N.W. from Exeter, population 1059, a beautiful and picturesque watering-place, celebrated for its magnificent scenery; it is situated on the Lynn Cliff, and has a fine view of the sea. There is a small pier at Linton, and fishing is carried on to some extent. The Valley of Rocks, a spot celebrated for its picturesque beauty, is about a mile north-west of Linton. *Lynmouth* is situated at the mouth of the streams East and West Lynn, which form a pretty cascade a little to the east of Linton. The view of the sea is very extensive. The neighbourhood of Lynmouth and Linton is much frequented by anglers: the Lynn abounds with trout. *Otterton*, 11 miles S.E. from Exeter, population 1231; the village, which is situated on an elevated site on the left bank of the river Otter, is principally composed of cob-built cottages. The church is very ancient, with a tower at the east end; it has been partly restored: adjoining to it is the Mansion, a part of an old religious house, belonging to the abbey of St. Michael in Normandy: it was founded by King John. The manufacture of pillow-lace is carried on here. *Paignton*, 23 miles S. by W. from Exeter, population 2746, a small but rapidly increasing watering-place. Before the Conquest the manor belonged to the see of Exeter, and some slight vestiges of the bishop's palace are still to be seen. The church is spacious and very ancient; it contains a curious stone pulpit carved and painted; on the exterior of the tower is an arch with a zigzag moulding. In the churchyard are the steps and shafts of an ancient cross. Paignton is celebrated for an early cabbage sent to all parts of the kingdom. Cider is made here in large quantities. The beach is excellent; a pier was constructed in 1838, at which vessels of 200 tons burden can load. *Prince Town*, 25 miles S.W. from Exeter, a very small hamlet on Dartmoor. Near Prince Town is the government prison, built in 1806, for the confinement of prisoners of war: the prison consists of seven buildings, each 300 feet long, and 50 feet wide, capable of holding together 9600 men. Attached to the prison is a neat chapel to contain 500 persons. This place is the field of an important experiment on the application of convict labour. In the autumn of 1850 a number of convicts were sent down here to be employed in the reclamation of a portion of the moor and other useful works. The prison being of such extent, and so well constructed as to afford abundance of room, security, and facility of supervision, and the situation, though bleak and dreary, being healthy, while it is sufficiently removed from any populous neighbourhood, the experiment is made under very favourable conditions. In 1852 the available accommodation was raised from 1000 to 1274. On December 31st, 1852, there were in the prison 1133. The average number for the year was 1027. In the course of the year 339 were sent with tickets of leave to Van Diemen's Land and Western Australia, and 37 received free pardons. The total expense for the year ending March 31st, 1853, was 30,042*l.*; the total value of the labour applied in and about the prison, and for making roads, reclaiming lands, &c. was estimated at 15,473*l.* Seventy acres of land were reclaimed from the waste in 1852. There are now under cultivation 98 acres, well drained, and surrounded with stone walls. Flax, barley, oats, turnips, mangold-wurzel, and carrots are grown, but potatoes have not hitherto succeeded. Sixty cows are kept, and the grass-land furnishes pasture and hay sufficient for them. A considerable number of pigs are also kept. In the garden within the prison there are vegetables grown for the use of the prisoners. Belts of forest-trees have been planted. Peat is dug for fuel, and is also used for the manufacture of gas. The sewerage is used for manure. In the yearly report the governor bears testimony to the general good conduct of the prisoners. Men who have received sentences for short periods, whose crimes have not been heinous, and who have behaved well, are selected for special service, such as looking after the cattle, driving carts, &c., without being in charge of an officer. Of such 18 have been employed outside the prison walls, and 35 within them: the dress of this class of men is blue instead of brown, and those employed outside the prison have in addition a red collar to their jackets. *Salcombe*, 38 miles S. by W. from Exeter, population of the ecclesiastical district 1656, is a very picturesque town, pleasantly situated, and so sheltered by high lands as to be one of the warmest in the kingdom. Myrtle-trees grow along the shore, and lemon and orange-trees in the gardens. The harbour is sheltered, but it has a bar at low water, and sunken rocks at the mouth, which render the entrance dangerous. Salcombe was a few years back celebrated for its white ale, a beverage peculiar to this part of Devonshire. *Sheepwash*, or *Shipwash*, population of the parish 525, on the north bank of the Torridge, 30 miles W. by N. from Exeter, had a considerable market in the middle of the last century, but is now a place of no consequence. *Silverton*, 6½ miles N. from Exeter, population of the parish 1876, was formerly a market-town. Besides the church there is an Endowed school. This place suffered much from a fire in 1837, which destroyed nearly half the houses. Sir Thomas Fairfax quartered with his army here in 1645. About one mile to the right is *Silverton Park*, a seat of the late Earl of Egremont. *Starcross*, 8 miles

l. by E. from Exeter, population 936, is in some repute as a watering-place. It derives its name from a cross that formerly stood near the landing-place on the bank of the river. A district chapel was built here in 1826; there is also a chapel for Wesleyan Methodists. *Starcross* is celebrated for its oysters and cockles. There is a station here of the South Devon railway, also a good stone pier for the use of steam-vessels. *North Tawton*, 21 miles W. by S. from Exeter, population of the parish 1906, was anciently a borough and market-town, and still boasts of its portreeve. The market has been long discontinued; the woollen manufacture, which it formerly possessed, is gone, and the place is of no importance.

Divisions for Ecclesiastical and Legal Purposes.—From the introduction of Christianity among the Anglo-Saxons to the year 703, the southern part of England, from Kent to Cornwall, was under one bishop. Upon the ecclesiastical division which took place in 703, Devonshire became part of the diocese of Sherborne. About 910 Devonshire formed a diocese of itself, the see being at Crediton. About the year 1040, in the reign of Harold I. or Hardicanute, Cornwall, which had previously formed the separate diocese of St. Germans, was united with Devonshire, and the see was soon afterwards (1050) removed to Exeter, where it has ever since continued. That part of the diocese which is in Devonshire is divided into three archdeaconries—Exeter, Barnstaple, and Totnes—which are subdivided into 13 rural deaneries.

The number of benefices in the county is given by Messrs. Lysons's *Magna Britannia* at 471, of which 258 are rectories, 130 vicarages, 2 donatives or curacies, and 41 parochial chapelries. There are several chapels of ease. The diocese of Exeter is in the ecclesiastical province of Canterbury. According to the 'Census of Religious Worship,' taken in 1851, it appears that there were then in the county 1297 places of worship, which belonged to the various religious societies in the following proportions:—Church of England, 549; Methodists (four sections), 379; Independents, 142; Baptists, 112; Brethren, 36; Unitarians, 12; Quakers, 8; Roman Catholics, 8; other bodies, 51. The total number of sittings provided was 334,372, of which the Established Church provided 191,710.

Devonshire is included in the western circuit: the assizes and quarter sessions for the county are held at Exeter, which city is a county of itself, having been made so by statute 2 & 3 Edward VI. The stannary laws [CORNWALL] have been in force from a very early period in the mining district in the south-west part of the county. The stannary towns are Ashburton, Chagford, Plympton, and Tavistock. County courts are held at Axminster, Barnstaple, Bideford, Crediton, Exeter, Holsworthy, Honiton, King's-bridge, South Molton, Newton Abbot, Okehampton, Plymouth, Tavistock, Tiverton, Torrington, and Totnes.

The county returns four members to Parliament—two for the northern and two for the southern division. The city of Exeter returns two members, as do the following boroughs: Barnstaple, Devonport, Honiton, Plymouth, Tavistock, Tiverton, and Totnes. The boroughs of Ashburton and Dartmouth return one member each; making the total number of members for the county, city, and boroughs, 22—four less than before the Reform Act. Exmouth and Teignmouth sent representatives to the great councils for maritime affairs.

History and Antiquities.—The earliest ascertained inhabitants of this county were the Damnonii (Richard of Cirencester), or Dumnonii ('Itin. Antoninus'). The many ancient encampments in Devonshire mark it as the scene of early encounters: some of these camps are evidently Roman. After the Roman conquest Devonshire was included in the province of Britannia Prima.

Of this remote period there are many remains. Circular inclosures formed by low stone walls occur in various parts of Dartmoor. Grimpsound, as it is called, about three miles from the village of Manaton, on the east side of the moor, is a circular inclosure of four acres: it has two entrances directly facing the north and south: at these points the wall, which appears to have been about 12 feet high, was the thickest. In the inclosure are several circles of stone of 12 feet diameter, especially near the south side of the inclosure. At Gidleigh Park, near Scorhill Tor, Dartmoor, is a very remarkable stone circle known as the Scorhill Circle. "The two principal columnar masses in this granite peristyle stand at nearly opposite points of the circle; the highest rising nearly 8 feet from the surface, and the other standing upwards of 6 feet. The lowest are about 3 feet high; several have fallen, but twenty of these time-worn obelisks still maintain their erect position, and circumscribe an area of about 100 feet in diameter." (Rowe's 'Dartmoor.') There are in the parish of Bratton Fleming, between South Molton and Ilfracombe, six upright stones, the remains apparently of an ancient circle. Near Merivale Bridge, on the Walkham, are 'hut circles,' as they are called, and other aboriginal remains, which indeed, as before mentioned, abound in different parts of Dartmoor. The granite tors of Dartmoor are natural. There are some sepulchral stones on Maddock's Down (south of Combe Martin), and a very fine cromlech at Drewsteignton, or Drow's Toignton, between Exeter and Okehampton. Numerous barrows, or tumuli, occur on Haldon and other downs, particularly in North Devon, and some cairns or piles of stones. Roman antiquities have been found in some barrows when opened.

Of Roman stations in Devonshire the most important appears to have been *Iscā Damnoniorum*, which the name and the antiquities discovered concur in fixing at Exeter. Another Roman station, *Moridunum*, or *Muridunum* ('*Itin. Anton.*'), is agreed by most to have been in this county. Two other stations are mentioned by Richard of Cirencester: '*ad Durium*' (the station on the *Durins* or *Dart*), supposed to be Totnes; and *Tamara*, the name of which indicates its situation somewhere on the river *Tauarn* (*Tamer*), and which was probably at *Tamerton Folliot*, on the estuary of the river some miles above *Devonport*. Richard also mentions two British towns, *Terminolus* and *Artavia*, in the territory of the *Chubri*, and probably in the north of Devon. It has been conjectured that *Denbury*, near *Newton Abbot*, is the place called *Devonissa* by the geographer *Ravennas*.

An ancient British road, afterwards converted by the Romans to their own use, traversed the whole county from east to west, passing near *Axminster* and *Honiton* to the camp at *Hembury*, and by a subsequent bend to *Iscā* or *Exeter*. From *Iscā* it ran south-west over *Haldon* and near *Newton Abbot* to *Totnes*, and thence west to the *Tamara*, or *Tamer*. Many other roads may be traced. The Roman antiquities found in the county have not been numerous: the principal seem to have been at *Exeter*, where a tessellated pavement was found, some bronzes, coins, and other remains. Some antiquities have been found at *Scaton* and other places.

In the Saxon invasion this county became the scene of contest. *Cynegils*, king of the West Saxons, is said by the Saxon chronicle to have beaten the Britons, A.D. 614, at *Beandune*, supposed to have been *Bampton*, though it is by no means clear whether it is the *Bampton* in Devonshire or that in Oxfordshire. The pressure of the West Saxons gradually constrained the Britons to retire westward. Devonshire was for a long period a desolate ground; it probably was not until the reign of *Athelstan*, who is said to have defeated *Howell*, king of *Cornwall*, near *Exeter*, A.D. 926, that the Britons were finally compelled to retire beyond the *Tamer*. In A.D. 876, 877, the *Danes* seem to have wintered at *Exeter*, and were in 877 besieged by *Alfred*, who compelled them to make peace and to give hostages for the observance of it. In 878, when *Alfred* had been compelled by a Danish invasion to conceal himself, *Ubbo*, or *Hubba*, one of the sons of *Ragnar Lodbrog*, and one of the chiefs of the invaders, landed in the north of Devon and blockaded *Kynwith Castle*, near *Appledore*. *Odun* (who is styled earl of Devon), who occupied the castle, made a vigorous sally just about daybreak, slew *Ubbo* and nearly 1000 of his men, and captured the magical standard of the *Danes*, woven by the sisters of *Ubbo* and worked with the figure of a raven. In 894 the *Danes* were again in Devonshire; those of them whom *Alfred* had settled in East Anglia and Northumbria, induced by *Hasting*, who was then infesting England, took ship, and sailing round the headlands of Kent and along the Channel, besieged *Exeter*; but on the approach of *Alfred's* army they fled to their ships. The great battle of *Brunaburh*, which has been by some placed in Northumberland, has been by others supposed to have been fought near *Axminster* in Devonshire. In 997, 1001, and 1003 the *Danes* committed considerable ravages in the district.

When *William* of Normandy attacked England his second campaign was in the west. *Exeter* yielded on his approach. In the next two years, when the Saxons of the neighbourhood rose in revolt, or rather renewed the struggle for independence, under the sons of *Harold*, who had fallen at *Hastings*, the citizens refused to admit them. *William* sent some troops to relieve the city, and the Saxons were defeated with great slaughter.

The coasts of Devonshire were about this time laid waste by the Irish, and the civil broils which arose during the next hundred years between the children and descendants of the Conqueror rendered Devonshire the scene of contest. The succeeding centuries are marked by few historical events except occasional attacks by the French on the towns along the coast, and some contests of inferior moment during the wars of the *Roses*. The nobility of the county were divided between the rival houses; the *Courtenays*, earls of Devon, were *Lancasterians*, and three brothers who successively enjoyed the title fell in the field or died on the scaffold.

In the rebellion of the Cornish men under *Lord Audley* and *Flammock* [*CORNWALL*], and in the rebellion under *Perkin Warbeck*, *Exeter* was the object of attack; but in both cases the attack failed. The last siege was raised by *Courtenay*, earl of Devon, attended by several Devonshire knights and the '*posse comitatus*.' *Warbeck* retired to *Taunton*.

Of the troubled periods to which the foregoing sketch refers Devonshire contains several memorials in the baronial castles, the ruins of which are still in existence. At *Exeter*, *Plympton*, *Okehampton*, and *Tiverton* were castles, all of which belonged to the *Courtenays*. [*EXETER*; *TIVERTON*.] Some of the walls of the keep of *Plympton Castle* yet remain, and some scanty ruins of that of *Okehampton*. *Berry Pomeroy Castle*, near *Totnes*, is an ancient mansion on the brow of a steep hill in a well-wooded country; it was the seat first of the *Pomeroy*s, afterwards of the *Seymour*s. *Compton Castle* near *Torbay*, and *Aiton Castle* near *Chulmleigh*, are still standing but converted into farm-houses; and there are remains of *Gidley Castle*; *Hemyock Castle*, near the upper waters of the *Culm*; *Dartmouth Castle*; *Kingswear Castle*, near *Dartmouth*; and

Lidford Castle, between *Tavistock* and *Okehampton*. Of ancient mansion-houses *Dartington*, near *Totnes*, built in the reign of *Richard II.*, about the end of the 14th century, and an old mansion at *Bradley*, near *Newton Bushel*, built in the 15th century, are among the most remarkable.

When the alteration of the church service took place at the Reformation, 1549, great disturbances broke out in Devonshire. They began at *Sampford Courtenay*, between *Okehampton* and *Chulmleigh*, and gradually assumed a serious aspect, as some of the gentry joined in the revolt. The spirit of disaffection spread into *Cornwall*. *Exeter* was besieged by the rebels; and it was not until several severe actions had taken place that *Lord Russell*, who had been sent down to suppress the revolt, succeeded in doing so. In 1554 *Exeter* was occupied by *Sir Peter* and *Sir Gawen Carow*, who had taken up arms to oppose the coming of *Philip of Spain*.

Of the monastic establishments of Devonshire, *Tavistock Benedictine Abbey*; *Buckland*, *Buckfast*, *Dunkeswell*, *Ford*, and *Newenham*, *Cistercian* abbeys; *Plympton* and *Hartland*, the former a priory and the latter an abbey of *Augustinian* Canons; and *Tor Abbey* for *Premonstratensian* Canons, were the chief. The ruins of these buildings are inconsiderable: the chapel and other parts of *Ford Abbey*, on the river *Axe*; the refectory and abbot's hall, and the gatehouse at *Tavistock*; part of the conventual church of *Tor Abbey*; and some remains of *Buckland*, *Hartland*, and other establishments, are yet standing. There are considerable remains of *St. Nicholas's Priory* at *Exeter*; the crypt, which has massive Norman arches, has been converted into a kitchen.

In the great civil war of *Charles I.* the county seems generally to have embraced the cause of the Parliament. *Plymouth* was seized by the townsmen during the absence of the governor appointed by the king, and the *Earl of Ruthen* was soon after made governor. *Exeter* was the head-quarters of the *Earl of Stamford*, the parliamentary general. In 1643 the Royalists besieged *Exeter*, which the *Earl of Warwick*, who commanded the fleet for the Parliament, was unable to relieve. *Colonel Digby*, a royalist, defeated the Parliamentarians at *Torrington*; and *Barnstaple*, *Bideford*, and a strong fort at *Appledore*, which were held for the Parliament, surrendered. *Exeter* also was compelled to surrender about the same time. *Prince Maurice* blockaded *Plymouth*, but without success; two assaults made in December 1643 were repulsed, and the siege was for a time abandoned. In the spring of 1644 several fresh attempts were made upon it with a like result. In 1644 the *Earl of Essex* with his army reached Devonshire, but no great or decisive event took place until *Essex* marched into *Cornwall*, where his infantry was obliged to capitulate to the king, who had followed him thither. [*CORNWALL*.] The king, returning from *Cornwall*, summoned *Plymouth* to surrender; and on its refusal *Sir Richard Grenville* was left to carry on the siege. In October 1645 *Sir Thomas Fairfax*, commander-in-chief for the Parliament, entered the county with his army, and in the course of the following winter and spring entirely put down the opposite party.

At the revolution of 1688 the *Prince of Orange* landed at *Torbay*, November 5th; and on the 8th he made a public entry into *Exeter*, where he remained for some days before any of the principal people of the county joined him. On the 21st he quitted *Exeter* on his march to *London*.

Teignmouth was burned by the French in 1690. In 1719, upon the apprehension of a French invasion, an encampment was formed on *Clist Heath*, 4 or 5 miles N.E. from *Exeter*. In 1779 the appearance of the combined French and Spanish fleets off *Plymouth* caused great alarm, and the prisoners of war were removed to *Exeter*. In 1798, upon the alarm of a French invasion, several regiments of volunteers were raised, artillery was brought from *Plymouth* for the defence of *Exeter* and placed in an ancient intrenchment on *Woodbury Down*, a few miles south-east of *Exeter*, where a camp was formed. Similar measures were taken upon the renewal of the alarm in 1803.

Devonshire is an agricultural county. It has but few manufactures, but many of its inhabitants are employed in quarrying stone, or in obtaining some other of the valuable minerals it contains. In 1851 the county possessed six savings banks, of which two were established in connection with the dockyards, and four in the towns of *Devonport*, *Exeter*, *Plymouth*, and *Tavistock*: the amount owing to depositors on 20th November 1851 was 1,504,305*l.* 19*s.* 8*d.*

DEVYNNOCK. [*BRECKNOCKSHIRE*.]

DEWSBURY, West Riding of Yorkshire, a market-town and the seat of a Poor-Law Union, in the parish of *Dewsbury*, is situated at the base of a hill rising from the left bank of the river *Calder*, in 53° 42' N. lat., 1° 39' W. long., distant 32 miles S.W. from *York*, 189 miles N.N.W. from *London* by road, and 186 miles by the Great Northern and Lancashire and Yorkshire railways. The population of the town of *Dewsbury* in 1851 was 5033. The living is a vicarage in the archdeaconry of *Craven* and diocese of *Ripon*. *Dewsbury* Poor-Law Union contains 11 parishes and townships, with an area of 24,165 acres, and a population in 1851 of 71,768.

In the time of the Saxons the parish of *Dewsbury* was one of the most extensive in England, comprising an area of 400 square miles. That area is now divided into nine parishes, including those of *Huddersfield*, *Bradford*, and *Halifax*. *Paulinus*, the first archbishop of *York*, resided at this place, and some have supposed that from the

success which accompanied his preaching the place of his residence received the name of Duisborough, 'God's town.' In the vicarage garden, near the church, are some Saxon tombs: other Saxon relics have been found. At the east end of the chancel outside the church is a cross, inscribed "Paulinus hic predicavit et celebravit, A.D. 627." This cross is a recent erection, but it is a fac-simile of a Saxon wheel-cross which formerly stood in the same place. The inscription is supposed to refer to the conversion of Edwin, king of Northumbria, with his court, by the preaching of Paulinus in 627.

The town of Dewsbury is pleasantly situated: the increasing importance of its manufactures has caused a great extension of the buildings and much improvement in the general aspect of the place; there are numerous good streets, and the town is lighted with gas. A new court-house has been recently erected, in which petty sessions and a county court are held.

The parish church of All Saints, Dewsbury, is an ancient structure: part of the building having fallen about the middle of last century it was rebuilt in conformity with the original style. A new church at the west end of the town is in the perpendicular style. The Baptists, Independents, Wesleyan and New Connexion Methodists, Quakers, and Roman Catholics have places of worship. There are here a Grammar school, National, Wesleyan, and Infant schools, a mechanics institution, and several subscription libraries and news-rooms.

Wednesday and Saturday are the market-days, the Saturday market being the most important. Three fairs are held in the course of the year. The town is conveniently situated for manufacturing operations. There are extensive establishments for the manufacture of blankets, carpets, and inferior descriptions of woollen cloth; worsted yarn manufactories; and wool-carding establishments. Wool-stapling, iron-founding, tanning, malting, and nail-making are extensively carried on. Several corn-mills and lime-works are in the neighbourhood.

(Allen, *History of Yorkshire*; Baines, *Directory of Yorkshire*.)

DHALAC, an island in the Red Sea, situated in 15° 53' 50" N. lat., 40° 40' 30" E. long., is about 35 miles long and 18 miles wide. It is the largest island in the Red Sea. It is low and its surface level, being formed of coralline rocks covered with sand, but destitute of all herbage during the summer heat, except a small quantity of bent-grass just sufficient to feed the few antelopes and goats that are on the island. In many places there are large plantations of acacia-trees, but they seldom attain above eight feet in height. There are no springs, and the rain-water is preserved in numerous cisterns. There are also some tanks. This island contains two harbours for small vessels, Dhalac el Kibeer and Dobeiow. No kind of agriculture is carried on. According to Bruce, one-half of the male population of the island are always employed in work on the opposite shores of Arabia, and by their labour furnish their families with dhurra and other provisions; when their time is expired they are relieved by the other half. They are good seamen and fishermen. Very elegant baskets are made of the leaves of the doum-tree, and sent to Loheila and Jidda. The island contains 12 villages of from 50 to 100 houses each. (*London Geographical Journal*, vol. v.)

DHAL, a small state in the province of Malwa, Hindustan, in 22° 35' N. lat., 75° 20' E. long. The city of Dhar covers a space three-quarters of a mile long and half a mile broad, is surrounded by a mud wall 30 feet high fortified with towers, and is the residence of the raja. The pettah or fort is detached from the city, and stands on a rising ground. The district in the possession of the Dhar raja comprehends about 1070 square miles, containing a population of 104,860. The state was taken under British protection in 1819 on condition of allegiance and military service; at that time the whole revenue of the Dhar raja, then a minor, was only 35,000 rupees; it is now about 475,000 rupees, or about 47,500*l*. The most important article of cultivation is opium, but the soil is capable of yielding every kind of tropical production. Some of the villages are inhabited by Bheels; of the remaining population by far the larger part are Hindoos; there are a few Mohammedans.

DIARBEKR, or DIYAR-BEKR, a town in Turkish Armenia, is situated on a commanding eminence of black basalt at a distance of 55 miles S.E. from Kharput and about 80 miles N.E. from Urfah, in 37° 55½' N. lat., 39° 52' E. long. It stands at a short distance from the right bank of the Tigris, the intervening space being occupied by gardens. The area of the town is considerable and nearly circular in form; the walls, which are pierced by four gates, are lofty and substantial, built of the ruins of more ancient edifices, surmounted by a castellated parapet, and strengthened by numerous round and square towers, which are most thickly placed on the northern side. Formerly the town was inhabited by 40,000 families; had extensive manufactures, especially of cotton goods; and carried on a very active commerce with India through Baghdad, and with Europe through Aleppo. But the fertile plain in which it stands, and which was cultivated in every part and studded with villages of 400 to 500 houses each, has in the present century been laid waste by the Kurds; the commerce with Baghdad was annihilated, and that with Aleppo reduced to insignificance. Still it contains about 8000 families (1500 are Armenians, 85 Catholic, 70 Greek, 50 Jewish, and 6300 Turkish), and some manufactures of cotton, silk, and morocco leather. The town is

admirably situated for commerce, and to restore its prosperity nothing is required but to secure safe communication with Baghdad and Aleppo. The Tigris cannot be used as a means of transport so high up as Diyar-Bekr, but rafts of timber are sometimes floated down from the mountains above the town. The streets of Diyar-Bekr are well built and well paved, but narrow, as in most hot climates. The houses generally are built in their lower stories with black basalt and in the upper with dark-coloured brick. The principal buildings are the 20 mosques, 15 khans, the bazars, 20 baths, and the citadel, built on the highest part of the rock above the river in the north-east part of the town, in which the pasha formerly resided. The citadel is now in ruins; its site commands a most extensive view, including the Karajah-Dagh to the west, the Moosh-Dagh to the north, the plain of the Upper Tigris, the Mardin hills to the south-east, and the plain of Urfah on the south. [ARMENIA.] The climate is very hot in summer; in winter it is delightful.

Diyar-Bekr occupies the site of the ancient *Amida*, which is said to have been of great antiquity. The Turks still call Diyar-Bekr by the name of *Kara Amid*, or Black Amid, in allusion to the material of which it is built. Amida was enlarged and strengthened by the emperor Constantius, in whose reign it was taken by Sapor, the Persian king, in 359. The Persians again took it under their king Cabades, 502; but the Romans soon recovered it again, and Justinian repaired the walls and fortifications. The town was pillaged and burnt by Tamerlane, 1393. The kings of Persia in after times frequently rendered themselves masters of it. Sultan Selim took it from Shah Ismael, and made it the capital of a province in 1515. The Persians again held it for several years subsequent to 1605.

Diyar-Bekr was formerly the name of an extensive pashalic or province of Turkey in Asia, comprising the basin of the Upper Tigris, and stretching from the Euphrates to the mountains of Kurdistan, between 37° and 39° N. lat. Its principal towns were Diyar-Bekr, Mardin, and Urfah or Orfah. The town is now included in the pashalic of Kharput or Erz-Rum, we do not know which. A British consul resides in Diyar-Bekr.

(*London Geog. Journal*, vol. vi.; Buckingham, *Travels*; Ammianus Marcellinus; Procopius; Gibbon, *Decline and Fall*.)

DIDCOT. [BENKSHIRE.]

DIE. [DRÔME.]

DIE, ST. [VOGES.]

DIEMEN'S LAND. [VAN DIEMEN'S LAND.]

DIEPPE, a sea-port and bathing town in France, capital of the second arrondissement in the department of Seine-Inférieure, is situated on the south coast of the English Channel, at the mouth of a small river formed by the junction of the Arques, the Béthune, and the Eaulne, in 49° 55' 35" N. lat., 1° 4' 52" E. long., and has 16,216 inhabitants within the commune. The town lies N. of Rouen and N.N.W. of Paris, and is 38 miles and 125 miles distant by railway from these cities respectively.

The town extends about a mile along the coast, having the harbour at the north-east end, and the castle, which stands on a tall chalk cliff and commands the town and the harbour, to the westward. It is regularly built; the streets are wide and well paved with round stones; the houses are picturesque, built of brick and stone, with high slanting roofs. The principal street, called the Grand Rue, runs right through the town to the harbour; it contains the best hotels, and presents in the bathing season a busy and animated appearance. There are six Places, or squares, and two interesting churches, St-Jacques and St-Remi. Dieppe has a public library, a theatre, assembly-rooms, and a splendid bathing establishment; 68 fountains adorn the streets, which are supplied by an aqueduct 3 miles long. The castle is an irregular pile of considerable extent. The town walls are yet standing, but Dieppe is not a fortress. The port, which is formed by two jetties and defended by the castle, is sufficiently large and secure, but the entrance is narrow; it admits vessels of 600 tons. There is a lighthouse on the western jetty.

The population of the suburb of Pollet, which lies to the east of the town and is joined to it by a flying bridge, are all engaged in the herring, oyster, and cod fisheries. The quantity of herrings cured has in some years amounted to 36,000 barrels, and of mackerel to 12,000 barrels. There are sugar-refineries, rope-walks, paper-mills, and ship-building yards in the town. Fine linen, lace, and articles of ornament in bone, horn, shell-work, and ivory are made. Wine, brandy, vinegar, salt, nails, iron, steel, millstones, and colonial produce also enter into the commerce of the town. The coasting trade is active. Fishing boats and coasting vessels are built. Steamers ply daily to Brighton in Sussex. The number of vessels of all kinds that entered and left the harbour in 1852 was 2017, with cargoes amounting to 191,021 tons.

Dieppe has tribunals of first instance and of commerce, a chamber of commerce, a college, and a school of navigation. It is rather a favourite landing-place with tourists between France and England; but in this respect it is far surpassed by Boulogne and Calais. The railroad to Rouen however still throws a good share of this source of profit into the town. The most interesting places in the neighbourhood are an ancient camp attributed to Caesar, and now called La Cité des Limes; and the ruins of the castle of Arques, near which Henri IV. defeated the Duke of Mayenne.

In the 9th century the site of Dieppe was occupied only by a few fishermen's huts; in the 11th century it had increased to a small town under the name of Bertheville. Henry II. of England erected in 1188 a castle at Dieppe, which was demolished by his son Richard I. In the 16th century the fisheries, and especially the herring fishery, furnished its inhabitants with their chief occupation and wealth; their vessels went as far north as Schonen in Sweden to take the fish, which after curing they exported to the Mediterranean in their own vessels, called 'druggers,' because they brought back from the Levant spices and drugs. In the middle of the 16th century the Dieppoises undertook the expedition in which Canada was discovered, and in 1687 they formed the first French settlements on the banks of the Senegal. In 1694 the town was bombarded by the English, and with the exception of the ancient church nearly destroyed. After that event the town was regularly built.

DIEST. [BRABANT, SOUTH.]

DIEU-LE-FIT. [DRÔME.]

DIEUZE. [MEURTHE.]

DIGNE, the ancient *Dinia*, capital of the department of Basses-Alpes, in France, the seat of tribunals of first instance and of commerce, of an agricultural society, communal college, and diocesan seminary, is situated at the foot of the Alps and at the junction of several brooks with the river or torrent Bléonne, a feeder of the Durance, about 60 miles N.E. from Marseille and the same distance E. by N. from Avignon; and has 4119 inhabitants, including the commune. The town stands on a little hill surmounted by a rock on which stands the cathedral and the prison. The cathedral has an iron dome and is a very conspicuous object; the prison is girt with strong walls. The streets are narrow, crooked, and dirty; and the houses are generally ill-built. The principal structures are the residence of the prefect of the department, the bishop's palace, the court-house, the college, the seminary, and the barracks. At the foot of the hill there is a well-built suburb named Gassardi, which is planted with fine plane-trees, and adorned with waterworks and a handsome fountain. There are remains of old buildings of the age of Charlemagne near the town; among others the ruins of an old cathedral. The town has no manufactures of any importance; but there is some trade in dried fruits and preserves, clover and hemp seeds, honey, wax, wool, hemp, goatskins, &c. Digne has been always famous for its hot springs and baths, which are about a mile from the town, and are frequented from May to September.

Of *Dinia*, which was (according to Pliny, iii. 4.) the capital of two Inalpine tribes, the Bodiontici and the Avantici, there are no remains. It was entirely destroyed in the invasion of the barbarians. The city early embraced Christianity, and has given title to a bishop since A.D. 340. On its destruction by the barbarians the inhabitants fled to a neighbouring height where they laid the foundation of the present town. Digne was frequently sacked during the religious wars of the 16th century. It had a population of 10,000 in 1629, in which year a plague reduced the number to 1500. The diocese of Digne comprises the department of Basses-Alpes; the bishop is a suffragan of the archbishop of Aix.

DIGOIN. [SAÔNE-ET-LOIRE.]

DIJON, capital formerly of the duchy of Bourgogne, now of the department of Côte-d'Or in France, is situated on the right bank of the Ouche, a tributary of the Saône, at the distance of 162 miles in a direct line, 195 miles by railway S.E. from Paris, in 47° 19' 19" N. lat., 5° 2' 16" E. long., and has 28,998 inhabitants including the commune.

Dijon existed, during the Roman dominion, under the name of Dibio or Divio. An ancient legend, attested by Gregory of Tours, relates that the emperor Aurelian made of Dibio a considerable fortress. From the dominion of the Romans Dijon passed, in the 5th century, under that of the Burgundians, and subsequently of the Franks. Under the Carolingian princes, Dijon was a lordship of the bishops of Langres, who often resided here. In the 9th century it was under counts of its own, who held it of the bishops as suzerains. In the 11th century the lordship of Dijon was united to the duchy of Bourgogne. In the 12th century the dukes caused the city to be rebuilt after it had been burned down, and subsequently bestowed upon it a municipal constitution. In the 14th century new walls were erected, inclosing the Roman town and the greater part of the suburbs. Under the dukes of Bourgogne, of the first race, Dijon was erected into a viscounty, but this came to an end A.D. 1276, and the rights of the viscounts were subsequently bestowed on the municipality and citizens. The dukes of Bourgogne, both of the first and second races, usually resided here, and when Louis XI. of France took possession of Bourgogne, and established the provincial parliament, he fixed its sittings in this town.

Dijon is situated in a plain on the eastern side of the Côte-d'Or hills. It is surrounded by walls and by ramparts which are planted with fine trees. The town is entered by five gates; it is traversed from north to south by the Suzon, which flows in a channel formed under the streets, and joins the Ouche close to the ramparts. The streets are well-built, clean, and cheerful. The houses, which are of freestone, are only of one or two stories. Of the public buildings the most imposing is the cathedral, which is dedicated to St. Benigne, and dates from 1291. The structure is a fine specimen of the gothic style. The interior is 233 feet long, 95 feet wide, and 92 feet high.

The west front presents the usual triple portals with rich rose window and niches over the central door, flanked by two handsome towers; and at the intersection of the nave and transept springs up a light and graceful spire 330 feet high. In this church the dukes of Bourgogne were inaugurated; it contains some handsome monuments. The church of Notre Dame, which was erected in the interval 1232-1334, is also a fine gothic edifice, remarkable for the elegant gallery which runs round the nave, transepts, and choir. The apse end behind the high altar is adorned with a finely sculptured group representing the Assumption of the Blessed Virgin. The intersection of the nave and transepts is surmounted by a lofty tower, which dates from the beginning of the 16th century. The principal square, called Place-d'Armes, is in the form of a horse-shoe and fronts the palace of the dukes of Bourgogne, in which also the parliament of Bourgogne held its sessions. The palace is surmounted by a lofty tower, now used as an observatory, and contains collections of paintings, sculptures, antiquities, and natural history, and also a library of 40,000 volumes. Among the other note-worthy public structures are the church of St.-Michel, which dates from the beginning of the 16th century, with the exception of the two towers and the dome which were completed in 1667; the church of the Chartreuse, in which some of the dukes of Bourgogne are buried; the court-house; the theatre, which is built after the model of that of Bordeaux; the residence of the prefect of the department; the town-house; the general hospital and the orphan asylum of Sainte-Anne.

The manufactures of Dijon are woollen cloth, hosiery, blankets, wollen and cotton yarn, leather, vinegar, mustard, and starch; there are also brandy distilleries, salt refineries, and browneries. A large trade is carried on in corn, flour, the excellent wine of the Côte-d'Or, wool, hemp, and wax candles. Dijon is well situated for trade at the junction of several roads; the Canal de Bourgogne passes along the valley of the Ouche, close to the town, which has communication also by railway with Paris and Lyon. [CÔTE-D'OR.] A chamber of commerce was accorded to Dijon in 1853.

Dijon is the seat of a bishop, whose see is co-extensive with the department of Côte-d'Or. It is also the seat of a university academy and of a high court of justice, which has jurisdiction over the departments of Côte-d'Or, Haute-Marne, and Saône-et-Loire. In connection with the university there are in Dijon three faculties of law, science, and letters, a secondary school of medicine, and a royal college. The town also possesses an ecclesiastical college, a botanic garden, and an excellent school of design, in which lectures are delivered gratuitously. It is the head-quarters of a subdivision of the 7th Military Division.

Few cities in France can vie with Dijon in beauty of site, or in the number and variety of its promenades, the plantations of which form a belt of foliage about the town. Among the latter are the ramparts, which afford a fine view of the town and the surrounding country; the Chemins-Couverts; the Allées-de-la-Retraite on the east side of the town, formed by four rows of noble lime-trees; the Crenx d'Enfer and the Fontaine Suisso, two beautiful fountains surrounded by fine plantations; the Promenade de l'Arquebuse; and above all the Cours du Parc, which is nearly a mile in length, divided midway by a spacious circle, and leads to the great park laid out by Le Nôtre on the banks of the Ouche.

(*Dictionnaire de la France; Annuaire pour l'An 1853.*)

DILMAN, a town in Persia, is situated on the caravan route from Tabriz to Erz-rum, 70 miles W. from Tabriz, 10 miles W. from the north-west angle of Lake Urumiyeh, and has about 15,000 inhabitants. It is situated in the wide and fertile plain of Selmas, which stretches westward from the lake to the base of the Kurdistán Mountains. The town is surrounded by gardens and orchards, and has clean streets. The plain about it is inhabited by Nestorians, Armenians, Catholics, Kurdish Leks, and Russian emigrants. About 4 miles to the westward is the old town of Dilman, a great portion of which is in ruins. From the number of mounds in the neighbourhood it seems to have been once of considerable extent, and it is described by St. Martin as being a very ancient Armenian city. (Colonel Sheil, in *London Geographical Journal*, vol. vi.)

DINAGEPORE, a district of Bengal, lying between 25° and 27° N. lat., 88° and 89° E. long., bounded N. by Ringpoor and Purneah, E. by Ringpoor and Mymensingh, S. by Mymensingh and Rajshahy, and W. by Purneah and Boglipoor. The form of the district is triangular, the base being to the south; its greatest length from south to north is 105 miles, and its extreme breadth from east to west is 82 miles. The area is about 2374 square miles: the population is estimated at about 2,500,000. About seven-tenths of the inhabitants are Mohammedans, and the remainder Hindoos.

The principal rivers by which the district is intersected are the Teesta, the Mahananda, and the Korotoya. During the rainy season, which usually sets in about the middle of June, and lasts for four months, these and many smaller tributary streams admit the passage of boats to almost every village in the district.

The surface of the country is undulating, but the greatest inequality of surface does not exceed 100 feet. The soil is generally light, and the principal cultivation being rice, the success of the harvest depends mainly on the quantity of rain. Hemp, sugar, indigo, and a small quantity of cotton are also cultivated; the hemp being grown in

order to prepare from its buds and leaves an intoxicating drug. The horses and oxen bred in Dinagapore are of very degenerate kinds. Tigers, bears, wild buffaloes, and wild hogs are very troublesome to the cultivators of land. Otters and the common porcupine are also numerous. Wild water-fowl of various kinds are seen in large flocks; the common wild geese is considered good eating. During the periodical inundation of the rice-fields great numbers of small fishes are taken in them, and on the subsidence of the water many are left behind in the mud.

The principal towns are Dinagapore, the capital; Malda, Gour, and Raygunga. Besides which the district contains a great number of villages. Dinagapore, the capital of the district, is situated in 25° 37' N. lat., 88° 22' E. long., about 100 miles N.N.E. from Moorshedabad. The houses are mostly of a mean description; a few dwellings of European residents are large and commodious. The population of the town is computed at 80,000.

(Buchanan, *Statistical Survey; Parliamentary Papers*.)

DINAN. [CÔTES-DU-NORD.]

DINANT, a very old town in the province of Namur, about 12 miles S. from the city of Namur, is situated partly on the right bank of the Meuse, at the base of a line of limestone cliffs, and partly on some islands in the river. On the cliff a strong citadel and a handsome chapel is built, and winding stairs cut in the rock render the heights accessible to the townsfolk. The population amounts to 5650. The principal church is distinguished by a bulb-shaped steeple; it is an ancient structure, some parts of it dating from the 10th century; and the interior is richly decorated. The town contains several salt-refineries, four mills for sawing marble, some quarries of which are worked in the neighbourhood, several grist-mills, paper-mills, breweries, and tanneries. Dinant formerly contained many extensive copper foundries, but this branch of industry has almost entirely disappeared. A considerable quantity of gingerbread is made in the town.

In 559 Dinant was enumerated among the possessions of the bishopric of Liège. In 870 it came into the possession of Charles the Bald. In the 12th century the town was fortified and considered a place of great strength. In 1466 Dinant was besieged by Philip the Good, and when summoned to surrender, the townsfolk hanged the duke's messengers. The duke then prepared to take the town by assault, when it surrendered and was given up to pillage during three days. On this occasion 800 of the inhabitants were tied back to back and thrown into the Maas; at the same time the town was burnt and its walls levelled to the ground. Charles the Bald a few years afterwards allowed the town to be rebuilt. In 1554 it was taken and pillaged by the French, and again in 1575 after a siege of eight days. At the treaty of Ryswick it was restored to the Bishop of Liège, but was again taken by the French in the war of the revolution, and became the capital of an arrondissement in the department of Sambre-et-Meuse. It was occupied by the allies in 1813. Dinant is on the high road between Namur and Givet. A railroad is in course of construction from Namur through Dinant to Luxembourg, and will probably be continued thence to Metz.

(*Dictionnaire Géographique de la Province de Namur; Handbook for Belgium and the Rhine*.)

DINARIC ALPS. [AUSTRIA.]

DINAS MOWDDY. [MERIONETHSHIRE.]

DINGLE, county of Kerry, Ireland, a market and post-town and the seat of a Poor-Law Union, is situated on the north side of Dingle Bay, in 52° 8' N. lat., 10° 15' W. long.; distant 208 miles S.W. from Dublin. The population of the town in 1851 was 3261. Dingle Poor-Law Union comprises 19 electoral divisions, with an area of 125,276 acres, and a population in 1851 of 26,725.

The ancient name was Dangan-I-Cushy, or the fortress of Hussey, an adventurer of English descent, to whom one of the family of Desmond granted the tract of country on which the town stands. In the 17th century Dingle enjoyed a considerable traffic with Spain, from whence large quantities of wines and spices were annually imported here in return for exports of tanned hides, Irish friezes, woollen stockings, salt-beef, butter, and salmon. The town was erected into a corporation by Queen Elizabeth in 1585, at which time it sent members to the Irish Parliament.

The town has an antique appearance. Some of the old houses are in the Spanish taste, with stone balconies, &c., and several bear date as early as the reign of Elizabeth. The parish church dedicated to St. James is said to have been built at the charge of the Spanish who frequented the port; it is now much decayed. The residence of the proprietor, the Knight of Kerry, is the principal modern building, attached to which are some well-laid-out gardens. A bridewell, a market-house, and a small barrack, are the principal buildings of the town.

The harbour, a land-locked creek on the northern side of the great estuary called Dingle Bay, is capable of floating vessels of 300 tons up to the town, and is pretty well protected from the westerly winds which prevail on this coast. From the difficulty however of distinguishing the entrance, vessels bound for Dingle run a risk in a westerly gale of going to leeward on the dangerous shoals of Castlemain harbour at the head of the estuary. The chief trade consists in the export of butter and corn to Liverpool.

(Smith, *History of the County of Kerry*.)

DINGWALL. [ROSS AND CROMARTYSHIRE.]

GEOG. DIV. VOL. II.

DIOIS, a district in the former province of Dauphiné in France, of which Die was the capital. It now forms the arrondissement of Die in the department of Drôme. [DRÔME.]

DIOMEDES ISLANDS. [BERING'S STRAIT.]

DIOU. [ALLIER.]

DISMAL SWAMP. [CAROLINA, NORTH; VIRGINIA.]

DISS, Norfolk, a market-town in the parish of Diss, is situated in 52° 22' N. lat., 1° 7' E. long.; distant 22 miles S.S.W. from Norwich; 86 miles N.E. by N. from London by road, and 94½ miles by the Eastern Counties and Eastern Union railways. The population of the town in 1851 was 2419. For sanitary purposes the parish is under the management of a Local Board of Health. The living is a rectory in the archdeaconry of Norfolk and diocese of Norwich.

Diss, anciently Disce or Dice, was held in royal demesne in the reign of Henry I. In the reign of Edward I. it became the property of Robert Fitzwalter. The town of Diss consists chiefly of three streets, rather irregularly laid out on an uneven site; many of the houses are of considerable antiquity. The town is lighted with gas. The river Waveney runs past the town, on the south, and separates here the counties of Norfolk and Suffolk. The parish church is a spacious edifice of early English date and style, and is built partly of flints. It has been recently thoroughly repaired and reseated. The Wesleyan Methodists, Baptists, Independents, and Unitarians have places of worship. There are here National schools; a public school for general education; a public library and scientific institution; and a branch savings bank.

Diss is the centre of an extensive agricultural district. The manufacture of coarse hempen cloth for sacking employs some of the inhabitants. There are several breweries in the town and vicinity. The market is held weekly on Friday, and there is a cattle fair on November 8th.

(Blomefield, *Norfolk; General History of Norfolk; Communication from Diss*.)

DITHMARSH (*Ditmarsken*, Dan.), the most westerly of the four districts of the Danish duchy of Holstein, has the German Ocean for its western boundary and Holstein Proper for its eastern, to which last it was united in 1459. On the north the Eider separates it from the duchy of Schleswig, and on the south the Elbe divides it from the Hanoverian duchy of Bremen. Its area is about 500 square miles, and its population about 64,000. It is protected against the inroads of the sea by strong dykes, is very productive in corn, pulse, linseed, &c., and rears a considerable number of cattle. Its subdivisions are the bailiwicks of North and South Dithmarsh. North Dithmarsh has an area of 230 square miles, with a population in 1847 of about 33,500. The principal town is *Heyde*, in the heart of the bailiwick, which has a spacious market-place, a church, and public school, with about 4000 inhabitants; it is the seat of administration. South Dithmarsh has an area of 275 square miles, with a population of 33,400 in 1847. The chief town is *Meldorf*, at the mouth of the Miele, which forms a small harbour. It is well built, and was formerly fortified, has a handsome church, a grammar-school, public gardens, and about 2020 inhabitants.

DIXMUDE. [FLANDERS, WEST.]

DIZIER, ST. [MARNE, HAUTE.]

DNIEPER, the ancient *Borjsthenes*. From the swampy forest highlands of Volkonsky, on the confines of the Russian governments of Tver and Smolensk rise three great rivers, the Volga, the Diina, and the Dnieper, which form the arteries of the internal navigation of Russia, carrying their waters respectively to the Caspian, the Baltic, and the Black seas, and flowing throughout their whole course within the limits of the Russian empire. Of these the Dnieper, rising in the circle of Viasma, in the northern part of Smolensk, flows south to the town of Smolensk, whence it turns west as far as Orcha, in the government of Mohilev; here it resumes a southern course, and after running for several miles through that government, it reaches the boundary and divides Mohilev from Minsk. In this part of its course it is increased by many tributary streams, the chief of which are the Droutz, the Soj, and the Berezina, which last is united to the Diina by means of a canal. [DÜNA.] After forming the boundary between the governments of Minsk and Czernigoff, the Dnieper enters the government of Kiev, where it receives the Pripet (which the King's and Oginski canals connect with the Bug, the Vistula, and the Niemen), the Desna, the Teterov, and the Irpen. Soon after its junction with the Desna, the Dnieper forms the western limit of the government of Pultava, and turning to the south-east, it enters that of Ekaterinoslav, having received in this part of its course the Pajol, Vorskia, Orel, Soula, and other streams. Having passed the town of Ekaterinoslav, the river runs south for about 60 miles, and in this part of its course forms thirteen rapids which impede the navigation for above 40 miles; below the rapids the river flows south-west between the governments of Kherson and Taurica, and enters the Black Sea by a wide embouchure, through which also the Bog, the ancient *Hypanis* (which rises in Galicia, and drains the provinces of Podolia and Kherson), pours itself into the same sea. The embouchure is in fact rather a lake or gulf; it extends from Kherson to Oczakoff, about 50 miles, with a breadth of from one to six miles. It is for the most part shallow, and its shores are very unhealthy in summer, during which season salt is gathered from the dried-up swamps.

The entire length of the Dniester, with its windings, is above 1000 miles; its average width is estimated at 700 paces. Its basin comprises fourteen of the finest provinces of Russia, with all of which it has communication by its navigable branches and by canals. The Dniester flows for the most part between high banks, the greatest elevation of which is along the eastern side. The upper part of its course is through a marshy forest country, and in the middle and lower course it passes over many rocks. The river is navigable almost from its source to its mouth; even the obstructions presented by the rapids have been removed by the magnificent hydraulic works of the Russian government; several of the ledges of rocks having been entirely removed, and channels formed which are protected from winds by lofty dikes of granite. Produce is generally conveyed down the river to the cities on the Black Sea, but fleets of large barks also pass annually by the canals mentioned (and those connect the Dniester with the Neva) to Riga and St. Petersburg. The freights consist chiefly of timber, corn, iron, linen, hemp, salt, &c. Below the cataracts upwards of 70 islands occur, which produce a grape resembling the currant; they are full of serpents and wild cats.

As the Dniester flows through more than nine degrees of latitude, there is great diversity of climate in various parts of its basin: at Smolensk the waters freeze in November, and continue ice-bound until April; at Kiev they are frozen from January to March only. The river abounds in sturgeon, carp, pike, and shad. There are bridges across it at Smolensk and Kiev, the latter, which is 1638 yards in length, and constructed with rafts, is removed about the end of October and replaced in the spring, as it would otherwise be destroyed on the breaking up of the ice.

The root syllable (Don or Dan) in the names of almost all the great rivers that flow into the mouth of the Black Sea—Don (Tan-ais), Dniester (Don-iever), Dniester (Don-iever), Don-ai (Dan-ube)—is probably an old Scythian or Slavic word for 'water.'

DNIESTER, a river of European Russia, has its source in a small lake on the north-eastern slope of the Carpathian Mountains, in the circle of Sambor, in the Austrian crownland of Galicia, near 49° 12' N. lat., 23° E. long. Within Galicia the Dniester receives the Tismana, Stry, Swica, Lomnica, and Bistritz on its right, and the Lipa, Stripa, and Sered on its left bank. Its course is north-easterly from its source to Sambor, after passing which it pursues a south-easterly course to Halicz, Mariampol, and Zaleszeyki. Thence it runs in an east-south-east direction to Chotym, at the north-western extremity of Bessarabia, where, leaving the Austrian, it enters the Russian territory. At Chotym it receives the Podhorze, which separates Galicia from the government of Podolia, and thence flows between Podolia and Bessarabia, first in an eastern then in a south-eastern direction, and with many windings to about 42° 52' N. lat., 29° 3' E. long. From this point to its mouth in the Black Sea the course of the river is south-south-east, the river separating for about 100 miles of its course the boundary between Bessarabia and the government of Kherson. Its tributaries in Russia are small, and its basin narrow. From Ushitz, where it takes a southern course, it passes the towns of Yampol, Dubossari, Bender, and Tiraspol. It enters the Black Sea by a broad liman, or shore-lake, about 19 miles in length and 5 miles in breadth, but not more than 7 feet in depth, which lies between Akerman and Ovidiopol, and communicates with the Black Sea by the Otchakov and Tsarigrad channels, which are separated by a series of low sandy islands.

The current of the Dniester is exceedingly rapid. The navigation commences at Halicz, but is interrupted two miles below Yampol by two considerable falls and several whirlpools; and it does not become free again until it reaches Bender. As far as Old Sambor it flows through a deep broad valley, which afterwards expands on its eastern bank into an extensive plain; while on its right bank it is occasionally skirted by offsets from the Carpathian chain, varying from 180 to 250 feet in height. These elevations accompany its course as low down as Chotym, from which point the river flows through an open flat country. The bed is muddy, and its waters, which are turbid and of a yellowish hue, and often broken by masses of rock, are frequently covered with foam. The whole length of the river is about 600 miles. Wood, grain, and other products are conveyed down the Dniester to Odessa. The principal places at which vessels load and unload are Stria and Saletchi on the Austrian, and Zranetz and Dubossari on the Russian side. The Dniester abounds in sturgeon. Herodotus (iv. 51), calls the river *Tyras*; and it was subsequently named *Danastris*.

DOAB, a word signifying 'two waters,' is used in Hindustan to denote any tract of land included between two rivers. Three districts to which the name of Doab is applied are situated in the province of Lahore. One of these, the Doab or Doabeh Barry, is included between the Ravey and Boyah rivers and contains the cities of Lahore and Amritsar; the second, the Doabeh Jallinder, is included between the Boyah and the Sutlej; and forms the most fertile portion of the Panjab district; the third, the Doabeh Rechna, comprehends the Ravey and the Chinaub. The district however to which the name is most commonly applied is situated between the Ganges and the Jumna. This district has its eastern extremity at Allahabad, whence it proceeds in a north-west direction to the hilly

country in northern Hindustan, the northern frontier of the district of Saharunpore in the province of Delhi forming its north-western boundary. The length of this tract is more than 500 miles, and its mean breadth about 55 miles; its prevailing character is flatness and nakedness. The principal productions are millet and barley, sugar, tobacco, cotton, and indigo. The straw of the millet is very serviceable as provender for cattle. The temperature of the air in this part of India is liable to sudden and violent alternations; the range of the thermometer between the morning and afternoon is sometimes 40 degrees. In April and May, when the hot winds prevail, the thermometer often rises higher than 120° in the shade, and at other seasons the temperature at daybreak is sometimes below the freezing point.

The southern part of the Doab came into the possession of the English in 1801, when it was acquired from the king of Oude. In 1803 the more northern part was ceded to the English by Dowlut Roa Scindia. The population is of a very mixed character, and consists of Jhats, Rajpoots, Patans, Thugs, and various other tribes, who, previous to the acquisition of the country by the English, had been much addicted to plunder, and dacoity or gang robbery was of frequent occurrence; this has been greatly remedied.

DOBERAN. [MECKLENBURG.]

DOBOKA. [TRANSYLVANIA.]

DOBRUDSCHA, a district in European Turkey, forms the north-eastern part of Bulgaria, and comprises the country north of the earthen rampart called Trajan's Wall, between the Danube on the west and north, and the Black Sea on the east. Trajan's Wall leaves the Danube between Rassova and Czernavoda, and runs across to the Black Sea a little south of Kustenje, a distance of about 35 miles. In its western part the wall skirts a small stream, the Kara-Su (Black-water), that connects several small lakes, and enters the Danube above Czernavoda. At the head of the valley of the Kara-Su, near Bourlak, a line of hills or downs composed chiefly of a porous limestone rock runs north and south 164 feet above the level of the Black Sea. Along the coast at Kustenje also there is an uninterrupted range of low hills and cliffs, so that it is certain the Danube never had an outlet across the Dobrudscha in this direction. The formation of a canal from Czernavoda to Kustenje has been long a favourite project; but on the summit-level, which consists of porous limestone, no water ever rests to feed such a canal if it were cut. Besides, the only water communication between these two points that would be of much use would be a ship-canal, or, in other words, the opening of a new bed for the Danube; and this the nature of the ground renders all but physically impossible.

The low undulating down runs northward all through the Dobrudscha, forming a small watershed between the Danube and the sea; on the north it joins a lofty mountainous mass which covers the north of the district between Baba-Dagh and Matchin. [BESSARABIA.] On the eastern side the Dobrudscha is marshy, and contains several lakes. There is a great scarcity of drinkable water in this district. It contains however many fertile spots, although in the hot season of the year, like all the countries near it, it resembles a desert. In the spring, on the melting of the snows, the soil is saturated with wet, and in most parts is converted into a sea of mud. The inhabitants are chiefly Bulgarians, Tartars, and runaway Cossaks, who rear sheep and buffaloes. Eagles, bustards, cranes, wild geese, partridges, kites, ducks, wild swans, and wild dogs are extremely numerous in the Dobrudscha. Along the Danube are the fortresses of Hirsova, Matchin, Isaakcha, and Tulcha. Tulcha stands at the head of the St. George mouth of the Danube, which forms part of the boundary between the Dobrudscha and Russia. In the interior is the town of Baba-Dagh, between the mountains of that name and Lake Rassein. Kustenje is a mere village. At the time we write (April, 1854) the Russians are in possession of the Dobrudscha, and the Turks are posted in strong force behind Trajan's Wall, which they have repaired and strengthened.

DOCKING, Norfolk, a village and the seat of a Poor-Law Union in the parish of Docking, is situated in 52° 55' N. lat., 0° 38' E. long., distant 33 miles N.W. from Norwich, 113 miles N. by E. from London by road. The population of the parish of Docking in 1851 was 1640. The living is a vicarage in the archdeaconry of Norfolk and diocese of Norwich. Docking Poor-Law Union contains 36 parishes and townships, with an area of 80,653 acres, and a population in 1851 of 18,146. Docking parish church is chiefly of perpendicular style and date. The Wesleyan and Primitive Methodists have places of worship. There is a National school. Petty sessions are held monthly in the village.

(General County History of Norfolk; Communication from Docking.)

DODBROOK. [DEVONSHIRE.]

DODDINGTON. [CAMBRIDGESHIRE.]

DODONA, the most ancient oracle of Greece, was probably situated in the valley of Joannina in Epirus, but its exact position has never been ascertained. Colonel Leake places it at the south-east extremity of the lake of Joannina, near Kastritz, and there are many reasons for believing that the Dodonian territory corresponded to the valley at the south of that sheet of water. It is true that there is no mention of a lake in the neighbourhood of the ancient Dodona; but it is described as surrounded by marshes, and it is not unlikely that the lake of Joannina may have been increased in later times from the

catavothra in the country. The temple at Dodona was dedicated to Jupiter, and was of Pelasgian origin. (Homer, 'Iliad,' xvi. 238; Herod. ii. 52.) Strabo is of opinion (vii. p. 328) that the priests at this temple were originally men, but that the duties of the office were afterwards performed by three old women. The people who had the management of the temple are called Selli or Helli. The oracles were delivered from an oak (Sophocles, 'Trachin.' 1171) or beech (Hesiod, 'ap. Strabon.' p. 327; Sophocles, 'Trach.' 173). The temple at Dodona was entirely destroyed by Dosimachus, the Ætolian prætor, B.C. 219 (Polyb. iv. 67), and probably was never restored, for it did not exist in the time of Strabo; but there was a town of the name in the 7th century A.D., and a bishop of Dodona is mentioned in the council of Ephesus. (Stephanus Byzantinus; Wesseling; Creuzer; Leake, *Northern Greece*.)

DOGGERBANK, a very extensive sandbank in the North Sea, lying between the east coast of England and the west coast of Holland, and situated between the Wellbank and the Broad-fourteen. The western part of the Doggerbank is about twelve leagues east from Flamborough Head, in the East Riding of Yorkshire, whence the bank extends in a direction nearly east-north-east to within twenty leagues of Jutland. In some places this bank is twenty leagues broad, but it is contracted towards the east, and terminates nearly in a point. The shoalest part is that nearest the English coast, where it has nine fathoms water, so that it presents no dangers or difficulties to navigators; in other parts the surface rises generally towards the centre; in some places the depth of water is as great as twenty-seven fathoms.

The Doggerbank is a noted station for the cod-fishery, and is much frequented by both English and Dutch fishermen. It is also known in history as the scene of an obstinate naval engagement which took place in the summer of 1781 between the English and Dutch fleets under the respective commands of Admirals Parker and Zoutman. The disabled condition of the ships on both sides put an end to the battle, in which neither side could claim a victory.

DOGMAELS, ST. [PEMBROKESHIRE.]

DOL. [ILLE-ET-VILAINE.]

DOLCIGNO, or DULCIGNO, a town in Upper Albania, 12 miles W. from Scutari, is situated on the rocky peninsula or cape of Kadili, on the coast of the Adriatic, and has a population of about 6000. The inhabitants, who were formerly notorious for piracy, are chiefly engaged in the oil-trade of the neighbourhood, and in conveying to Scutari in lighters the cargoes of such coasting-vessels as cannot enter the Bojana, which forms the outlet of the lake of Sentari. This town, or perhaps Duleigno Vecchie, which is five or six miles more to the north, was anciently called *Olcinium*. The Illyrians of *Olcinium* were also pirates.

DÔLE, a town in the department of Jura in France, stands on the right bank of the Doubs, a feeder of the Saône, at a distance of 221 miles S.E. from Paris on the road to Geneva, 28 miles S.E. from Dijon, in 47° 5' 33" N. lat., 5° 29' 52" E. long., and has 9913 inhabitants, including the commune. It is pleasantly situated on the crest and slope of a hill; the streets are rather steep, but well built, and ornamented with fountains; and the neighbourhood is prettily laid out in gardens, vineyards, and promenades. The parish church on the Place Royale is a handsome gothic building. The ancient tower of Vergy still stands, and is now used as a prison. The other remarkable buildings are—the new prison, the former Jesuit college, the court-house, the museum, and the bridge over the Doubs. The town has tribunals of first instance and of commerce, a college, a public library of above 6000 volumes, a museum, a school of design, several hospitals, and a theatre. It is well situated for trade on the canal that joins the Rhône and Rhine. Hosiery, tiles and pottery, chemical products, vinegar, and beer are manufactured; there are also iron-smelting furnaces supplied with ore from the neighbouring mines of the Jura, flour-mills, and establishments for the rearing of silkworms; corn, flour, wine, wood, charcoal, marble, and iron enter into the commerce of the town. Large quantities of roses, tulips, and other flowers are grown in the vicinity. A railway has been projected from Dijon through Dôle to Salins near the Swiss frontier. A ruined aqueduct and amphitheatre, and some remains of the old Roman road from Lyon to the Rhine, mark the place as having been a Roman station.

The town formerly belonged to the dukes of Burgundy, and is famous for its sieges. In 1435 the inhabitants gallantly repulsed the Duke of Bourbon, who wished to wrest the place from Mary of Burgundy; but in 1479 the French took it by treachery, massacred the inhabitants, and burnt the town. Of the few buildings that escaped this destruction the tower of Vergy alone still exists. Dôle afterwards came into the hands of the Spaniards with the rest of Franche-Comté, of which it was for some time the capital. Charles V. added to the fortifications in 1530. In 1636 it was fiercely but ineffectually besieged by the Prince of Condé; Louis XIV. took it in 1668, and again in 1674, when he demolished the fortifications. By the treaty of Nimeguen the town, together with the whole of Franche-Comté, was made over to France.

(*Dictionnaire de la France*.)

DOLGELLEY, Merionethshire, North Wales, an assize and market-town, and the seat of a Poor-Law Union, in the parish of Dolgelley, is situated on the left bank of the river Wnion, in 52° 44' N. lat., 3° 52' W. long.; distant 18 miles S.W. by S. from Bala, and 208 miles

N.W. by W. from London by road. The population of the town of Dolgelley in 1851 was 2041. The living is a rectory in the arch-deaconry of Merioneth and diocese of Bangor. Dolgelley Poor-Law Union contains 13 parishes and townships, with an area of 130,370 acres, and a population in 1851 of 12,909.

The town of Dolgelley is but a poor and mean place, although, when seen from a distance, it presents an agreeable and interesting appearance. Its beauty is chiefly owing to the picturesque character of the surrounding scenery. Several good houses and shops have been recently built. The parish church is a neat and unpretending structure; it has a large tower. A handsome monument has been lately erected to Baron Richards, who was a native of the parish. The Wesleyan and Calvinistic Methodists, Baptists, and Independents have places of worship in the town. The Free school founded in 1665 has an income from endowment of 40*l.* a year, and had 20 scholars in 1853. The county hall is a convenient modern structure built of stone, near the river Wnion. The market-place is a low square building. Over the river Wnion is a neat stone bridge of 7 arches.

In the town coarse woollen cloths and flannels are made by weavers in their own houses. The webs are bought by agents, who send them to Liverpool for exportation, or to Shrewsbury for home sale. In the neighbourhood are fulling-mills and bleaching-grounds. Some business is done in tanning and dressing lambskins and kidskins for the Worcester market. The summer assizes are held at Dolgelley. Markets are held on Tuesday and Saturday; and there are nine fairs in the course of the year.

(Parry, *Cambrian Guide; Land We Live In*, vol. iii.)

DOLLART BAY. [EMS.]

DOLWYDDELLAN. [CAERNARVONSHIRE.]

DOMBES, a principality in France in ante-revolutionary times, consisted of two portions separated from each other by an intervening part of the district of Bresse, by which the eastern portion was entirely surrounded. The western portion was bounded W. by the Saône; S. by the districts of Franc-Lyonnois and Bresse; and N. and E. by Bresse. It is now comprehended in the department of the Ain. Its capital was Trévoux. Dombes was possessed and governed by sovereign princes of the house of Bourbon until the year 1762, when the reigning prince exchanged his principality for the duchy of Gisors in Normandy, and other lands. Dombes was then united to the crown; but retained its 'parlement,' or civil court, which sat in Trévoux. [AIN.]

DOMINGO, ST. [HISPANIOLA.]

DOMINICA, one of the English Antilles, but lying between the French islands of Martinique and Guadalupe: the parallel of 15° 18' N. lat., and the meridian of 61° 24' W. long. pass through the island. Dominica was discovered by Columbus in 1493, and received its name in consequence of its being first seen on a Sunday. The right of occupancy was long claimed equally by England, Spain, and France, but the island was virtually a kind of neutral ground until the year 1759, when its possession was assumed by the English, and their right to hold it was formally recognised in 1763 by the treaty of Paris. In 1778 Dominica was taken by a French squadron under the Marquis de Bouillé, but was restored to England at the peace in 1783. In 1805 the island was again attacked by the French fleet under Admiral Villeneuve, but was successfully defended by the garrison under Sir George Prevost.

Dominica is 28 miles long and 16 miles broad at the widest part; but its mean breadth is not more than 9 miles. The area is computed at 260 square miles. The origin of the island is volcanic. Pumice-stone, sulphur, and other volcanic productions are found. There are numerous quarries of a volcanic lava, sufficiently durable for the purpose of ordinary buildings, which are worked for the use of the colony. The surface of the island is mountainous. Morne Diablotin, the highest summit, is 5300 feet above the sea. The valleys are very fertile, and watered by numerous streams. Near the centre of the island, and about 6 miles from the town of Roseau, on the top of a high mountain, is a fresh-water lake, with an area of several acres, and said to be in parts unfathomable. The island contains an abundance of large timber-trees of the kinds commonly found in the West India Islands; the trunks of the gum-trees are hollowed out to form canoes. The streams abound with excellent fish, among which are mullets, pike, eels, and cray-fish; the fishery on the coast is also very productive.

The principal produce of Dominica consists of sugar, molasses, rum, coffee, cocoa, oranges, and cotton. The island is unequally divided into 10 parishes. Roseau, the principal town, is situated on a tongue of land on the south-west side of the island, in 15° 19' N. lat., 61° 23' W. long. It is regularly built, with long and wide paved streets, which intersect each other at right angles. The population is about 4000. The roadstead is safe, although the anchorage is far from good, from October to August; but during the hurricane months a heavy sea frequently rolls in from the south. Prince Rupert's Bay, on the north-west side of the island, is at all times safe and commodious.

The population in 1844 was 22,200. The government consists of a lieutenant-governor, council, and assembly of 20 members. There are chapels for Episcopalians, Wesleyan Methodists, and Roman Catholics.

A board of education has been recently appointed, and has established 7 schools, at which there is an attendance of 905 children. There are also 3 free schools in Roseau with 285 scholars. Other schools are under the superintendence of the Wesleyan missionaries and the Roman Catholic clergy.

The imports consist principally of plantation stores, cotton, linen, and woollen manufactures from England; corn, fish, and lumber from the British North American colonies and the United States, and live stock from the neighbouring continent of America. The exports are principally coffee, cocoa, sugar, rum, and oranges.

(*Parliamentary Papers.*)

DOMPIERRE. [ALLIER.]

DON, the ancient *Tanaïs* and the Tartar *Tuna*, a river of European Russia, rises in the small lake Ivanofskoe, in the government of Tula, and thence flows in a general south-south-east direction, through the governments of Ryazan, Tambov, and Voronosh, to the town of Paulovsk, receiving within these limits the Sosva, the Voronosh, and the Sosna. Below Paulovsk it runs east through the territory of the Don-Cossaks to within about 35 miles of the Volga. Repulsed by the mountainous region on the west bank of that river, the Don then proceeds in a south-western direction to the Sea of Azof, which it enters by three mouths, having received in this part of its course, from the right bank the Donecz, or Donetz, the most considerable of its tributaries, and from the left bank the Medwiedicza, the Manish, and the Sal, the last of which flows from the Caucasian mountains. The length of its course is estimated at about 880 miles. The width varies from 350 to 1200 feet. This river has a slow current, and abounds in shallows and sand-banks, but has neither falls nor whirlpools. In spring it overflows its banks, and forms broad and unwholesome swamps; it is navigable as high as Zadonsk on the north-western border of Voronosh, and has depth of water enough from the middle of April to the end of June for large vessels, but is so shallow during the remainder of the year, that there is scarcely two feet of water on the sand-banks. Its mouths are so much choked with sand as to be unnavigable for any but flat boats. The waters of the Don abound in fish. A canal projected by Peter the Great, and partly executed, is intended to join the Don and the Volga. It commences a little north of 50° N. lat., in the Ilavlia, which enters the Don near its most eastern point, and is to terminate in the Kamychenka, a feeder of the Volga, its whole length, including the canalisation of the two rivers, being about 90 miles.

The currents of the tributaries of the Don are also sluggish, and none of them but the Donecz is navigable. As far as the town of Veronosh the Don flows between fertile hills; but from that point until it strikes the chain of the Volga, its left bank is skirted by lowlands, and its right by a range of uplands; thence to its confluence with the Donecz its right bank is skirted by chalk hills, and its left by a continued steppe. The waters of the Don are impregnated with chalk, and are muddy, and prejudicial to the health of those who are unused to them. The *Ilyrgis*, which Herodotus mentions as a tributary of the Don, is probably the Donecz.

DON-COSSAKS. The territory of the Don-Cossaks forms a province of South Russia, lying between 47° and 51° 10' N. lat., 37° 20' and 44° 45' E. long.: and is bounded N. by the governments of Voronosh and Saratov, E. by Astrakhan, S. by Circassia and the Sea of Azof, and W. by the governments of Ekaterinoslav and Voronosh. The area is stated to be 62,276 square miles, and the population in 1846 amounted to 704,300.

The general character of the country is that of a plain, in many parts consisting entirely of steppes. The interior is a complete flat, but in the north and along the banks of the Don there are slight elevations, and the south-eastern parts bordering on Lake Bolskoi are traversed by low hills. The rest of the country, with the exception of the parts immediately adjacent to the banks of the larger rivers, is a broad steppe traversed by numerous sluggish streams and abounding in luxuriant pasture intermixed with tracts of sand. The whole territory does not contain a single forest, and even brushwood is only occasionally found. The northern districts are best adapted for agriculture: the southern, where the soil is saline and sandy, for grazing. On the steppes are many low artificial mounds and ancient tumuli, which are supposed, from the features and head-dress of the rude stone images erected over some of them, to be of Mongolian origin. Many of these tombs have been opened, and found to contain gold and silver urns, rings, buckles, &c.

The chief river is the Don, which enters the territory on the west from Voronosh, winds across it to the east to within a few miles of the Volga, and then turning suddenly round, flows through the eastern and southern districts to the Sea of Azof. In its course through this government it is joined by the Medwiedicza, Ilavlia, Sal, Manish, and several minor streams, all on the left bank. The Donecz, or Little Don, which flows south-east between Ekaterinoslav and Voronosh and joins the Don in the interior of this government, a little east of Tcherkask, is the most important tributary on the right bank. A few miles below Old Tcherkask the Don leaves the government of the Don-Cossaks and traverses an insulated part of that of Ekaterinoslav which encircles the Bay of Taganrog, leaving the Don-Cossaks only two small strips of coast on the Sea of Azof. Besides these there are several other rivers which discharge their

waters into the Sea of Azof, and there are numerous streams in the steppes, of which the greater part terminate in marshes, and are dry in summer. The principal lake is the Bolskoi, an enlarged bed of the Manish, about 70 miles long and 9 miles broad, the length of which forms for that distance the boundary between the territory of the Don-Cossaks and Circassia. Next to this the most considerable lakes are those of Nowoe and Staroe-Osero, which are covered in summer with an incrustation of salt from one to two inches in thickness.

The country enjoys a mild climate. The spring sets in early; and in the summer, which is of long continuance, the land is refreshed by frequent showers; the autumn is at times damp and foggy, and the winter, though clear and not accompanied with much snow, is severe and attended by stormy weather. The rivers are closed by ice from November to February. Failures of the harvest are rare, but the inhabitants often suffer severely from the ravages of the locust, which is the scourge of the country.

All the north and east of the country is inhabited by the Cossaks of the Don, Calmucks, and Nogay Tartars, who have exchanged the roving life of nomads for the settled habits of the agriculturist. The western district lying between the Don, the Donecz, and Ekaterinoslav, is inhabited by German colonists, chiefly Mennonites from Prussia, and is one of the most prosperous and best cultivated portions of Russia. The Nogays also have been compelled to settle in villages and devote themselves to agriculture, the processes of which as well as of other common industrial arts, they have learnt from their German neighbours. The Cossaks of the Don have always been in some degree agriculturists, but their chief occupation was, and is, cattle breeding; indeed these are the leading employments of the three great divisions of the population. Vast quantities of wheat, the most important article of cultivation, are produced, and large exports are made at the ports of the Sea of Azof. After wheat, merino wool is the most important product. The Mennonites possess immense flocks of sheep.

Agriculture, cattle-breeding, fishing, and the cultivation of the vine constitute the principal occupations of the Don-Cossaks. In the lowlands of the north, which lie along the banks of rivers, the soil is very fertile, and produces grain of various kinds, such as rye, barley, wheat, oats, maize, and buckwheat; also peas, flax, and hemp. But even in the south, fields are found in the heart of the steppes at a distance of 30 miles and even 40 miles from the Don, with rich crops of grain upon them.

The vine, the culture of which was introduced among the Cossaks by Peter the Great, is cultivated to a considerable extent, and wine of a good quality to the value of 100,000*l.* a year finds its way to Moscow and other towns in the interior. The Mennonites and Cossaks are allowed to distil brandy for their own use, which is a great favour in Russia, where the distillation of spirits is a monopoly of the crown. The former are also exempt from military service, and appoint their own judges. The settlements of this people are on the left bank of the Moloschna, the right bank of which is occupied by German Lutherans, from Würtemberg, Baden, and Switzerland, but these do not enjoy the same privileges as the Mennonites. Horses are very numerous. The native Cossak horse is small and spare in flesh, with a thin neck and narrow croup; he is, on the whole, an ill-looking animal, but strong, fleet, and hardy. The poorer Cossaks have each three or four horses, but many of the Tabunco, or herds, of the wealthier breeders, contain 1000 or more. All, with the exception of the saddle-horses, are kept on the pasture-grounds throughout the year, and in winter are forced to seek for their food either beneath the snow or from the high reeds on the banks of rivers. Dromedaries are reared by the Calmucks, and thrive well on the saline plants of the steppes. The ox is used for draught; goats are bred principally by the Calmucks, and are used as leaders to the sheep over the steppes. Fish in large quantities are taken in the Don and its tributaries, and along the shores of the Sea of Azof. Honey and wax to the amount of 300,000 lbs. are annually gathered. The exports consist of horses, cattle, fish, tallow, hides, and skins, the agricultural produce named above, and also of caviar and isinglass. Salt is gathered in summer from the evaporated lagoons along the sea.

The steppes are not the usual resort of wild animals or of much game; wolves, foxes, marsh-cats, dwarf otters, martens, marmots, jerboas, and hares are occasionally met with. Of wildfowl there are the steppic-fowl (*Otis tetraz*), water-starling, Muscovy duck, swan, snipe, pelican, and falcon. The principal amphibious animals are tortoises. The steppes also breed the Polish cochineal insect, of which however no use is made, the silkworm, and the cantlarides.

The chief towns are—*Old Tcherkask*, which stands on an island formed by a branch of the Don called Aksai, in 47° 27' N. lat., 39° 58' E. long., and has 15,000 inhabitants, chiefly Cossaks. Owing to the inundations of the Don, and the unhealthiness of the site, it was resolved in 1804 to remove to a healthier spot about 4 miles distant, on which New Tcherkask now stands; but the Cossaks are said still to be attached to the old site. *New Tcherkask*, which in 1840 contained about 2000 houses and 11,327 inhabitants, is well laid out with broad regular streets; the houses are only one story high, most of them of wood. This town is the seat of the government offices, and the residence of the attaman or hetman of the Cossaks. It has a gymnasium and eight churches, several schools, and hospitals.

Perdjansk, on the Sea of Azof, is a still more modern town; it stands on the Moloschna in the district of the Monnonites, and has a population of about 3000, composed of Italians, Russians, and Greeks. Its port is better than that of Taganrog. The inhabitants are chiefly engaged in the corn trade.

Trades and mechanical pursuits are carried on only in the two chief towns, New and Old Tscherkask, and the larger stanitzes, or villages; for as the Cossak depends upon himself for the supply of his daily wants, there is consequently little encouragement for the manufacturer and mechanic. The only large manufactures are caviar, wax, and isinglass. The exports are sent to Taganrog, which is the chief mart for the sale of what the country produces; periodical fairs are held in Old and New Tscherkask, &c.

The territory of the Cossaks is divided into seven notchalstae, or provinces, namely, 1. Aksai, on the Don, in which are Old Tscherkask and New Tscherkask, the only towns in the country; 2. The First District of the Don, containing the large villages of Troilinskaya, Bistrianskaya, Tsiemlianskaya, &c.; 3. The Second District of the Don, with the large villages of Tscherskaya and Gelubinskaya; 4. Medwiedicza, with the large villages of Ust-Mestwiedicza, Berosofka, and Ostiofskaya; 5. Koperskyo, with the large villages of Urupinskaya, Kotofskaya, and Dobrinskaya; 6. Doneczkaya, with the large villages of Kasanskaya, Luganskaya, and Mikitenska; and 7. Minsk, with the large villages of Grabova and Alexiefkaya.

The territory of the Don-Cossaks contains but 2 towns and 120 stanitzes. The villages, many of which have markets, are always placed on the banks of rivers and composed of from 50 to 300 houses, well built, clean, and conveniently arranged, with one or more churches of stone or wood. Some of these stanitzes are large and resemble towns, and are surrounded by a wall and narrow ditch; the khutors, or stables, stalls, &c., lie outside of them. The Cossaks, who have been settled in the country since 1569, are genuine Little Russians, and speak pure Russian mixed with occasional provincialisms. They are proverbially hospitable and cheerful, but violent when excited; and although they consider the plunder of their enemies lawful in war, theft is almost unknown among them. Their mode of life is in general very simple and frugal, and the enjoyment of civil freedom has given them an independence of mind which places them far higher in the social scale than the abject Russian. Their starchines, or nobles, are in general well educated. Their educational establishments, of which they have several, are within the jurisdiction of the university of Charkov.

In respect to church matters, this territory forms the diocese or eparchate of New Tscherkask, and contains about 400 churches and several monasteries. The majority of the people are of the Russo-Greek Church. The Calmucks are Lamaists, and the Nogay and other Tartars are Mohammedans.

The history and government of the Don-Cossaks is given in the article COSSAKS. They are exempt from taxes and crown monopolies, and enjoy other privileges; in return for which they are bound to furnish a large force of cavalry for the service of the emperor. They are governed by a hetman or attaman, who is now generally a Russian officer; and every stanitze has its local hetman, who is elected by the inhabitants. The civil and military affairs of the province are managed by a council or chancery presided over by the attaman. The Calmucks are governed by the same laws, and subject to the authority of the attaman. They are equally bound to serve with their Cossak fellow countrymen, by whom however they are held in great contempt. They dwell in tents of skins, and are exclusively occupied in rearing cattle, sheep, camels, and especially horses, with which they supply the Russian light cavalry.

The Cossaks pay much attention to their dress, which consists of a blue jacket frequently laced with gold and lined with silk, a silk vest and girdle, full white trousers, and black woollen cap, with a large red bag dangling behind. The females, who are inferior in symmetry of form to the males, have agreeable features, a florid complexion, and fine black eyes. They wear a long falling tunic of cotton or silk partly open in front, and confined by an ornamental waistband. Beneath this upper garment appear broad trousers, with which yellow boots are usually worn. The hair of the unmarried female floats in long braided tresses over the shoulder, but when married she conceals it under a cap richly embroidered with gold and pearls. Their dances resemble those of the Russian gipsies, and are performed by two persons only, who accompany their movements with loud cries.

DONAGHADEE, county of Down, Ireland, a market and sea-port town in the barony of Ards, is situated in 54° 35' N. lat., 5° 30' W. long., distant 119 miles N. by E. from Dublin, 17 miles E. by N. from Belfast, and 21 miles from Portpatrick, on the opposite coast of Great Britain. The population in 1851 was 2821.

Donaghadee owes its rise to being the most convenient point of communication between the latest colonists of Ards and their countrymen in Scotland, with whom they carried on a sufficient traffic to induce the proprietor, the Lord Montgomery, about 1650, to erect a quay 128 yards in length and from 21 feet to 22 feet broad. The Scottish mails landed here from before 1744, at which time Donaghadee enjoyed a large share of the imports and exports of this part of the country. A new pier was constructed a few years back at the expense

of government. It incloses a basin of seven acres, and is calculated to hold sixty vessels of the larger class. The expense was upwards of 150,000*l.*; the work is executed in the best manner, but it has not proved as serviceable as was anticipated. The town, which consists of two principal streets, is well built and airy; it has a considerable export trade in cattle and grain, and a large import of coal. The town is the head-quarters of a fishery district. Some of the female inhabitants are employed in embroidering muslin chiefly for Glasgow manufacturers. Fairs are held in June, July, August, October, and December. There are a handsome church, several chapels for Presbyterians, and one chapel for Wesleyan Methodists. Petty sessions are held here. The coast-guard have a station at the port.

On the north-east side of the town stands a remarkable artificial mount, or rath, surrounded by a dry fosse from 27 feet to 32 feet broad. The circumference of the mount at the bottom is 480 feet, at the top 219 feet, and its greatest conical height 140 feet. A powder magazine has been built on the summit. From the top of the mount Scotland and the Isle of Man are visible in fair weather. The submarine telegraph, affording a communication between Donaghadee and Portpatrick, on the west coast of Scotland, was brought into operation on May 23rd, 1853.

(*Harris, History of the County of Down; Northern Tourist.*)

DONCASTER, West Riding of Yorkshire, a market-town, borough, and the seat of a Poor-Law Union, in the parish of Doncaster, is situated on the right bank of the river Don, on the great north road which passes through the town, in 53° 31' N. lat., 1° 8' W. long., distant 37 miles S. by W. from York, 162 miles N.N.W. from London by road, and 156 miles by the Great Northern railway. The population of the borough and township, which are co-extensive, was 12,052 in 1851. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor. For sanitary purposes the borough is under the management of a Local Board of Health. The livings are in the archdeaconry and diocese of York. Doncaster Poor-Law Union contains 54 parishes and townships, with an area of 107,340 acres, and a population in 1851 of 35,269.

Doncaster was the *Danum* of Antoninus, and was called Donna Cæstre by the Saxons, from which its present name is derived. Doncaster is one of the cleanest, most airy, and most beautiful towns in the kingdom. The approach from London is by a wide and nearly level road, ornamented with ancient elm-trees. The town stands on the Watling-street of the Romans. Coins, urns, and other Roman remains are occasionally dug up in the vicinity.

Doncaster had its first charter of incorporation from Richard I., the privileges granted by whom were confirmed and enlarged by several of his successors. The town of Doncaster is kept in excellent order, the streets being well paved, and lighted with gas.

Among the public buildings of Doncaster are the mansion-house, a handsome edifice, which cost about 10,000*l.*; it is used for the meetings of the corporation, for concerts, assemblies, and public meetings; the guildhall, and a covered market-place, both recently finished; and the jail, which has arrangements for the classification of prisoners. A county court is held in the town.

The parish church, dedicated to St. George, was burnt down in 1850. A handsome subscription has been raised for the purpose of rebuilding the edifice; the first stone of the new building has been recently laid, and the work is now being proceeded with. Christ church was erected some years ago from a bequest of 13,000*l.* left for that purpose by the late John Jarratt, Esq., a native of Doncaster. The spire, 160 feet high, was much injured by lightning in November, 1836. The Independents, Baptists, Wesleyan and Primitive Methodists, Quakers, Roman Catholics, and Unitarians have places of worship. The educational establishments of Doncaster are numerous and well supported. The Grammar school, which has an endowment of 19*l.* a year and a voluntary payment from the corporation of 50*l.* a year, had 32 scholars in 1853. There are also National and British schools. The Yorkshire institution for the deaf and dumb is a school of instruction and industry, and is very successfully conducted. Other institutions are the subscription library, the mechanics and apprentices library, and the Lyceum literary and scientific society. A valuable library also belongs to the church, which is accessible to all the inhabitants. There is a savings bank. The public charities are numerous. St. Thomas's hospital, endowed in 1588 by Thomas Ellis, is an asylum for six "poor and decayed housekeepers of good name and fame." Quintin Kay's charity of 300*l.* per annum is chiefly devoted to the relief of poor and reduced persons, and to the apprenticing of six poor children to mechanical or handicraft trades. Jarratt's charity is for the relief of six reduced housekeepers. The other charities in Doncaster are the dispensary, the lying-in, clothing, sick, and soup charities.

Doncaster has some iron and brass foundries, sacking and linen manufactories, rope-works, a flax spinning-mill, and manufactories of agricultural machines. The market is held on Saturday. There are four annual fairs for cattle, horses, sheep, and woollen cloth. A wool market is held weekly, on Saturday, in June and July; also on the first Saturdays of August, September, and October. The corn market is one of the largest in the kingdom. A covered corn exchange was erected in 1843. The walks and drives in the vicinity of the town, and the pleasing character of the surrounding scenery, render

Doncaster a desirable place for visitors. Another cause of attraction is furnished by the annual races. These are held in the third week of September, and continue for five days. It is said that they are a source of great emolument to the town, but this has been doubted. It is certain that they are productive of much immorality. The race-ground, which is about a mile from the town, is perhaps unrivalled. The grand stand, a handsome and commodious edifice, was erected by the corporation of Doncaster. The St. Leger stakes excite great interest not only throughout the kingdom, but in all parts of the world. The municipal body subscribes largely to the maintenance of the races, under the idea that they tend to the prosperity of the town.

DONEGAL, a maritime county of the province of Ulster in Ireland, lies between $54^{\circ} 27'$ and $55^{\circ} 22'$ N. lat., $6^{\circ} 55'$ and $8^{\circ} 48'$ W. long.; it is bounded E. and S. on the inland side by parts of the counties of Londonderry, Tyrone, Fermanagh, and Leitrim, and S.W., W., and N. by the Atlantic Ocean. The greatest length from Inishowen Head on the north-east to Malin Beg Head (sometimes called Teelin Head) on the south-west is 85 statute miles; the greatest breadth from Fearn Hill on the south-east to Horn Head on the north-west is 41 statute miles. The area, according to the Ordnance Survey of Ireland, comprises 1865 square miles, or 1,193,443 acres, of which 393,191 acres are arable, 769,587 uncultivated, 7079 in plantations, 479 in towns, and 23,107 under water. The population in 1851 was 255,160.

Surface, Hydrography, Communications.—Donegal forms the north-western extremity of Ireland. The inland boundary preserves a general direction of south-west by north-east, and from Lifford northward is formed by the navigable river and harbour of Lough Foyle. The maritime boundary is extremely irregular, being deeply indented on the north by the estuaries of Lough Swilly, Mulroy, and Sheep Haven, and on the south by Donegal Bay. The whole county is uneven and mountainous, with the exception of the midland district extending from the liberties of Londonderry westward to Letterkenny and Rathmelton, on Lough Swilly, and southward along the Foyle to Lifford and Castle Finn; and some other inconsiderable tracts around Ballyshannon and Donegal on the south and Dunfanaghy and Buncrana on the north. The mountain groups of Donegal, together with the highlands of Tyrone and Derry, present a deeply withdrawn amphitheatre to the north-east inclosing the basin of the Foyle. That portion of the mountainous circuit which lies within this county is broken only in the north by the openings of Lough Swilly and Mulroy Bay; and on the south (where the connecting highlands of Donegal and Tyrone are narrowed between the valley of the Finn and the Bay of Donegal) by the gap of Barnesmore. Slieve Snaght, which rises to a height of 2019 feet in the centre of the peninsula of Inishowen, forms the extremity of this chain on the north. Westward from Slieve Snaght, and similarly situated in the centre of the peninsula of Fannad between Lough Swilly and Mulroy Bay, is Knockalla, 1196 feet, backed in like manner by Lough Salt Mountain, 1541 feet, between the head of Mulroy Bay and the low country stretching inland from Sheep Haven. Westward again from Sheep Haven is Muckish, 2190 feet in height, which slopes down on the north to the promontory of Horn Head; and Carntroena (1396 feet), which extends to the sea at Bloody Foreland. Southward from Muckish stretches a vast region of highlands, which expands towards the west in wide-extended tracts of bog, interspersed with small lakes and covered with black heaths down to the sandy beach of the Atlantic: on the east it presents a series of bold continuous eminences overhanging the basin of the Foyle. The chief eminences of the chain are Erigal and Dooish on the north, the first 2462 feet in height (the highest ground in the county), the second 2143 feet; and Bluestack, 2213 feet, and Silverhill, 1967 feet, both on the south. From Bluestack extends a series of considerable elevations westward, along the northern boundary of the Bay of Donegal, terminating in the precipices of Slieve League and the promontory of Malin Beg; the Barnesmore Mountains sweeping eastward continue the chain into Tyrone. This mountainous tract covers upwards of 700 square miles. It contains several spots of great interest to the tourist, such as Lough Salt, the prospect from which over Horn Head and Tory Island has been justly celebrated; and Glen Veagh, under the eastern declivity of Dooish, where cliffs of 1000 feet hang for upwards of two miles over a glen and lake, the opposite bank being clothed with a natural forest, which is still the retreat of the red deer.

From the liberties of Londonderry northward the coast of Lough Foyle between the mountains of Inishowen and the sea is well inhabited and improved. From Inishowen Head, at the entrance of Lough Foyle, the coast, which from this point is very rocky and precipitous, bends north-west to Malin Head, the most northern point of this county and of Ireland. The cliffs at Inishowen Head are 313 feet in height; at Bin Head, about half-way between Culdaff and Malin, they rise to the altitude of 814 feet above the sea. On the Lough Swilly side of the peninsula the coast is low, and in many places covered with sand, which the north-westerly gales heap up in immense quantities on all the exposed beaches of this coast. Lough Swilly extends inland upwards of 20 miles, and forms a spacious and secure harbour; the average breadth is about a mile and a half, and the inner basin is completely land-locked; but the vicinity of Lough

Foyle, which floats vessels of 900 tons up to the bridge of Derry, renders Lough Swilly of less importance as a harbour. Westward from Lough Swilly the coast of Fannad, which is insulated by the Bay of Mulroy, is very rugged, and in many parts overspread with sand blown in between the higher points of rock. The Bay of Mulroy is encumbered with sand-banks and intricate windings; it extends inland upwards of 10 miles, and is completely land-locked, being scarcely half a quarter of a mile wide at the entrance. The small peninsula of Rosguill, intercepted between this bay and Sheep Haven, has been almost obliterated by the sands which have been blown in here within the last century. On the opposite shore of Sheep Haven stand Doe Castle, and the house and demesne of Ardes, the most remote and at the same time the most splendid seat in this quarter of Ulster. On a creek of Sheep Haven is the little port-town of Dunfanaghy, immediately under Horn Head, which rises north of it to the height of 833 feet, with a cliff to the ocean of 626 feet. In the sound between Horn Head and Bloody Foreland are the islands of Innisboffin, Inishdoony, and Tory Island, which last is at a distance of 8 miles from the shore. Tory Island is $3\frac{1}{4}$ miles in length, by half a mile to three-quarters of a mile in breadth, and is inhabited by perhaps the most primitive race of people in the United Kingdom. The average elevation of the western part of the island is no more than from 50 to 60 feet above the level of the sea, and the want of shelter is felt very severely in those north-westerly gales which set in with such violence on this coast.

From Bloody Foreland south to Malin Beg Head, a distance of 40 miles in a straight line, nothing can be more desolate than the aspect of the western coast of Donegal. Vast moors studded with pools of bog water descend to the Atlantic between barron deltas of sand, through which each river and rivulet of the coast winds its way to the sea. In winter when these sandy channels are overflowed it is impossible to proceed by the coast-line, as there are no bridges over any of the larger streams north of the village of Glenties. The wildest part of this district is called the Rosses, in which the village of Dungloe, or Cloghanlea, is the principal place. A great number of islands lie off this coast, separated from the mainland and from one another by narrow sounds and sand-banks. Of these eleven are inhabited, of which the principal are:—Aranmore, or the north island of Aran; Rutland, or Innismacard; Innisfree, and Owey. The herring fishery was very successful here in 1784 and 1785; each winter's fishing was calculated to have produced the inhabitants of the Rosses a sum of 40,000*l*. They loaded with herrings upwards of 300 vessels in each of these years. These successes induced the government, in conjunction with the Marquis of Conyngham, the proprietor, to expend a large sum of money in the improvements necessary to erect a permanent fishing station on the island of Innismacard. A small town was built and called Rutland, but it was scarcely completed when the herrings began to desert the coast; at the same time the sands began to accumulate: at present the island is nearly half covered with sand, and the fishing station is quite obliterated. Below high-water mark on the coast of Innisfree grows a marine grass peculiarly sweet and nutritive for cattle, which watch the ebb of the tide and feed upon it at every low water.

The district of the Rosses is separated from the more reclaimed country about Glenties and Ardara on the south by the river Gweebarra, the sandy channel of which is from a mile and a half to a quarter of a mile in breadth throughout the last eight miles of its course, and can only be passed by fording in dry weather. Westward from Ardara the coast is lined with cliffs from 500 to 600 feet in height on the northern side of the great promontory terminated by Malin Beg Head. The loftiest cliffs however on the whole line of coast are those of Slieve League immediately east of Malin Beg, where the height from the sea to the summit of the shelving rock above is at one point 1964 feet. Eastward from Slieve League to the town of Donegal the northern shore of Donegal Bay affords excellent shelter from the north-west gales in several successive creeks. Of these the harbour of Killybeggs is very much the most sheltered and commodious, being the only one secure from a gale from the west or the south-west. The harbour of Donegal itself at the head of the bay is sufficiently good for a much more busy trading place; and 10 miles S. from it is the embouchure of the navigable river Erne, which flows from Lough Erne through Ballyshannon. Round the head of Donegal Bay from Killybeggs to Bundoran cultivation extends more or less up all the seaward declivities: the neighbourhood of Ballyshannon is well improved; and north-east from the town of Donegal a good tract of arable land stretches inland to the picturesque lake of Lough Eask and the Gap of Barnesmore, where a mountain defile of the most romantic character, about seven miles in length, connects it with the south-western extremity of the district of the Foyle.

The *Finn*, which is the chief feeder of the Foyle on this side, issues from a lake of 438 feet above the level of the sea, situated in the centre of the mountain chain extending south of Erigal, and after a course of about 30 miles eastward joins the Foyle at Lifford bridge, 8 miles below Castlefinn, where it is navigable for boats of 14 tons. Other feeders of the Foyle out of Donegal are:—the Derg, which comes from Lough Derg, in the south-eastern extremity of the county of Donegal, and joins the main stream in Tyrone; the Deele, which

has a course nearly parallel to the Finn, and descends upwards of 800 feet in its course from Lough Deele to the Foyle, which it joins a mile below Lifford; and the Swilly burn or brook, which passes by Raphoe, and is navigable for a few miles above its junction. Lough Derg is about 2½ miles wide each way; and surrounded on all sides except the south by steep and barren mountains: it is 467 feet above the level of the sea, and its greatest depth is 75 feet. This lake is subject to violent gusts of wind. It abounds in excellent trout. The Swilly River, although it has a course of little more than 15 miles, brings down a good body of water through Letterkenny to Lough Swilly. The Leannan River, which likewise flows into Lough Swilly by Rathmelton, is a considerable stream, as is also the Lackagh, which discharges the waters of the lakes of Gartan, Lough Veagh, Lough Salt, and Glen Lough into Sheep Haven. The waters of Lough Salt, which is perhaps the deepest pool in Ireland, descend 731 feet in a course of little more than three miles to Glen Lough. Of the rivers of the western course the chief is the Gweebarra, already mentioned: of a similar character is the Gweedore, which separates the Rosses on the north from the district of Cloghanealy. The Owenaa, which flows through Ardara, is the only other considerable river on this coast; the minor streams issuing from small lakes and the torrents which descend from the moors in winter are almost innumerable.

The general direction of all the valleys which intersect the highlands of Donegal is north-east and south-west, and this natural disposition marks out the three chief lines of mountain road; namely, from Ballyshannon and Donegal to Lifford and Londonderry, through the Gap of Barnesmore; from Ardara to Lifford and Letterkenny, by the head of the Finn; and from Dunfanaghy and the cultivated country about Sheep Haven into the Rosses, by the passes between Doolish and Erigal. These latter roads are little frequented, so that west of Eumiskillen the Gap of Barnesmore is the only ordinary communication between Connaught and Ulster. The district along the Foyle and round the head of Lough Swilly is as well supplied with means of communication by land and water as any other part of Ireland. Throughout the county the roads are good.

Geology, Mineralogy, &c.—The Floetz limestone field, which occupies the central plain of Ireland, extends over the borders of this county from Bundoran, where the limestone cliff rises to the height of 100 feet over the Atlantic, 10 miles north-east to Ballintra, where the extreme edge of the stratum is perforated by a subterraneous river. Limestone gravel is also found along the flanks of the primitive district as far as some miles north of Donegal town, and to the presence of this valuable substance may be chiefly attributed the cultivation which distinguishes this part of the county from the sterile tract that separates it from the basin of the Foyle. From the mountains of Barnesmore, north, the whole formation of this county, with the exception of the transition tract along the basin of the Foyle, is primitive.

The prevalent rocks are granite and mica-slate, passing into gneiss, quartz-slate, and clay-slate. The granite is a coarse granular sienite, the detritus of which gives a strong reddish tinge to the sands washed down by the streams that traverse it. It occurs supporting flanks of mica-slate along the whole line of mountains from Lough Salt to Barnesmore. On the eastern flanks of this range the mica-slate passes into grauwacke, which forms the substratum of the valley of the Foyle: the same rock occurs over the lower parts of Inishowen, and also appears on the southern side of the range near Donegal town. Granular limestone is found in beds throughout the whole mountain district in great quantity and variety of colour, as, among various other indications, gray at Malin Head; grayish-blue at Lough Salt; fine granular, pearl-white, pearl-gray, flesh-red, and bright bluish-gray at the marble hill near Muckish; yellowish-white, grayish-white, and rose-red at Ballymore; pearl-white and pale rose-colour at Dunlewy, under Erigal; pearl-gray in extensive beds at the head of the river Finn; and grayish fine blue at Killybegs. Siliceiferous, magnesian, and marly limestone also occur in various parts of the baronies of Inishowen and Raphoe, with a remarkable steatite near Convoys, on the Deele, which cuts under the knife like wood, and is used by the country people for the bowls of tobacco-pipes. Beds of greenstone and greenstone-porphry are sometimes found resting on the deposits of granular limestone, and occasionally on the mica-slate and granite, and the dikes from which these originate may be seen traversing the primitive rock at Horn Head and Bloody Foreland. Among the rarer minerals occurring in this remarkable region are columnar idocrase, malacolithe, epidote, and essonite (cinnamon-stone), from a bed of mica-slate in the Rosses, and from the bar of the Gweebarra River; garnet in hornblende-slate over the marble of Dunlewy, and cherry-red garnet from Glenties; also plumbago from the shore of Ardes; copper pyrites from Horn Head; lead-earth and iron-ochre from Kildrum in Cloghanealy; pearl-white and yellowish-white porcelain clay from Aranmore Island; potter's-clay from Drumardagh, on Lough Swilly; iron pyrites from Barnesmore; lead-ore from Finntown, Letterkenny, Glentogher, and various other places; and pipe-clay from Drumboc, near Stranorlar. The white marble of Dunlewy, near the mountain Erigal, is stated to be of an excellent quality, and its bed very extensive; it has been traced over a space of half a mile square, and is so finely granular that it may be employed in the nicest works of sculpture. "Its texture and whiteness," says Mr. Griffith, "approach more

to those of the Parian than of the Carrara marble. It is very well known that perfect blocks of the Carrara marble are procured with great difficulty; and I firmly believe that the marble of Dunlewy is free from mica, quartz grains, and other substances interfering with the chisel, which so frequently disappoint the artists who work upon the marble from Carrara." A large supply of fine siliceous sand was formerly drawn from the mountain of Muckish by the glass-houses of Belfast, and considerable quantities have been exported to Dumbarton for the manufacture of plate and crown glass.

Climate, Soil, Agriculture, &c.—The climate of Donegal is raw and boisterous, except in the sheltered country along the Foyle. The prevalent winds are from the west and north-west, and they sometimes blow with extreme violence. In a storm on December 4, 1811, H.M. ship *Salhander* was lost in Lough Swilly. The maws and gills of all the fish cast on shore by the violence of the storm—eels, cod, haddock, lobsters, &c.—were filled with sand; from which it would appear that by the furious agitation of the sea the sand had become so blended with it that the fish were suffocated. From the remains of natural forests in many situations where no timber will at present rise against the north-west blast, it has been inferred that the climate is now more severe than it formerly was, a conjecture which would seem to be corroborated by numerous ruins of churches and houses, overwhelmed by sand blown in on situations where, had such events been common at the time of their foundation, no one would have ventured to build.

The soil of the primitive district is generally cold, moory, and thin. The limestone tract from Ballyshannon to Donegal is covered with a warm friable soil, varying from a deep rich mould to a light-brown gravelly earth. The soil of the transition district, arising chiefly from the decomposition of slaty rock, is a light but manageable clay, which is very well adapted for crops of potatoes, flax, oats, and barley, and in some situations, as along the rivers Finn and Foyle, bears wheat abundantly. In 1851 the area under crops in the county was 227,453 acres, of which 6470 acres grew wheat, 100,882 oats, 10,141 barley, here, and rye, 1254 beans and peas, 34,432 potatoes, 19,595 turnips, and 2086 green crops. The number of holdings was 32,752. Donegal is not a grazing county: the good land is almost all under tillage; and the grasses of the remainder are generally too sour for feeding. The Raphoe and Tyrhugh farming societies originated about A.D. 1800, and have been of service in the encouragement of green crops and nurseries. The principal plantations are at Ardes and Tyrallen, a fine seat near Stranorlar. Improvements have been introduced of late years by various public-spirited proprietors.

The linen manufacture is increasing in the cultivated country about Raphoe and Lifford, and also in the neighbourhood of Ballyshannon. Bleachgreens are numerous in the neighbourhood of Stranorlar. Strabano, in the county of Tyrone, within two miles of Lifford, is the principal linen market for the southern district. Londonderry and Letterkenny are the markets for the district to the north. Burning kelp continues to be a profitable occupation along the coast. Considerable numbers of whales have from time to time been taken off this coast; but this, as well as the herring-fishery, is now neglected.

There is considerable fishing in Lough Foyle and at various points around the coast. Turbot, cod, soles, and plaice are taken in large numbers; herrings, mackerel, and various other fish are also largely taken.

The condition of the peasantry in the south and west of the county is not much better than that of the wretched inhabitants of northern Connaught. All the butter and eggs of the poorer farmers go to market to make up the rent, and buttermilk and potatoes constitute their diet.

Donegal is divided into six baronies: Tyrhugh on the south, Bannagh and Boylagh on the west, Kilmacrennan on the north-west, Inishowen on the north-east, and Raphoe on the east and centre. BALLYSHANNON, Killybegs, and DONEGAL were erected into corporations in the reign of James I.; these corporations are now extinct. Lifford, which is the assize-town of the county, is governed by a charter of the 27th February, 10th James I. The vicinity of Strabane has prevented Lifford from increasing: the court-house and county jail constitute the greater part of the town. The other towns are LETTERKENNY, Rathmelton, Buncrana, Ballybofey, and STRANORLAR. DUNFANAGHY, GLENTIES, and MILLFORD are seats of Poor-Law Unions. RAPHOE, in conjunction with Derry, gives name to a bishop. The places whose names are printed in small capitals will be found described under their respective titles; the other towns and villages claiming notice are the following:—

Ardara, population 651, occupies a romantic site at the head of Loughros beg Bay, about 17 miles N.W. from Donegal. Besides the Episcopal church there are here chapels for Roman Catholics and Wesleyan Methodists. Petty sessions are held monthly, and fairs in May, August, and December. *Ballintra*, 6 miles S. by W. from Donegal, lies in a very beautiful country, but is in itself a poor village: population, 458 in 1851. Six fairs are held in the course of the year. There is a dispensary. In the neighbourhood are some good villa residences. *Ballybofey* is a market-town about half a mile from Stranorlar, of which it is generally considered the market part: population, 965. The town is pleasantly situated on the Finn River, and, with Stranorlar, is the most westerly town in the county, lying

just at the commencement of the wild, rugged mountain-tract. The town has very little trade. In the neighbourhood are some bleaching-grounds. The extensive demesne of Drumboe adjoins Ballybofey. *Ballygorman*, situated on the peninsula of Malin Head, is the most northerly village in Ireland: population of the townland, 467. Near the village is Malin Head, the extreme point of the peninsula. *Buncrana*, 14 miles N.N.W. from Londonderry, a market and post-town on the right bank of Lough Swilly, population 797, is an agreeable little town, much frequented by summer visitors as a bathing-place. The church, which has a fine spire, some Dissenting chapels, the sessions-house, and infantry barracks, are the chief public buildings. Flax and corn-mills in the vicinity are worked by water-power obtained from the Castle and Mill rivulets. Buncrana is an inconsiderable fishing-station. Buncrana Castle, in the immediate vicinity, was founded by the O'Donnells, the ancient chieftains of the district. Fairs are held on May 9th and July 27th. *Carndonagh*, or *Carn*, 20 miles N. by E. from Londonderry, a small market-town on the road from Londonderry to Malin Head, population 708, and Inishowen workhouse 647, is a neat, well-built town, with some trade. *Castletown*, population 637, is a small market-town, situated on the river Finn, about 7 miles S.W. from Lifford. The tide-water flows up to the town. The valley of the Finn is well cultivated. Manor courts are held here, and there are seven fairs in the course of the year. *Dungloe*, 25 miles N.N.W. from Donegal, population 484, is a small and sequestered village, which, from its being the largest within an extensive and dreary tract of wild country, is a place of some importance. It contains a church, a chapel, and police-barracks. Large portions of the surrounding bogs have been reclaimed by the villagers. Fishing is carried on, but the bay being shallow the takings are small. *Killybegs*, 15 miles W. from Donegal, is a market and sea-port town: population, 819. The town is irregularly built, and the streets are narrow and inconvenient. The harbour is good, but the exports are few and of little value: at some seasons large numbers of fishing-boats resort to the harbour. The market is held on Tuesday, and there are fairs in January, April, June, August, and November. The town was formerly called *Callebegge*, and is a place of considerable antiquity: it was created a borough in the reign of James II., and sent two members to Parliament, but it has long been disfranchised. *Lifford*, 13 miles E.N.E. from Londonderry, is a market and assize-town; it was formerly a parliamentary borough: population, including the suburb of Strabane, 570, and 183 inmates of the jail. It is a very small and poor town, consisting principally of two streets, and is built on the river Foyle, formed here by the junction of the rivers Finn and Mourne. The town has scarcely any trade, and bears evident marks of decline. The old jail was used until very lately as a place of confinement for idiots and lunatics; the new jail is a semicircular building of considerable extent, and is remarkable for neatness, cleanliness, and good order. The county infirmary is situated here. Lifford gives the title of viscount to the Hewitt family. *Mountcharles*, 4 miles W. by S. from Donegal, population 444, is situated on the Bay of Donegal, and is built along the summit of a rocky eminence. The Hall, a small residence of the Marquis of Conyngham, to whom Mountcharles gives the title of viscount, is close to the village. Fairs are held here monthly. *Moville*, population 776, situated on the west shore of Lough Foyle, about 20 miles S.E. from Carndonagh, is a pleasant little watering-place. During the summer there is regular communication with Londonderry by steam-vessels. The neighbourhood is exceedingly picturesque. There are several chapels in the town. Petty sessions are held monthly, and seven fairs are held in the course of the year. *Pettigoe*, population 390, is prettily situated about a mile from the embouchure of the Tarmon into Lough Erne. Besides the church there are here chapels for Roman Catholics and Wesleyan Methodists. Petty sessions are held in the town: there are fairs on the 20th of each month. *Rathmelton*, or *Ramelton*, 25 miles N.E. from Donegal, population 1428, is a market-town, situated on the right bank of the river Lanan, near the place where it falls into Lough Swilly. The town has a clean and somewhat cheerful appearance. There are corn-mills, a brewery, and bleaching-grounds; linen is woven in the weavers' houses. Besides the church there are Presbyterian and Methodist chapels. Three annual fairs are held. The valley of the Lanan in the neighbourhood of Rathmelton is extremely beautiful: the river flows through a picturesque and well-wooded glen, and the heights on either hand are considerably diversified. A few miles from Rathmelton, on the same side of Lough Swilly, is the fishing village of *Rathmullen*: population, 639. It is a poor place of one irregular street. There are some ruins of a Carmelite monastery.

The southern part of Donegal, down to the plantation of Ulster, was known as Tyrconnell, and was the patrimony of the O'Donnells. The most distinguished of the chieftains of Tyrconnell was Hugh O'Donnell, surnamed the Red, whose entrapment by Sir John Perrot, and subsequent imprisonment at Dublin as a hostage for the good conduct of his clan, caused much hostility against the government of Queen Elizabeth in this part of Ulster. O'Donnell, after more than three years' confinement, escaped, and took an active part in the rebellion of the Earl of Tyrone. In December, 1601, Tyrone and O'Donnell attempted the relief of Kinsale, in which their Spanish auxiliaries were besieged by the lord deputy, but owing, it is said, to

a dispute about precedence, their armies did not act in concert, and a total defeat was the consequence. O'Donnell then sailed for Spain, to solicit in person new succours from Philip. After spending a year and a half in fruitless negotiation, he was seized with fever and died at Valladolid, where he was interred with royal honours in the church of St. Francis. In the meantime a town had been walled in at Derry by Sir Henry Dockwra, who had also built a castle at Lifford for the control of Tyrconnell. The vicinity of an English garrison proved so unsatisfactory to the proprietor of Inishowen, Sir Cahir O'Dogherty, that on some vague assurances of aid from Spain, communicated by the exiled earls, he broke into open revolt May 1st, 1608, and having surprised Culmore and put the garrison to the sword, advanced on Derry next day, which he carried with little resistance and burned to the ground. He then fell back on Kilmacrenan, and took up a strong position on the rock of Doune, where he held out for five months until he was killed by a Scotch settler, who shot him as he leaned over the edge of the rock. O'Dogherty being thus slain in rebellion and the exiled earls attainted of high treason, Donegal, along with five other counties of Ulster, escheated to the crown. On the plantation of Ulster, the district about Lifford was allotted to English undertakers, of whom the chief were Sir Ralph Bingley and Sir John Kingsmill. In Inishowen Muff was granted to Grocers' Hall. Letterkenny owes its origin to Sir George Marburie, and Rathmelton to Sir William Stewart. There were some few forfeitures among the proprietors of Irish descent at the time of the Act of Settlement. The forfeitures consequent on the war of the revolution of 1688 did not extend into Donegal. The last historical event connected with this county was the capture of the French fleet off Tory Island by Sir John B. Warren in 1798.

The most remarkable piece of antiquity in Donegal is the Grianan of Aileach, the palace of the northern Irish kings from the most remote antiquity down to the 12th century. It stands on a small mountain 802 feet in height, near the head of Lough Swilly. The summit of the mountain, which commands a noble prospect, is surrounded by three concentric ramparts of earth intermixed with uncemented stones. The approach by an ancient paved road leads through these by a hollow way to a dun or stone fortress in the centre. This part of the work consists of a circular wall of Cyclopean architecture, varying in breadth from 15 feet to 11 feet 6 inches, and at present about 6 feet high, inclosing an area of 77 feet 6 inches in diameter. The thickness of this wall is diminished at about 5 feet from the base by a terrace extending round the interior, from which there are flights of steps somewhat similar to those at Steague Fort, another remarkable Cyclopean erection in the county of Kerry. There was probably a succession of several such terraces before the upper part of the wall was demolished. Within the thickness of this wall, opening off the interior, are two galleries, 2 feet 2 inches wide at bottom and 1 foot 11 inches at top by 5 feet in height, which extend round one-half of the circumference on each side of the entrance doorway, with which however they do not communicate: their use has not been determined. The remains of a small oblong building of more recent date, but of uncertain origin, occupy the centre. The space contained within the outer inclosure is about 5½ acres; within the second, about 4 acres; within the third, about 1 acre; and within the central building, or cashel, a quarter of an acre. The stones of the wall are generally of about 2 feet in length, polygonal, not laid in courses, or chiselled, and without cement of any kind.

The description is thus minute, as from an ancient Irish poem published in the first part of the 'Memoir of the Ordnance Survey of Ireland,' and which bears conclusive internal evidence of having been written before A.D. 1101, the building of Aileach ('the stone fortress') is attributed with every appearance of accuracy to Eochy Ollahir, whose reign is one of the very earliest historical epochs in Irish history. In this poem are preserved the names of the architects, the number of the ramparts, and the occasion of the undertaking. Until the publication of the Memoir, the uses and history of this remarkable edifice were totally unknown. It was reduced to its present state of ruin in 1101, by Murtagh O'Brien, king of Munster, who, in revenge for the destruction of Kincora by Donnell Mac Loughlin, king of Ulster, A.D. 1088, invaded this district and caused a stone of the demolished fortress of Aileach to be brought to Limerick for every sack of plunder carried home by his soldiery. This event was remembered as late as 1599, when the plunder of Thomond by Hugh O'Donnell was regarded as a just retaliation. On Tory Island also are some Cyclopean remains, not improbably connected with the very ancient tradition of the glass tower mentioned by Nennius. Tory signifies the 'island of the tower.' On the same island are also a round-tower and the remains of seven churches and two stone crosses. Throughout the county are numerous memorials of St. Columba, or St. Columbkille, the name by which he is more usually known in Ireland. This distinguished saint, the apostle of the Picts and founder of the Church of Iona, was born at Gratan, a small village south of Kilmacrenan, where he founded an abbey which was afterwards richly endowed by the O'Donnells. Near Kilmacrenan is the rock of Doune, on which the O'Donnell was always inaugurated. The remains of the abbey of Donegal still possess interest for the antiquary, and on the north of Glen Veagh are some very ancient remains of churches. But by much the most celebrated ecclesiastical locality in this county is the

Purgatory of St. Patrick, situated on an island in Lough Derg. The ancient purgatory was in high repute during the middle ages; the penitent was supposed to pass through ordeals and undergo temptations similar to those ascribed to the Egyptian mysteries. (See O'Sullivan's 'Hist. Cathol. Hib.' and Thomas Wright's 'St. Patrick's Purgatory'.) On St. Patrick's Day, in 1497, the cave and buildings on the island were demolished by order of Pope Alexander VI., but were soon after repaired: they were again razed by Sir James Balfour and Sir William Stewart, who were commissioned for that purpose by the Irish government in 1682. At this time the establishment consisted of an abbot and forty friars, and the daily resort of pilgrims averaged four hundred and fifty. The cave was again opened in the time of James II., and again closed in 1780. At present the Purgatory, which has been a fourth time set up, but on an island at a greater distance from the shore than the two former, draws an immense concourse of the lower orders of Roman Catholics from all parts of Ireland, and many from Great Britain and America every year. The establishment consists during the time of the station (from the 1st of June to the 15th of August), of twenty-four priests: the pilgrims remain there six or nine days: the penances consist of prayer, maceration, fasting, and a vigil of twenty-four hours in a sort of vault called the 'prison.' During the time the pilgrims remain on the island they are not permitted to eat anything but oaten bread and water. Water warmed in a large boiler on the island is given to those who are faint; this hot water is called 'wine,' and is supposed to possess many virtues. One of the pilgrims whom Mr. Inglis saw here, had her lips covered with blisters from the heat of the 'wine' she had drunk. The number of pilgrims is variously estimated from 10,000 to 20,000 annually.

The county of Donegal is chiefly in the diocese of Derry and Raphoe, but partly in that of Clogher. The county returns two members to the Imperial Parliament. Quarter Sessions are held at Buncrana, Donegal, Glenties, Letterkenny, and Lifford. Assizes are held twice a year at Lifford, where there is a county jail: there are bridewells at Donegal, Letterkenny, Lifford, Buncrana, and Glenties. The county infirmary is at Lifford. The district lunatic asylum, to which the county of Donegal sends 85 patients, is at Londonderry. Fever hospitals are at Letterkenny, Rathmelton, and Dunfanaghy, and there are 25 dispensaries in the county. The county is divided into six Poor-Law Unions, and portions of two other Unions. Donegal county is within the military district of Belfast. There are artillery stations at the forts of Rathmullen, Knockalla, Macomish, Dunree, Inch and Ned's Point, on Lough Swilly, and at Greencastle on Lough Foyle. Barracks for infantry are at Ballyshannon and Lifford. The County Constabulary force, numbering 275, officers included, has its head-quarters at Letterkenny. The county is divided into 8 constabulary districts, of which the head-quarters are—Rathmelton, Raphoe, Buncrana, Ballyshannon, Killybegs, Glenties, Dunfanaghy, and Carnadonagh. There are 32 stations of the coast-guard, and 13 stations of the revenue police.

(*Statistical Survey of Donegal; Memoirs of Ordnance Survey of Ireland; Thom, Irish Almanac; Parliamentary Papers, &c.*)

DONEGAL, county of Donegal, Ireland, a market and sea-port town, and the seat of a Poor-Law Union, chiefly in the parish of Donegal and barony of Tyrhugh, is situated in 54° 8' N. lat., 8° 1' W. long.; 120 miles N.W. by N. from Dublin. The population in 1851 was 1580. Donegal Poor-Law Union comprises 18 electoral divisions, with an area of 160,158 acres, and a population in 1851 of 33,708.

Donegal is situated at the mouth of the river Esk, and is surrounded on three sides by lofty hills, while the fourth side is open to the sea. Besides the parish church, which is a neat edifice, there are chapels for Roman Catholics, Presbyterians, Independents, and Methodists. There are here a bridewell and a dispensary. Petty sessions are held monthly. A fair is held on the second Friday in each month.

The town contains a spacious market-place. A good market-quay, with 9 feet of water, was built some years ago at the expense of the Earl of Arran; the harbour has a sufficient depth at low-water for vessels drawing 12 feet. Donegal was incorporated as a borough in the reign of James I., and sent two members to the Irish Parliament, but at the union the corporation became extinct.

Donegal Castle, a former seat of the O'Donnells, earls of Tyrconnell, is situated close to the river side, and is still in tolerable preservation; it is now carefully protected from further dilapidation. A monastery for Franciscans was founded here in 1474; the ruins are still standing on the shore below the town. A sulphureous spa of considerable celebrity adjoins the town. The neighbourhood of Donegal is of a very romantic character.

(*Fraser, Handbook of Ireland; Thom, Irish Almanac.*)

DONERAILE. [CORK.]

DO'NGOLA, a province of Upper Nubia, extending southward from 19° 30' N. lat., along the banks of the Nile as far as Korti, about 18° N. lat., where it borders on the country of the Sheygia Arabs. The Nile coming from Sennaar flows in a northern direction through Halfay, Shendy, and the Barabra country to about 19° N. lat., 33° E. long., where it suddenly turns to the south-south-west, passing through the Sheygia country. After passing below the rock of Barkal, as it reaches the town or village of Korti, its course assumes a direction nearly due west, which it continues for about 20 or 30 miles and

then resumes its north direction towards Egypt. The province called Dongola stretches along the banks of the river from Korti east to the westward and then northward, following the bend of the stream to below the island of Argo, where it borders on Dar-Mahass, which last is a distant province of Nubia.

The island of *Argo*, 30 miles long and about 7 miles wide at its broadest part, is formed by the rich alluvial deposit of the Nile. It contains several villages, but the population, as in other parts of the country, is too scanty to cultivate all the fertile soil. The chief products of the island—corn, cotton, indigo, and dates—are grown along the margin of the island, the interior being useless without irrigation; indeed such is the deficiency of labour and capital that not more than one-tenth of this magnificent island is under cultivation.

The whole length of Dongola is about 150 miles, and its breadth may be considered as extending no farther than the strip of cultivable land on each bank, which varies from 1 to 3 miles in breadth, beyond which is the desert. The left or west bank is the more fertile, the eastern being in most places barren, and the sands of the desert stretching close to the water's edge. The principal town is *Marakah*, or *New Dongola*, which stands on the left bank of the Nile, in 19° 10' 19" N. lat., 30° 22' 15" E. long. It was in great measure built by the Mamelukes during their possession of the country from 1812 to 1820, when they were driven away by Ismail, son of the pasha of Egypt. The town is populous, and important for its trade and as a military station. Its exports are chiefly slaves in return for a variety of goods from Cairo. The pasha has an indigo factory in Dongola. Caravans from Kordofan, Khartoum, and Sennaar pass through the town. The bazaar is supplied with coarse calicoes, printed cotton handkerchiefs, rice, sugar, coffee, hardware, shoes, and perfumes, all of which are brought here from Cairo. Agriculture is much neglected in the vicinity of the town, chiefly in consequence of the difficulty of irrigation. Farther south and on the right bank of the Nile is *Dongola Agous*, or *Old Dongola*, formerly a considerable town, but now reduced to about 300 inhabitants. From the prevalence of northerly winds the sand of the desert has been heaped up about the houses of Old Dongola, so that many of them are entered from the roof. From the village of *Debbah*, a little south of Old Dongola, on the left bank of the Nile, caravans start for Kordofan. *Ambukol*, another village, is farther south and about a mile from the river. Between this place and New Dongola the land is less waste on the islands than on the banks. Most of the islands are well cultivated and produce abundant crops, but in consequence of excessive taxation and the government monopolising the sale of most of the products the peasantry are very poor. There is a bazaar at *Ambukol*; and *dhurra*, cattle, sheep, goats, asses, butter, grease, and excellent cotton are sold. At *Korti*, a few hours eastward of *Ambukol*, there are bazaars for the sale of cattle, sheep, goats, asses, dates, coarse cotton-cloth, perfumes, grease, &c.

Dongola was a Christian country till the 14th century, and Ibn Batuta speaks of it as such. Makrizi in the 15th century describes Dongola as a fertile and rich country with many towns; and Poncet, who in 1698 visited Old Dongola and its king and court, speaks of it as a considerable place. After Poncet's time the Sheygia Arabs desolated Dongola, and reduced it to subjection during a great part of the 18th century. Dongola is now a Beylik dependent on the pasha of Egypt; the bey resides at Marakah, and has jurisdiction also over the country of the Sheygia Arabs, who from being independent have been reduced to abject poverty under the Turkish rule. The natives of Dongola resemble those of Lower Nubia in appearance; they are black but not negroes; they produce indigo, *dhurra*, barley, beans, and have sheep, goats, and some large cattle. All the indigo grown must be sold to the pasha. The fine horses which in Egypt are known by the name of Dongola come chiefly from the Sheygia or Barabra countries. The houses are built of unbaked bricks, made of clay and chopped straw.

(*Waddington and Hanbury, Travels; Caillaud, Travels; Rüppel Macgregor, Commercial Statistics.*)

DONINGTON. [LINCOLNSHIRE.]

DONINGTON CASTLE. [LEICESTERSHIRE.]

DONJON, LE. [ALLIER.]

DONNYBROOK. [DUBLIN, COUNTY OF.]

DOON, a lake and river in Ayrshire, Scotland. Loch Doon, which at its nearest extremity is about 15 or 16 miles S.E. from Ayr, derives its waters from the neighbouring hills in Kirkcudbright. It is upwards of 7 miles in length, and little more than half a mile broad, and is inclosed by lofty hills, totally destitute of trees, but affording pasturage to sheep. On a small island near its head stands a timeworn castle, which it is said was a residence of Edward, brother of Robert Bruce. The loch abounds with trout.

The river Doon is formed by the discharge of the water from the loch, which is regulated by sluices. For upwards of a mile, after leaving the loch, the river makes its way through Ness Glen, a huge gully or ravine in the rocks, which almost appear to have split asunder in order to form a course for the river. The river pursues a north-westerly course of about 17 miles, and falls into the Frith of Clyde, nearly 2 miles S. from the town of Ayr. Near its right bank, about a mile from the sea, stand the remains of Alloway Kirk, and on a

slightly elevated site, close to the river side, is the monument to Robert Burns.

DOONGURPORE, a small principality tributary to the British, is situated in the district of Bagur and province of Gujerat, in a hilly tract, of which very little is known. The greater part of the inhabitants of Doongurpore are Bheels, who are considered to be the aborigines of the country. Some years ago the raja, to preserve his authority, which was threatened by the more powerful among his subjects, took some bands of Sindes into his pay, but they soon usurped all power, and were proving destructive to the country, when the raja sought and obtained the protection of the English, under whose intervention the country has recovered from the desolate condition to which it had been reduced. Its relation to the Company's government is now that of a protected and tributary state. The area of the territory is about 1000 square miles; the population is about 100,000; the revenue about 10,900*l.*; the tribute is not to exceed three-eighths of the annual revenue. The town of *Doongurpore*, the capital, is situated in 23° 45' N. lat., 73° 40' E. long.; about 95 miles N.E. from Ahmedabad. Near this town is situated a lake, of which it is said that its bounds are constructed with solid blocks of marble.

DOORNIK. [TOURNAY.]

DORCHESTER, the county town of Dorsetshire, a municipal and parliamentary borough and market-town, and the seat of a Poor-Law Union, is situated in 50° 43' N. lat., 2° 25' W. long., distant 120 miles S.W. by W. from London by road, and 141 miles by the London and South-Western railway. The population of the borough of Dorchester in 1851 was 6394. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The livings are rectories in the archdeaconry of Dorset and diocese of Salisbury. Dorchester Poor-Law Union contains 39 parishes and townships, with an area of 64,815 acres, and a population in 1851 of 17,210.

Dorchester was called by the Romans *Durnovaria* and *Durinum*. By the Saxons it was called 'Dorneaster,' whence we have the modern name Dorchester. It has also been called 'Villa Regalis,' to distinguish it from Dorchester in Oxfordshire, called 'Villa Episcopalis.' Two mints were established here by King Athelstan. The town was nearly destroyed by fire in 1613; about 300 houses, with the churches of the Holy Trinity and All Saints, were totally consumed.

Many severe battles were fought in the vicinity of Dorchester between the contending forces during the civil war. At the assizes held here on the 3rd of September, 1685, by Judge Jeffries and four other judges, out of 30 persons tried on a charge of being implicated in Monmouth's rebellion, 29 were found guilty and sentenced to death. The following day 292 persons pleaded guilty, and 80 were ordered for execution. John Tutchin, who wrote the 'Observer' in Queen Anne's time, was sentenced to be whipped in every town in the county once a year; but on his petitioning to be hanged as a mitigation of his punishment, he was reprieved and subsequently pardoned. The manor of Dorchester has passed through the hands of numerous families. The corporation claim a prescriptive right, but they have charters of Edward III., Charles I., and other sovereigns. The assizes and courts of quarter-sessions for the county and for the borough are held here. A county court is also held. The borough has returned two members to Parliament since the 23rd year of the reign of King Edward I.

The town of Dorchester is pleasantly situated on a slight elevation near the river Frome, and consists principally of three spacious streets, which are paved and lighted. A delightful walk, well shaded, surrounds two-thirds of the town. The shire-hall is a plain building of Portland stone, and is commodiously fitted up. The guildhall, erected in 1847, is a convenient and handsome building in the Elizabethan style. The jail, built in 1795, contains the county jail, the house of correction, and the penitentiary. Adjoining the town are cavalry barracks. The terminus of the Southampton and Dorchester railway is in the town.

There is a considerable trade carried on in beer. Butter is also sent hence to the metropolis. In the reigns of King Charles I. and James I. cloth was manufactured in Dorchester. The market-day is Saturday. There are fairs on February 14th, Trinity Monday, St. John the Baptist's, and St. James's days; the three last are principally for sheep and lambs, for which Dorchester is celebrated.

The borough of Dorchester includes four parishes—All Saints, St. Peter's, the Holy Trinity, and Fordington. St. Peter's church, a spacious building in the perpendicular style, contains some curious monuments; it is well built, and consists of a chancel, nave, aisles, and an embattled tower 90 feet in height. All Saints, rebuilt in 1845, is a handsome structure in the decorated style. Fordington church is ancient, and has a south doorway of interesting character. There are places of worship for Baptists, Independents, Wesleyan Methodists, and Unitarians. A Free Grammar school was founded and endowed by Mr. Thomas Hardy in 1569. It has an income from endowment of 52*l.* 10*s.* a year, with two exhibitions at either university, and two scholarships at Cambridge. The number of scholars in 1853 was 36. A school of older date was refounded in 1623 by the corporation; the endowment is small. The number of scholars in 1853 was 60. There are also National and British schools. The county hospital, an

excellent institution, was founded in 1841. A county museum is well maintained. There are several almshouses and a savings bank.

The town was strongly fortified and entirely surrounded by a wall when in possession of the Romans, and the site where an ancient castle stood is still called *Castle Green*. The castle was demolished, and a priory for Franciscan monks was constructed out of the materials in the reign of Edward III., near the site of the old castle. The church of the priory was pulled down at the Reformation, and the house was subsequently converted into a Presbyterian meeting-house.

Embossed pavements, Roman urns, and a quantity of coins of the Roman emperors have been dug up in the vicinity of Dorchester. Remains of a Roman amphitheatre, of a Roman camp called Poundbury, and of a large British station called Maiden Castle, are in the neighbourhood.

(Hutchins, *Dorsetshire*; *Communication from Dorchester*.)

DORCHESTER. [OXFORDSHIRE.]

DORDOGNE, a department in the south of France, named from its principal river the Dordogne, extends from 44° 35' to 45° 43' N. lat., 1° 28' E. to 0° 2' W. long., and is bounded N. by the department of Haute-Vienne, E. by those of Lot and Corrèze, S. by Lot-et-Garonne, and W. by the departments of Gironde, Charente-Inférieure, and Charente. Its length from north to south is about 77 miles, its breadth from east to west about 69 miles. The area of the department is 3536 square miles; in extent of surface it is surpassed by only two departments—Gironde and Landes. The population according to the census of 1851 was 505,789, which gives 143 inhabitants to a square mile, being 31.71 below the average per square mile for the whole of France. The department is formed out of the old province of Périgord, with a small portion of the Limousin and some communes from Angoumois and Saintonge.

The department belongs almost wholly to the basin of the Dordogne. Two mountain torrents, the *Dor* and the *Dogne*, springing from the gorges of the Mont-d'Or, in Puy-de-Dôme, unite near the village of Bains their waters and names to form the *Dordogne*, which from this point flows first north and then west for a few miles, till it reaches the western border of the department of Puy-de-Dôme, where it is joined on the right bank by the Chavaron, which rises in the south of the department of Creuse. Here turning nearly due south it separates for many miles the departments of Puy-de-Dôme from Corrèze, and this from Cantal, receiving on either bank numerous streams from the Auvergne Mountains and the mountains of the Limousin. [CANTAL; CORRÈZE.] Crossing in a general south-west direction the south-eastern angle of Corrèze and the north of Lot, it gains the eastern border of the department of Dordogne, a little below Souillac, whence it runs almost due west across the department to which it gives name, and to its junction with the Garonne near Bourg, in the department of Gironde. The point of land between the two rivers at their junction is called *Bec-d'Ambes*. The whole length of this river is 250 miles, 132 miles of which are navigable; vessels of 300 tons go up as far as Libourne. The periodical high tide or bore in the Gironde ascends 20 miles above the mouth of the Dordogne. [BORE; GIRONDE.] Its principal feeders in the lower part of its course are—the *Vézère* [CORRÈZE]; the *Isle*, which flows south from Haute-Vienne as far as Périgueux, whence it turns nearly due west to Coutras; here it is joined on the right bank by the Dronne, which rises also in Haute-Vienne, and drains the north-west of the department of Dordogne; a little below Coutras the Isle runs south, and enters the Dordogne at Libourne in the department of Gironde, after a course of 124 miles, being navigable from Périgueux. The northern angle of the department belongs to the basin of the Charente, and is drained by the Bandiat. [CHARENTE.] A narrow strip on the southern border is drained by the Dropt, a feeder of the Garonne. Besides these there are a vast number of smaller streams, several lakes, and excellent springs. In all the waters of the department, pike, trout, and eels abound. Some of the springs form jets, and others have a periodical ebb and flow.

The surface is hilly; the last western slopes of the Limousin and Auvergne Mountains cover the greater part of it. The ranges north of the Dordogne springing from the Limousin run generally towards the south-west; those south of that river spring from the mountain masses of Cantal, and run nearly due west along the southern boundary of the department. The hills are generally overgrown with woods, broom, or heath; but in many places they are bare, rocky, and very steep. The valleys of the department are long, narrow, and winding; some of them of great beauty and fertility, the slopes of the hills that close them in being generally covered with vineyards; this is especially the case with the valleys of the Isle and the Dordogne. The general character of the soil of the uplands is barrenness. The northern portion, which forms the arrondissement of Nontron, consists almost entirely of high forest-land and irreclaimable moors, the only cover of which is broom and underwood; the chief exception to this is some good grass-land between the Bandiat and the Tardoire. In the more central part, which constitutes the arrondissement of Périgueux, though the hills are not so high, the soil is similar, forests and moors covering two-thirds of the surface. Rye and buckwheat are almost the only cereals grown; these

districts. The deficiency of corn is supplied by the immense produce of chestnuts, which are used as human food, and also for fattening hogs, a source of great profit to the farmer. The highest land in the department is in the arrondissement of Sarlat, the hills rising to the height of 700 to 800 feet, with sides in some places perpendicular. About Bergerac the hills having subsided, the valley of the Dordogne opens out into an extensive plain, and here maize, wheat, peas, beans, and other farm produce are abundantly raised. Of the arrondissement of Ribérac, which is watered by the Dronne, about one-third consists of rich heavy wheat land, and the remainder of arid gravelly soil, or hungry barren sand. The vines in this district are trained to creep along the branches of elms and walnut-trees, which present a beautiful appearance in the autumn, bending with the weight of the ripe grape-clusters; but by this method, though more grapes are produced, the wine is said not to be so good.

Besides the products already named, truffles (the famous Truffles de Périgord), the best in France, medicinal and aromatic plants are abundant; fruit-trees are cultivated to a great extent, especially the walnut for making oil. In the forests oak and chestnut are the prevailing trees. The annual produce of wine is 16,940,000 gallons, one-half of which is used for home consumption, and the rest exported or distilled into brandy and liqueurs; the best kinds are the white wines of the arrondissement of Bergerac. On account of the deficiency of grass-land, horses, cattle, and sheep are not numerous; pigs and goats are; poultry and game are abundant and excellent. Mules and asses are the common beasts of burden. The climate is generally mild, but the cold on the hills is sometimes very great in winter. Snow sometimes falls, but seldom lies more than a day or two; winter and spring are rainy; summer is excessively hot in the valleys; the autumn is very delightful. Violent winds from the north and west are not unusual, and hailstorms often do great harm to the crops in summer. The department is traversed by 5 state, 20 departmental, and 55 communal roads. The Paris-Bordeaux railroad runs for a few miles along the left bank of the Dronne, in the extreme west of the department.

Mines of iron, coal, and manganese are worked; marble, alabaster, millstones, building and lithographic stones are quarried; lead, antimony, magnesia, slate, fullers' earth, chalk, gypsum, &c. are found. There are 59 smelting furnaces and forges for the manufacture of hammered iron and steel; 1413 wind- and water-mills; and 450 establishments of different kinds for the production of coarse woollens, serge, hosiery, brandy, oil, paper, leather, cutlery, &c. The commerce of the department consists of its iron, wine, hams, truffled turkeys, and leather.

The department contains 2,263,582 acres, about one-half of which is capable of cultivation; 222,138 acres are under vine-culture. It is divided into five arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Périgueux	9	116	110,748
2. Bergerac	13	187	118,247
3. Nontron	8	87	86,697
4. Ribérac	7	93	73,177
5. Sarlat	10	146	116,920
Total	47	629	505,789

1. In the first arrondissement the chief town, *Périgueux*, which is also the capital of the department, stands on the right bank of the Isle, at a distance of 296 miles from Paris, in 45° 11' 4" N. lat., 0° 43' 29" E. long., and has 12,488 inhabitants, including the commune. The interior of the town is gloomy; the houses are high, large, and well-built of freestone, but the streets are so narrow and tortuous, that the height of the houses serves to make them cheerless. The site of the old ramparts is now occupied by two handsome boulevards. The streets of the town present some curiously ornamented houses of the 16th century. The principal buildings are—the cathedral of St-Front, the former church of the Jesuits, the town-house, the court-house, and the bridge over the Isle. Périgueux is the seat of a bishop, has tribunals of first instance and of commerce, a college, a public library of 16,000 volumes, an hospital, barracks, a theatre, a museum of antiquities, and also a garden of antiquities, in which the various fragments of Roman sculpture and architecture found in the neighbourhood are arranged in order. It is supplied with water by public fountains, which are fed by an aqueduct lately completed. There are several pretty promenades ornamented with statues. The industrial products of the town are paper, woollen-cloths, cutlery, hosiery, brandy, leather, nails, and the celebrated *Pâtés de Périgueux*, a confection made of partridges and truffles, which is largely exported; the town also trades in flour, salt, iron, wood, pork, groceries, poultry, and cattle. The market for pigs held here is the largest in France. Périgueux occupies the site of ancient *Vesunna*, the capital of the *Petrocorii*, whose name it subsequently bore. Its importance in ancient times is evidenced by its site at the junction of five Roman roads, and by the remains of a vast amphitheatre, aqueducts, baths, and several temples; but the most remarkable Roman building remaining is the circular tower called *La Tour de Vesune*, which is

still 67 feet high, 200 feet round, and has walls 6 feet thick; it has neither doors nor windows, and the purpose of its erection is unknown.

Among the other towns we give the following: the population throughout is that of the commune—*St-Astier*, which was formerly defended by a strong castle, still partly remaining, stands on the Isle, 11 miles W. from Périgueux, and has 2600 inhabitants. *Brantôme*, on an island in the Dronne, was formerly famous for its Benedictine abbey. The abbey church, which dates from the 11th century, is a very interesting structure. A crypt hollowed out of the rock to the north of the abbey contains some colossal bas-reliefs. The other remarkable structures are the abbey buildings, which are of vast extent, and the parish church, which dates from the 15th century, and contains fine specimens of wood carving. The town was formerly fortified, and was the scene of many a foray between the French, Normans, and English: population, 2800. *Pierre de Bourdeilles*, commonly called *Brantôme*, was abbot of the abbey of Brantôme, and wrote his historical memoirs in it. *Excideuil*, the birthplace of Marshal Bugeaud, on the Loue, a feeder of the Isle; *Hautefort*, 25 miles E. from Périgueux, on a hill, the crest of which is surmounted by a fine old castle; *Savignac-les-Eglises*, on the Isle; *St-Jean-de-Vergt*, 12 miles S. from Périgueux; and *Thenon*, 17 miles E.S.E. from it, are small places which give names to cantons.

2. In the second arrondissement, the chief town *Bergerac*, is situated in a fertile plain on the right bank of the Dordogne, 26 miles S.S.W. from Périgueux, and has 9971 inhabitants, including the commune. It is an ill-built place; the streets are narrow winding lanes; some good houses are seen in the market square, and near the bridge across the Dordogne. This bridge (which has five arches), the theatre, and the public library, are the most remarkable objects in the town, which has also tribunals of first instance and of commerce, a college, and an ecclesiastical school. In the neighbourhood there are several iron-foundries and smelting furnaces. The English took Bergerac in A.D. 1345, and fortified it; they were driven out of it by Louis d'Anjou, but made themselves masters of it a second time, and were not finally dispossessed of it till 1450. It suffered greatly in the religious wars of France, during which it was a stronghold of the Calvinists. The citadel and fortifications were demolished by Louis XIII. in 1621. *Breumont*, on the crest of a hill above the Couze, a feeder of the Dordogne, originated in a church erected here in 1272. The present town which is of square form, surrounded by turreted walls with a central square, in which the four principal streets meet at right angles, was built by the English when they were masters of Guienne: population, 1835. *Eymet*, on the left bank of the Dropt; *Lalinde*, 12 miles E. from Bergerac on the Dordogne; *Monpazier*, a well-built place on the Dropt; and *St-Alvaire*, 20 miles E. from Bergerac, are small places with a little over 1000 inhabitants each.

3. In the third arrondissement, the chief town, *Nontron*, an ill-built place, prettily situated on the slopes of two hills on the right bank of the Bandiat, has a tribunal of first instance, an hospital, and 3704 inhabitants, who manufacture cutlery and leather, and are employed in the iron and manganese mines and iron-works of the neighbourhood. The town existed in the 8th century; it was plundered several times by the Northmen. The English took it in 1420. The Huguenots under Coligny sacked Nontron in 1570, and slew a great number of the inhabitants, who resisted to the last extremity. *Jumillac-le-Grand*, 20 miles E. from Nontron, on the left bank of the Isle, has several iron-foundries and smelting-furnaces, a fine old castle, from which the English were chased by Duguesclin in 1379, and 3194 inhabitants. *Thiviers*, an ill-built town, 15 miles S.E. from Nontron, stands on a steep hill, has tan-yards, paper-mills, potteries, tile-works, and iron-foundries; it trades in corn, wine, hides, cheese, truffles, &c., and has a population of 2400. The other cantons are named from mere villages.

4. In the fourth arrondissement, the chief town, *Ribérac*, stands in a fertile district, on the Dronne, 23 miles W. from Périgueux; it is irregularly built, and has 2942 inhabitants, who trade in corn, linen, pigs, and leather. The old castle of the dukes of Turenne is the only interesting structure in the place. A tribunal of first instance is held here. *Neuvic*, on the left bank of the Isle, has 2254 inhabitants. *St-Aulaye*, on the Dronne; *Monpont*, on the left bank of the Isle, near which there is a large Roman camp; *Mussidan*, at the junction of the Crempre with the Isle; and *Bourdeilles*, on a high rock overhanging the left bank of the Dronne, are the most important of the other towns, each having under 2000 inhabitants.

5. In the fifth arrondissement the chief town is *Sarlat*, which stands 32 miles S.E. from Périgueux, in a hollow closed in by steep arid hills, and watered by the river Sarlat, a small feeder of the Dordogne. The streets are narrow and crooked, the houses old and ill-built, the site gloomy and unhealthy. The town has tribunals of first instance and of commerce, a college, an ecclesiastical school, and 5800 inhabitants, including the commune. The college, the hospital, and the parish church are the best of the public buildings. A good deal of paper and walnut-oil are made here. Sarlat was formerly a strong place and sustained several sieges, one of which, though directed by Turenne, was unsuccessful. It is still surrounded by old walls. The bishopric of Sarlat, which was created by Pope John XXII., was

suppressed after the first French revolution. *Belvès* stands on a hill 13 miles S.W. from Sarlat, and has 2529 inhabitants, who manufacture paper, leather, hosiery, coarse woollens, and nut-oil. The town consists of a spacious square on the crest of the hill, and of several steep irregular streets, which lead into it. *Le Bugue*, a pretty little town near the confluence of the Vézère and the Dordogne, has 2398 inhabitants, who manufacture woollens and nut-oil, and trade in wine and provisions with Bordeaux. There are also near the town at the village of Miremont, several iron-foundries, and one of the largest grottoes in France. *St.-Cyprien*, S.W. from Sarlat, on the right bank of the Dordogne, stands at the foot of a hill bristling with rocks, and at the entrance of a rich valley; it has 2324 inhabitants, and a much frequented mineral spring. *Montignac*, a considerable town on the Vézère, which here becomes navigable, has 3752 inhabitants; on a hill above it are the remains of a fine old castle, which played an important part in the wars with the English in the 14th century. *Terrasson*, higher up the Vézère, stands on the slope of a steep hill on the left bank of the river, which is passed by a fine bridge of recent erection; the streets are narrow and steep, but some of the buildings are good: the population is 2893. *Domme*, once an important fortress, on a high hill above the Dordogne and *Villefranche-de-Belvès*, in the south-eastern angle of the department, are the most important of the other towns, with about 2000 inhabitants each.

The department forms the see of the Bishop of Périgueux; it is comprised in the jurisdiction of the High Court of Bordeaux, and belongs to the 14th Military Division, of which Bordeaux is headquarters.

(*Dictionnaire de la France*; Balbi, *Géographie*; *Annuaire pour l'An* 1853.)

DORDRECHT. [Dort.]

DORE-ABBEY, sometimes called ABBEY-DORE, Herefordshire, a village and the seat of a Poor-Law Union in the parish of Dore-Abbey, is situated on the right bank of the little river Dore, in 51° 58' N. lat., 2° 51' W. long.; 12 miles S.W. from Hereford, and 135 miles W.N.W. from London. The population of the parish in 1851 was 588, including 87 inmates of the Union workhouse. The living is a rectory in the archdeaconry and diocese of Hereford. Dore-Abbey Poor-Law Union contains 29 parishes and townships, with an area of 74,917 acres, and a population in 1851 of 9208. The village is pleasantly situated, but is a place of little consequence. In the reign of Stephen a monastery for Cistercian monks was founded here, whence the village received its appellation of Abbey-Dore. The abbey church, which now forms the parish church, is a spacious and handsome cruciform structure with a massive tower.

DORIS, DORIANS. Doris was a small district of Ancient Greece, the seat of the Dorians, the most powerful of the Hellenic tribes. It occupied the valley of the Pindus (now the Apostolia) between the mountain ranges of Cētia and Parnassus, lying between 38° 30' and 38° 50' N. lat., and 22° 10' and 22° 40' E. long., and was bounded N. by Southern Thessaly, W. by Ætolia, S. by Ozolian Locris, and E. by Phocia. The country is a narrow gently undulating valley, open towards Phocis; and through this valley the Pindus, a tributary of the Cephissus, flows to join the latter stream; which it does after a short course at no very great distance from the source of the Cephissus. The valley itself is tolerably level and well watered by numerous small streams which swell the volume of the Pindus; but the mountains on both sides are lofty, rugged, and precipitous, rendering the winters in the valley long and severe. The soil is fertile and productive in grain. The valley of the Pindus stands higher than that of the Cephissus, and is naturally separated from it by the hills which on either side approach and leave only a narrow passage for the river. (Leake's *Northern Greece*, ii. 70.) It was in this valley that the four towns which formed the Doric Tetrapolis—Erineus, or Dorium, the principal town, Boium, Cythinum, and Pindus—were situated. The Dorians did not however confine themselves to the plain. From various passages in ancient writers it is evident that they at one time extended across Mount Cētia to the Gulf of Maliaçus, while as Mr. Grote has shown (*Hist. of Greece*, i. 141) it is probable that prior to their conquest of the Peloponnesus they also occupied the country along the northern shores of the Corinthian Gulf, comprising a large part of Ætolia, the Ozoline Locris, and Phocis. In the historical period the Dorians were in possession of the entire eastern and southern parts of Peloponnesus.

Doris is said to have been originally called Dryopis, from the Dryopes who occupied the country before its conquest by the Dorians. The plain is entered by two mountain passes from the north, one crossing the eastern side of Mount Cētia, the other a portion of the same ridge farther west. On the south was an important pass leading from Doris to Amphissa, at the head of which stood the commanding military town of Cythinum, the site of which appears to be now occupied by Gravia. The ruins of Mariolates, Col. Leake supposes to mark the site of Boium.

The history of Doris proper is of little importance. It submitted to the Persians in the invasion of Xerxes, and its towns were spared. In the various Ætolian, Phocian, and Macedonian wars it suffered greatly. The towns are mentioned as existing by Strabo and Pliny.

The Dorians derive their origin from a mythical personage named

Dorus, who is generally made the son of Hellen, though he is described as the son of Xuthus by Euripides (*Ion*, 1590). Herodotus mentions (I. 52) five successive migrations of this race. Their first settlement was in Phthiotis, in the time of Deucalion; the next, under Dorus, in Hestiasotis, at the foot of Ossa and Olympus; the third, on Mount Pindus, after they had been expelled by the Cadmeans from Hestiasotis. In this settlement, says Herodotus, they were called the Macedonian people; and he elsewhere (viii. 43) attributes to the Dorians a Macedonian origin; but there does not appear to have been any real connection between the Dorians and the Macedonians (who, it has been shown, were of Illyrian extraction: Müller, *'Dor.'* i. p. 2) beyond this vicinity of abode. The fourth settlement of the Dorians, according to Herodotus, was in Dryopis, the country noticed above and subsequently known as Doris, or the Dorian Tetrapolis; and their last migration was to the Peloponnesus. Another, and most remarkable expedition, not mentioned by Herodotus, was the voyage of a Dorian colony to Crete, which is stated to have taken place while they were in their second settlement at the foot of Olympus (*'Androm.'* apud Strabon., p. 475 D); and Dorians are mentioned among the inhabitants of that island even by Homer (*'Od.'* xix. 174). This early settlement in Crete must not be confused with the two subsequent expeditions of the Dorians to that island, which took place after they were well settled in the Peloponnesus, the one from Laconia under the guidance of Pollis and Delphus, the other from Argolis under Althamenes. The migration of the Dorians to the Peloponnesus which is generally called 'the return of the descendants of Hercules,' is stated to have occurred 80 years after the Trojan war, that is, in B.C. 1104 (Thucyd. i. 12). The origin and nature of the connection which subsisted between the Heracleids and the Dorians are involved in much obscurity, but we cannot here enter into the question.

The Dorians must have been very inferior in number to the inhabitants of the countries which they conquered; but the superiority of their peculiar tactics ensured them an easy victory in the field, and they appear to have taken all the strong places either by a long blockade or by some lucky surprise; for they were altogether unskilled in the art of taking walled towns. The governments which the Dorians established in all the countries which they thus invaded and conquered was, as might have been expected, very analogous to that which the Norman invasion introduced into England, namely, an aristocracy of conquest; for while the successful invaders remained on a footing of equality among themselves, all the old inhabitants of the country were reduced to an inferior condition, like the Saxons in England. They were called *περιουκοί*, or 'dwellers round about the city,' a name corresponding exactly to the *Pfahlbürger*, or 'citizens of the Palisade,' at Augsburg, who dwelt in the city suburbs without the wall of the city; to the 'pale' in Ireland before the time of James I.; to the people of the contado in Italy; and to the *fauxbourgeois* in France. (Niebuhr, *'Hist. of Rome'*, i. p. 398, Eng. tr.; Arnold's *'Thucydides'*, i. p. 626; and Borghini, *'Origine della Città di Firenze'*, p. 280, ed. 1584.) All the members of the one class were gentle, all those of the other class were simple. The constitution of Sparta in particular was an aristocracy of conquest as far as the relations between the Spartans and Lacedæmonians were concerned, while the Spartans themselves lived under a democracy with two head magistrates, who were indeed called kings, but possessed very little kingly power.

One of the most remarkable of the Doric institutions was that of the *Ephori*, or Overseers, a body of magistrates who possessed extraordinary privileges. The institution of this office is usually ascribed to Theopompus, the grandson of Charilaus the Proclid; but we agree with Dr. Arnold (*'Thucyd.'* vol. i. 646, and see Müller's *'Dorians'*, ii. 550, Eng. trans.), in thinking that the Ephori, who were five in number, were coeval with the first settlement of the Dorians in Sparta, and were merely the municipal magistrates of the five hamlets which composed the city; but that afterwards when the Heracleids began to encroach upon the privileges of the other Dorians, and it would seem in the reign of Theopompus, the Dorians gained for the Ephori an extension of authority which placed them virtually at the head of the state, although the nominal authority was still left in the hands of the Heracleids. Thus the Ephori were popular magistrates as far as the Dorians themselves were concerned, and the guardians of their rights, yet in relation to the *περιουκοί* they were the oppressive instruments of an overbearing aristocracy. (Plato, *'Leg.'* iv. 712.) The Ephori were chosen in the autumn of every year; and the first in rank gave his name to the year. Every Spartan without regard to age or wealth was eligible to the office. The Ephori possessed judicial rights, generally presiding in causes of great importance; they held also a censorial office, and were empowered to fine whom they pleased, and exact immediate payment of the fine; they could suspend the functions of any other magistrate, and arrest and bring to trial, or, under certain circumstances, depose even the kings. They presided and put the vote in the public assemblies, and performed all the functions of sovereignty in receiving and dismissing embassies, treating with foreign states, and sending out military expeditions. The king, when he commanded, was always attended by two of the Ephori, who exercised a controlling power over his movements. The usurpations of the Ephori became at length almost unbearable, and they were murdered on their seats of justice by Cleomenes II. and their office

overthrown. It was however subsequently restored, though with diminished powers, and existed under the Romans.

The usual name for a constitution in a Dorian state was an order or regulative principle (*κόσμος*), and this name appears to have arisen from the circumstance that the attention of the Dorian legislators was principally, if not solely, directed to the establishment of a system of military discipline and to the encouragement of that strict subordination which is the result of it. It was by superior prowess and discipline that the Dorians had acquired their rank, and it was only by a continuance of this superiority that they could hope to maintain themselves in the same position. Accordingly, it was important that while the bulk of the population was occupied as much as possible in agricultural employments, the Dorian aristocracy should enjoy sufficient leisure and have every inducement of religion and amusement to practise those martial exercises in which it was so needful for them to excel. The same occasion for strict discipline may also account for the extraordinary austerity which prevailed in most Dorian communities. The Dorian women enjoyed a degree of consideration unusual among the Greeks. The *Syasitia*, or common tables, which were established in most Dorian states, were designed to admonish those of the privileged class that, living as they did in the midst of a conquered but numerous population, they must not consider themselves to have any individual existence, but must live only for the sake of their order (*κόσμος*). The Delphian oracle regulated all the Dorian law systems.

The Dorians used a peculiar variety of the Greek language known as the *Doric dialect*. It was spoken in the Dorian Tetrapolis; in the greater part of the Peloponnesus, and in the numerous Dorian colonies. The lyric poets of Greece in general wrote in the Doric dialect; and the choruses in the Attic plays are written in a kind of Doric. On this dialect the reader may consult, in addition to Mattaire and Gregory of Corinth, who have written on the Greek dialects in general, the excellent remarks of Müller, '*Dorians*,' v. ii. App. VIII. p. 484, Eng. trans.

In addition to the Dorian settlements which have been mentioned, this race sent out many colonies: of these the most important were established along the south-west coast of Asia Minor and the western coast of Greece. Among the more important on this coast were Ambracia, Anactorium, Apollonia, Epidamnus, and Leucas. Rhodes, Cyprus, Corcyra, and Sicily also boasted a Dorian population; Byzantium and Chalcedon were Megarean colonies; and the celebrated cities, Tarentum and Crotona, in Italy, were founded under the authority of Sparta.

(Müller, *Dorians*; K. F. DORKING, Surrey, a market-town and the seat of a Poor-Law Union in the parish of Dorking, is situated in 51° 14' N. lat., 0° 19' W. long.; distant 12 miles E. by S. from Guildford, 23 miles S. by W. from London by road, and 29 miles by the Reading branch of the South-Eastern railway. The population of the town of Dorking in 1851 was 3490. The living is a vicarage in the archdeaconry of Surrey and diocese of Winchester. Dorking Poor-Law Union contains eight parishes and townships, with an area of 37,970 acres, and a population in 1851 of 11,362.

Dorking occupies an agreeable and healthy situation in the valley on the south side of the North Downs, near the river Mole. The town has a neat and clean appearance, the streets are well laid out, lighted with gas, and paved. The parish church, a spacious edifice, rebuilt in 1837, consists of nave, aisles, transept, and chancel, and has a tower rising from the intersection of the nave and transept; the tower is surmounted with an octagonal spire of considerable height. The Independents, Wesleyan Methodists, and Quakers have places of worship. There are National, British, and Infant schools, and a savings bank.

The chief trade of Dorking is in flour, lime, and chalk. Poultry of a peculiar kind is reared for the London market, though less extensively now than formerly. The Dorking fowl is distinguished by having five claws to each foot. The weekly market is on Thursday; a monthly stock market is held on the second Thursday of the month; an annual fair is held on the day before Holy Thursday. Petty sessions and a county court are held in Dorking. Many Roman coins have been found in the neighbourhood, including silver coins of Tiberius and Antoninus. In the neighbourhood of Dorking are many handsome mansions, among which is Deepdene, the residence of Henry Thomas Hope, Esq.

(Manning and Bray, *Surrey*; Brayley, *Surrey*.)

DORNOCH. [SUTHERLAND.]

DORPAT, or **DERPT** (in Livonian, *Tehrputa*), a town in the government of Livonia in Russia, is situated at the foot and on the declivity of a hill on the Embach, a feeder of Lake Peipus, in 58° 22' N. lat., 26° 45' E. long., 138 miles N.E. from Riga, and 168 miles S.W. from St. Petersburg, and has about 14,000 inhabitants, including the Riga and St. Petersburg suburbs. The river is crossed by a handsome bridge of granite of three massive arches, and the town, which is embellished with gardens, forms a semicircle, laid out in straight

broad streets, which are kept very clean, and adorned with some handsome public buildings of freestone, particularly the government offices and university buildings. The houses, constructed either of bricks or wood, the walls and roofs of which are painted in showy colours, do not in general exceed one story in height. The Domberg Hill, at the north-western extremity of the town, is approached from one of the principal squares, and is laid out in avenues and walks; the summit is called Cathedral Place, from its having been the site of a cathedral, which was burned down in 1775, and is at present the site of an observatory, of the university library, of schools of anatomy and natural history, museums, &c. The observatory of Dorpat, long presided over by Struve, is one of the most celebrated in Europe. Among its excellent astronomical apparatus is a great refracting telescope by Fraunhofer, which was placed here by the Emperor Alexander. In the middle of the 18th century Dorpat had a cathedral and seven churches within the walls, besides three outside of them. Of the town as it then existed there remains little except the ruins of the old cathedral, the whole city having been almost destroyed in the great fire of 1775. The ramparts still exist but they are converted into public walks. Internal trade, the navigation of the Embach, and the wants of those who are connected with the university, afford employment to the people of the town. They also hold a large annual fair in January for the sale of Russian and foreign manufactures. The university was founded in 1632 by Gustavus Adolphus, at a time when Livonia, Esthonia, and Ingria, belonged to the Swedish crown, but was suppressed by Alexis Michaelovitch in 1656. The Swedes having however recovered possession of Livonia, it was re-established in 1690; in 1699 they transferred it to Pernau, and in December 1802, it was reconstituted by the Emperor Alexander for the benefit of Livonia, Esthonia, and Courland, the nobility of which elect a curator or superintendent, who conjointly with its heads, administers its revenue, which amounts to about 5800*l.* a year. The university, which is open to students of every religious persuasion, but is particularly a Protestant institution, consists of the four faculties of theology, law, medicine, and philosophy; had 45 professors in 1848, and was attended by about 600 students. It has a library of nearly 60,000 volumes, and suitable collections for natural and experimental philosophy, mineralogy, zoology, anatomy, and pathology, &c.; a botanical garden, containing above 18,000 plants, a theological and a philological seminary, a gymnasium, and a training school.

DORSETSHIRE, an English county included between 50° 30' and 51° 5' N. lat., and 1° 48' and 3° 7' W. long.; is bounded E. by Hampshire, N. by Wiltshire, N.W. by Somersetshire, and W. by Devonshire: along all its southern borders it is washed by the English Channel. Dorsetshire is for a short distance separated from Hampshire by a rivulet which joins the Avon of Wiltshire and Hampshire above Christchurch: for a short distance it is separated from Somersetshire by the Ivel or Yeo, and the brooks that run into it; and in the west it is separated from Somersetshire and Devonshire by the Axe and some small streams that run into that river.

The form of the county is very irregular, and one small part is entirely detached from the rest and inclosed by Devonshire. Its greatest length is from east to west, from Alderholt, near Fordingbridge, in Hampshire, to the western extremity of the detached part, which is inclosed within the boundary of Devonshire, 57 or 58 miles; but from the irregular course of the boundary, the line joining these two points is not wholly in Dorsetshire. The breadth from north to south varies much; the greatest breadth is from the spot where the river Stour enters Dorsetshire to Portland Bill or Point, 40 miles; at the eastern extremity, along the Hampshire border, the breadth is 16 miles; at the western extremity, near Lyme Regis, only 5 miles. The area is 987 square miles; the population in 1851 was 184,267.

Coast, Bays, and Islands.—At the eastern end of Dorsetshire the coast is precipitous; but the cliffs extend scarcely a mile south-west from the border of Hampshire, and are succeeded by a low sandy tongue of land, running about a mile farther in the same direction to the narrow entrance of Poole harbour. This bay penetrates 6 miles inland towards the west, and expands to a breadth of 4 or 5 miles. Its outline is very irregular, and it forms several small bays, as Hole's Bay, Lytchet Bay, Arne Bay, &c. It receives the Frome, the Piddle, and other streams; it consists for the most part of banks of mud, which are dry at low water, and covered with sea-weed, and are separated from each other by deeper channels. The town of Poole is on a peninsula at the entrance of Hole's Bay, on the north side of the harbour. There are several islands in Poole harbour; Brownsea or Brownsey, the largest, which lies near the entrance of the harbour, is a mile and a half long from east to west, and nearly a mile broad. It is sandy, partly covered with heath, furze, and fern, and partly cultivated or laid out in a plantation. There are on it an old castle and one or two tenements. The water is so shallow in Poole harbour, except in the channels, that only small or lightly-laden boats can pass over the banks, even at high water; several of the channels are only sufficient for fishing boats and small craft; the Wareham and Main channels, the south or Wych channel, and that which leads to the town of Poole, are navigable for larger vessels. The shore round Poole harbour is low, and near where the Frome falls into it the land is protected from inundation by an embankment. From the entrance of Poole harbour a low shore runs southward

nearly 3 miles, and then becomes steep, and turns eastward, forming Studland Bay, the southern limit of which is Handfast Point; it then runs about 4 miles south by west to Peverel Point and Durlston Head, thence west by south 5 miles to St. Aldhelm's or St. Alban's Head, 344 feet high, and continues in an irregular line west by north 17 or 18 miles to Weymouth Bay, forming along the line of coast several small bays.

The shore of Weymouth Bay is low, and extends 2 miles south to the towns of Melcombe Regis and Weymouth; here the cliffs recommence, and run 1 mile south-west to Sandsfoot Castle, whence a low shore extends 2 miles south by east to Portland Castle, on the peninsula or Isle of Portland. The lofty coast of this island takes a circuit of 5 or 6 miles to the Bill of Portland, the southernmost point of the county, and thence above 3 miles northward to the commencement of the Chesil Bank, which connects the north-west extremity of the Isle of Portland with the mainland. The bay between Weymouth and the Isle of Portland is called Portland Road.

The Isle of Portland is about 4 miles long, and in the widest part nearly a mile and a half broad. It is one continued bed of rock of freestone. The highest point in the island is 458 feet above the level of the sea; the cliffs on the western side are very lofty; those at the Bill are not more than 20 or 30 feet high. The island supplies the greater part of the provisions requisite for the sustenance of the population. Water is plentiful and good; one stream has sufficient volume to turn a mill. The herbage is very fine, and affords pasturage to a number of sheep, whose flesh is considered to be excellent mutton. The arable land is mostly common field; the inclosures are bounded by stone fences. Wheat, oats, pease, and a little barley are grown; sainfoin is also cultivated. There are few trees in the island. The islanders are a robust race, peculiarly adapted to the hard labour of quarrying stone, in which a considerable number are employed. They occasionally engage in fishing, and a few are employed in agriculture, trade, and handicraft. The custom of gavelkind prevails here. The island has one village, Chesilton, at the commencement of the Chesil bank, on the north-west side of Portland. There are two castles; one, on the east shore of the isle, is very ancient, and built in the form of a pentagon, with a number of small loop-holes, whence it has been vulgarly called 'Bow and Arrow Castle'; it is sometimes called Rufus's Castle. The other is on the northern side of the island, built by Henry VIII., and, in connection with Sandsfoot Castle, commands Portland Road; a few guns are still mounted. Near the Bill are two lighthouses. The quarries will be noticed hereafter. Masses of rocks extend under water to a considerable distance from the island. A dangerous surf, called 'The Race of Portland,' extends from the west of the island eastward to St. Aldhelm's Head. Portland Road is sheltered from the south-west wind, and affords good holding ground at 8 or 9 fathoms. In 1847 an act was passed for the formation of a harbour of refuge off the Isle of Portland by the construction of a breakwater, extending northward from the north-eastern point of the island for a mile and a quarter, so as to include a large part of Portland Road. A considerable number of convicts are employed on the works, a convict establishment having been formed on the island for the purpose. The works are now steadily advancing.

Leland, Hollinshed, and Camden agree in speaking of Portland as having been once separated from the mainland; but it has long been united to it by the Chesil Bank, one of the longest and most extraordinary ridges of pebbles in Europe. From its commencement at the Isle of Portland it extends in a remarkably straight line north-west for many miles, running parallel to the coast, from which it is separated by a narrow arm of the sea called 'The Fleet,' as far as Abbotsbury, 10 miles from Portland: here it unites with the mainland and runs along the shore nearly six miles further to the commencement of the cliffs at Burton Castle, not far from Bridport. The breadth of the Chesil Bank is in some places near a quarter of a mile, but commonly much less. The base is formed of a mound of blue clay, which is covered to the depth of four, five, or six feet by a coat of smooth round pebbles, chiefly of white calcareous spar (these are called Portland pebbles), but partly of quartz, chert, jasper, &c., so loose that a horse's legs sink almost knee deep at every step. Marine plants grow in patches along the edge of the bank by the water-side. The pebbly covering is continually shifting, in consequence of the action of the winds and the sea. The fleet receives the water of several rivulets, and runs into the open sea at its south-eastern extremity by a narrow channel called 'Small Mouth.' At the north-western extremity it forms a 'swannery,' which once consisted of 7,000 swans. The Fleet is much frequented by water-fowl, among which Dr. Maton observed the wild swan.

From Burton Castle the coast, generally abrupt and frequently high, runs west-north-west 10 or 12 miles to the border of Devonshire: the cliffs in this part are remarkable for the beauty and variety of the fossils which they contain. The whole extent of the Dorsetshire coast, including the circuit of the Isle of Portland, may be estimated at above 75 miles.

Surface, Hydrography, Communications.—The surface of this county is for the most part uneven. The principal elevations are the chalk downs, which, entering Dorsetshire from Wiltshire on the northern side of Cranbourne Chase, 2 or 3 miles S.E. from Shaftesbury, turn

to the south and run to the valley of the Stour, in the neighbourhood of Blandford. From the valley of the Stour the chalk downs run nearly west to the neighbourhood of Beaminster, and form the northern boundary of the basin whose drainage is received by Poole Harbour. The hills near Beaminster form, with the exception of some outlying masses, the western extremity of the great chalk formation. The chalk hills from Beaminster run south-east or east and form the 'South Downs,' the highest points in which are along the southern escarpment. The hills gradually approach the coast a few miles north-east of Melcombe Regis. From Lulworth the chalk hills run eastward to Handfast Point, the headland which separates Studland and Swanage bays. Pilsdon Pen, west of Beaminster, which is 934 feet high, is the highest point in the county, and belongs to the greensand formation. Swyre Hill, on the coast, near Kimmeridge, in the Isle of Purbeck, is 669 feet high.

The *Stour*, the chief river of Dorsetshire, rises in Wiltshire, in Stourhead Park, on the border of Somersetshire, and running south by east enters Dorsetshire between three and four miles from its source. Its course in Dorsetshire is generally in a south-east direction and by a very winding channel. Its feeders are the Shreen, the Lidden, the Cale, and the Allen. After it receives the Allen the Stour flows east-south-east 6 or 7 miles into Hampshire, after entering which it receives a considerable stream, 16 or 18 miles long, from Cranbourne; and about 4 miles lower it joins the Avon near Christchurch, in Hampshire. The whole course of the Stour is nearly 65 miles. It is navigable for about 40 miles to Sturminster Newton.

The river *Yeo*, *Ive*, or *Ivel*, is formed by two brooks, one rising in Somersetshire and one in Dorsetshire, which uniting near Milbourne Port (Somersetshire), and flowing south-west, enter Dorsetshire between Milbourne Port and Sherbourne, about 3 miles from their respective sources. The Yeo then flows first west-south-west, then west-north-west for about 7 miles, when it again touches the border of Somersetshire, along which it winds for about 3 miles, and then entering Somersetshire flows north-west into the Parret. The Stour and the Yeo carry off the drainage of all that part of the county which lies north of the North Downs.

The North and South Downs inclose the basin of the two rivers Piddle, or Trent, and Frome, which unite in Poole Harbour below Wareham, and from their situation with respect to that town are respectively called Wareham North and Wareham South River. The *Piddle* rises in the village of Alton on the southern declivity of the North Downs, and flows south and south-east past Piddletrenthide and Piddlehinton to Piddletown. From Piddletown it has a general east-south-east course about 22 miles in length to its entrance into Poole Harbour. The *Frome* rises on the Downs near Corscombe, north-east of Beaminster, and flows south-east. At Maiden Newton it receives a stream from the Downs near Beaminster. From Maiden Newton the Frome flows south-east 8 miles to Dorchester. From Dorchester it flows east nearly 20 miles into Poole Harbour, just upon entering which it unites with the Piddle, and has the same low-water channel as that river: its whole length to Poole Harbour is about 35 miles. For a considerable part of their course both the Frome and the Piddle flow through low meadows; the channel of each is repeatedly divided and reunited. They are not navigable above Wareham.

The western extremity of the county is watered by the Bredy, the Brit, the Char, and the Axe, which last rather belongs to Devonshire. The *Bredy* flows westward 7 or 8 miles from Little Bredy into the sea near Burton Bradstock, at the north-west extremity of the Chesil Bank. The *Brit* rises near Beaminster, on the southern slope of the chalk hills, near the junction of the North and South Downs, and flows south about 9 miles into the sea below Bridport; the mouth of it forms Bridport Harbour. The *Char* is about as long as the Brit; it rises near Pilsdon Pen, and flows south and south-west into the sea at Charmouth. The *Axe* rises in Dorsetshire and flows for some miles along the border of the county.

Dorsetshire has no canals. The Dorset and Somerset Canal, for which acts were obtained in 1796 and 1803, but which was never executed, was to have entered the county near Stalbridge and to have followed the valley of the Stour till it opened into that river above Blandford Forum. The intended English and Bristol Channels Ship Canal was to cross the western extremity of the county.

The only passenger railway in Dorsetshire is the most western portion completed of the main line of the London and South-Western. It enters the county a few miles west of Ringwood, and proceeds in a south-westerly direction past Poole, where it crosses a portion of Poole Harbour, and sends off a short branch to the town of Poole, and forwards to Wareham, whence it proceeds in a westerly direction to Dorchester. Its total length in Dorsetshire is about 33 miles.

The Penzance, Falmouth, and Exeter mail-road crosses the county in nearly its whole extent. It enters it near Woodyates Inn, between Salisbury and Blandford, and runs south-west through Whitechurch and Piddletown to Dorchester, and thence west by Bridport and Charmouth to Axminster, in Devonshire. The Exeter mail-road crosses the northern part of the county, entering it near Shaftesbury, and running thence sometimes in Somersetshire and sometimes in Dorsetshire by Sherbourne to Yeovil, in Somersetshire. It just crosses the western extremity and the detached portion of the county

between Chard and Honiton. The Falmouth, Devonport, and Exeter mail-road also just crosses the western part of the county. The Southampton and Poole mail-road enters the county beyond Ringwood, and runs by Wimbourne Minster to Poole. There are several other important roads in the county.

Geological Character.—The direction of the chalk-hills, which has been already noticed, furnishes the key to the geological structure of Dorsetshire. The North and South Downs respectively extend westward from the neighbourhood of Shaftesbury and the peninsula, which, although a part of the mainland, is called the Isle of Purbeck. The Downs unite at their western extremity near Beaminster, and inclose a basin, the 'Trough of Poole,' in which we have the formations superior to the chalk; beyond or without this basin we have the formations which underlie the chalk.

The eastern part of the county, as far as Cranbourne, Chalbury and Wimbourne Minster, and the Trough of Poole, are occupied by the plastic clay. Potter's clay in beds of various thickness and at different depths alternates with loose sand in this formation in the Trough of Poole. The potter's clay is sent to Staffordshire, where it is mixed with ground flints and employed in the finer kinds of pottery. Beneath the potter's clay lies a seam of very friable earthy brown coal, which crumbles when put into water, burns with a weak flame, emitting a particular and rather bituminous smell, somewhat like Bovey coal. An extensive horizontal bed of pipeclay skirts the northern declivity of the South Downs, and contains a bed of coal exactly resembling that of Alum Bay in the Isle of Wight; clay of the same bed, but not of equal quality, may be found in other parts of the Trough of Poole; it is quarried extensively near the town of Poole, where clay for fire-bricks is also dug. Near Handfast Point the sand of this formation passes into sandstone. The plastic clay is found capping one or two hills south-west of Dorchester.

The chalk formation bounds the plastic clay. In the North Downs the chalk occupies a breadth of nearly ten miles, namely, from Shaftesbury to Cranbourne, and along the valley of the Stour from above Blandford to Wimbourne Minster: at its western extremity the formation is still broader, extending about 18 miles beyond Beaminster to Stinsford, near Dorchester. On the southern side of the Trough of Poole it becomes much narrower, scarcely averaging two miles in breadth. The cliffs along the south coast are partly chalk: the strata are in some places curved and occasionally vertical. The valleys drained by the upper part of the Frome and its tributaries are occupied by the greensand, so that the mass of the chalk hills about Beaminster is cut off from the rest of the formation. In the district south of the chalk range and extending to the coast the chalk-marl, greensand, would clay, and iron sand are found skirting the chalk in the order in which we have named them in the Isle of Purbeck, and extending along the coast between the chalk and the Purbeck and Portland limestone, next to be noticed. The iron-sand near Lulworth contains imperfect beds of wood-coal. The would clay is not found along the coast west of the Isle of Purbeck.

The Purbeck strata, belonging to the upper series of the oolitic formation, consist of argillaceous limestone alternating with schistose marl: they crop out from under the iron-sand in the Isle of Purbeck. A variety of the Purbeck stone known as Purbeck marble was formerly much used for columns and ornaments in our cathedrals and old churches. The thickness of the Purbeck beds is estimated at 290 feet. The Portland oolite, another member of the same series which succeeds the Purbeck stone, occupies the remainder of the Isle of Purbeck and the whole of the Isle of Portland. It consists of a number of beds of a yellowish white calcareous freestone, generally mixed with a small quantity of silicious sand. But the different beds of which it is composed often vary in their characters, nor are the same beds of a uniform character in different localities. The varieties of this formation afford a great part of the stone used for architectural purposes in London. The Portland stone came into repute in the time of James I., who used it by the advice of his architects in rebuilding the banqueting-house at Whitehall. After the great fire of London, A.D. 1666, vast quantities of this stone were used in rebuilding St. Paul's and other public edifices. A considerable portion of Westminster bridge and the whole of Blackfriars bridge are built of it.

The strata of stone of all kinds on the east side of Portland have an aggregate thickness of 93 feet, on the west side of 112 feet. The upper stratum or 'cap stone' is employed in building the Portland breakwater. The Kimmeridge clay, a blue slaty or grayish yellow clay, which also belongs to the upper oolitic series, underlies the Portland stone: it sometimes contains beds of a highly bituminous shale, which, from their being found near Kimmeridge in the Isle of Purbeck, have obtained the name of Kimmeridge coal, and have given to the whole formation the name of Kimmeridge clay. The thickness of the Kimmeridge clay is estimated at 600 or 700 feet. It forms the base of the Portland oolite in the Isle of Portland, and the line of junction between the two formations is elevated on the north side of the island far above the level of the sea. The coasts of the island are here formed by a sloping bank of Kimmeridge clay, surmounted by an abrupt escarpment of oolite. On the south side of the island by the dip of the strata towards the south, the line of junction is brought down to the level of the sea.

Towards the south-western shore of the Isle of Purbeck, where

the chalk downs approach the sea, and are skirted only by a very narrow belt occupied by the iron sand, and beyond that seaward by the Portland oolite, the sea has formed several singular coves, at the entrance of which are lofty headlands of oolite; while the cove or basin is excavated inland as far as the chalk. The precipitous sides of these basins exhibit in a most striking manner the formations between the chalk and the oolite.

Westward of the coves just described, extending from Weymouth Bay towards the river Brit, occurs what is termed by geologists 'a saddle,' a double series of formations. After the greensand, Purbeck and Portland beds, and Kimmeridge clay, have successively cropped out from beneath the chalk, the coral rag, and Oxford clay, members of the middle series of oolites, rise to the surface in succession, and are succeeded by the forest marble and the great oolite, which belong to the lowest series of the oolitic formations. To the southward of the great oolite and forest marble, the superior strata reappear in reverse order of succession; the Oxford clay, then the coral rag, and then the Kimmeridge clay, which runs down to the shore at Weymouth, and rises again from the sea in the Isle of Portland, where it appears capped with the Portland oolite.

In the north-western and western parts of the county, the chalk formation is succeeded by the greensand, which crops out from beneath it, and skirts the northern side and the western extremity of the North Downs. The greensand forms the outlying masses of Pilsdon and Lewston hills, and of others yet farther west along the borders of Dorsetshire and in the county of Devon. [DEVONSHIRE.] West of Shaftesbury extends a bed of Kimmeridge clay, which crops out from under the greensand: west of the Kimmeridge clay is a range of coral rag hills; and still farther west occur the Oxford clay and the great oolite. All these formations are overlaid by the westward extension of the chalk and greensand from the valley of the Stour to Beaminster; but some of them re-appear in the cliffs which line the coast westward of the Chesil bank. The western extremity of the county is occupied by the lowest members of the oolitic series and by the lias. The line of junction of these formations extends nearly north and south from Ilminster in Somersetshire to the sea. The detached part of the county which is inclosed within Devonshire is partly occupied by the red marl formation.

Climate, Soil, Agriculture.—The climate of Dorsetshire, though mild and healthy, is not so warm as its geographical situation would lead us to expect; a circumstance owing to the nature of the soil and the bareness of its chalk hills, there being little or nothing to break the force of the winds that sweep over them. The air is somewhat keen and bracing. In the valleys the climate resembles that of the valleys of Devonshire, and the vegetation is very similar. It appears from Domesday Book that in the 11th century there were vineyards in several parts of this county.

A considerable portion of the soil in the south-eastern part of Dorsetshire is composed of a loose sand and gravel, with a portion of ferruginous loam. The whole surface of the county consists chiefly of this loose sand and gravel, clay and chalk. The most fertile spots are those where all the three have been mixed in the valleys by the rivulets which run down the hills carrying the soil with them. The poor sandy soil occupies that part of the county which joins Hampshire. In the centre and towards Wiltshire lies the chalk; and along the coast, over a more solid chalky rock, is a stratum of clay, which likewise covers the western part towards Devonshire, and the northern towards Somersetshire.

The chalk hills to the west of Dorchester, and along the borders of the vale of Blackmore, are of considerable elevation, and contain several narrow vales and deep hollows. The most elevated parts of the chalk district are most profitably retained as sheep-walk, the pasture being fine and short. In the bottom of the vale of Blackmore are some extremely fertile meadows watered by the river Stour. The hills which look down upon this valley are high and bare; but the lower sides are beautifully varied with woods and fields. The quantity of arable land throughout the county bears but a small proportion to the pasture; and greater attention is paid to the rearing of sheep and feeding of cattle than to the raising of corn.

On the larger farms the farm-houses are old buildings of, and covered with, stone tiles; in the smaller they are mostly thatched with reed. Many cottages are built with mud walls composed of road scrapings, chalk, and straw, the foundation being of stone or brick. Garden walls are frequently built of these cheap materials, their top being protected from the weather by a small roof of thatch, which extends a few inches over each side.

The introduction of sainfoin on the dry chalky soils has been a great advantage, as it produces a rich fodder, requires little manure, and lasts many years. In this soil the wheat is generally sown after clover which has stood one or two years, but sometimes also after turnips or rape fed off. The folding of the land saves manure, and the vicinity of sheep downs gives an opportunity of having large folds and repeating the folding often, both before and after sowing the seed. The tread of the sheep consolidates loose soils better than the heaviest roller.

Barley is here a more important crop than wheat. It is sown from the middle of March to the middle of May. The earliest sown is generally the best. The produce averages 30 bushels per acre. Oats

are sown on the heavier and moister soils. Potatoes are cultivated to a considerable extent in the rich loams about Bridport, Beaminster, Abbotsbury, &c. Sainfoin is sown with a spring crop: four bushels of seed are required for an acre. It is cut before the blossom is fully expanded, and made into hay, which is excellent fodder for sheep in winter. After several years, when it begins to go off, it is ploughed up, and the land sown with oats. Hemp is cultivated to some extent in the richest soils, which contain a considerable proportion of sand, and are too light for beans. Flax is likewise cultivated in the sound deep loams which have been gradually enriched by manuring the preceding crops.

The meadows along the vale of Blackmore are extremely rich, and produce much hay, which is used to feed the dairy cows in winter. The upland meadows are well managed, and frequently dressed with lime and dung. Many sheep which feed on the downs in summer are wintered in the vales. The pastures on the hills are well adapted to feed dairy cows. The Dorset butter is in good repute in London and Portsmouth for ship provision as well as domestic use. Dorset salt butter, when well washed, is very commonly sold in London for fresh butter. The butter is made from the cream, and the skimmed milk is made into cheese.

The Dorset sheep are noted as a profitable breed to those who rear house-lambs for the London market. They give much milk, and fatten their lambs better than any other breed. There is another very small breed in the Isle of Purbeck, and near Weymouth, of which the flesh is in repute with epicures: some consider them as the real and original Dorsetshire breed. They resemble the small forest sheep formerly found on all the commons of the Forest of Windsor, and on Bagshot Heath, the mutton of which was in equal repute as Bagshot mutton. The wool is fine, but the fleeces does not weigh above 1½ or 2 lbs. on an average. The Southdown breed is very generally found in Dorsetshire, and suits the pasture and climate better than the Leicester.

Divisions, Towns, &c.—The county of Dorset previous to the year 1740 was divided into five more considerable parts, or as they were termed 'divisions,' which took their names from the towns of—1. Blandford, II. Bridport, III. Dorchester, IV. Shaftesbury, and V. Sherbourne. These were further subdivided into 35 hundreds, 24 liberties, and 10 boroughs.

Since 1740 a new arrangement of the county has been adopted. The five divisions have been increased to nine, namely:—Blandford, north and south, Bridport, Cerne, Dorchester, Shaftesbury, or Shaston, east and west, Sherbourne, or Sherborne, and Sturminster. These divisions are further subdivided into 36 hundreds, 22 liberties, and 9 boroughs. The borough of Poole is considered as a county in itself.

The following are market-towns:—DORCHESTER, the county town, and a municipal and parliamentary borough, on the river Frome; the parliamentary boroughs of BRIDPORT, on the Brit; LYME REGIS, on the Sea; MELCOMBE REGIS, on the Sea, united with that of WEYMOUTH; POOLE, on Poole Harbour; SHAFTESBURY, on the border of the county adjacent to Wiltshire; WAREHAM, between the Piddle and the Frome; and the municipal borough of BLANDFORD FORUM, on the Stour. Of these places, and of the market-towns of BEAMINSTER, on the Brit, near its source, CERNE ABBAS, on the Cerne, CRANBOURNE, SHERBOURNE, on the Yeo, STURMINSTER, on the Stour, and WIMBOURNE MINSTER, on the Allen, as well as CORFE CASTLE, a disfranchised borough in the Isle of Purbeck, an account is given under their respective titles. Of Milton Abbas, Stalbridge, and Swanage, we give a brief notice here.

Milton Abbas, or Abbot, is said to derive its name (which is a contraction of Middleton Abbot) from its situation near the centre of the county. It is in a deep vale inclosed by steep chalk hills on the north and south side. The parish had in 1851 a population of 915 persons. Its market and fairs have been given up. An abbey founded here by King Athelstan formerly gave importance to the town. The buildings of the abbey were preserved for a long time, but were gradually pulled down, chiefly to be replaced by more modern erections. The hall yet remains, a noble and magnificent old room, part of the mansion of Milton Abbey, belonging to the Damer family. This family enjoyed for some time the title of Earl of Dorchester, now extinct. The conventual church is now a private chapel. It consists of the choir, transepts, and tower of the old abbey church: the choir is chiefly of early decorated character; the transepts and tower are perpendicular. The general appearance of this edifice is very fine.

Stalbridge is situated about 21 miles N. by E. from Dorchester. The population of the township in 1861 was 1826. The market is held every alternate Tuesday; and there are two cattle fairs in the year. The town is irregularly laid out. In the market-place is a very dilapidated ancient cross, 22 feet high, or including the base of three steps 30 feet. The church, a large ancient structure, with a high embattled tower at the west end, has been recently repaired. There are an Independent chapel, and a free school. Stone is quarried in the parish, and used for building and roofing.

Swanage, 29 miles E.S.E. from Dorchester, population, 2014, a decayed market-town and sea-port. The church, which is spacious, is of different periods; some parts are very ancient. There are chapels belonging to the Independents and Wesleyan Methodists.

The town consists of a street a mile in length, containing many good shops. Swanage is much resorted to during the summer for sea-bathing. Many of the inhabitants are employed in extensive stone-quarries in the neighbourhood.

The following are the more important villages, with their population in 1851, and a few other particulars:—

Affpuddle, 8 miles E.N.E. from Dorchester: population of the parish, 488. The church, which is a very handsome specimen of the decorated style, originally belonged to Cerne Abbey; in the interior is some fine carving. On Bladen Heath, in this parish, are several curious excavations. *Beer Regis*, 10½ miles E.N.E. from Dorchester, population 1242, is a decayed market-town. The church has a noble carved oak roof; in the interior are remains of several fine altartombs. The Independents and Wesleyan Methodists have places of worship, and there is a Free school. A fair is held on September 10th and the four following days. Beer Regis now forms part of the borough of Wareham. *Broadway*, 5 miles S. by W. from Dorchester: population of the parish, 610. Besides the church, which was rebuilt in 1836, there are a Wesleyan Methodist chapel and a National school. The village is much resorted to on account of a mineral sulphureous spring, known as Nottingham Spa. *Broad Windsor*, 18 miles N.E. from Dorchester: population, 1661. Besides the parish church, which is ancient, there is a new church at Blackdown, a hamlet of Broad Windsor; there are also a Dissenting chapel and a Free school. Sallcloth is manufactured. *Buckland Newton, or Buckland Abbas*, 11 miles N. from Dorchester, formerly a market-town, now an extensive village: population of the parish, 990. There are here an ancient parish church, a chapel for Dissenters, and a Free school. *Charmouth*, 21 miles W. from Dorchester, population 664, a village situated on the coast at the mouth of the river Char, is much resorted to during the summer for sea-bathing. It has a modern church, an Independent and a Wesleyan Methodist chapel, and National and British schools. *West Chickerell*, 7 miles S.S.W. from Dorchester: population of the parish, 577. The church, which is in the early English style, originally belonged to Bindon Abbey. In the interior is a Norman font. At the west end of the church are two large bells, suspended under stone arches. The Independents have a chapel in the village. There is a fishery here, of which the proceeds, chiefly mackerel, are forwarded to London and elsewhere by railway from Dorchester. *Dawlish*, 8 miles N.E. from Dorchester: population, 442. The village, which lies in a hollow, and has a brook running through it, contains a very ancient and interesting church, a Wesleyan Methodist chapel, and a Free school. An extensive business was formerly carried on in making wire shirt-buttons. Several Roman remains, including a tessellated pavement, have been discovered in the neighbourhood. *Evershot*, 13 miles N.N.W. from Dorchester, population 606, formerly a market-town; two fairs are held in the course of the year. The church is ancient. Near the south side of the church is St. John's Spring, generally called the source of the river Frome. The Free Grammar school, founded in 1628, has an income from endowment of about 90*l.* a year, and had 53 scholars in 1851. *Gillingham*, 26 miles N. by E. from Dorchester, population 2806, contains a spacious and handsome church, recently rebuilt; chapels for Baptists, and Wesleyan and Primitive Methodists, a Free school, a National school, and a Temperance hall. A small market is held on Friday, a fair for cattle on Trinity Monday, and a pleasure fair on September 12th. The town is lighted with gas. There are silk manufactures, flour-mills, and an extensive brewery. *Hampreston, or Ham Chamberlayne*, 24 miles E.N.E. from Dorchester: population of the entire parish, which is partly in Hampshire, 1193. The church is very ancient. There are a new Independent chapel, with a spire and clock, a Methodist chapel, and a National school. At Stape Hill is a Roman Catholic nunnery. *Lytchett Matravers*, population 878, about 10 miles E. by N. from Dorchester, has a fine old church, in which are some good monuments. In the village are chapels for Wesleyan and Primitive Methodists, and a National school. *Lytchett Minster*, an adjoining village, population of the parish 878, being the same number as Lytchett Matravers, possesses a parish church, erected in 1834. The Baptists and Wesleyan Methodists have places of worship; there are also a National school and some parochial charities. Lytchett Beacon commands an extensive and beautiful view of the coast. *Marnhull*, 22 miles N.N.E. from Dorchester: population, 1481. The church is a spacious edifice in the early English style. There are a Wesleyan Methodist and a Roman Catholic chapel, a Free school, and a Roman Catholic school. In the neighbourhood is Nash House, a fine mansion, containing some good pictures. *Motcombe*, 30 miles N.N.E. from Dorchester: population, 1535. The church was rebuilt in 1846; attached to it is a National school built and supported by the Marquis of Westminster. The Wesleyans and Primitive Methodists have chapels. The Marquis of Westminster has a fine seat here called Motcombe Hall. *Netherbury* is situated on the right bank of the Brit, between Beaminster and Bridport, 19 miles W.N.W. from Dorchester: population, 2066. The church, which is in the perpendicular style, has been partly restored. There are a Dissenting chapel and a Free school. In the neighbourhood are several good mansions. *Parkstone*, 32 miles E. from Dorchester, population of the chapelry 899, a village in a picturesque situation near Poole harbour. Besides the church, which was built in 1833, there is an Independent chapel. The neighbourhood affords

some fine views, and the village is much resorted to in the summer. *Piddletown*, 5 miles N.E. from Dorchester, population 1297, a small well-built town situated on the river Piddle. The church is perpendicular, and contains a very rich Norman font and several interesting tombs. The Independents and Wesleyan Methodists have places of worship. A market formerly held here has been long discontinued. Fairs for cattle are held on Easter Tuesday and October 29th. *Radipole*, 6 miles S. by W. from Dorchester, population 609, a pleasant little village on the left bank of the Wey. Besides the church, which is very handsome, there are chapels belonging to the Independents and Roman Catholics. In the neighbourhood are many villas and genteel residences, and the place is much resorted to by summer visitors. *Shapwick*, 17 miles N.E. by E. from Dorchester: population, 444. The church is a curious old building. Shapwick once possessed a market: part of an ancient cross is still left. A priory was founded here in 1414. Some remains of an ancient camp are to be seen in the neighbourhood. *Spetisbury*, 15 miles N.E. from Dorchester: population, 660. The church is ancient, and has an embattled tower. There are places of worship for Independents and Wesleyan Methodists. The Roman Catholics have a church, convent, and school at Middlestreet, a hamlet of Spetisbury. An alien priory formerly existed here. In the vicinity are some remains of an earthwork. *Sydling St. Nicholas*, 8 miles N.W. by W. from Dorchester: population, 676. Besides the church, there are Independent and Methodist chapels, and a Free school. A singular custom lately prevailed here of the farmers meeting every Sunday after service under an old elm, known as the Old Cross Tree, to hear the complaints of their farm-labourers. *Winterbourne St. Martin*, or *Martinstown*, 2½ miles W.S.W. from Dorchester: population, 434. The church is ancient, but of different dates. The village stands in the midst of an agricultural district, and has a considerable trade. Winterbourne formerly had a market; a fair which is well supplied with cattle, is held on St. Martin's day. Maiden Castle, the remains of a Roman camp, is situated in this parish. There are several other villages and parishes in Dorsetshire which are named Winterbourne. *Witchampton*, situated on the right bank of the river Allen, 22 miles N.E. from Dorchester, population 504, was formerly a market-town. The church is a large and handsome specimen of the decorated style. There are a Wesleyan chapel, an Infant and a Charity school, and four almshouses. A paper-mill gives employment to some of the inhabitants. *Wyke Regis*, 9 miles S. by W. from Dorchester, population 1898, a small village on the sea-coast. The houses are good, and the church is a very fine Norman edifice, with a square embattled tower, which serves as a landmark for vessels in the channel. In the interior are some good monuments and rich stained glass windows. Wyke Regis church is the mother-church of Weymouth. There is a Free school. From the heights in the vicinity some extensive prospects are obtained. *Yerminster*, 16 miles N.N.W. from Dorchester, population 666, formerly a market-town. Two fairs are held here annually.

Divisions for Ecclesiastical and Legal Purposes.—In the earlier period of the ecclesiastical constitution of England, Dorsetshire was included in the bishopric of Dorchester in Oxfordshire, a see founded by Birinus, first bishop of the West Saxons, about 626, and afterwards removed to Winchester. In the year 705, when Ina, king of Wessex, divided his kingdom into dioceses, Dorsetshire was comprehended in that of Sherborne, from which place the see was removed about the middle of the 11th century to Sarum. Upon the erection of the see of Bristol in 1542 Dorsetshire was transferred to the new diocese, of which it constituted the chief part, and it continued to be so until transferred back by the late act to the diocese of Salisbury. According to the 'Census of Religious Worship' taken in 1851 it appears that there were then in the county 563 places of worship, namely, 304 of the Church of England; 147 of four sections of Methodists; 69 of Independents; 15 of Baptists; and 28 of minor bodies. The total number of sittings provided was 121,206. By the Poor-Law Commissioners the county is divided into 12 unions:—Beaminster, Blandford, Bridport, Cerne, Dorchester, Poole, Shaftesbury, Sherbourne, Sturminster, Wareham and Purbeck, Weymouth, and Wimbourne and Cranbourne. These Unions include 282 parishes and townships, with an area of 596,413 acres, and a population in 1851 of 173,332; but the boundaries of the Unions are not strictly co-extensive with those of the county. This county is included in the western circuit. The assizes were anciently held at Sherbourne; sometimes, though rarely, at Shaftesbury; but generally, especially in latter times, at Dorchester, where they may be considered as now fixed. The shire-hall and county jail are at Dorchester. The quarter-sessions are also held at Dorchester; and county courts are held at Blandford, Bridport, Dorchester, Poole, Wareham, and Weymouth.

Before the passing of the Reform Act 20 members were returned to the House of Commons from Dorsetshire. The county now returns 14 members, namely, 3 for the county; 2 each for the boroughs of Bridport, Dorchester, Poole, and Weymouth united with Melcombe Regis; and one each for the boroughs of Shaftesbury, Lyme Regis, and Wareham. Corfe Castle was disfranchised by the Reform Act, and included in the neighbouring parliamentary borough of Wareham.

History and Antiquities.—This county was in the earliest period noticed by history inhabited by a people whom Ptolemæus calls

Durotriges, a name which Mr. Hutchins (after Camden) derives from the British words *dwr*, water, and *trig*, an inhabitant, and interprets to mean 'dwellers by the water side.' According to Asser *Menevensis* the Britons called this people *Dwr Gwyr*; the Saxons called them *Dorsettan*, whence the modern name of the county. The Durotriges appear to have been of Belgic race. Upon the conquest of South Britain by the Romans Dorsetshire was included in *Britannia Prima*.

Of this early period of our history there are several remains in various camps and earth-works, stone-circles, cromlechs, and barrows. [CERNE ABBAS.] In the north-eastern part of the county, and the adjacent part of Wiltshire, are several embankments with ditches; they all run in a winding and irregular manner mostly from south-east to north-west, having the ditch on the north-east side. At Sutton Walronde are two hills which appear to have been Celtic earth-works.

There are several Roman camps in the county. Mr. Hutchins enumerates 25; and the walls and amphitheatre of Dorchester, and the coins and pavements found there, are monuments of the same victorious people. There were at least two Roman stations in the county, namely, *Durnovaria* ('Itin.' Antoninus), or *Dunium* (Ptolemæus), Dorchester; and *Vindocladia*, or *Vindogladia*, *Vindelia* in Richard of Cirencester, which some are disposed to fix at Wimbourne, others more probably at Gussage, between Blandford Forum and Cranbourne. To these Dr. Stukeley would add a third, *Ibernium* (mentioned by the anonymous *Ravennas*), which he fixes at Bere Regis.

The Ikenield or Icknield way enters the county at its western extremity, coming from Hembury Fort [DEVONSHIRE], and runs east by south to Dorchester, near which it is very perfect, high and broad, and paved with flint and stone; from Dorchester it runs by Sheepwick and Sturminster Marshall, and the Gussages into Wiltshire. The remains of a Roman road may be traced on the south-west side of the Frome, leading from Dorchester in a north-west direction as far as Bradford Peverel and Stratton, soon after which it disappears; another road may be traced from Dorchester on the other bank of Frome, parallel to the former road, and uniting with it at Stratton; and there are traces of several others.

When the Saxons established their octarchy Dorsetshire was included in the kingdom of Wessex; and even after the West Saxon princes acquired the sovereignty of England they resided occasionally in this county. Ethelbald and Ethelbert, the elder brothers of Alfred the Great, were buried at Sherbourne; and Ethelred I., another brother of the same prince, at Wimbourne.

In the invasions of the Danes this county suffered severely. In 876 they made themselves masters of Wareham, where they were besieged by Alfred, who obliged them to quit that place the next year, when 120 of their vessels were wrecked at Swanage. In 1002 Sweyn, king of Denmark, in his invasion of England, destroyed Dorchester, Sherbourne, and Shaston or Shaftesbury.

Throughout the middle ages few events of historical interest connected with the county occur. The contest of the Roses little affected this part of the kingdom. The towns on the coast were flourishing, as appears from the following list of the vessels which they furnished to the fleet of Edward III. at the siege of Calais, 1347:—Weymouth, 20 ships and 264 mariners, or, according to Hackluyt, 15 ships and 263 mariners; Lyme, 4 ships, 62 mariners; Poole, 4 ships, 94 mariners; Wareham, 3 ships, 59 mariners. Weymouth furnished only 2 vessels less than Bristol and only 5 less than London; they were however more weakly manned and probably smaller. To the fleet of the lord high admiral (Howard of Effingham), at the time of the armada, 1588, this county furnished 8 vessels (3 of them volunteers) and 340 men. The second engagement of the English fleet with the armada was off Portland Bill.

In the civil war of Charles I. the gentry were mostly for the king; but the people of the towns, where the clothing trade was then carried on, and of the ports, were for the parliament. In the beginning of the war, Sir Walter Earle and Sir Thomas Trenchard, partisans of the parliament, possessed themselves of Dorchester, Weymouth, Portland, Lyme, Wareham, and Poole, while Sherbourne Castle, Chideock Castle, and Corfe Castle were garrisoned by the king. Corfe Castle held out for the king till 1645-6. The year 1645 was distinguished by the rising of the club-men in the counties of Dorset, Wilts, and Somerset; their object was to defend this part of the county from the outrages of both parties. Their assembling excited the jealousy of the parliamentarians, whose superiority was now established. Cromwell defeated a considerable body of them at Hamilton Hill, and other bodies were persuaded to disperse.

In 1851 the county had 10 savings banks—at Blandford Forum, Bridport, Dorchester, Lyme Regis, Poole, Shaftesbury, Sherbourne, Wareham, Weymouth, and Wimbourne. The amount due to depositors on the 20th of November, 1851, was 432,946l. 11s.

DORT, (*Dordrecht*, formerly *Thuredrecht*), a city of South Holland, is situated on an island formed by the Maas, 11 miles S.E. from Rotterdam, in 51° 49' N. lat., 4° 42' E. long., and has about 21,000 inhabitants. The island on which it stands was separated from the opposite shore in November, 1421, by an irruption of the waters. By this irruption the dykes were broken down, more than 70 villages were destroyed, and a great number of the inhabitants drowned. Dort is one of the most ancient cities in Holland, and was formerly the capital of the

province, and the residence of the counts of Holland. The independence of the United Dutch Provinces was first declared at Dort in 1572; and here in 1618 and 1619 sat the Synod of Dort which condemned the doctrines of Arminius. The old gothic structure in which the synod was held is now a public-house. The situation of Dort is naturally so strong, that although frequently invested it has always made successful resistance to the besiegers. It has a safe and good harbour, and is well situated for trade, having two canals, by means of which goods can be conveyed to warehouses in the heart of the city. East Indiamen heavily laden can come up to the quays. The chief industrial establishments are shipbuilding docks, saw-mills, sugar-refineries, tobacco factories, salt-refineries, white-lead works, and in the neighbourhood numerous linen bleaching-grounds. There is a large trade also in corn, flax, train-oil, salt-fish, and wood; large rafts of timber are brought down the Rhine from German forests to this place, and broken up for sale. The brothers De Witt were natives of the town. The town-hall is a handsome building, and the principal church is a gothic structure 300 feet long and 125 feet wide, with lofty towers and chimneys. The electro-telegraphic wires laid down along the projected line of railway between Antwerp and Rotterdam pass through Dordrecht.

DORTMUND. [ARNSBERG, vol. i. col. 531.]

DOTIS, a town in the north-west of Hungary, is situated about 12 miles S.E. from Comorn, in 47° 38' N. lat., 18° 20' E. long., and has about 5000 inhabitants. Between the town and its suburb (called Tóváros, 'Lake Town,' from its situation on a small lake), are the ruins of an ancient castle, which was a favourite residence of Matthias Corvinus, king of Hungary. Among the buildings of note are three churches, one of which is very old, a Capuchin and a Piarist monastery (the latter having a grammar-school), a head-district school, a military hospital, and a bath-house. The inhabitants have several flour- and saw-mills, and manufacture coarse woollen cloths, earthenware and pottery, beer, &c. The Esterházy family have a splendid castle here, with grounds laid out in the English style. There are vineyards, large sheep-grounds, and extensive forests, in the neighbourhood. Dotis and much of the surrounding land are the property of the Esterházy family.

DOUAI, or DOUAY, a large, ancient, and important town on the Scarpe, in the French department of Nord, stands in 50° 22' N. lat., 3° 4' E. long., at a distance of 21 miles by railway S. from Lille, 80 miles S.W. from Brussels, and 149 N. by E. from Paris by the railroad which joins these two cities, and has 18,013 inhabitants including only the commune. It is surrounded by ancient walls, flanked with towers and laid out in agreeable promenades. The town is further defended by a fort on the left bank of the Scarpe. The streets are well laid out. The town-hall, the church of St. Pierre, the cannon-foundry, and the arsenal, are the principal buildings. The inhabitants are engaged in the manufacture of linen, lace, thread, gauze, cotton, soap, glass, leather, beer, gin, pottery, paper, oil, chemical products, and refined sugar. A considerable trade is carried on also in corn, wine, brandy, chicory, wool, hops, flax, woollen cloth, and cattle. Douai is the seat of a University Academy, and of a High Court of Justice, which has jurisdiction over the departments of Nord and Pas-de-Calais; it has also a college for English Roman Catholic priests, founded by Cardinal Allen, an Englishman; a royal college; a school of artillery; a school of drawing and music; a public library, which contains 27,000 volumes; a museum of natural history; a botanic garden; and a collection of paintings and antiquities; several hospitals; and a theatre. A tribunal of first instance is held here. Exhibitions of the industrial products take place every two years. The commerce of the town is more active than formerly, in consequence of its connection by railroads with the chief towns of France and Belgium. Douai has also extensive communication by means of the Scarpe, which falls into the Schelde, and by numerous canals that connect it with the principal trading towns of France, Belgium, and Holland.

Douai is a place of great antiquity: it existed in the time of the Romans, and became under the counts of Flanders a place of considerable importance. Philip the Fair took the town from the count of Flanders, A.D. 1297, but it was restored to the counts in 1368 by Charles V. of France. With the rest of Flanders it passed under the dominion of the kings of Spain; and in 1552 Philip II. of Spain founded a university here. In 1667 Louis XIV. took possession of Douai: it was taken in 1710 by the allies under Marlborough and Eugene, but the French retook it after the English withdrew from the coalition against France. Much flax is grown, and coal is dug, in the neighbourhood of the town.

DOUBS, a department in the east of France, takes its name from the river Doubs, which has its source and a considerable part of its course within its boundaries. It lies between 46° 35' and 47° 31' N. lat., 5° 39' and 6° 58' E. long., and is bounded N.W. and N. by the departments of Haute-Saône and Haut-Rhin; E. by Switzerland, and S.W. and S. by the department of Jura. This department is irregularly shaped; its greatest length from north to south is 66 miles, from east to west 60 miles: the area according to the latest cadastral returns of the French government is 2019 square miles, and the population according to the census of 1851 was 296,679, which gives 146.94 to the square mile, being 27.77 below the average per square mile for the whole of France. The population however is

very unequally distributed: in the plains it is far above the average, but very thin indeed in the mountainous parts. The department is formed out of a portion of the old province of Franche-Comté.

The department presents high mountains, forests, narrow valleys, heaths, rocks, and marshes. It is crossed from north-east to south-west by four parallel chains of the Jura Mountains; in the highest of these, which runs along the Swiss frontier, are the summits Mont-d'Or and Mont-Suchet, respectively 4920 and 5248 feet high; the other chains become successively lower, so that the highest point in the western chain, Roch-d'Or, is only 2860 feet in height. The two more eastern chains have their sides clothed with pine forests, the perpetual verdure of which forms a strong contrast with the snows that cover the mountain tops during six months of the year, or in the absence of snow, with the bare rocky crags which occupy the crests of these chains: on their southern slopes there is good pasturage during the summer and autumn, to which numerous herds of cattle are driven; and here in the 'chalets' or shepherds' huts (the only habitation met with in these regions) a great quantity of excellent butter and cheese is made. Even in the valleys of this region little attention is paid to the cultivation of the soil, in consequence of the length of the winter, the depth of the snow, and the short continuance of the fine season. The only crop is oats, of which a good deal is grown, but even this crop is sometimes lost under the early snow. The other two chains, though they present many bare rocky heights, have a milder climate, forests of oak (*quercus robur*) and beech instead of pine, and a more fertile soil in the valleys, which yield wheat, but in no great quantity; the vine is cultivated on sheltered spots facing the south. The west of the department, between the Doubs and the Oignon, is comparatively level, very fertile, and much more densely peopled than the highlands; here the hills are covered with vineyards, and the plains abundantly produce wheat, maize, hemp, flax, fruits, and other crops. The valleys which separate the mountain chains are longitudinal, that is, they run in the direction of those chains; they vary greatly in width, in some places opening out into tolerably wide basins, but frequently contracting into deep narrow gorges. The climate is cold but healthy in the mountainous districts, where the snow lies commonly from October till April; in the western plains the temperature is more genial; west and north-west winds are frequent, and bring rain; the south-west wind is ordinarily violent and dry.

The production of bread-stuffs is not sufficient for the consumption; of wine the annual produce is only 3,784,000 gallons; walnuts, cherries, and other fruit-trees are extensively cultivated. Horned cattle, resembling the Swiss breed, and horses, are reared in great numbers. The rivers contain trout, perch, tench, eel, carp, pike, crab, &c. A silver mine was formerly worked on the flanks of the Mont-d'Or. Iron and coal mines are worked; shell-marble, gypsum, and building-stone are quarried; lignite, marl, fuller's and potter's clay are found; and peat for fuel is dug in many places. The mountain pastures abound with medicinal and aromatic plants, and of these large quantities are gathered.

In the mountainous districts the rearing of cattle and the making of cheese and butter, are the chief occupations of the population; the annual value of the cheese made in the department is estimated at 1,650,000 francs, of the butter at 260,000 francs. The cheese is of good quality, and resembles Gruyère. Of manufacturing industry, properly so called, the products furnished by the department are—watch and clock movements, cotton and woollen cloths, cotton yarn, hosiery, paper, glass, glue, leather, beer, hammered iron, steel, iron-wire, files, scythes, and other agricultural implements. A good deal of kirch-wasser and extract of wormwood is made. The commerce, a large proportion of which is carried on with Switzerland, consists in the articles named, and in hides, cattle, timber, deals, oak staves, tin and iron-ware, &c. There are 433 corn and other mills in the department, most of which are worked by water power; 35 iron-foundries and smelting furnaces, and 156 factories of different kinds. Fairs to the number of 270 are held yearly. Roadway accommodation to the extent of 310 miles is afforded by 5 royal and 21 departmental roads. The department has as yet no railroads, but the electro-telegraphic wires connecting Paris with Lausanne and the chief towns of Switzerland, are laid down through Besançon and Portarlier.

The department takes its name from the river Doubs, which traverses it twice throughout its entire length. This river rises at the foot of Mont Rixon, in the south-east of the department, and runs in a north-east direction for about 70 miles. For 10 miles of this distance below Chaux-de-Fonds the river forms the eastern boundary of France; then entering the Swiss canton of Neuchâtel it runs about 8 miles to the east of north-east striking against Mont-Terrible, the highest part of the chain that connects the Vosges and the Jura Mountains, then glances off to westwards for about 16 miles as far as St.-Hippolyte, where it receives the Dessoubre on the left bank, and takes a northern direction to within 4 miles of Montbelliard. From this point the river making a rapid semicircular sweep, first to the east and then to the north-west, finally flows south-west, passing Clerval, Baume-les-Dames, and Besançon; a few miles below this last town it enters the department of Jura, where it receives the Loue on its left bank, and taking a more southerly course, reaches the department of Saône-et-Loire, in which it joins

the Saône on its left bank at Verdun, after a course of 211 miles, and a descent of 2605 feet. In its upper course the Doubs flows between pine-clad mountains over a limestone bed, in the cavities of which the clear rapid stream sometimes disappears altogether. On approaching the Swiss frontier in the lower part of the canton of Morteau, the river, increased by numerous streams, forms a fine broad sheet of water, pent in at its northern extremity by the mutual approach of wild rocky precipices on each side, which leave a passage only 27 feet in width; through this gorge the river dashes perpendicularly down a space of 87 feet, and forms a magnificent cataract, the snowy foam and thundering roar of which strikingly contrast with the gloom and silence of the frowning rocks and dark forests above. This cataract called *Le Saut-du-Doubs*, or 'the Doubs Leap,' is the finest in this part of France. A great deal of timber is floated down the river. The navigable reaches of its south-western course form part of the canal from the Rhône to the Rhine, which, leaving the Saône near St-Jean-de-Lozne and running along the western valley of the Doubs, joins the Rhine near Mulhausen. The only other river worth notice is the *Oignon*, which rising in Haute-Saône, and flowing due south to near Villers-Sexel, then turns south-west, separating the department of Haute-Saône from those of Doubs and Jura, and enters the Saône just within the department of Côte-d'Or after a course of 68 miles.

The surface of the department contains 1,292,151 acres. About 478,900 are more or less capable of cultivation, 301,000 are under woods and forests, 176,000 are mountain pasture, and 254,000 are irreclaimable heaths and marshes. The whole department is divided into four arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Besançon . . .	8	209	110,826
2. Pontarlier . . .	5	89	52,195
3. Baume . . .	7	189	68,354
4. Montbéliard . .	7	162	65,304
Total . . .	27	649	296,679

1. In the first arrondissement the chief town is *Besançon* [BESANÇON]. *Ornans*, the only other town worth notice, is prettily situated on the Loue, which is crossed by two stone bridges, at a distance of 10 miles S.E. from Besançon, and has a population of about 3000, including the commune. It is a well-built town. The most remarkable structures are the church of St-Laurent and the town-house, in connection with which are the market-hall and prison. On an elevated platform commanded by high hills, and just outside the town, are the ruins of a strong castle, one of the residences of the old dukes of Bourgogne. The town has an ecclesiastical college, a large trade in cheese, and manufactures of paper, leather, and kirschwasser, which is distilled from the cherries abundantly grown in the neighbourhood.

2. In the second arrondissement the chief town is *Pontarlier*, which stands in a valley between the Jura Mountains, at the junction of the Dragoon with the Doubs, 35 miles S.E. from Besançon, in 46° 54' 9" N. lat., 6° 21' 37" E. long., and has 4936 inhabitants. It is well built, with neat houses arranged in wide straight streets; the principal buildings are the cavalry barracks, the college, the market-house, and the town-hall. The town is the seat of a tribunal of first instance, and has a public library, a communal college, large iron-foundries and smelting furnaces, hydraulic saw-mills, a copper-foundry, a brewery, and several tanyards. Besides the products intimated, cheese, cattle, horses, watches, extract of wormwood, paper, and agricultural implements enter into the commerce of the town. *Mont-Benoît*, a small place 9 miles from Pontarlier, deserves mention only on account of the large buildings of the Benedictine abbey from which it takes its name, and which are classed among the historical monuments of France. The abbey existed from the beginning of the 12th century to the first French revolution, when it was suppressed. *Morteau*, a small place of great manufacturing industry, on the left bank of the Upper Doubs; and *Mouthe*, near its source, the inhabitants of which are engaged in felling timber and in rearing cattle and horses, are the only other places worth notice.

3. In the third arrondissement the chief town is *Baume*, or *Baume-les-Dames*, which stands in 47° 22' 9" N. lat., 6° 21' 43" E. long., on the right bank of the Doubs, and on the Canal du-Rhône-au-Rhin, at the extremity of a fine plain inclosed by vine-clad hills. It is a neat little town, and contains a fine church, an hospital, a college, a small public library, and a tribunal of first instance. The population is 2544; who manufacture iron, glass, paper, leather, &c. From the 5th century to 1789 Baume was celebrated for its Benedictine nunnery, the inmates of which had to give proof of noble descent, and were not cloistered. *Clerval*, higher up the Doubs; *Isle-sur-Doubs*, still more to the northward; *Rougemont*, near which there are extensive stalactitic caverns; and *Vercel*, 13 miles E. of Baume, are small places, which give name to some of the other cantons, and have about 1500 inhabitants each.

4. In the fourth arrondissement the chief town *Montbéliard*, or *Montbéliard*, stands in the northern angle of the department, in a valley between the Vosges and the Jura Mountains, 48 miles N.E.

from Besançon, in 47° 30' 36" N. lat., 6° 48' 19" E. long., and has a tribunal of first instance, a college, and 5605 inhabitants, including the commune. It is situated at the confluence of the Alan and the Lusine, about three miles north of the point where their united waters enter the Doubs. The town is well built, and ornamented with several fountains: the most remarkable buildings are—an old castle flanked by strong towers (which now serves for a prison), the church of St-Martin, the town-house, the market-house, and the hospital. Watch and clock movements, hosiery, files, cotton-yarn, leather, scythes, and other agricultural implements are manufactured; there is also a brisk trade in corn, colonial produce, cheese, linen, deals, oak planks and staves, timber, &c. Montbéliard was formerly a place of great strength. It was the capital of a county which, after having formed part of the kingdom of Bourgogne, was included with the latter in the estates of the Emperor Conrad II., but was soon after governed again by its own counts. In 1395 the county came by marriage to the Würtemberg family. The town was taken by a surprise by the French under Marshal de Luxembourg in 1647; Louis XIV. took it in 1674, and demolished the ramparts. The eldest son of the dukes of Würtemberg resided in Montbéliard from 1723 till the outbreak of the first French revolution. French troops occupied the town in 1793, and it was ceded with its territory to France by Würtemberg in 1796. There is an Anabaptist chapel at Montbéliard. *Audincourt*, 3½ miles from Montbéliard, is a small place of about 2000 inhabitants, but it has one of the finest establishments in France for the manufacture of iron, yielding annually 500 tons of pig, 2000 tons of hammered, and 500 tons of sheet iron, besides 20,000 cases of tinned plates. There is a Calvinistic church in Audincourt. The places that give name to the other cantons are mere hamlets.

The department, together with that of Haute-Saône, forms the arch-diocese of Besançon; it is under the jurisdiction of the High Court of Besançon, and belongs to the 7th Military Division, of which Besançon is head-quarters. There is a university academy, an endowed college, and a consistorial church at Besançon.

(*Dictionnaire de la France*; Balbi, *Géographie*; *Annuaire pour l'An 1853*.)

DOUGLAS, the capital of the Isle of Man, a market-town, seaport, and watering-place, is situated on the south-east coast of the island, in 54° 10' N. lat., 4° 27' W. long., distant 75 miles N.W. from Liverpool, and 281 miles N.W. from London. The population of the town of Douglas in 1851 was 9880. The town is chiefly in the parish of Onchan, or Conchan: a small portion is in the parish of Braddan, or Kirk Braddan. The livings of both parishes are vicarages in the archdeaconry and diocese of Sodor and Man.

The name of the town was formerly written Dufglass, which is supposed by some to have been derived from the two rivers Doo and Glass, which run close to the town. The view which is obtained on approaching the bay is extremely interesting and beautiful. The bay is about three miles in extent, reaching from Clayhead to Douglas Promontory, in the form of a crescent, and sheltered from all winds except the south-east. Much improvement has taken place in Douglas of late years, especially since the establishment, in 1830, of regular communication by steam-vessels between Liverpool and the Isle of Man. The steamers ply daily in summer and twice a week during the winter. Steamers also ply occasionally to Fleetwood and Dublin. Douglas has become a favourite residence and watering-place. The new town has a well-arranged square and several handsome terraces, and is being extended northwards. The margin of the bay is studded with numerous fine marine villas. Castle Mona, erected by the Duke of Athol, and formerly one of his seats, but now used as an hotel, is a large and handsome building. The pier, which is 520 feet long, and upwards of 40 feet broad, was built by government at the cost of 25,000*l*.

Among the public buildings may be noticed the court-house on the pier; the custom-house for the island, an extensive building in the market-place; the Wellington market, a commodious erection with a large room for public entertainments; the House of Industry, which affords an asylum for upwards of seventy aged and infirm persons, and is supported by subscriptions and annual collections in the churches; the Odd-Fellows Hall, a large and elegant structure, erected by a body of shareholders for public dinners, balls, concerts, &c.; and a public hospital in Fore-street, with a dispensary attached.

The parish church of Braddan, an ancient structure, was partially rebuilt in 1773. In Keith's 'Catalogue' it is said that "Mark, bishop of Man, held a synod at Kirk Braddan in 1292, when 39 canons were made." There are 4 chapels, the oldest being St. Matthew's; St. George's is pleasantly situated on an eminence at the west end of the town; a third is dedicated to St. Barnabas; the fourth is St. Thomas's, a very handsome edifice recently erected. The Wesleyan Methodists have two chapels, and the Primitive Methodists, Scotch Presbyterians, Independents, Roman Catholics, Baptists, Plymouth Brethren, and Mormonites have each a place of worship. There are National and Infant schools; a Free Grammar school connected with St. Matthew's chapel; a school supported by the Wesleyan Methodists; two savings banks; a mechanics institute with library; and four public libraries.

The manufacture of linen and canvas is carried on to a considerable extent. There are paper, woollen, and rope-works. On the shore are numerous bathing-machines. By an act of the Insular legislature, or

Deemster (which holds its sessions at Castletown), in 1851, the government of the town of Douglas is vested in the hands of nine commissioners, with power to levy rates for sewerage, watching, lighting, &c.

In the neighbourhood of Douglas are remains of a nunnery erected by St. Bridget in the early part of the 6th century. In Braddan churchyard are some very ancient stones, the inscription on one of which is in runic characters, and very perfect; others are of a rude description.

DOUGLAS. [LANARKSHIRE.]

DOULLENS. [SOMMERSET.]

DOUNE. [PERTSHIRE.]

DOUR. [HAINAULT.]

DOURO (in Portuguese), DUERO (in Spanish), are the names of one of the largest rivers of Spain and Portugal. The Duero rises in the province of Castilla la Vieja, about 30 miles W.N.W. from the town of Soria. Its course to Soria is very irregular, along the slopes of a series of bleak ridges which extend north-westwards from the great mountain mass of the Moncayo. From Soria to the village of Almarail, where it receives the Rituerto, it flows southward. Its course is afterwards to the west through the central parts of Castilla la Vieja and Leon, during which it receives the Ucero, the Pisuega, the Rio Seco, the Esia, and other large affluents, besides numerous smaller ones. Soon after receiving the Esia it turns to the south, and flows in that direction about sixty miles, forming the boundary between Spain and Portugal, till it meets the Aguada. In this part of its course it receives the Tormes and other tributaries. After its junction with the Aguada it enters Portugal, takes the name of the Douro, and flowing across the country in a western direction enters the sea below Oporto. During its course through Portugal it receives the Sabor, the Tua, the Corga, the Tamega, and other rivers, on the north bank; and the Coa, the Tavora, and Pavia, on the south bank. It divides the province of Beira on the south from the provinces of Tras os Montes and Entre Douro e Minho on the north. The entire length of the river is about 500 miles. The bridges which cross it amount to about 20, of which about 16 are of stone.

The navigation of the Douro extends from Oporto to São João de Pesqueira, a little below the mouth of the Sabor. During heavy rains, or when the snow is melting on the mountains, and especially when the rains and melting snow act in combination, the river becomes very deep, and the current extremely rapid. It sometimes rises to such a height as to inundate the whole of the lower part of Oporto, rushing over the bar at the mouth of the harbour with a roaring noise, and occasionally forcing the vessels out to sea, no cable and anchor being then strong enough to hold them. The vessels however are usually secured by a strong boom, one end of which is made fast on board and the other end on the shore. The navigation of the river is generally difficult, and when full is very dangerous, not only from the rapidity of the current, but from the masses of broken rocks which in some places obstruct the bed of the river. The wine-boats which navigate the Douro are flat-bottomed; the largest will contain about 70 pipes, the smallest about 30 pipes. By these boats the whole of the wine of the Upper Douro is conveyed to Oporto, where it is stored for exportation, chiefly to England.

DOVEDALE. [DERBYSHIRE.]

DOVER, Kent, one of the Cinque Ports, a borough, sea-port, and market-town, and the seat of a Poor-Law Union, is situated in 51° 6' N. lat., 1° 18' E. long.; distant 16 miles S.E. by S. from Canterbury, 71 miles E.S.E. from London by road, and 88 miles by the South-Eastern railway. The population of the borough in 1851 was 22,244. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor, and returns two members to the Imperial Parliament. The livings are in the archdeaconry and diocese of Canterbury. Dover Poor-Law Union contains 23 parishes and townships, with an area of 27,068 acres, and a population in 1851 of 27,044.

Dover is situated on the coast, at the opening of a deep valley formed by a depression in the chalk hills, which here present a transverse section to the sea. This depression, which runs into the interior for several miles, forms the basin of a small stream called the Dour. The site of Dover being the nearest point of communication with the continent, it was at an early period of British history an important place. At or near this point Julius Cæsar made his first attempt to land on the British shores, when the height of the cliffs, and the warlike appearance of the natives collected upon them, warned him to seek a more accessible landing-place. In the time of Edward the Confessor Dover was made one of the five ports appointed to be maintained for the special defence of the coast, and called from their number 'The Cinque Ports.' William the Conqueror met with opposition at Dover, which he remembered and revenged; but he did not on that account overlook the importance of the station, or neglect to strengthen the defences and restore the town. Subsequent sovereigns and governments have paid due attention to the fortifications at Dover, which from its position was at an early date regarded as 'the key of the kingdom.' In Dover King John submitted to the pope, and surrendered his kingdom to the papal nuncio. In 1295 a French fleet attacked and plundered the town; the inhabitants however

procuring aid from the surrounding country returned with a large force and drove the Frenchmen to their ships with considerable loss. A few years subsequently to this affair the French again attacked and burnt the town. The castle has been frequently besieged: on one occasion Hubert de Burgh, appointed constable of Dover Castle by King John, gallantly maintained his position here against the determined attacks of Louis, the dauphin of France, who after returning a third time to the siege was compelled to abandon the attempt, on which he had spent several months. De Burgh then collecting the navy of the Cinque Ports, of which he was warden, attacked with 40 vessels a French fleet of more than double his force, and took or destroyed all but about 15 vessels. This event put an end to the hopes of the dauphin, who soon after retired from Britain.

In the war between the crown and the Parliament Dover Castle, which was in the hands of the Royalists, was suddenly seized for the opposite party by a few determined men of Dover, headed by a merchant of the town, who in the silence and darkness of midnight scaled the walls, and overcoming the surprised sentinels opened the gates to a party of their adherents, before whom the garrison, unaware of the smallness of the assailing force, precipitately fled. In 1745, when a visit from the Pretender was looked for, the military works were considerably extended. Half a century later, when Bonaparte threatened an invasion of England, the military works of Dover Castle were after careful survey remodelled and enlarged, and considerable additions made to the fortifications. The solid rock was excavated for the construction of barracks, and accommodation was provided for a garrison of from 3000 to 4000 men. On the other side of the town the Heights were also fortified; and on the hill above the town barracks were erected. A passage to these barracks was constructed in a perpendicular shaft with three flights of stairs, each of 140 steps. From the hill at the top of this Grand Shaft, as it is called, an excellent view of the town and the channel is obtained. Extensive batteries of great strength are erected here, which are not however mounted with cannon. Indeed as they have happily not been required the works have never been fully completed.

The town of Dover is not in itself very attractive. The principal street is about a mile in length, running in the direction of the valley. Many showy houses for sea-bathing and other visitors have been built of late years; there are also some handsome shops and substantial public offices. The station of the South-Eastern railway is a building of some importance; and there is an hotel on a very large scale. Of seven churches once possessed by the town only two remain. St. Mary's church has a Norman tower. The edifice was restored some years back. St. James's church has also some Norman features. Two churches have been erected within the last few years. Christchurch, in the parish of Hougham, is within the town of Dover. The Baptists, Independents, Quakers, Methodists, and Roman Catholics have places of worship here. There are National and Free schools, a dispensary and an hospital in conjunction with it, a proprietary library, and a savings bank. A county court is held in the town. Wednesday and Saturday are the market-days: fairs are held in November. Some paper-mills and corn-mills are in the neighbourhood.

Dover is the principal station and the seat of government of the Cinque Ports; the other cinque port towns being Hastings, Sandwich, Hythe, and Romney. Various changes have taken place in the circumstances, and even, from the continued contest between sea and shore, in the physical features of some of these ports. Other towns and ports have been added to the original confederation under the title of members. The chief object for which the Cinque Ports were constituted into a distinct jurisdiction and endowed with peculiar privileges has been for two centuries superseded by the establishment of the naval force of this country; and most of the ancient privileges of the ports have been abrogated by the operation of the Municipal Corporations Reform Act. Still Dover from its position in relation to the Continent must always be regarded as an important point on the British shores. The warden of the Cinque Ports is constable of the castle of Dover.

The shipping trade of Dover is not very extensive, the harbour being constantly liable to be filled up by the influx of sand and shingle. Ship-building, sail-making, rope-making, and other trades dependent on the shipping are carried on to some extent. The vessels registered as belonging to the port on 31st December 1852 were:—Under 50 tons 51, tonnage 1421; above 50 tons 22, tonnage 2498; and 2 steam vessels, tonnage 106.

The vessels entered and cleared at the port of Dover during 1852 were as follows:—Coasting trade, inwards 407, tonnage 33,088; outwards 129, tonnage 6704; colonial trade, inwards 10, tonnage 1141; foreign trade, inwards 78, tonnage 6898; outwards 59, tonnage 3410; steam vessels, inwards 16, tonnage 2082. As Dover is the principal pilot station of the Cinque Ports, there are 56 pilots stationed here for the Channel service.

Many endeavours have been made at various periods and at enormous cost to improve Dover Harbour; but these efforts have been to a great extent rendered ineffective in consequence of the continual accumulation of sand and shingle. The authorities however continue to use means to keep the harbour as clear as possible, and to maintain the depth of water requisite for the packet service.

Dover Harbour has peculiar importance also from the operations

carried on with the view of making it a harbour of refuge. The Report of the Government Commissioners appointed in 1844 to investigate the subject recommended the construction of works so extensive as to involve an outlay of two and a half millions of money. The commissioners recommended that in the first place a pier should be run out from Cheesman's Head into 7 fathoms water. This portion of the work is being carried forward; its progress however depends much upon the state of the wind and weather.

(Hasted, *Kent*; Batchelor, *Guide to Dover*; *Land We Live In*, vol. ii.; *Parliamentary Papers*; *Communication from Dover*.)

DOVERFIELD. [NORWAY.]

DOWLETABAD, a strongly fortified town in the province of Aurungabad, 7 miles W.N.W. from the city of Aurungabad, in $19^{\circ} 57' N.$ lat., and $75^{\circ} 15' E.$ long. The fort consists of an enormous insulated mass of granite, standing a mile and a half from any hill, and rising to the height of 500 feet. The rock is surrounded by a deep ditch, across which there is but one passage, which will allow no more than two persons to go abreast. The passage into the fort is cut out of the solid rock, and can be entered by only one person at a time in a stooping posture. The place is altogether so strong, that a very small number of persons within the fort might bid defiance to a numerous army. On the other hand, the fort might be invested by a very inconsiderable force, so as to prevent supplies being received by the garrison, who, owing to the intricacy of the outlet, could never make an effective sally. The lower part of the rock, to the height of 180 feet from the ditch, is nearly perpendicular, and impracticable to ascend. The rock is well provided with water.

Dowletabad is now included in the territory of the Nizam of Hyderabad. Since the seat of government has been transferred to AURUNGABAD the town of Dowletabad has greatly decayed; only a small portion of it is now inhabited.

DOWN, a maritime county of the province of Ulster in Ireland; lies between $54^{\circ} 1'$ and $54^{\circ} 41' N.$ lat., $5^{\circ} 30'$ and $6^{\circ} 24' W.$ long.; is bounded N. by an angle of Lough Neagh, the county of Antrim, and the Bay of Belfast; E. and S. by the Irish Channel; and W. by the counties of Louth and Armagh, from which it is partly separated by the Bay of Carlingford and the River Newry. The greatest length from Cranfield Point on the south-west to Orlock Point on the north-east is 51 English miles; the greatest breadth from Moyallan on the west to the coast near Ballywater on the east is 38 miles. The coast line (including Lough Strangford) from Belfast to Newry, exclusive of small irregularities, is about 125 English miles. The area according to the Ordnance Survey of Ireland, consists of 608,415 acres land, and 3502 acres water, being 611,917 acres in all, statute measure, or 956 square statute miles nearly. The population in 1851 was 328,883.

Surface, Hydrography, Communications.—Down forms the south-eastern extremity of Ulster. The surface of nearly all the county is undulating; but the only uncultivated district is that occupied by the Mourne Mountains and the detached group of Slieve Croob. The mountainous district of Mourne is bounded E. by the Bay of Dundrum and W. by the Bay of Carlingford, and covers an area of nearly 90 square miles. In this range are numerous mountain elevations, reaching in the case of Slieve Donard to 2796 feet. This mountain group contains much picturesque scenery, and is adorned with several fine mansions and extensive plantations. The Slieve Croob range covers an area of about 10 square miles to the north-east of the Mourne Group. Slieve Croob, the highest elevation of the range, has an altitude of 1755 feet; on its north-eastern declivity the river Lagan rises at an elevation of about 1250 feet above the level of the sea.

The remainder of the county, about 850 square miles, is productive, being either under cultivation or serving the purposes of turbarry. A low chain of cultivated eminences, well timbered, and on the northern and western side covered with the demesnes and improvements of a resident gentry, commences east of Dromore, and extends under various names along the valley of the Lagan and the eastern shore of Belfast Lough, as far as Bangor. This range separates the basin of the Lagan from that of Lough Strangford.

The eastern shore of Belfast Lough has no anchorage for vessels above the third class. There is a small quay for fishing and pleasure-boats at Cultra, a mile below the bathing village of Holywood, where regattas are held. Out of Belfast Lough the first harbour on the coast of Ards is at Bangor. East of Bangor is the little harbour of Groomsport or Gregory's Port, where Duke Schomberg landed in 1690. South-east of Groomsport is Donaghadee, the only place of security for a large vessel from Belfast Lough south to the harbour of Strangford. [DONAGHADEE.] North of Donaghadee lie three islands, called the Copelands; from a family of that name which formerly held the opposite coast. On one of these, called the Cross or Lighthouse Island, there is a lighthouse, which marks the entrance to Belfast Lough from the south. This building which was erected about 1715, is a square tower, 70 feet high to the lantern; the walls are 7 feet thick. The sound between Big Island, which lies nearest the land, and the shore of Down, is about a mile and a quarter in breadth.

From Donaghadee south the coast is low, rocky, and dangerous. The rock of Sculmartin, covered at half-flood, and the North and South Rocks, the former never covered, the latter at every half tide, lie farthest off shore, and are most in the way of vessels coming up

channel. The lighthouse erected on South Rock in 1797, has proved highly serviceable to all traders in the channel. At Ballywalter, Ballyhalbert, Cloghy, and Newcastle, in Quintin Bay, all situated on the eastern shore of Ards, are fishing stations; but there is no shelter in any of them for vessels of more than 30 tons.

South from Newcastle is Tara Bay, much frequented by fishing-vessels, and capable of great improvement. The peninsula of Ards runs out at Ballyquintin to a low rocky point south of Tara Bay. A dangerous rock called the Bar Pladdy, having 11 feet water at spring ebbs, lies immediately off Quintin Point. The entrance to Strangford Lough lies west of the Bar Pladdy, between it and Killard Point, on the opposite side. Within the entrance the Lough expands into a very extensive sheet of water, extending northwards to Newtownards, and nearly insulating the district between it and the sea. The tide of so large a sheet of water making its way to and from the sea, causes a great current in the narrow connecting strait at every ebb and flow, and renders the navigation at such times very difficult. Across this strait is a ferry, which gives name to the town of Portaferry at the eastern or Ards side of the entrance. The town of Strangford, which lies opposite, is supposed to derive its name from the strength of the tide-race between. The true channel, at the narrowest part of the strait, is little more than a quarter of a mile across, being contracted by rocks, one of which, called the Ranting Wheel, causes a whirlpool dangerous to small craft. There is another but less dangerous eddy of the same kind at the opposite side. Within the entrance there are several good anchorages, and landing-quays at Strangford, Portaferry, Killileagh, the quay of Downpatrick, and Kirkcubbin. Strangford Lough contains a great number of islands, many of which are pasturable, and great numbers of rabbits are bred on them. From Killard Point the coast bears south-west, and is rocky and foul as far as Ardglass, where there is a pretty good harbour for small vessels. Immediately west of Ardglass lies the harbour of Killough, between Ringford Point on the east and St. John's Point on the west. A natural breakwater extends between these points, and gives a pretty secure anchorage for large vessels within. There is an inner harbour for small craft, dry at ebb, with a quay, built about the beginning of the last century.

West of St. John's Point opens the great Bay of Dundrum, which extends from this point on the east to the coast of Mourne on the west, a distance of about four leagues by a league in depth, running north by west. The pier and harbour of Newcastle on the south-western side of the bay are highly serviceable to the fishing-boats of the coast, and have been the means of saving several vessels within the last few years.

From Newcastle south to Cranfield Point the coast of Mourne possesses only three small boat harbours, the principal of which is at Derryogue, where there is a fishing station. On this part of the coast, near Kilkeel, is a lighthouse 120 feet high. Between Cranfield Point on the east, and the extremity of the barony of Dundalk, in the county of Louth, on the west, is the entrance to the extensive harbour of Carlingford. This Lough is about 8 miles long by a mile and a half broad, and has steep mountains to the east and west along each side. From Narrow Water, where it contracts to the width of a river, the tide flows up to Newry; whence there is a canal communication with the Upper Bann River, which flows into Lough Neagh. There are numerous rocks and shoals at the entrance, and a bar all across, on which there are but 8 feet of water at ebb tides. The middle part of the lough is deep, but exposed to heavy squalls from the mountains. There are two great beds of oysters in this lough, one off Rosstrevor Quay, $2\frac{1}{2}$ miles long by half a mile broad; the other off Killowen Point, one mile long by half a mile broad. Warren's Point has a good quay, from which steamers sail regularly for Liverpool; most of the exports of Newry are shipped here from the small craft that bring them down the canal. The scenery on both sides of Carlingford Lough is of striking beauty.

Hydrography, Communications, &c.—With the exception of the Upper Bann, all the rivers of Down discharge their water into the Irish Channel. The navigable river Lagan, which, for about half of its course, has a direction nearly parallel to the Bann, turns eastward at Magheralin, 4 miles north-east of which it becomes the county boundary, and passing by Lisburn falls into the Bay of Belfast after a course of about 30 miles. The Ballynahinch or Annacloy river brings down the waters of several small lakes south-east of Hillsborough, and widens into the Quoile river, which is navigable for vessels of 200 tons one mile below Downpatrick, where it forms an extensive arm of Strangford Lough. The Quoile is covered with numerous islands, and its windings present much beautiful scenery. The Newry river rises near Rathfriland, and flowing westward by the northern declivities of the Mourne range, turns south a little above Newry, and after a short course falls into the head of Carlingford Lough. Numerous streams descend from the district of Mourne immediately to the sea, and there is no part of the county deficient in a good supply of running water.

The Lagan navigation, which was commenced in 1755, and connects Lough Neagh with Belfast Lough, gives a line of water communication to the entire northern boundary of the county; and the Newry Canal, connecting the navigable river Bann with the Bay of Carlingford, affords a like facility to the western district, so that, with the

exception of about 10 miles between the Bann and the termination of the Lagan navigation, the entire county boundary is formed either by the coast line or by lines of water carriage. The summit level of the Lagan navigation towards Lough Neagh is 112 feet above the level of the sea.

The Newry Canal admits vessels of 80 tons through the heart of Ulster. This canal, which was commenced in 1780, and opened in 1741, lies partly in the county of Down and partly in Armagh; it extends from its junction with the Bann River near Gilford, to Fathom, on the Bay of Carlingford, about 14 Irish or 17½ English miles, having its summit level 77 feet above the sea. The average breadth of the canal at top is 40 feet: the locks are 15 in number, and 22 feet in the clear. Its management is now under the control of the Board of Works.

Down is well supplied with roads. The great northern road from Belfast to Dublin passes through the county from north to south, by Hillsborough, Dromore, Banbridge, Loughbrickland, and Newry: this is the only turnpike-road in Down. The other chief lines are from Belfast to Donaghadee by Newtownards; from Belfast to Downpatrick by Ballynahinch; and from Downpatrick to Newry by Castlewellan and Rathfriland. The Ulster railway, from Belfast to Armagh, passes through parts of the parishes of Moira and Shankill in this county. A railway has been constructed from Belfast to Holywood, a bathing-place much resorted to by the citizens of Belfast in summer. Another line, which is to extend to Donaghadee, has been completed as far as Newtownards; another branch is projected to Downpatrick: these lines form part of the Belfast and County Down railway.

Geology, Mineralogy, &c.—The chief geological features of the county are strongly marked. The Mourne and Slieve Croob groups consist of granite. The boundary of this primitive district begins from the east at Dundrum, whence passing northward to Slieve Croob, it runs nearly due west, including the lordship of Newry, and passes into the adjoining counties of Armagh and Louth. Northward and eastward of the granite district the whole of the remainder of the county is occupied by an extension of the transition series which forms the southern basin of Lough Neagh. Clay-slate in greater or less degrees of induration is the prevalent rock. Towards the sea on the north-east and east, slate quarries are common. On the Antrim boundary near Moira, an extension of the tertiary limestone or chalk formation, which occurs throughout the basaltic district, occupies a small portion of this county, and affords a valuable supply of lime manure. Limestone boulders are found along the eastern shore of the Bay of Belfast; and at Carthespil, near Comber, on the western side of Strangford Lough, there is a quarry of reddish granular limestone. Great quantities of marl are raised in the neighbourhood of Downpatrick.

Copper ore has been found in the mountains about 5 miles north-east of Rosstrevor; also near Portaferry, and at Clonliff, between Newtownards and Bangor, and in 1853 in the neighbourhood of Dundrum. At Bangor is a lead-mine which has been worked with moderate success at various times. Lead ore occurs on the estate of Ballyleady, in the same neighbourhood, and on that of Bryansford, near Newcastle; also at Killough, and near Portaferry.

Chalybeate spas occur at Newry, Dromore, Magheralin, near Donaghadee, and Rathfriland, and at various places in the barony of Ards. A chalybeate spring strongly impregnated with sulphur and nitre rises about 2 miles north-west of Ballynahinch, on the declivity of Slieve Croob mountain, which has been found very efficacious in scorbutic cases: the village of Ballynahinch has in consequence become a rather fashionable resort during the summer months.

Climate, Soil, Agriculture.—The vicinity of the sea prevents the continuance of frosts on the east and south; and the insulated position of the mountainous tract confines the heavier mists and rains to that part of the county where their effects are least felt. The general inequality of the ground carries off surface waters and prevents damps, so that the climate, although somewhat cold, is considered healthy. The prevailing winds in spring are from the east: westerly winds, although more frequent than from any other point, have not so great a prevalence as in the neighbouring counties. Larch timber thrives on very exposed situations on the Mourne mountains.

The prevalent soil in the low district is a stony loam formed by the decomposition of the schistose rock. Clayey soils are confined to the north-east of the county and the barony of Ards, and are of a strong and productive quality, but they are wet and require a large quantity of manure. The richest soil in the county is in the district of Lecale, and a small tract of loam incumbent on limestone gravel in the neighbourhood of Moira and Magheralin: the timber here is of larger growth than elsewhere in Down. Alluvial tracts are frequent, and yield luxuriant crops of grass without manure. Considerable quantities of wheat are raised throughout the county, but chiefly along the shores of Strangford Lough; oats and barley are the chief produce of the south and centre of the county. Fences on the Antrim boundary and along the line of the Dublin road are of quickthorn; clay banks and dry stone walls are most frequent in the other parts of the county.

Large quantities of sea-weed are used as manure along the north-east and eastern coast. The distance of limestone quarries renders lime manure very expensive throughout the central baronies; but in

the south and south-east there is an abundant supply of marl in the barony of Lecale. This valuable substance is found in meadows and alluvial tracts at the bottoms of hills, and consists entirely of marine exuviae: the bed of marl is sometimes 5 feet in thickness.

Down is not a grazing county, nor are there sheep farms; but great numbers of pigs are reared for the provision markets of Newry and Belfast. The general condition of the people is much superior to that of the peasantry of the southern counties. The resident nobility and gentry are more numerous in proportion to the extent of the county than in any other part of Ulster. The yeomanry of the county are an intelligent class.

Down contains nine baronies, and part of the lordship of Newry; the remainder of this division lying in Armagh. The baronies are—Ards, on the east and north-east, between Lough Strangford and the sea: Castlereagh, Lower and Upper, on the north-east and north, between Lough Strangford and the county of Antrim: Dufferin, on the western shore of Lough Strangford: Iveagh, Lower, on the north and north-west towards Antrim and Lough Neagh: Iveagh, Upper, on the west and midland: Kinsalearty, midland, between Upper Iveagh and Dufferin: Lecale, on the south-east, between Strangford Lough and Dundrum Bay: Mourne, lying between Dundrum Bay and Carlingford Lough; and part of the lordship of Newry. BANBRIDGE: DONAGHADEE; DOWNPATRICK, the county town; DROMORE, the seat of a bishop; KILKEL; NEWTOWNARDS, and the Downshire part of the town of NEWRY, are noticed in separate articles. Ballymacarrett is noticed under BELFAST, of which it is a suburb. Other places which require to be mentioned we notice here.

Ardglass, a decayed town, and small sea-port, at the head of the Bay of Ardglass, is distant 7 miles S.E. by S. from Downpatrick; population 974 in 1851. In the time of Henry VI. Ardglass was a royal borough, governed by a portreeve; it was also at that time represented in the Irish Parliament, and had a considerable trade. After the rebellion of 1641, and the subsequent rise of Belfast as an important sea-port, Ardglass sunk into insignificance. Latterly it has somewhat improved; the harbour is frequented by numerous fishing boats, and small coasting vessels; and visitors resort here in considerable numbers during the season for bathing. The harbour and bay afford good shelter.

Ballynahinch, a small town near the centre of the county, 7 miles N.W. by W. from Downpatrick; population 1006 in 1851, is situated in a vale between ranges of rocky hills. Of late years more easy communication has been obtained with neighbouring towns by means of new roads. Fairs are held in Ballynahinch on the third Thursday in each month. Near the town is Montalto House, once the principal residence of the Hastings family.

Bangor, a sea-port, market-town, and borough, is situated on the shore of Bangor bay, on the south side of the entrance to Belfast Lough; distant 18 miles N. from Downpatrick; population 2850 in 1851. Bangor is rather irregularly built, but has on the whole an agreeable appearance. Besides the parish church, there are two Presbyterian meeting houses and a Methodist chapel. Efforts have been made during several years past to improve the harbour. A dock has been constructed; a small harbour suitable for boats has also been made, and a pier run out from the south-east shore obliquely across the bay. There is a good deal of intercourse by vessels between Bangor and Portpatrick on the west coast of Scotland. The linen and cotton manufactures employ many of the inhabitants of the town and neighbourhood. Cattle and provisions are exported. An abbey existed here at a very early period; a portion of the ruins is still in existence. Fairs are held at Bangor on January 12th, May 1st, August 1st, and November 22nd.

Castlewellan is a market-town situated on the road from Newry to Downpatrick, between the Mourne mountains and the Slieve Croob range, 7 miles S.W. from Downpatrick; population 849 in 1851. Castlewellan is a neat town, pleasantly situated; it possesses some good buildings, including the market-house, sessions-house, and chapels for Roman Catholics and Presbyterians. The market is held weekly, the business transacted being chiefly in linen yarn and farm produce. Two bleaching establishments are in the neighbourhood. Ten fairs are held in the course of the year. In the neighbourhood is Castlewellan, the seat of the Earl of Annesley, the grounds of which are finely wooded and picturesque.

Comber, or *Cumber*, is a small market-town at the north-western extremity of Lough Strangford, 7 miles S.E. from Belfast; population 1790 in 1851. The inhabitants are chiefly employed in the linen manufacture. The ruins of a castle, called Mount Alexander, exist on a site which was formerly occupied by a Cistercian abbey. Besides the parish church, there are chapels for Presbyterians and Wesleyan Methodists. At low water the beach presents a spacious expanse of sand some thousands of acres in extent. Fairs are held at Comber on the first Thursday of January, O.S., on April 5th, June 28th, and October 19th. There is here a station of the Belfast and Newtownards railway.

Gilford, population 2814, a small market-town pleasantly situated on the right bank of the river Bann, about 4 miles N.W. from Banbridge. Flax spinning, linen weaving, and bleaching are carried on. Fairs are held on June 21st and November 21st. Gilford Castle, the seat of Sir William Johnstone, Bart., stands near the town.

Grey-Abbey, population 858 in 1851, is situated on the east shore of

Lough Strangford, about 6 miles S. by W. from Donaghadee. Besides the church, there are chapels for Presbyterians and Roman Catholics. The abbey from which the place received its name was founded here in 1192 by the lady of John de Courcy: some interesting and well preserved remains of the buildings still exist. Four fairs are held in the course of the year.

Hillsborough, population 1800 in 1851, a market-town and formerly a parliamentary borough, 64 miles N.N.E. from Dublin; is pleasantly situated on the side of a hill commanding an extensive view. The parish church is a handsome edifice with three towers. There are chapels belonging to the Roman Catholics, Presbyterians, Quakers, and Moravians. The mansion of the Marquis of Downshire is situated on the west side of the town, and on the east are the ruins of a castle erected by Sir A. Hill in the reign of Charles I.; it is now a royal fort. The linen trade is carried on to some extent. There are a market-house, a district bridewell, and two hospitals.

Holywood, a small sea-port town, in the parish of the same name, 78 miles N.E. by N. from Dublin; the population in 1851 was 1408. The church, which is ancient, is believed to have been the chapel of a Franciscan priory once established here. The Presbyterians have a large modern gothic chapel. A few of the inhabitants are engaged in fishing, but the greater number are agriculturists or weavers. Fairs are held four times a year. During the summer months Holywood is resorted to for sea-bathing. The town is connected by railway with Belfast.

Killileagh, 72 miles N.N.E. from Dublin; population 1086, a small market- and sea-port town, was formerly a parliamentary borough. A castle was built here by De Courcy about the year 1180, which was demolished in 1648 by General Monk. It was shortly afterwards rebuilt. The church is cruciform and is a handsome building; the other principal buildings are a Presbyterian meeting-house, a market, and a barrack. The cotton manufacture is carried on, and the imports and exports of iron, timber, corn, and provisions form a considerable trade. A market is held on Monday; fairs are held four times in the year.

Killough, a small sea-port town 75 miles N.E. from Dublin; population 951. Fishing is very extensively carried on: there is some export trade in corn: also a large salt work. In the neighbourhood are several curious caves.

Moirá, a small town on the road from Belfast to Armagh, 66 miles N. by E. from Dublin; population, 689. The town consists principally of one long well-built street, and contains a church and several meeting-houses. The linen manufacture is carried on.

Rathfriland, a market-town about half way between Newry and Castlewells, 27 miles S.S.W. from Belfast, population 2053 in 1851, is pleasantly situated on a rocky elevation above the point where several roads meet. The remains of a castle, formerly of considerable strength, occupy the summit of the rock on which the town is built. The town possesses a market-house, two Presbyterian meeting-houses, and a Roman Catholic chapel; also a dispensary for the Newry Poor-Law Union. The linen manufacture is the chief occupation of the inhabitants. Seven fairs are held in the course of the year.

Rosstrevor, population 764, a sea-port town and watering-place, is finely situated on a gentle slope at the base of the Mourne Mountains, about 7 miles S.E. by S. from Newry. The vicinity is adorned with numerous good mansions, and the surrounding scenery is very beautiful. The town has been much improved of late years. Near the town is a handsome obelisk, erected to the memory of the late General Ross. There are seven fairs held in the course of the year.

Strangford, population 620, a market-town and sea-port on the west shore of the entrance of Lough Strangford, about 6 miles N.E. by E. from Downpatrick. In the neighbourhood are four of the castles built by John de Courcy on the shores of Lough Strangford. There are here a chapel of ease, a chapel for Wesleyan Methodists, and a custom-house. There is a small quay. A considerable trade is carried on. Fairs are held on August 12th and November 8th.

Warrenspoint, a small market-town and sea-port on the left bank of Newry River, at its junction with Carlingford Lough, 5 miles S.E. by S. from Newry: population, 1769 in 1851. The town is agreeably situated, and consists chiefly of a square and several streets which diverge from the square. Besides the parish church there are chapels for Wesleyan Methodists, Presbyterians, and Roman Catholics. There are here a dispensary and a savings bank. Considerable quantities of agricultural produce are exported. Flax is imported. The fishery employs some of the seafaring population. Warrenspoint is the port of Newry for large vessels; and the place is in repute for sea-bathing. Fairs are held on the last Friday of every month.

Down returns four members to the Imperial Parliament, namely, two for the county, one for the borough of Newry, and one for the borough of Downpatrick. Besides these boroughs, Newtownards, Bangor, Killileagh, and Hillsborough returned members to the Irish Parliament, and are still corporate towns. The lordship of Newry, the greater part of which lies within this county, is an exempt jurisdiction both ecclesiastical and civil.

The linen manufacture is the staple trade of Down, and gives employment to a greater number of operatives, in proportion to the population, than in any other part of Ireland. The linen manufacture has been long carried on in Ireland, but its first great impulse was in

the edict of Nantes, who, by introducing the improved machinery of the continent, and setting an example of more business-like habits, raised the manufacture to a high degree of perfection and importance. In the 4th of Queen Anne the export duty on Irish linens was taken off, and from that time the trade has continued to flourish.

The importation of flax-seed employs a considerable capital in Belfast and Newry. The dressing of the grown crop gives employment to numerous scutchers and hacklers throughout the county; but the introduction of linen-spinning machinery has materially lessened the demand for hand-labour in converting the dressed flax into thread. Weaving is mostly carried on in the houses of small farmers, and there are few weavers who do not give part of their time to agriculture; hence they are generally a healthy and long-lived class of men. When the webs are ready for the bleacher, they are carried to market.

The next process, and that which employs nearly an equal number of hands, is the bleaching and preparing for market the green web as purchased from the weaver. The chief manufacturing district of this county, as of Ireland at large, is along the valley of the Upper Bann. The waters of this river are peculiarly efficacious in bleaching; and its rapid descent affords numerous sites for the machinery employed. From Tanderagie in Armagh to five miles above Banbridge in Down, the banks of this river present an almost continuous succession of bleaching-grounds. On that part of the river which flows through Down there are 18 of these establishments, each covering a large tract of ground, and giving employment to a numerous rural population. Besides these establishments, there are upon the Bann extensive flour-mills, and two or three factories. The neighbourhood of Gilford and Moyallan, about half way between Banbridge and Tanderagie, is celebrated for its rural beauty. Orchards are attached to all the better class of cottages, and the vicinity of so many bleaching-grounds gives the effect of a continuous tract of rich park scenery to each bank of the river. The proprietors of the majority of these establishments are Dissenters and members of the Society of Friends, and the population generally is Protestant. The cotton and muslin manufacture employs many persons. The exports and imports of Down are made almost entirely through the ports of Belfast and Newry. About 80,000 firkins of butter are exported yearly from Down, and this as well as all other exports is increasing.

The fishery on the coast from Bangor to Carlingford Bay is pursued with a good deal of industry, but without sufficient capital or skill. The herring-fishery commences in July, and is pursued throughout the autumn and beginning of winter. The principal fishing-ground lies off Lecale, at a distance of a quarter of a mile to two leagues from shore, in 3 to 17 fathoms water, and extends with little interruption from Newcastle on the south to the entrance to Strangford Lough upon the north. The fish taken are herrings, mackerel, haddock, cod, ling, gurnet, plaice, and turbot. Besides this there are several other fishing-grounds off the coasts of Mourne and Ards.

The county assizes are held twice a year at Downpatrick. Quarter sessions are held by the assistant-barrister twice a year at Downpatrick, Hillsborough, Newry, and Newtownards. The constabulary force stationed in Down in the year 1852 consisted of 255 men, including officers.

Before and for some time after the coming of the English, Down was known as Ulladh or Ulidia, the original of the name of Ulster. The ancient inhabitants are supposed to have been the Voluntii of Ptolemaeus. The north-eastern portion of Down was at an early period occupied by the Picts, of whom there was a considerable colony so late as the 6th and 7th centuries, extending from Strangford Lough to the Lower Bann in Antrim. The territory occupied by the Picts was called Dalaradia, and extended from the Ravil river in Antrim over the southern part of that county and the north and north-east of Down.

The presence of St. Patrick in this county in the 6th century is attested by authentic records, and can be traced with topographical exactness at the present day. Downpatrick, Saul, Dromore, Moville, and Bangor are the chief ecclesiastical foundations of Patrick and his immediate successors. Of these the last was the most famous, having a college which for many years rivalled the schools of Armagh and Lismore.

Down was overrun by the English under John de Courcy in 1177. The county was originally divided into two shires, Down and Newton, or the Ards, to which sheriffs were regularly appointed until 1333, when the revolt of the Irish on the murder of William de Burgho overturned the English authority throughout Ulster. The attainder of Shane O'Neill, who was slain in rebellion in 1567, threw all Iveagh, Kinelarty, Castlereagh, and Lower Ards into the hands of the Crown. In 1602 O'Neill of Castlereagh being seized on some slight pretext, and imprisoned in Carrickfergus Castle, contrived to make his escape by the assistance of one Montgomery, the brother of a Scotch knight of some fortune, who afforded the fugitive protection on his arrival in Scotland, and afterwards negotiated his pardon on the terms of having the greater part of O'Neill's estate made over to himself and Mr. Hamilton, his associate in the proceeding. The colony led over by Sir Hugh Montgomery settled chiefly about Newtownards and Grey Abbey, along the north-eastern coast between

ugh and the sea, and by their enterprise and industry, part of the county in a very flourishing condition. The general plantation of Ulster soon after gave security to their improvements. The family of Hamilton settled at Bangor and Killileagh. That of Hill, which about the same time acquired large estates in the north of the county, settled in the neighbourhood of Belfast, and soon after their arrival laid the commencement of a town at Hillsborough, the residence of their present representative, the Marquis of Downshire. At present the fee of the county is almost entirely in the hands of Protestant proprietors of English and Scotch descent.

Of the Pagan antiquities of Down, the most remarkable is a stone cromlech, inclosed by a circular ditch of extraordinary dimensions, called the Giant's Ring, near Shaw's Bridge, half way between Lisburn and Belfast. The inclosure is nearly half an English mile in circumference; and the rampart is still from 12 to 14 feet in height. There are stone monuments of the same character at Sliderry Ford, near Dundrum, and Legarane in the parish of Drumgoolan. There is a remarkable cairn, or sepulchral pile of stones on the top of Slieve Croob. The main pile is 77 yards in circumference at bottom, 45 yards at top, and 54 feet high at its greatest elevation; there are 22 smaller cairns raised on the top. A great earthen rampart which runs along the Armagh boundary of Down, is called by the people of the county the Dane's Cast, and sometimes Tyrone's ditches. There are numerous raths, or earthen entrenched mounds throughout Down, of which the most remarkable are at Downpatrick, Donaghadee, and Dromore. Of the Anglo-Norman military antiquities of Down, the castle of Dundrum is the most important. Green Castle in Mourne was a place of great importance in the early history of Ulster. The castle of Newcastle was built by Felix Magennis in 1588, and is still inhabited. The Magennises had castles also at Castlowellan and Rathfriland. There are extensive military remains at Ardglass, and the castles of Killileagh, Ardquin, Portaferry, Bangor, and Hillsborough are the most important of those still standing. There are also some remains of the fortifications erected by General Monk for the defence of Scarvagh, Poyntz, and Tuscan passes into Armagh.

The chief ecclesiastical remains in Down are at Downpatrick, where are the ruins of the cathedral, and of three other religious houses. The cathedral was 100 feet in length; the roof of the centre aisle was supported by five arches of fine proportions. There is a round tower at Drumbo, near Belfast. A few remains still exist of the abbey of Bangor; and at Grey Abbey there is standing in good preservation a part of the abbey founded here in 1192 by Africa, daughter of the King of Man, and wife of De Courcy. A mile and a half to the east of Downpatrick is a hill about 150 feet high, called Strual Mountain, celebrated all over Ireland for the resort of the lower orders of Roman Catholics, who come here every Midsummer for the performance of penance.

In 1851 there were three savings banks in the county at Hillsborough, Newry, and Warrenspoint. The total amount owing to depositors on the 20th November, 1851, was 49,303*l.* 2*s.*

DOWN, a bishop's see in the ecclesiastical province of Armagh in Ireland. The chapter, which is regulated by patent of James I., consists of dean, precentor, chancellor, archdeacon, and two prebendaries. With the exception of part of one parish lying in Antrim this diocese is situated entirely in the county of Down, of which it occupies the eastern portion. The see of Down was founded about the end of the 5th century by St. Patrick, who appointed Cailin, abbot of Antrim, to the bishopric. The cathedral of the diocese is at DOWNPATRICK. The most distinguished bishop of Down prior to the English invasion was Malachy O'Morgair, who succeeded in 1137, and assisted the Primate Gelasius in the introduction of the Roman discipline. In 1442 the union of Down with the see of Connor took place in the person of John, first bishop of the united diocese. By act 3rd and 4th William IV., c. 37, the united diocese of Down and Connor is further augmented by the diocese of Dromore. [CONNOR; DROMORE.] The income of the united diocese is 4204*l.* (Beaufort, *Memoir of a Map of Ireland*; Ware, *Bishops*; Thom, *Irish Almanac*; *Parliamentary Papers*.)

DOWNHAM MARKET, Norfolk, a market-town and the seat of a Poor-Law Union, in the parish of Downham Market, is situated near the right bank of the river Ouse, in 52° 36' N. lat., 0° 24' E. long., distant 40 miles W. by S. from Norwich, 84 miles N. by E. from London by road, and 87½ miles by the Eastern Counties and East Anglian railway. The population of the town in 1851 was 2867. The living is a rectory in the archdeaconry of Norfolk and diocese of Norwich. Downham Poor-Law Union contains 34 parishes and townships, with an area of 80,702 acres, and a population in 1851 of 20,976.

Downham Market is a town of considerable antiquity. Spelman states that it had a market confirmed to it in the time of Edward the Confessor. The town has been much improved of late years. There is a spacious market square. The parish church, dedicated to St. Edmund, is an ancient structure occupying an elevated site; it has a low embattled square tower surmounted with a spire. The Baptists, Wesleyan and Primitive Methodists, and Quakers have places of worship; there are a National school and a savings bank. A county

court is held in the town. The market is held on Saturday. Fairs are held on March 3rd, May 8th, and November 18th. By the river Ouse and the Cam, which flows into it not far from the town, vessels can proceed from Lynn, on the coast, 12 miles below, to Cambridge, about 30 miles above, Downham.

(Blomefield, *Norfolk*; *General History of Norfolk*; *Communication from Downham*.)

DOWNPATRICK, county of Down, Ireland, a municipal and parliamentary borough, a market and assize town, and the seat of a Poor-Law Union, in the parish of Downpatrick and barony of Lecale, is situated in 54° 20' N. lat., 5° 45' W. long., distant 93 miles N.E. by N. from Dublin. The population of the town in 1851 was 3287, besides 803 in the workhouse and other institutions. Downpatrick returns one member to the Imperial Parliament. Downpatrick Poor-Law Union comprises 24 electoral divisions, with an area of 147,361 acres, and a population in 1851 of 63,659.

Downpatrick takes its name from St. Patrick, who is stated in many ancient records to have been buried here. Before his time the place was called Rath Keltair and Dun-da-leth-glass, from an earthen fortification, the ruins of which still cover a considerable space, and present an imposing appearance on the north-west of the town. On the conquest of Ulster by the English in 1177, De Courcy made Downpatrick his head-quarters. The town is pleasantly situated near the right bank of the river Quoile; it is partly surrounded by hills and partly by flat and marshy grounds. The town is divided into the English, Irish, and Scotch quarters. The streets are irregularly built, but the public buildings are numerous. The original cathedral church was erected in 1412, but was devastated by Lord de Grey in 1533: the cathedral has lately been rebuilt, and is now a very handsome edifice in the pointed style of architecture. Besides the parish church there are chapels for Presbyterians, Wesleyan Methodists, and Roman Catholics. Downpatrick has a Diocesan school chiefly supported by the bishop and clergy, and a jail school supported by the county. The county jail is situated at Downpatrick; there are also a court-house, a market-house, barracks, an infirmary, and a fever hospital. Downpatrick claims to be a borough by prescription, and until the Union was represented by two members in the Irish Parliament. The town is well lighted and paved. The linen manufacture is carried on to a small extent, as well as brewing, tanning, and soap making. Vessels of 100 tons can come up to Quoile Quay, one mile from the town. Markets are held on Saturday, and regular monthly markets are held in place of the old fairs, which are abolished. The assizes for the county are held twice a year, and petty sessions every alternate week. Close to the town are the ruins of Inch Abbey.

(Fraser, *Handbook of Ireland*; Thom, *Irish Almanac*.)

DOWNTON, Wiltshire, a disfranchised borough in the parish of Downton, is situated on the river Avon, in 50° 59' N. lat., 1° 44' W. long., distant 28 miles S.E. by S. from Devizes, and 87 miles S.W. by W. from London by road. Salisbury, which is 6 miles from Downton, is 96 miles from London by the Salisbury branch of the South-Western railway. The population of the town of Downton in 1851 was 2727. The living is a vicarage, with the vicarage of Nunton annexed, in the archdeaconry and diocese of Salisbury.

Downton was a place of some importance in the middle ages, and had a castle, of which extensive earthworks known as 'the Moot' remain. The borough sent members to Parliament with some interruptions from the time of Edward I. till the period of the Reform Act, when it was disfranchised. The town consists chiefly of one long street, in which the houses are irregularly placed. Over the three branches of the Avon at this place are three bridges. The parish church is a large cruciform structure, with nave, side aisles, chancel, and transepts. The Baptists and Wesleyan and Primitive Methodists have places of worship. There are National, British, and Infant schools, and a branch of the Salisbury savings bank. A paper manufactory gives employment to some of the inhabitants. A market formerly held at Downton has been long discontinued. There is an ancient cross called 'The Borough Cross.' At a short distance from Downton is the estate purchased for the heirs of Lord Nelson, for which the sum of 100,000*l.* was voted by Parliament.

(Hoare, *Wiltshire*; *Communication from Downton*.)

DRAGUIGNAN, a town in France, capital of the department of Var, is situated on the Artubie, a feeder of the Argens, 490 miles S.E. from Paris, in 43° 32' 18" N. lat., 6° 28' 46" E. long., and has 8009 inhabitants, including the commune.

Draguignan is a place of considerable antiquity, having been mentioned in the titles of the earliest counts of Provence. In the early part of the middle ages the town was strongly fortified with a bastioned wall and three citadels. The ramparts were destroyed in the civil wars, but were rebuilt in 1615 and strengthened with towers, and a wide ditch was drawn round the town. The town suffered much in the religious wars of France. It is situated in a fertile plain surrounded by an amphitheatre of hills covered with vines and olive-trees. It is tolerably well built, ornamented with numerous fountains and many rows of trees, and traversed by a canal from the Artubie, which drives the machinery of several factories. The chief buildings are the court-house, the prison, the clock-tower, which is built on the summit of a high perpendicular rock, and the hospital. The inhabitants manufacture coarse woollens, soap, leather, stockings, brandy, silks,

wax candles, and earthenware: there are many oil-mills in the town. The environs (which are peculiarly delightful in winter) produce excellent fruit and wines. Draguignan has a public library of 15,000 volumes, a cabinet of medals, a museum of natural history, containing chiefly the minerals of the department, a botanic garden (which is beautifully laid out and open as a promenade), a high school, and an agricultural society.

DRAMMEN, a sea-port town of Norway, in the province of Agderhuus, is situated on both sides of the broad and impetuous river of the same name, which here discharges its waters into the Drammenfjord, in the Gulf of Christiania. The town stands in 59° 44' N. lat., 10° 12' E. long., 24 miles S.W. from the city of Christiania, and has about 12,000 inhabitants. It is divided into three quarters, of which Bragness is situated on the northern, and Stroemsøe and Tangen on the southern bank of the river: they are united by a bridge. Bragness consists of a row of houses about a mile in length. The main streets are chiefly composed of storehouses. Tangen is in fact the roadstead and landing-place, and is consequently the resort of mariners, fishermen, and small dealers. Drammen has a parish church, two other churches, several schools, and manufactures of spirits, leather, tobacco, sail-cloth, oil, ropes, &c. It is extensively engaged in trade and navigation, in building ships, and in the export of timber, deals, pitch, iron, &c. The water in the harbour is of depth sufficient to allow all vessels to lie alongside the quays and other landing-places. There are marble quarries in the vicinity.

DRAVE. [AUSTRIA, vol. i., col. 719.]

DRAYTON-IN-HALES, or **MARKET-DRAYTON**, Shropshire, a market-town and the seat of a Poor-Law Union, in the parish of Drayton-in-Hales, is situated in 52° 54' N. lat., 2° 28' W. long.; distant 19 miles N.E. by N. from Shrewsbury, and 153 miles N.W. from London by road. The population of the parish, a portion of which is in Staffordshire, was 4947 in 1851. The borough is governed by a mayor and corporation. The living is a vicarage in the arch-deaconry of Salop and diocese of Lichfield. Drayton Poor-Law Union contains 14 parishes and townships, with an area of 61,637 acres, and a population in 1851 of 14,160.

The town of Market-Drayton is watered by the river Tern. The market held in Drayton was formerly one of the largest in the district, but after the formation of canals the facilities afforded for conveying produce to various parts of the country diminished considerably the importance of this market. The town is lighted with gas. The parish church, built in the reign of Stephen, had its architectural character quite altered by repairs in 1787. Christ church, Little Drayton, is a district church recently erected. Its style is early English; the seats, which are free, will accommodate 600 persons. The Independents and Wesleyan and Primitive Methodists have places of worship. There are here a Free Grammar school with an endowment of about 35*l.* per annum, at which the number of scholars in 1853 was 40; a National school, for which a handsome and commodious Elizabethan structure was erected in 1836; a savings bank; and a young men's society, which has a library and reading-room.

Drayton has some manufactures; it has a paper-mill, and hair seats for chairs are made; but the population of the locality is chiefly agricultural. The market-days are Wednesday and Saturday: several fairs are held in the course of the year. A county court is held in the town.

(Communication from Market-Drayton.)

DRENTHE, a province in the kingdom of Holland, is bounded N. by Groningen, E. by Hanover, S. by Overijssel, and W. by Friesland. It lies between 52° 35' and 53° 12' N. lat., 6° 5' and 7° 5' E. long. The area is 1029 square miles, and the population in 1852 was 86,735. The general character of the soil is bad. In fact out of the 658,648 acres which the province contains only 338,221 acres are capable of cultivation; 317,580 acres consist of heaths, bogs, and marshes, and the remainder is covered with canals, brooks, roads, and buildings. Agriculture, pasturage, and digging and exporting peat form the chief employment of the population. The province lies on each slope of the watershed between the Zuider-Zee and Dollart's Bay. Several small streams rise in it; the most important of them is the Haverter-Aa, along part of which the canal from Meppel to Assen runs. There are no towns in the province. Assen, the capital, is a village of 1800 inhabitants, 16 miles S. from the city of Groningen. Hoovorden, a strong fortress in the south of the province, stands on a feeder of the Vecht, and has a population of 2200. The pauper colonies of Fredericksoord and Willemsoord were established in 1818 on the western border of the province: in these establishments a great number of paupers are employed by the state in reclaiming and cultivating the waste lands, in brick-making, spinning, weaving, and various handicrafts.

DRESDEN, the capital of the kingdom of Saxony, is situated in the circle of Meissen, on both banks of the Elbe, in 51° 6' N. lat., 13° 44' E. long., at an elevation of about 410 feet above the level of the sea, 116 miles by railway S. by E. from Berlin, 72 miles E. by S. from Leipzig, 303 miles N.N.W. from Vienna by railway through Briinn and Prague, and has a population according to the census of 1852 of 104,500, including the military who number about 12,000. The fine plain in which it stands is bounded on the east by eminences which are offsets from the Saxon Switzerland, and are mostly

crowned with vineyards and gardens: on the south and south-west there are similar elevations, which spring from the Erzgebirge. Westward lies the beautifully romantic 'Vale of Rocks,' or 'Plauische Grund,' through which the Weiseritz flows before it traverses part of Dresden and falls into the Elbe. On the north-western side of the city the Elbe winds round an enclosure planted with avenues of trees, and on the north the distance is bounded by a succession of hills, in general covered with firs and pines. Dresden is one of the most agreeable and interesting capitals in Europe, and well deserves the appellation of the 'German Florence.' It is divided into three parts; on the left bank of the Elbe is the Altstadt, or Old Town, with its three suburbs, and the Friedrichs-stadt, which is separated from the Altstadt by the Weiseritz: these two quarters form by far the larger portion of the city, and are disjoined from the third, or the Neustadt (New Town) by the Elbe, which is here 480 feet in breadth, and crossed by an elegant stone bridge of 16 arches. In continuation of the New Town, there are some later erections, called the 'Neue Anbau,' or New Buildings, which form a kind of suburb. The space gained by levelling the fortifications in the years 1810 and 1817 has been appropriated to gardens, promenades, and building.

Dresden has altogether 11 barriers or gate-entrances, 27 public squares, 20 churches (of which 13 are for Lutherans, 1 for Reformed Lutherans, and 6 for Roman Catholics) and 5 synagogues. The houses are principally built of Pirna freestone, and in general are from five to six stories in height. The Altstadt, sometimes called Old Dresden, has 4 squares and 41 streets. The most interesting structure in this quarter is the Royal Palace, an irregular gothic building 1300 paces in circuit, which faces the west side of the bridge. The chief parts of this edifice are the royal audience chamber; the Roman Catholic church of the royal family, which is surmounted by a tower and steeple 378 feet in height, and is adorned with paintings by Rubens and Mengs; the chamber of ceremony on the second floor, the porcelain-cabinet, the walls of which are ornamented with porcelain; the Proposition-Saal, in which the sessions of the Saxon legislature are opened; the royal library; the hall of audience, with a splendid ceiling painted by Sylvester; and the parade-chamber, with paintings by the same master. The celebrated Grüne-Gewölbe (Green Vault) opens upon the palace-yard, and contains a costly collection of precious stones, pearls, and works of art in gold, silver, amber, and ivory, arranged in eight rooms, the painting of which is green, and the walls are decorated with mirrors laid into compartments of marble and serpentine stone. This collection, which was begun by king Augustus, and has been gradually increased by his successors, is estimated at above one million sterling in value. Close to the palace are the chancery buildings, the depository for the national archives, and the Stallgebäude, which contains the cabinet of casts and models and the picture gallery. This building formerly also contained a gallery of arms with upwards of 20,000 specimens of armour, weapons, &c., principally from all ages in Saxon and German history, ancient and modern; but these are now deposited in the Zwinger, which is noticed below. The picture gallery, in the upper story of the building, is composed of the outer gallery, which runs round the four sides of the Stallgebäude, the inner gallery towards the yard, and the Pastell-cabinet. The outer gallery contains above 500 paintings of the Flemish school, 90 paintings of the Italian, and many of the French and German schools: the inner gallery is occupied by 356 specimens of the Italian school; and the Pastell-cabinet comprises 150 paintings of various masters. A new building was in course of erection for the reception of these pictures three or four years ago. Near the Stallgebäude stands the Palace of Princes, in which are a handsome chapel, a gallery of portraits of princes of the Saxon and Bavarian lines, a porcelain cabinet, a library of 10,000 volumes, and a cabinet of engravings. A covered way leads from this palace to the opera-house, where there is space on the stage for 500 performers, and in the house itself for 8000 spectators. The adjoining square is called the Zwinger, three sides of which are occupied by six pavilions connected by a gallery one story high; the quadrangle contains four fountains and 300 orange-trees. The six pavilions, which are profusely ornamented, contain a museum of natural history, consisting of four galleries and six saloons; a cabinet of engravings, comprising above 250,000 plates, arranged in classes; and a historical museum, or armoury, one of the finest collections of the kind in Europe, consisting of arms, weapons, warlike instruments, accoutrements, and trappings of all kinds, arranged in nine apartments.

The other buildings of note in the Old Town are the Brühl Palace, which is the principal depository for the Meissen china; and behind it are spacious gardens and grounds commanding delightful views of the banks of the Elbe and the surrounding scenery. Immediately adjacent are the hall, in which there is an annual exhibition of the productions of Saxon artists; the Academy of Arts and School of Design; and the Gallery of Duplicates, in which there are 250 paintings for which there was not sufficient room in the Great Gallery, and the celebrated tapestries worked after Raphael's designs. On one side of the square of the Frauenkirche is the Mint; and adjoining it the Arsenal, which contains a valuable collection of every kind of arms, and in one of the apartments the portraits of all the Saxon sovereigns

from Maurice to the present times. Facing the Arsenal stands the Academical Building, now used for a medical and surgical school; below it there is a subterraneous hall decorated with paintings by Francisco Casanova. In the Pirna-street is the House of Assembly, a building of two stories, where the States hold their sittings and committees. The only handsome square in the Old Town is the Old Market Place, of which the town-hall is the great ornament. In this direction lie also the Botanical Garden, New Post-Office, the Trades' Hall with its colonnade, the Treasury, German theatre, two royal villas with fine gardens and chapels, the Observatory and grounds attached, the Mews and Riding School, Military Hospital and gardens, and the Orphan Asylum and church. The most remarkable churches in the Old Town are—the Frauenkirche (Church of Our Lady), built in 1726, after the model of St. Peter's at Rome; the Kreuzkirche, or the Church of the Cross, a parallelogram, surmounted by a steeple 305 feet in height; the Protestant church of St. Sophia, an irregular structure, erected in 1351; and the Roman Catholic or court church before mentioned, which contains the vaults for the royal family, besides a multitude of paintings, statues, monuments, carvings, altars, &c.

Three suburbs are connected with the Old Town by means of as many avenues—the Pirna, See or Dohna, and Wildsurf suburbs. The first of these, which extends from the banks of the Elbe to the Kaidiz Brook, has a long street in which is a royal palace with delightful grounds attached to it. The Botanical Garden, belonging to the Medical School, is close adjoining; and likewise Maurice's Avenue, on part of the site of the former fortifications, and named from a piece of sculpture representing Maurice, the elector, delivering his sword to Augustus. In front of the external entrance into the Pirna suburb is the Great Garden, which is nearly five miles in circuit; and to the right lies the Nursery of Fruit Trees, which contains upwards of 65,000 plants, and a building in the centre where concerts are held every week. The See suburb covers the south-west and the Wildsurf the western side of the Old Town. From the last-mentioned suburb is an avenue called the Ostra-Allee, on one side of which are Prince Maximilian's palace, gardens, and observatory: this avenue opens upon a massive bridge across the Weiseritz which leads to the Friedrichs-stadt, the second grand quarter of Dresden, between which and the Elbe are the wooded grounds called the Ostra-Gehege. Here are the Roman Catholic cemetery and infirmary, in which is Balthazar Permoser's monument to his own memory, chiselled by himself, and representing the Descent from the Cross.

The access from the Old Town to the New Town, the third grand quarter of the city, which lies to the north-east on the right bank of the Elbe, is across the palace square and stone bridge before mentioned, called the Bridge of the Elbe, from its being the largest and handsomest structure of the kind which traverses that river. It is also denominated Augustus's Bridge, in honour of Augustus II., its founder. It rests on 16 arches, is 1420 feet long and 36 feet broad, and was completed in the year 1731. The fourth pier, which was blown up by Marshal Davoust in 1813, was restored by the Russians in the following year. A bronze-gilt crucifix, resting on a gilt-copper globe placed on a mass of rustic stone about 28 feet in height, stands upon the fifth pier. The bridge opens on the New Town side upon an inclosed space planted with lime-trees, and embellished with an equestrian statue of Augustus II. A broad street lined with lime-trees runs from the bridge to the northern extremity of the New Town; on the western side of it is the Japanese Palace, or Augusteum, and parade in front; and on the eastern side a range of barracks for the cavalry and infantry. The Augusteum is used as a depository for collections of antiquities, coins, and porcelain manufactures, and for the royal library. The Cabinet of Antiquities, arranged in 12 spacious and well-lighted rooms; the Cabinet of Coins, rich in the coins of Saxony as well as remarkable for a fine series of medals struck in honour of illustrious individuals of all countries; and the Cabinet of Porcelain, displayed in 18 rooms, are all on the ground-floor. The Royal Public Library is deposited in 3 saloons and 21 apartments in the first and second stories, and contains 300,000 printed volumes, 3000 manuscripts, above 150,000 pamphlets, and 20,000 maps. Among these are upwards of 1600 printed books of the 15th century. The terminus of the railway to Leipzig is near the Augusteum. The New Town also contains a church dedicated to the Most Holy Trinity; a town-hall; the cadet academy; several military schools; and the commandant's residence. It has 22 streets in all. To the north-east of the New Town lies the Neue Anbau (New Buildings), which is occupied by some handsome residences; a playhouse and baths; a house of industry; schools for the indigent and for the garrison of Dresden; and a spacious cemetery. The house for the reception of bodies of unknown persons is decorated with the Dance of Death, a rude sculpture in stone containing 24 figures.

Among public establishments not hitherto noticed are a high school, conducted by 12 masters and attended by about 400 pupils. Dresden contains altogether 71 establishments for Protestant education. The Catholics have a high school and several other educational establishments. The number of institutions for the sick and maimed and orphans is 8, including 3 hospitals. There is a variety of learned and other societies.

Dresden has no external trade of much importance. It is a place

of transit for colonial and other foreign produce from Magdeburg, Hamburg, &c., and has five general fairs, besides a yearly fair in June, at which a considerable quantity of wool is sold. The manufactures comprise scientific and musical instruments, gloves, carpets, turnery-ware, jewellery, silk and woollen stuffs, straw-hats, painters' colours, artificial flowers, chemical products, &c. Morocco and other leather, refined sugar, tobacco, white-lead, tin-ware, glass, stockings, cotton goods, &c., are also manufactured on a small scale. There is a foundry for bomb-shells and cannon, and a yearly exhibition of Saxon manufactures.

The immediate vicinity of Dresden abounds in places of public resort, and its environs are full of attractions for strangers. The French defeated the allies under the walls of Dresden, August 26th and 27th, 1813. Near the village of Rücknitz, about a mile to the south-east of the city, is a block of granite surmounted by a helmet erected on the spot where Moreau fell by the side of the emperor Alexander. Dresden shared largely in the excitement that prevailed in Europe after the French revolution of 1848. The second Chamber early in 1849 voted for the adoption of a republican form of government for Germany. A republican insurrection followed: Dresden was bombarded by Prussian and Saxon troops on the 7th of May; and it was not till after three days' fighting that the last of the insurgents were driven out of the town. Small steamers ply on the Elbe upwards to Pillnitz, and downwards to Meissen and Magdeburg. The city has railway and electro-telegraphic communication with Vienna, Paris, Berlin, and all the principal towns of Germany. Dresden sustained some damage in the spring of 1845 in consequence of the inundation of the Elbe.

DREUX, an ancient town in France, the capital of the third arrondissement in the department of Eure-et-Loir, stands on the Blaise, a tributary of the Eure, 41 miles W. from Paris, in 48° 44' 27" N. lat., 1° 22' 8" E. long., and has 6451 inhabitants, including the commune. It is partly surrounded by the Blaise, which here divides into several branches, and enters the Eure a short distance north of the town. Dreux is on the great western road to Alençon, Laval, Rennes, St.-Brieuc, and Brest.

Dreux was known under the Romans by the name Durocasses, and appears to have been included in the territories of the Carantes. From Durocasses the name was contracted into Droce, from which the modern form Dreux is derived. The town with the surrounding district, forming the county of Dreux, was included in the acquisitions made by the Normans in France, but was early taken from them, and became part of the domain of the French crown. The Norman English burnt the town in A.D. 1188. In December 1562 a severe action was fought in the plain of Dreux, between the rivers Eure and Blaise, between the royal Catholic army, under the constable Montmorency, and the army of the Calvinists, commanded by the Prince of Condé and Admiral Coligny. The Calvinists were defeated and the Prince of Condé taken prisoner. In 1593 Dreux, which was in the possession of the party of the League, was taken by Henri IV. after a vigorous resistance of eighteen days. The walls were not repaired after this event, and the town soon lost its political importance.

Dreux stands in a pleasant country, and is pretty well built. On a high hill which commands the town are the remains of the ancient castle of the counts of Dreux. On the site of these ruins stands the magnificent chapel built by Louis Philippe whilst duke of Orléans, and greatly enlarged and beautified by him during his reign. It was intended to be the final resting-place of the members of his family, and at the accession of the duke to the throne of France it already contained the remains of the Duke and Duchess of Penthièvre, the Count of Toulouse, and the Princess de Lamballe, which were brought hither by the care of the Duchess dowager of Orléans, the king's mother, whose body is also deposited here. The chapel contains also the tombs of the Princess Mary and the Duke of Orléans, children of Louis Philippe; the Princess Adelaide, the king's sister, who died December 30, 1847, was the last of the Orléans family buried here. An enormous brick tower, said to be the keep of the old castle above mentioned, was long used as a telegraph establishment under the old signal system. The town-hall and the parish church are handsome gothic structures; in the former is the tomb of Philidor, the musical composer and celebrated chess-player, who was a native of Dreux. The inhabitants manufacture serges and woollen hosiery; they also trade in sheep and cattle. There are tau-yards, iron-foundries, and dye-houses in the town, which has tribunals of first instance and of commerce, a college, and a good hospital.

DRIFFIELD, GREAT, East Riding of Yorkshire, a market-town and the seat of a Poor-Law Union, in the parish of Driffeld, is situated in 54° 0' N. lat., 0° 26' W. long., distant 28 miles E. by N. from York, 196 miles N. by W. from London by road, and 202 miles by the Great Northern and connected railways. The population of the town of Great Driffeld in 1851 was 3792. The living is a vicarage, with the perpetual curacy of Little Driffeld attached, in the arch-deaconry of the East Riding and diocese of York. Driffeld Poor-Law Union contains 43 parishes and townships, with an area of 104,910 acres, and a population in 1851 of 18,265.

The parish church of Great Driffeld, dedicated to All Saints, is an ancient edifice; but the steeple is of later date than the body of the church. The Independents, Baptists, and Primitive and Wesleyan

Methodists have places of worship in Great Driffield, and there are National and Infant schools.

The town of Great Driffield occupies an agreeable situation at the foot of the Wolds, near one of the sources of the river Hull. It consists chiefly of one long street. A small stream which runs parallel with the street is enlarged below the town into a navigable canal, by which a communication is maintained with the port of Hull by the river Hull. Since this communication was opened Driffield has considerably improved; the town contains many good shops, and is lighted with gas. Among the public buildings and institutions are the new corn-exchange and public rooms, a dispensary, a mechanics institution, a branch of the Hull savings bank, and a station of the Hull and Scarborough railway. A county court is held in the town.

The district around Driffield is fertile. The market is held on Thursday, and extensive transactions take place in corn and cattle. Flour-mills and mills for bone-crushing are in the vicinity. A manufactory for chemical manure is in Great Driffield. The Malton and Driffield Junction railway is continued to the York, Newcastle, and Berwick line, and joins it near Thirsk. At the hamlet of Danes Hill are several tumuli.

(Communication from Great Driffield.)

DROGHEDA, in the counties of Louth and Meath, Ireland, a municipal and parliamentary borough, a market and sea-port town, and the seat of a Poor-Law Union, is situated on the river Boyne, in 53° 43' N. lat., 6° 20' W. long.; distant 28 miles N. by W. from Dublin by road, and 32 miles by the Dublin and Drogheda railway. In 1851 the population was 16,845. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns one member to the Imperial Parliament. Drogheda Poor-Law Union comprises 12 electoral divisions, with an area of 98,706 acres, and a population in 1851 of 48,203.

The name Drogheda, of which Tredagh (as it is generally written in old books) is a corruption, signifies 'the bridge of the ford.' A synod was held here by Cardinal Paparo, the Pope's legate, in 1152, which was very numerously attended by the Irish ecclesiastics, and had the effect of greatly strengthening the authority and discipline of the Church of Rome in Ireland. Henry III., in the year 1228, divided the town into two parts, namely, Drogheda versus Uriel, on the Louth side of the river, and Drogheda versus Midium, on the Meath side. In 1412 the two corporations were united by Henry IV., since which time Drogheda on both sides of the Boyne has continued to be one body corporate. Being a frontier town of the pale Drogheda was a principal rendezvous for the forces which were so frequently required in Ulster between the 14th and 17th centuries; and many of the Irish parliaments were held here, particularly during the 15th century.

On the breaking out of the rebellion in 1641 Drogheda was besieged by Sir Phelim O'Neill and a large force of Irish who invested the town on both sides on the 1st of December. The siege was raised on the 28th of February. Cromwell besieged the town in September 1649. He was twice repulsed, but succeeded in the third attempt, which he led himself. Most of the garrison were put to the sword. Drogheda was last held for the Roman Catholic party by the Lord Iveagh, with a garrison of 1000 men, in 1690, but it surrendered to a detachment of King William's army the day after the battle of the Boyne.

The old walls and four gates were standing within the last fifty years. A few buttresses and St. Lawrence's Gate are all that now remain. The last is a striking object, and is in good preservation. Drogheda is rich in ecclesiastical antiquities. The Dominican Friary on the north part of the town was founded by Lucas de Netterville, archbishop of Armagh, in 1224, and is celebrated as the scene of the submission of four Irish princes to Richard II. in 1394. A lofty tower of this friary, called the Magdalen Tower, is still standing, together with some of the cloisters. The Franciscan Friary on the north-east of the town is standing, although much ruined, and forms a striking feature in the view of Drogheda from the approaches on the Dublin side. A gable and bell-tower, with part of the aisle, of the priory of Canons Regular also remain on the west of the town near the river; and there are some traces of the priory of St. Lawrence near the gate, and of the hospital of St. Mary, beyond the priory of the Canons Regular.

Drogheda is a compact and well-built town; but the miserable suburbs extending north and south greatly disfigure the approaches. The chief part of the town lies on the left side of the river, which is the higher ground. The principal street runs nearly north and south, and forms a portion of the great northern road. About the centre of the town, on the western side of the main street, stands the town-house, a handsome building with a clock and cupola. Drogheda contains three churches: St. Mary's, a small plain edifice built on the ancient site of the chapel of a Carmelite convent; St. Peter's, a handsome Grecian building, erected about the middle of the last century; and St. Mark's, a chapel of ease to St. Peter's. The Roman Catholic chapel of St. Peter, which is considered the cathedral church of the archdiocese of Armagh, is a spacious gothic edifice: there are also a handsome Presbyterian meeting-house, and a Wesleyan Methodist chapel. Besides these there are four other Roman Catholic chapels, three friaries, and two nunneries, one of which, called the Sienna

Nunnery, near the site of the Franciscan Priory, is a large establishment. There are two barracks, an almshouse, the mansion-house, an infirmary, a savings bank, a jail, a corn-market, and a theatre. The town and harbour have been much improved of late years. A viaduct 95 feet in height, constructed across the river Boyne, forms part of the Dublin and Belfast Junction railway. An iron lattice bridge across the Royal Canal is for the passage of the trains of the Dublin and Drogheda railway. Richmond Fort, erected during the government of the Duke of Richmond, contains an hospital and a military store-house, and commands a very fine view of the town. Formerly the linen manufacture was the staple trade of Drogheda, but it has very much decreased: there are three extensive flax mills, six corn-mills, and two breweries; the other manufactures are cotton, leather, tobacco, soap, and candles: there are also an iron-foundry, which employs 800 persons, five salt-works, and some brick-kilns. There is considerable trade between Drogheda and Liverpool by six regular steam-vessels, and the importations and exportations are large. The harbour is convenient; vessels of 300 tons can come up to the quay. At the entrance of the harbour are three lighthouses. The market is on Saturday. Eight fairs are held in the course of the year. The assizes, quarter sessions, and petty sessions are held here. On the 31st of December 1852 the number and tonnage of the vessels registered as belonging to the port of Drogheda were as follows:—Vessels under 50 tons 7, tonnage 193; above 50 tons 39, tonnage 4459; and 5 steam-vessels of 1787 tons. In the cross-channel and coasting trade there entered and cleared at the port during 1852 as follows:—Inwards 648, tonnage 47,976; outwards 281, tonnage 21,378; steam-vessels, inwards 213, tonnage 83,034; outwards 254, tonnage 97,359. In the colonial and foreign trade there entered 52 vessels, tonnage 8069; and cleared 3 vessels, tonnage 935.

(Fraser, *Handbook of Ireland*; Thom, *Irish Almanac*.)

DROHOBYCZ, a town in the circle of Sambor, in the Austrian crownland of Galicia, is situated on the Tysszanika, a tributary of the Dniester, in 49° 22' N. lat., 23° 35' E. long., and has a population of about 7000, seven-eighths of whom are Jews. A great portion of the houses are filthy cabins, constructed of boards. The town however has several buildings of consequence, among which are the high-church, a fine structure of the gothic order, a Basilian monastery, with a grammar-school conducted by the brotherhood, a chapter-house, several churches, a synagogue, castle, and seminary for teachers. The town, with its eight suburbs, contains about 1200 houses. The royal salt-works, including the adjacent works at Mobyryc, Soloc, and Stebnik produce about 3700 tons annually, which are extracted from salt rocks and saline clay. In the neighbourhood of the town are iron-mines and pitch-wells. There is a brisk trade in native and foreign produce, particularly wine, linens, cottons, leather, and grocery, which is mainly carried on by the Jews; and the corn and cattle markets bring much profit to the place.

DROITWICH, Worcestershire, a municipal and parliamentary borough and the seat of a Poor-Law Union, is situated in a narrow valley through which flows the small river Salwarpe, in 52° 16' N. lat., 2° 8' W. long., distant 7 miles N.N.E. from Worcester, 116 miles N.W. by W. from London by road, and 132½ miles by railway via Birmingham. The population of the borough of Droitwich was 3125 in 1851; that of the extended parliamentary borough was 7096. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and returns one member to the Imperial Parliament. The livings are in the archdeaconry and diocese of Worcester. Droitwich Poor-Law Union contains 26 parishes and townships, with an area of 51,984 acres, and a population in 1851 of 18,020.

The Romans had a station called Salinæ at the spot now occupied by Droitwich. Remains of a Roman villa were discovered in forming that portion of the Oxford and Wolverhampton railway which passes through Droitwich. So much of the tessellated pavement as could be removed was deposited in the Worcester Natural History Museum: several coins, medals, and fibulae were found at the same place. Droitwich is mentioned in Domesday Book on account of the tax then derived from its salt springs. A charter was granted to the borough by King John. The Court Chamber, situated in the centre of the town, is a handsome and commodious structure. The upper portion of the building is appropriated for the meetings of petty sessions, which are held weekly; the under portion is used as a market-house. Near the Court Chamber is St. Andrew's church; St. Peter's is situated a short distance from the town. The Methodists and Plymouth Brethren have places of worship, and there are National and Infant schools. Droitwich possesses an excellent hospital, founded by Lord Keeper Coventry, the income of which is 1200*l.* a year. It is governed by trustees, and supplies 36 men and women with a room, clothing, and 5*s.* per week each. The foundation also provides 80*l.* a year and a house for a schoolmaster, and 50*l.* a year and a house for a schoolmistress, for the education of 50 boys and 50 girls. The boys have 10*l.* given them in aid of their apprentice fee; the girls receive 3*l.* on leaving the institution. Droitwich possesses a savings bank; and a penny bank has been recently established. A county court is held in the town.

The chief trade of Droitwich is that in salt, manufactured from the salt springs, which are very productive. About 60,000 tons of salt are annually produced. The Worcester and Birmingham Canal

passes near Droitwich, and communicates with the river Severn at Worcester; and a canal for vessels of 60 tons burden, constructed by Brindley, forms also a direct communication from the salt-works to the river Severn. The line of the Oxford and Wolverhampton railway passes through Droitwich. A station of the Birmingham and Bristol railway is about a mile and a quarter from the town. The market is held on Friday; there are two annual fairs. About a mile from Droitwich is Westwood Park, the seat of Sir J. Pakington, M.P. for the borough.

(Nash, *Worcestershire; Communication from Droitwich.*)

DRÔME, a department in the south-east of France, bounded N. and N.E. by the department of Isère, E. by the department of Hautes-Alpes, S. by the departments of Basses-Alpes and Vaucluse, and W. by the Rhône, which separates it from the department of Ardèche. The form of the department is irregular: its greatest length from north to south is about 80 miles; from east to west 50 miles. It is comprehended between 44° 9' and 45° 20' N. lat., 4° 38' and 5° 45' E. long. The area according to the cadastral returns of 1851 is 2519 square miles: the population in the same year amounted to 326,846, which gives 129.75 to the square mile, being 44.96 below the average per square mile for the whole of France.

Surface, &c.—The department forms an inclined plane which slopes from east to west. About one-third of the surface consists of a sandy and in part stony plain running north and south along the Rhône, with a breadth of 5 to 8 miles. The rest of the department is mountainous. From a secondary chain of the Alps, which runs along the eastern boundary, numerous offshoots all of calcareous formation extend westward, gradually diminishing in height as they advance in that direction, and finally subsiding into the valley of the Rhône. The highest of these masses is more than 5000 feet above the sea; but the general elevation of the ridges is not much above 3000 feet. Their summits, which are everywhere accessible, yield good pasturage in the summer and autumn, and at these seasons they are frequented by the migratory flocks of the neighbouring departments; their sides are covered with dense forests of pine, oak, beech, &c. The valleys between the ridges, which are the chief haunts of the population, communicate with each other by narrow dangerous by-roads, and are furrowed by rivers or mountain torrents that frequently cause great damage by their overflow. The facilities for irrigation are very great, and this mode of culture is extensively adopted, especially in the valley of the Rhône, the fertility of which is in a great measure owing to the skilful employment of the system of irrigation. The air is pure and healthy. The high mountains are covered with snow during several months of the year; but in the valleys, and along the Rhône, the heat in summer is intense. North and south winds alternately prevail, the former bringing dry weather, the latter rain.

Hydrography.—The Rhône, which divides this department from that of Ardèche, is navigated by steamers, and receives all the rivers of the department, which are all short, and are here briefly described proceeding from north to south. [**RHÔNE.**] The *Galaure*, which rises in the department of Isère, crosses the north of the department, and enters the Rhône at St.-Vallier. The *Isère*, remarkable for its deep, black waters, and the magnificent views which its valley presents, receives in this department the *Herbasse*, and joins the Rhône a few miles north of Valence: it is navigable. [**ISÈRE.**] The *Veoure* has its whole length in the department, and flows south-west into the Rhône past Chabeuil. The *Drôme*, which gives name to the department, rises on the confines of Hautes-Alpes, and flows in a rapid stream north-west as far as Die, receiving the *Bes* on the right bank; from Die to Pontaix its course is nearly due west, and from the last-mentioned town it runs south to its junction with the *Rohanne* on the left bank, whence it flows west to the Rhône, which it enters below Livron after a course of 66 miles. A good deal of loose timber is floated down this river as far as Pontaix, above which its bed is very rocky; here the timber is made into rafts and floated on to the Rhône. No part of the Drôme is navigable. Strong embankments have been formed at dangerous points along the stream to prevent it from inundating the cultivated land along its banks. The next river to the south is the *Roubion*, which is joined by the *Jabron* at Montélimart, just before its entrance into the Rhône. The *Lez* forms part of the southern boundary, and flowing south-west enters the Rhône in the department of Vaucluse. The *Eygues* or *Aigues* rises in the south-east of the department, and passes Nyons, below which it enters the department of Vaucluse, and joins the Rhône a little west of Orange. The *Ouvèze* rises in the extreme south of the department, and passing Le-Buis enters the department of Vaucluse on its way to join the *Sorgues*.

Produce, &c.—The department contains 1,612,312 acres. Of this area, 408,067 acres are covered with woods and forests; 354,269 acres are heath and moor-land; 640,265 acres are capable of cultivation; 44,364 acres are natural pasture-land, and 59,272 acres are under vines. Corn sufficient for the consumption is not produced; maize, buckwheat, and haricot beans are the chief crops. The olive, the walnut, the almond, the chestnut, and other fruit-trees are cultivated with success. The mulberry-tree is extensively grown for the production of silk; the first crop of leaves serves to rear the silkworms, and the second is given to cattle. The number of mulberry-

trees in the department is about 3,000,000, and above 500,000 lbs. of raw silk are annually produced. The culture of the vine is an object of great attention in the valley of the Rhône, and in the arrondissements of Die and Nyons. The annual produce of wine is 8,580,000 gallons, a large portion of which is exported; the best kinds are the famous red and white wines called *Hermitage*, which for their mellifluous goût, colour, and perfume rank among the best wines in the world. Black truffles of excellent quality are abundant. Horses and horned cattle are not numerous; mules are the common beasts of burden. Sheep and black pigs are reared in considerable numbers. Among the wild animals are foxes, wolves, deer, chamois, beavers in the islands of the Rhône, otters, hares, rabbits, eagles, vultures, pheasants, partridges, &c. There is a good deal of meadow land, chiefly in the valley of the Rhône, which by means of irrigating rills is made to yield two and three crops a year.

Several iron-mines are worked; copper and lead are found; coal is met with in various districts, but only one mine is worked. Sand used in glass manufacture, chalk, gypsum, rock crystal, alabaster, granite, potters' clay, &c., are found. There are also several mineral and salt springs. The manufacturing industry of the department is important and active. Woollen cloth, silk, hosiery, serge, cotton-yarn, leather, paper, nut and olive oil, brandy, ropes, lime, tiles, bricks, &c., are manufactured; there are various dyeing and bleaching establishments; 552 wind and water-mills, 5 iron smelting furnaces and foundries, 711 workshops and factories of various kinds, and most families have a *magnanière* for rearing silk-worms. There is roadway accommodation by 5 state and 5 departmental roads; the railway now in course of construction from Lyon to Avignon runs for about half its length in this department, passing through Tain, Valence, and Montélimart. The electro-telegraphic communication by this line between Paris and Marseille has been completed some time. Electro-telegraphic wires connect Valence with Grenoble, whence they are laid down to Chambéry in Savoy, and thence across the Alps to Turin and Genoa. There are 450 fairs and markets held in the year. The great markets for raw silk are held in Valence and Montélimart.

The department is divided into four arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Valence . . .	10	101	155,017
2. Montélimart . .	5	69	68,926
3. Die . . .	9	117	66,498
4. Nyons . . .	4	74	36,405
Total . . .	28	361	326,846

1. In the first arrondissement the chief town is *Valence*, the Roman *Valentia*, which is also the capital of the department, and is described under its proper head. [**VALENCE.**] Among the other towns we give the following: the population is that of the commune throughout:—*Bourg-du-Péage*, or *Péage*, on the left bank of the Isère, which separates it from Romans, owes its origin to the bridge built here in the 9th century by the monks, who had the right of toll (*péage*); it has 3858 inhabitants, who manufacture coarse silk, silk hats, leather, and ropes. *Bourg-lès-Valence*, 2 or 3 miles from Valence, has several pretty residences, and a population of 3059. *Chabeuil*, on the left bank of the *Veoure*, is an ill-built place, with 4461 inhabitants, who manufacture woollens, glove and shoe leather, and paper; there are also silk-throwing and bleaching establishments, and a college here. The town, which formerly gave title to a principality, has no object of interest except the remains of its ancient castle. *Grand-Serre*, on the *Galaure*, has iron and steel-works, and 1588 inhabitants. *Loriol* stands at the foot of a hill on the left bank of the Drôme, opposite Livron, with which it is joined by a handsome bridge; it has 3460 inhabitants, several silk-throwing establishments, and nurseries, and some trade in hides and skins. *Romans*, on the right bank of the Isère, owes its origin to the abbey founded here by St. Bernard, bishop of Vienne, in A.D. 837; it is well built in a pretty situation, and joined to Péage by the bridge before mentioned, from which there is a magnificent view of the valley of Isère, terminating eastwards in Mont Blanc, while in the opposite direction the mountains of Vivarais are visible. The town is girt by a fosse and walls which are flanked with square towers, and entered by five gates. The church of St. Bernard, and the theatre which stands in the middle of a handsome promenade, called *Champs-de-Mars*, are the most remarkable buildings. Silk, hosiery, woollen cloth, serge, and leather are manufactured; there are also establishments for reeling and throwing silk, lime and gypsum kilns; and the town has a good trade in wool, hemp, linen, wine, oil, black truffles, skins, &c. Romans has a tribunal and chamber of commerce, a college, ecclesiastical school, and 9471 inhabitants. There are vast mulberry plantations about this town. *St.-Donat*, on the left bank of the *Herbasse*, has 2223 inhabitants, who manufacture silk and tiles. *St.-Jean-en-Royans* stands in a beautiful valley, closed in by high mountains, on the right bank of the *Lionne*, which falls into the *Bourne*, a feeder of the Isère; it is a favourite place of resort with French landscape painters, on account of the romantic scenery about it: population, 2516. *St.-Vallier*, at the junction of the *Galaure* with the Rhône, has 2690

inhabitants, who manufacture silk crape and twist, chemical products, pottery, beer, and leather. A little east of this town, in a narrow savage gorge of the Galaure, are the ruins of a fine old castle, near which the road runs in a deep cutting through rocks. *Tain*, a pretty little town 10 miles N. from Valence, on the left bank of the Rhône, stands opposite Tournon, with which it is connected by a fine suspension-bridge, and has 2459 inhabitants, who are engaged in the culture of the vine, cotton-spinning, and quarrying granite. This little town stands at the southern foot of the steep hill called Hermitage, on the craggy terraced slopes of which are the vineyards that produce the famous Hermitage wines.

2. In the second arrondissement the chief town, *Montélimart*, beautifully situated among vineyards, meadows, and mulberry plantations, is an ancient place surrounded by ramparts which are flanked with watch-towers, and entered by four gates facing the cardinal points. It stands near the left bank of the Rhône, at the confluence of the Roubion and the Jabron, which unite their waters at the southern gate, where they are spanned by a fine stone-bridge. The town is well built; the Grande Rue, which is paved with basalt, and through which the road from Lyon to Avignon runs, is the most commercial part. The left bank of the Rhône, a little above the town, is formed by basaltic cliffs. [ARDECHE.] Around the ramparts, both within and without, there is a fine drive lined with double rows of trees. The most imposing structure is the old castle or citadel, which overlooks the whole town. Montélimart has 8245 inhabitants, a tribunal of first instance, and a college; it is a busy manufacturing town, and has several silk and cotton factories, tanneries, tile-works, and lime-kilns; serge and hosiery also are made. It is famous for the manufacture of morocco leather and the almond cakes called 'nougat.' Besides the articles already named, corn, flour, raw silk, walnut and olive oil, cattle, and provisions enter into the commerce of the town. From the two rivers abundant water-power is derived to drive the machinery of the several factories; and from the same sources the system of canals for irrigating the grounds in the neighbourhood is filled. *Dieu-le-Fit*, situated among mountains, 15 miles E. from Montélimart, is the seat of a busy manufacturing population of 4163. The most remarkable building is the new Calvinist church. The manufactures are woollen cloths, serge, swanskin, flannel, glass, pottery, &c.; there are also dye-houses, and establishments for spinning silk, cotton, and worsted. In the neighbourhood there are mineral springs and a large cavern which bears the name of Tom-Jones. *Grignan*, a small place of 2000 inhabitants, stands on a hill above the Lez, and was formerly famous for a magnificent château, celebrated in the letters of Madame de Sevigné, who died in it (April 18, 1696), and was buried in the parish church of Grignan. This château is now in ruins, having been burnt during the first revolution. *Pierrelatte*, an ill-built town, 13 miles S. from Montélimart, stands at the foot of a rock crowned with the ruins of an old castle, which capitulated in 1562 to the ferocious Adrets, who hurled the garrison over the battlements and massacred all the inhabitants of the town. The environs yield much corn, wine, and silk; there are silk-mills and tan-yards in the town, which has 3430 inhabitants.

3. In the third arrondissement, the chief town *Die* (the *Dea Augusta* and *Dea Vocontiorum* of the Romans), stands in the middle of a fertile valley, on the right bank of the Drôme, and has 3920 inhabitants. The town, which is defended by walls flanked with numerous towers, was formerly the seat of a bishop; the old palace and former cathedral are the principal buildings. It has a tribunal of first instance, a Calvinist church, manufactures of woollen cloth, silk, and cotton yarn, besides several dye-houses, fulling-mills, and magnanières. The neighbourhood produces excellent fruits, and the delicious white wine called 'Clairette de Die.' *Crest*, 20 miles W. from Die, on the right bank of the Drôme, stands at the foot of a rock which has the form of a cock's crest, whence the name of the town. It was formerly defended by a castle, which commanded the passage of the river and rendered this one of the strongest towns in Dauphiné; only one tower of the castle now remains, which is used as a house of correction. In the church there are some fine old bas-reliefs, and an inscription which recounts the chartered privileges of the town, with the date 1188. The town has 4948 inhabitants, who manufacture woollen and cotton cloths, serge, blankets, silk handkerchiefs, cotton yarn, paper, leather, tiles, and lime; it has also sugar refineries, fulling-mills, and dye-houses, and trades largely in truffles. *Saillans*, also on the right bank of the Drôme, is a busy manufacturing little town of 2000 inhabitants.

4. In the fourth arrondissement, the chief town, *Nyons*, or *Nions*, stands on the Eygues, at the opening of a valley which is cultivated like a garden by means of irrigating rills. The town is defended by walls and towers, and entered by four gates; the interior is ill-built. The most remarkable object is the stone bridge over the Eygues. Soap, woollen stuffs, earthenware, spun silk, and leather are the chief industrial products of the inhabitants, who number 3251. *Le-Buis*, an ill-built place in the valley of the Ouvèze, takes its name from the boxwood (*buis*) which abounds in its neighbourhood. Silk-throwing and the manufacture of oil and leather are the chief occupations of its 2456 inhabitants.

The department forms the see of the Bishop of Valence, is included in the jurisdiction of the High Court of Grenoble, and belongs to the

8th Military Division, of which Lyon is head-quarters. Education is more extensively diffused than in most of the French departments. There is a university academy and an ecclesiastical college in Valence, a diocesan seminary in Romans, communal colleges in Montélimart and Valence, and a Protestant training school in Dieu-le-Fit. The Calvinists have Consistorial churches in Crest, Dieu-le-Fit, Die, and Bourg-lès-Valence.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Statistique de la France.*)

DROMORE, county of Down, a market-town in the parish of Dromore, is distant 17 miles E.S.E. from Downpatrick: and 84 miles N. by E. from Dublin on the great northern road to Belfast. The population in 1851 was 1872. The town is situated on the river Lagan, and contains besides the cathedral or parish church, which is a mean structure on the bank of the river, one Roman Catholic and two Presbyterian chapels. Large quantities of linen cloth are manufactured here; and many of the inhabitants are engaged in weaving. Near the town is a mineral spring of celebrity. East of Dromore stands a remarkable mound, 60 feet high, with three concentric entrenchments, and an extensive outwork towards the Lagan. Fairs are held in February, May, July, and October.

The see of Dromore is in the ecclesiastical province of Armagh. The chapter consists of a dean, precentor, chancellor, treasurer, arch-deacon, and one prebendary. This diocese occupies the western portion of the county of Down, and extends partially into Armagh and Antrim. It contains 28 benefices. The foundation of the see is attributed to St. Colman in the 6th century. By Act 3rd and 4th Wm. IV. c. 37, this bishopric has become incorporated with the united diocese of Down and Connor.

DRONERO [CONI.]

DRONFIELD. [DERBYSHIRE.]

DRONTHEIM. [TRONDHJEM.]

DROXFORD, a division of Hampshire which has been constituted a Poor-Law Union. Droxford Poor-Law Union, which is nearly coextensive with the division, contains 11 parishes, with an area of 47,476 acres, and a population in 1851 of 10,676. The population of the parish of Droxford, in which the Union Workhouse is situated was 2005 in 1851. Droxford village is situated in 50° 58' N. lat., 1° 8' W. long.; distant 12 miles S.E. from Winchester, and 62 miles S.W. from London. The living is a rectory in the archdeaconry and diocese of Winchester.

DRUMSNA. [LEITRIM.]

DRUSES. [SYRIA.]

DRYPOOL. [YORKSHIRE.]

DUBLIN, a maritime county in the province of Leinster in Ireland, lies between 53° 11' and 53° 37' N. lat., 6° 3' and 6° 32' W. long.; and is bounded N.W. and N. by the county of Meath, E. by the Irish Channel, S. by the county of Wicklow, and S.W. by the county of Kildare. Its greatest length from north to south, between Gormans-town and Bray, is 32 miles; and its greatest breadth, between Howth Head and Leixlip, is 18 miles. The area, not including the city of Dublin, comprises 222,709 acres, of which 196,063 are arable, 19,312 uncultivated, 5519 under plantations, 170 covered with rivers, canals, &c., and 1820 in towns. Exclusive of the city of Dublin the population in 1851 was 146,631.

Surface and Coast-line.—The county of Dublin, excepting a small tract on the south, is fertile and well cultivated. The only portions of the county not under cultivation are the promontory of Howth, and the range of mountains which separates Dublin from Wicklow on the south. The Dublin mountains, of which the central group has an average height of 1000 or 1200 feet, are partially separated from the loftier elevations of the county of Wicklow by the valley of Glencullen on the east, and by that of Ballynascorney or Glenismake on the west; a neck of elevated land, intervening between these valleys, connects the range with the Kippure group on the south, the highest point of which rises to the height of 2473 feet above the sea-level. The whole range forms a fine mountain back-ground to the rich scenery of the plain of Dublin.

The northern part of Dublin county is more undulating than the immediate vicinity of the capital. A low range of cultivated eminences, called the Man-of-War Hills, extends across the line of communication with Meath and Louth, and the ground on the north-western border next Meath and Kildare is pretty much broken by picturesque valleys. The only marked eminences however north of the mountainous tract, are the islands of Lambay and Ireland's Eye, and the hill of Howth. The isthmus which connects Howth with the mainland is a low narrow neck, which gives Howth very much the appearance of an island. The highest point of the promontory of Howth is 567 feet above the level of the sea. The cliffs towards the bay and channel are lofty, and the whole promontory contributes much to the picturesque effect of Dublin Bay.

The coast which, reckoning all its windings, has a length of 70 miles, is indented by the Bay of Dublin and by several creeks forming tide harbours; the principal of which are those of Killiney, Malahide, Rogerstown, and Lough Shinny. Artificial harbours have been formed at Balbriggan, Howth, and Kingstown.

South of Skerries the sandy shore gives place to a limestone cliff as far as the creek of Lough Shinny near the town of Rush. Off the creek of Malahide is the rocky island of Lambay. The peninsula of Howth contains about 1500 acres, and, except towards the low isthmus which connects it with the mainland, stands in deep water. The sound between Howth and Ireland's Eye (a rocky picturesque island of thirty acres, which lies about three quarters of a mile off the northern side of the promontory) being a sheltered situation with considerable depth of water, was, till the erection of Kingstown Harbour, the chief government packet station. The harbour consists of two piers—the eastern one 2493 feet in length, and the western 2020 feet. On the extremity of the eastern pier is a lighthouse. The whole work is faced with cut granite, except the sloping glacis under water, which is of red grit from Runcorn in Cheshire. This harbour, the formation of which cost nearly half a million sterling, is now almost entirely neglected. From Howth round to the sands of the North Bull the whole of the promontory is rocky and precipitous towards the sea. On a detached rock at the south-eastern extremity, called the Bailey, stands a lighthouse, which marks the northern entrance to the Bay of Dublin. From the Bailey of Howth to Dalkey Island at the opposite extremity of the Bay of Dublin, is a distance of 6½ English miles. Between these points the bay recedes in a semi-elliptical sweep to a depth of about six miles inland. The shore surrounding the head of the bay, where the Liffey, Tolka, and Dodder rivers empty themselves, is low: it rises however towards Blackrock and Kingstown, and beyond Kingstown is of a bold and picturesque character. The river of Bray, which discharges itself about half a mile north of the promontory of Brayhead, is the county boundary.

As a harbour, the Bay of Dublin is materially encumbered by a great tract of sand, which is bisected by the Liffey in a direction from west to east. The portion on the north of the Liffey is called the North Bull, and that on the south the South Bull. In order to protect the navigation of the Liffey from the sands of the South Bull, a pier consisting of a mound of gravel contained between double stone walls was undertaken by the Irish government in 1748. It runs from the suburb of Ringsend along the northern margin of the South Bull, to a distance of 7938 feet. In 1761 a lighthouse was commenced at the extremity of the Bull, and from it a wall was carried inwards towards the Pigeon-house. This sea-wall, completed in 1796, is composed of two parallel walls of hewn granite, laid without cement; the space between is filled to a certain height with gravel and shingle; over this there is a course of stone-work imbedded in cement; and the whole is finished on the top with a course of granite blocks laid in trass. The wall is 32 feet broad at bottom, and 28 feet at top. The Pigeon-house has been converted into a dépôt for artillery and military stores. Another wall, called the North Wall, running nearly south-east from the opposite shore of Clontarf, is intended in like manner to confine the sands of the North Bull. By means of these works the navigation of the Liffey has been greatly improved, but the channel requires constant dredging. The bar, on which there are eleven feet of water at spring-tides, runs across the channel immediately outside the lighthouse. An extensive basin in continuation of the North Wall basin, and a graving dock 384 feet long by 80 feet wide, are now in course of construction.

The insecurity of the bay, joined to the failure of the works at Howth, led to the formation of a harbour at Kingstown, on the site of the old harbour of Dunleary, on the south side of the bay, in 1817. The small pier and tide harbour at Dunleary have been inclosed within the new works, and are now crossed by the Dublin and Kingstown railroad. The new harbour is formed by two piers inclosing an area of 250 acres, with a depth of from 15 to 27 feet, and approaching each other within a distance of 850 feet. The eastern pier, on the extremity of which there is a bright revolving light, is 3500 feet long; the western one has a length of 4900 feet; and along both piers there are quays, 40 feet wide, which are protected from the sea by parapets 9 feet high. Along the breast of the harbour is a wharf 500 feet long.

Hydrography and Communications.—The Liffey has a course of little more than eight miles from the point where it enters Dublin county to the Bay of Dublin at Ringsend. It is navigable for sea-borne vessels to the custom-house, and for barges and row-boats to Chapelizod, about three miles further up. The Dodder, the course of which lies almost wholly within this county, takes its rise from numerous small streams descending from Kippure Mountain, and forming a rapid stream which descends in a course of about ten miles into the Bay of Dublin at Ringsend. The Tolka is a small river rising near Dunboyne in the county of Meath: it flows east by south through Blanchardstown and Glasnevin to the north-western extremity of Dublin Bay, which it enters below Ballybough bridge.

The county is traversed in a westward direction by the Royal Canal and the Grand Canal, which unite the Liffey with the Shannon. The Royal Canal leaves the Broadstone terminus (which opens into the Liffey a little east of Dublin custom-house) and passes through Maynooth, Mullingar, Ballymahon, and Killashee to Tarmonbarry on the Upper Shannon, the whole length being 92 miles. The width of the canal throughout is 42 feet at top and 24 feet at bottom; the depth of water is sufficient to float barges of 100 tons. The summit-level is

near Mullingar, 53 miles W. from Dublin, and at a height of 322 feet above the sea; here the canal is fed by the waters of Lough Owel. The articles borne on this canal into the interior are coals, manure, and merchandise of various kinds; those conveyed to the capital comprise stone, sand, bricks, turf, corn, meal, potatoes, pigs, butter, &c. A branch canal connects the town of Longford with the main trunk at Killashee.

The Grand Canal, the most important line of internal navigation in Ireland, runs west by south from James's-street Harbour, on the south-west of the city of Dublin, across the counties of Dublin, Kildare, and King's County to the Shannon at Shannon Harbour, whence a branch, 15 miles in length, runs to Ballinasloe along the right bank of the Suak, completing the navigation westward for a distance of 95 miles from the capital. At its highest level, which is 279 feet above the sea, near Robertstown in the county of Kildare, the canal is fed by two tributaries of the Barrow; the slope between Dublin and Robertstown is 26 miles in length, and the ascent is effected by means of four double and fourteen single locks. The dimensions of the canal throughout are 45 feet at the top and 25 feet at bottom; the depth of water is six feet in the body of the canal and five feet on the sills of the lock-gates. From the main trunk at Robertstown a very important branch runs south-west through Rathangan to Monasterevan, whence along the right bank of the Barrow two cuts have been made, one to Mountmellick and the other to Athy, below which the Barrow is navigable to its mouth in Waterford Harbour. The Grand Canal has an extensive range of docks, covering an area of 25 acres on the right bank of the Liffey near Ringsend. The communication with the river is by three sea-locks, and the basins within are capable of containing 600 sail in 16 feet of water. Attached are three graving-docks for vessels of different dimensions, with several extensive stores; the whole being surrounded by spacious wharfs. The communication between the Grand Canal docks and the line from James's-street Harbour is by a branch canal of about three miles, running from the docks round the south-east and south of the city.

The main roads, subject to turnpikes, which issue from Dublin, are those to Howth, Malahide, Drogheda by Swords and the Naui, Drogheda by Ashbourn, Ratoath, Navan, and Mullingar, Carlow by Rathcoole and Tallaght. The chief lines free from toll are the military road and the roads to Enniskerry, Bray, and Kingstown. The railroads that radiate from the capital and traverse the county of Dublin are—the Dublin and Drogheda line, which runs northward along the coast through Malahide and Balbriggan, and sends off a branch to Howth; the Great Southern and Western, which connects Dublin with Limerick and Cork, passing through Clondalkin and Lucan in this county; the Midland Great Western, connecting Dublin with Galway; and the Dublin and Kingstown line, which is continued from Kingstown to Dalkey on the atmospheric principle.

Geology and Mineralogy.—The greater part of the county of Dublin is occupied by a tract of mountain limestone, extending northward into Meath, and bounded in this county on the south by primitive rocks. Along the northern coast also there are patches of primitive rock, as the greenstone and argillaceous schists, which form the Man-of-War Hills and the island of Lambay, and the stratified quartz and schist of Howth. The primitive formation on the south of the limestone plain consists of a ridge of granite supporting flanks of micaceous and argillaceous schists. At Dalkey, and generally along the eastern and north-eastern limits of the granite district, the stone quarried is of the closest grain, and excellently adapted for building purposes. Between Blackrock and Dundrum the edges of the limestone field are in several places within a few yards of the granite, the intervening rocks of the series not being observable. The limestone is extremely compact along the margin of the field towards the primitive series, and forms a good building material. Magnesian limestone occurs at Sutton-on-Howth, and on the Dodder, near Milltown. It dresses with peculiar sharpness under the hammer or chisel.

The only mines worked are the lead and copper mines at Ballycorus, within half a mile of the Scalp. Galena, potters'-clay, and manganese have been found on Howth, and fuller's-earth of a middling quality at Castleknock, on the left bank of the Liffey.

Climate, Soil, Agriculture, &c.—The climate of Dublin is temperate; frosts rarely continue more than a few days, and snow seldom lies. The prevailing winds are from the west; easterly and north-easterly winds prevail in the spring. The quantity of rain that falls at Dublin is less than falls at Cork or Belfast: the average annual depth of rain is only about 23 inches 7 lines.

The soil of Dublin abounds in mineral springs: of those within the city ten are saline purgative springs. There is at Lucan, on the right bank of the Liffey, a spa strongly impregnated with sulphuretted hydrogen gas. These waters have been found very efficacious in cutaneous diseases. There are tepid springs of 75° Fahrenheit near Finglas and Loixlip. The water, which rises from the Calp district around Dublin, is so impregnated with sulphate or nitrate of lime as to render it unfit for most domestic purposes.

The vegetable soil of the county of Dublin is generally shallow. On the granite bottom it is a light gravel, which requires strong manuring. The subsoil of the Calp district is a tenacious clay, which retains the water and renders the loamy soil wet and cold; but drainage and an unlimited supply of scavengers' manure from the city have brought

that part of this district, which lies immediately round the capital, into a good state of productiveness. The quality of the land improves towards the west and north, and the district bordering on Meath is not inferior to the generality of wheat lands in the midland counties. Villas, gardens, dairy-farms, kitchen-gardens, and nurseries occupy the immediate neighbourhood of the capital, and grazing-farms and meadow-lands extend over the country which is not occupied by demesnes, to a distance of 10 and 12 miles beyond those on the west and north. Cattle, sheep, and pigs are numerous and of improved breed: in 1851 on 18,512 holdings their numbers were respectively 41,845; 30,775; 21,067. The horses on the same holdings in the same year were 19,921: poultry numbered 155,286. In the rural districts tillage-farms vary from 10 to 800 acres; by far the greatest number consists of from 10 to 30 acres. Grazing-farms are larger, varying from 200 to 700 acres. The fields are mostly inclosed by quickset hedges.

Divisions and Towns.—The county is in the archdiocese of Dublin, and in the diocese of Glendalough. It is divided into four Poor-Law Unions, North Dublin, South Dublin, Balrothery, and Rathdown; and into nine baronies:—1 and 2. Balrothery (East and West) on the north. 3. Nethercross, scattered through the other baronies in seven separate divisions, of which six lie north of the city of Dublin. 4. Coolock, on the north-east of the city of Dublin. 5. Castleknock, on the north-west of the city of Dublin. 6. Newcastle, on the west and south-west of the city of Dublin. 7. Uppercross, on the south-west of the city of Dublin. 8. Rathdown, on the south-east of the city of Dublin. 9. Dublin.

DUBLIN, the capital of the county and of Ireland; BALROTHERY and RATHDOWN, which are seats of Poor-Law Unions, with the sea-port of KINGSTOWN, are noticed in separate articles. The towns and villages which further require to be noticed we give here.

Balbriggan, population 2810 in 1851, a small sea-port town 22 miles N. by E. from Dublin on the Drogheda railway, is a place of some trading and manufacturing importance. It was a mere fishing village previous to 1780, when Baron Hamilton laid the foundation of its permanent improvement by the erection of two cotton factories, and the construction of a pier to improve the harbour. The public buildings are a church with a square embattled tower, a Roman Catholic chapel, a Methodist meeting-house, a sessions court-house, and a market-house. Quarter and petty sessions are held. The town is the head-quarters of the district police; and there is a coast-guard station at the martello tower on the strand. An important corn-market is held on Mondays. Cattle fairs are held April 29th and September 29th. Fustians, checks, jeans, and calicoes, are extensively manufactured. The embroidering of muslin employs a good many hands; and about 40 stocking frames are employed in the manufacture of the famous 'Balbriggan hosiery.' There are here dye-houses attached to the factories, a tan-yard, and salt-works. A viaduct of 11 arches, 35 feet high, by which the Drogheda railway crosses the harbour, is a great ornament to the town. The new and inner harbour, completed in 1829, formed of a curved pier 420 feet long, and terminating in a lighthouse, has 14 feet water at high tide. The chief exports are corn, meal, and flour; the imports are coal, bark, and salt. **Baldoye**, population 817, situated on a small creek, about 7 miles N.E. from Dublin. There is here a station of the Dublin and Drogheda railway. The Roman Catholic chapel is a handsome edifice, with a portico of four Tuscan pillars, over which is a turret supporting a dome and cross. In the village are a dispensary, National schools, and stations of the constabulary and the coast-guard. In summer the visitors to the place for sea-bathing are numerous. A small fishery is carried on. **Blackrock**, population 2342, a well but irregularly built town, consisting of a main street, and several smaller streets, is situated on the Kingstown railway, 5 miles S.E. from Dublin. The town stands on the south shore of Dublin Bay, in a very pretty neighbourhood, studded with marine villas. It is much resorted to for sea-bathing. The chief buildings are a chapel of ease, a Roman Catholic chapel, and a Carmelite nunnery, attached to which there is a large Free school for girls. **Boaterstown**, population 535, on the shore of Dublin Bay, about 3 miles S.E. from the General Post-Office, contains a neat church, adorned with a square tower and pinnacles and a lofty spire; a commodious chapel for Roman Catholics, and a convent of Sisters of Mercy, in which about 200 poor children receive instruction. There are here National schools. The Kingstown railway runs close past the village and has a station here. **Bray**, situated on the sea-shore, 12 miles S.E. from Dublin at the mouth of the Bray River, is partly in Dublin county, but chiefly in Wicklow. The portion of the town situated in the county of Dublin is called *Little Bray*, and contained in 1851 a population of 1096; it is united to the Wicklow portion by an old bridge of four arches. The entire population of the town is 3156. The most important buildings, which are all on the Wicklow side, are a church, a Roman Catholic chapel, a Presbyterian chapel, and a Methodist meeting-house; there are also a fever hospital, a savings bank, National schools, a petty sessions-house, and police and coast-guard stations. The chief trade of Bray is in coal, slate, and Sutton limestone, which are imported in small craft; corn is exported. There are many handsome villas in the neighbourhood. Markets for provisions are held on Tuesday and Saturday. Ten fairs are held in the course of the year. **Chapelizod**, population

1683, situated on the Liffey, 3 miles W. from the Dublin General Post-Office, has a church, a Roman Catholic chapel, a National school, and a police station. The beautiful scenery of the Liffey in this neighbourhood, and the proximity of the Phoenix-park render it a favourite place of resort in summer. Opposite to one of the entrances to the park near the village is the Roman Catholic church of the Nativity, a handsome building in the early English style, with a tower 120 feet high. **Clondalkin**, population 474, about 4½ miles S.W. from Dublin, is situated close to the Grand Canal, and to the line of the Great Southern and Western railway, of which there is a station here. The village contains several neat houses. There are here the parish church, a chapel for Roman Catholics, almshouses for widows, and several charitable institutions. Near the village is the monastery of Mount Joseph, established in 1813. There is here an ancient round tower 100 feet high, 15 feet in diameter, with a conical roof of stone. Numerous handsome residences are in the vicinity. **Clontarf**, population of the village and sheds 875, memorable in Irish history for the great defeat of the Danes by the Irish under Brian Boru on Good Friday, 1014, is a pretty but scattered village, 3 miles E.N.E. from Dublin. The old castle of Clontarf was taken down in 1835 and a modern mansion with a Norman tower erected on its site. Marino, the seat of the Earl of Charlemont, is close to the village. A small church and a large and handsome Roman Catholic chapel are the most notable buildings. There are extensive oyster beds off the sheds of Clontarf. **Dalkey**, population 252, distant 8 miles S.E. from Dublin, at the eastern extremity of Dublin Bay, was formerly a town of some importance, and had in 1358 a charter of incorporation. The chief relics of its ancient consequence are the remains of three old forts, and a church. The only public building is the Roman Catholic chapel. A large church has been recently erected near the coast; and not far from it is the Loretto convent, a handsome cruciform structure. In the village there are a National school and coast-guard and police-stations. On Dalkey Island, which is about 3 miles from the shore and has an area of 22 acres, are a martello tower and battery. The atmospheric railway connects Dalkey with Kingstown and Dublin. **Donnybrook**, population 1970, a suburb of Dublin, on the road to Bray, is situated on the Dodder, which is crossed by Anglessea bridge. The public buildings include the parish church, chapels for Roman Catholics and Wesleyan Methodists, a Magdalen asylum, a dispensary, a lunatic asylum, and an hospital for incurables. It was formerly famous for its fair, originally granted by King John, and lasting 15 days from the 26th of August. The fair, which is now one of pleasure, is still held; but it does not continue longer than a week, and of late years it has been greatly shorn of its traditional glories. **Drumcondra**, population 434, a suburb of Dublin, about 2 miles N. from the General Post-Office, contains many elegant mansions. The Roman Catholic Missionary college of All Hallows, a commodious building, situated in the midst of extensive grounds, provides accommodation for 200 students, who are educated for foreign missionary service. There are here a Roman Catholic chapel, a dispensary, and an asylum for female penitents. **Dundrum**, population 594, about 4 miles S. from the General Post-Office, consists of one main street, chiefly cottages. It contains a chapel for Roman Catholics, a petty sessions court-house, a dispensary, and a National school. The parish church of Tancy, a handsome cruciform edifice, stands on Taney hill. The village is finely situated and is much resorted to in summer by invalids. **Glamevin**, population 398, a suburb of Dublin, 2 miles from the General Post-Office, is situated on the bank of the river Tolka. There are here a small church, the Model Training school of the National Board of Education, the Clarendon Institution for the deaf and dumb, a Roman Catholic institution for the deaf and dumb, almshouses for widows, the Botanic Gardens of the Dublin Society, and Prospect cemetery, which contains several beautiful monuments, including one to the memory of Curran. **Harold's Cross**, population 2934, situated on the Grand Canal and on the road to Rathfarnham, 3 miles S. by W. from Dublin, is a large village built round a spacious central green, and surrounded by handsome villas and grounds. The principal buildings in and near the village are—the church, at the entrance of Mount Jerome cemetery; the convent of St. Clare, attached to which is a neat chapel; a Free school for female orphans; the Carmelite friary; and Pinn's cotton factory, in which 6000 spindles are driven by steam and water power. The cemetery, the great attraction of the place, has an area of 25 acres beautifully laid out and surrounded by a shrubbery and lofty trees. It contains many handsome tombs and monuments, including one to the late Mr. Drummond, under-secretary for Ireland. **Howth**, population 829, a small fishing town, about 8 miles N.E. by N. from Dublin, consists chiefly of one main street. It contains the parish church, a Roman Catholic chapel, a dispensary, a National school, and stations of the constabulary and the coast-guard. The harbour cost a large amount of public money, but did not answer the purpose of its construction, and the mail packet station was in consequence transferred to Kingstown. Howth castle is an extensive embattled structure with a tower at each end. George IV. landed at Howth in August 1821. A branch of the Dublin and Drogheda railway was opened to Howth in August 1846. **Kilmainham**, population 473, besides 255 inmates of the jail, a suburban village on the road to Naas and near the terminus of the Great Southern and Western

railway, is interesting for its Royal hospital, county court, and jail. The hospital is a quadrangular building two stories high, inclosing an area 210 feet square, neatly intersected with walks; the north entrance is surmounted by a square tower, clock turret, and octagonal spire. The hospital is the official residence of the Commander of the Forces in Ireland. Like Chelsea hospital in London, which it resembles also in its architectural features, Kilmainham hospital forms a home for maimed officers and soldiers. It was built in 1680, after a design by Sir C. Wren. The county court-house is a large and handsome building, connected with which is the county jail. Elections of members for the county are held here, and also quarter sessions. In the village is a chapel for Independents. There are some woollen cloth mills at Kilmainham. Not far from the hospital is the terminus of the Great Southern and Western railway, the platform of which is 612 feet long, covered in by a roof supported on 72 cast-iron columns. *Lucan*, population 578, a village on the Great Southern and Western railway, is situated 7 miles W. from Dublin, on the high road to Galway, and consists of a wide street of small but neat houses. It occupies a pretty site, in a fertile valley on the left bank of the Liffey, which is here spanned by a bridge of one arch with a granite parapet. The village contains a parish church, which is surmounted by a tower and spire, a large Roman Catholic chapel, a Methodist meeting-house, the spa-house, and National schools. Lucan is noted for its chalybeate spring. The scenery round the village is varied and beautiful. In Weston Park the Liffey falls over a series of rocky ledges and forms a cascade called the 'Salmon Leap,' over which the fish dart at a single bound. *Lusk*, population 710, situated near the Rush station on the Drogheda railway, 17 miles N. by E. from Dublin, has a handsome church with a massive square tower, erected on the site of Lusk abbey, a large Roman Catholic chapel, and two National schools. Lusk church contains several ancient ecclesiastical remains. *Malahide*, population 596, a small village on the Malahide inlet, 9 miles N. from Dublin on the Drogheda railway, consists chiefly of neat cottages, let in the summer to sea bathers, and has a parish church, a Roman Catholic chapel, and police and coast-guard stations. Across the inlet, which is dry at low water, the Drogheda railway is carried by a wooden viaduct and embankments. Grain, meal, and flour are exported, and large quantities of coal are imported. Off the coast there are extensive oyster beds. The castle, or 'Court of Malahide,' a large square building flanked by lofty circular towers, stands on a high limestone rock, commanding a fine view of the bay. It has been the residence of the Talbots, lords of Malahide, since 1174, with a short interval during the Commonwealth; and contains several splendid apartments roofed and decorated with richly carved ancient Irish oak. *Ranelagh*, population 3209, a suburb of Dublin, situated on the road to Dundrum, 2 miles S.E. from the General Post-Office, consists of a main street, a square, and several avenues and terraces. The Carmelite convent, attached to which is a handsome chapel, and the Methodist meeting-house, are the principal buildings. There are many pretty villas and ranges of houses in the neighbourhood of Ranelagh. *Rathmines*, population 3216, a suburb, about 2 miles S. from the General Post-Office, separated from Dublin city by the Grand Canal, which is here crossed by Latouche's bridge, presents a street of well-built houses a mile and a half in length, intersected by avenues and terraces. The church of the Holy Trinity and the Roman Catholic chapel are handsome structures. There are Free and National schools. On the right of the road to Dublin are the Portobello artillery and cavalry barracks. Considerable improvement has taken place in the neighbourhood within the last few years. *Rush*, population 1496, a fishing village, situated on the coast 17 miles N. by E. from Dublin, has a commodious harbour for small craft. The harbour has been recently repaired, and will accommodate vessels of about 50 tons burden. The banks frequented by the Rush fishermen are about 20 miles from the shore, and abound in ling, hake, and haddock. The Roman Catholic chapel and the martello tower on the beach are the principal buildings. Kenure Park, near the town, is a spacious and handsome mansion, once the residence of the great Duke of Ormond. *Skerries*, population 2327, a small town situated on the coast and on the line of the Drogheda railway, 18 miles N. by E. from Dublin. The inhabitants are chiefly engaged in the fishery off the coast. The chief buildings are the parish church, which has a square tower surmounted with pinnacles, and a large Roman Catholic chapel. There are here malting-kilns, corn-mills, and a yeast brewery. A coasting trade is carried on in potatoes, limestone, and coal. A great number of females in the town and neighbourhood are employed in muslin embroidery. The harbour is formed by a pier, and affords good holding ground and shelter for vessels of about 90 tons. The town is frequented in summer for bathing. Off the port are the four Skerry Islands. There is a martello tower on Shenicks Island, the largest of the four, which has an area of 15 acres; and another on Red Island, which is nearest the shore. *Swords*, population 1294, is a market town situated on the road to Drogheda, 8 miles N. from Dublin, and on a small river that enters Malahide Bay. From 1578 to the Union, Swords was a parliamentary borough and returned two members to the Irish Parliament. At the Union 15,000*l.* were granted as an indemnification for the loss of its privileges; with the money was founded a school, which still exists, and is attended by above 300 children. The town consists

of a wide street about a mile in length. The parish church, a handsome modern structure, and a Roman Catholic chapel, which is surmounted with a small tower and spire, are the chief buildings. Quarter sessions are held here twice a year, and petty sessions every fortnight. There is a National school in Swords. The parish of Swords is studded with numerous country seats and villa residences. There are here a round tower and some remains of ancient ecclesiastical buildings.

Before the Union, Swords and Newcastle returned two members each to the Irish Parliament. The county of Dublin, the city of Dublin, and the university of Dublin are each at present represented by two members in the Imperial Parliament.

The commerce of the county of Dublin, exclusive of the capital and its immediate vicinity, is limited to the coasting trade carried on at Balbriggan, Bray, and the other towns along the coast. The cotton and stocking manufactures carried on at Balbriggan have been already mentioned. Many females are employed in embroidering muslin for Belfast and Scotch houses. There are extensive corn-mills on the Liffey, the Balbriggan river, and the Kimmage brook, on the south-west of Harold's Cross. The fishing-grounds lie in from 15 to 60 fathoms' water between the Dublin coast and the Isle of Man. The fish consist chiefly of turbot, brit, sole, and plaice, which are sent to market daily throughout the year. There is a well-known fishing-ground between Rush and Lambay Island on which cod, ling, haddock, whiting, &c., are taken. The fishery districts of Dublin and Swords comprise together 85 miles of sea-coast.

The Pagan antiquities of the county of Dublin are not numerous. There is a cromlech on the hill of Carrikmoor in Howth. Another cromlech stands to the south of Killiney, on the descent into the vale of Shanganagh; and at Brennanstown, on the Bray road, 6½ miles from Dublin, there is a third of large dimensions. Dublin is however rich in ecclesiastical and military antiquities. The round tower of Clondalkin, 4½ miles from Dublin, on the southern road by Rathcoole, is in better preservation than most similar edifices in Ireland. The antiquities at Swords, on the great northern road, 7 miles from Dublin, consist of a palace of the archbishops of Dublin in ruins, a square steeple of the old church, and a round tower 73 feet in height. This tower is also in good preservation, and retains its conical stone capping. Between Swords and Baldoyle, 5 miles from the capital, is the hamlet of St. Doulagh's, containing one of the most singular stone-roofed churches in Ireland. The entire edifice measures but 48 feet by 18 feet. It is divided into a rude nave and choir, which communicate by a narrow square-headed doorway not sufficiently high to admit a full-grown person upright. The castles of Clontarf, Baldangan, Naul, and Castleknock are among the principal detached military edifices.

The county assizes are held at Kilmainham, and the quarter-sessions at Kilmainham, Balbriggan, and Swords. In December 1851 there were in the county 148 National schools, attended by 12,758 male and 14,514 female children. The constabulary force of the county numbers 243 men including officers; the head-quarters of the force are at Ballybough. There are 11 coast-guard stations in the county. The county of Dublin, together with the cities of Dublin and Drogheda, and the counties of Meath, Louth, and Wicklow, contribute in proportion to their populations to the support of the Richmond Lunatic Asylum, built in Dublin in 1815. Five fever hospitals and 47 dispensaries are supported by voluntary contributions and grand-jury presentments. In 1851 there were 3 savings banks in the county, at Dublin, Balbriggan, and Castleknock. The total amount owing to depositors on November 20th, 1851, was 219,046*l.* 1*s.* 4*d.*

DUBLIN, the metropolis of Ireland, a municipal and parliamentary borough, sea-port town, and the head of two Poor-Law Unions, is situated on the banks of the Liffey at its entrance into the Bay of Dublin, in 53° 20' 38" N. lat., 6° 17' 29" W. long., and 60 miles W. from Holyhead. The population, which in 1841 was 232,726, amounted to 258,361 in 1851. The borough is governed by 15 aldermen and 45 councillors, one of whom is annually elected lord mayor; and returns two members to the Imperial Parliament: two members are also returned by the University of Trinity College. For purposes of police the city and its dependencies are divided into 7 districts, placed in charge of 2 commissioners, 7 superintendents, and 24 inspectors, with 100 sergeants, 1000 constables, and 20 supernumeraries. The North Dublin Union comprises 9 electoral divisions, with an area of 41,187 acres, and a population in 1851 of 135,182. The South Dublin Union comprises 8 electoral divisions, with an area of 48,523 acres, and a population of 183,594.

The early history of Dublin is involved in great obscurity. It is generally agreed that the city named Eblana in the geography of Ptolemæus occupied the site of Dublin; and the name Eblana, as well as the names Dublin, Dyflin, and Dyvelin, which are met with in historical documents, all seem to be corruptions of the Irish Dubh-linn, which signifies Black-pool. The city was held in early times by the Viking-Ostmen, who built a citadel here and carried on constant predatory warfare with the native Irish. In 845 the Danes arrived in Dublin, demolished the citadel, and slaughtered or subjected its Norwegian inhabitants. For more than two centuries the Danes of Dublin continued to wage war with the native Irish, causing much devastation and bloodshed.

The history of Dublin since the Anglo-Norman invasion in 1170

belongs rather to the general history of the kingdom than to that of the city. [IRELAND.] Under the Norman sway the city increased in importance and extent. In 1205 the castle was ordered to be built and the city to be fortified, and in 1215 a stone bridge was built over the Liffey. The Reformation was established in Dublin in 1535; in 1550, on Easter Sunday, the liturgy was read in English for the first time in Christ church. The university of Trinity College was founded by Queen Elizabeth in 1593. Since the Union with Great Britain, although Dublin has greatly declined as a centre of commercial and manufacturing industry, it has increased in size and population, and continues to advance in architectural improvement.

The ground on which Dublin stands rises gently from the river towards the north and south-west: the highest ground in the city is at the Broadstone harbour of the Royal Canal, which is 62 feet above the level of high-water in the Liffey. The Circular Road, which has a length of about 9 miles, incloses a much larger space than is occupied by the city, especially to the south-west and north-west. The city is lighted with gas, and it is supplied with water chiefly from the Royal and Grand canals.

The eastern division of the city, on the right bank of the river lies almost wholly without the limits of the ancient city, and stands on level ground, the northern part of which has in a great measure been reclaimed from the former bed of the Liffey. Six extensive spots of open ground ornament and ventilate this portion of the city; namely, Wellington-square, Fitzwilliam-square, Merrion-square, the park of Trinity College, the Castle gardens, and Stephen's-green. Dame-street, which leads from the castle to the university, expands towards its eastern extremity into College-green, from which all the leading lines of communication radiate. The whole area of College-green on the east is occupied by the front of Trinity College, a large and dignified pile of building of the Corinthian order erected in 1759, and extending north and south 300 feet, a little in advance of the provost's house.

Near the college stands the Bank of Ireland, formerly the Irish house of parliament, founded in 1729, which presents a portico of six Corinthian columns towards College-street, and a semicircular façade with a receding centre of unusual magnificence towards College-green. In the roadway opposite the bank is an equestrian statue of William III., in former days the object of many party demonstrations.

Of the squares which lie east and south of College-green, Stephen's-green is the first in point of extent. The area within the railing measures more than 20 statute acres, and is handsomely laid out. In the centre of the inclosure there is an equestrian statue of George II. In Dawson-street, which leads out of the north side of Stephen's-green, is the Mansion House, a large plain building with a statue of George I. on the lawn on the south side of it. A little east of the Mansion House is the Dublin Society's House, between Kildare-street and Merrion-square. Here is the site of the building for the Great Exhibition held in Dublin in 1853. Merrion-square, the finest in Dublin, is formed by handsome buildings inclosing an area of 12½ acres, which is tastefully laid out, forming a favourite promenade. Other remarkable objects in this division of the city are—Sir Patrick Dun's Hospital, a large granite structure; the Grand Canal docks; Queen's-square, off Great Brunswick-street; St. Andrew's, a large and costly Roman Catholic chapel; the terminus of the Kingstown railway in Westland-row; and on Burgh Quay, south-east of Carlisle bridge, the building formerly known as Conciliation Hall, and the Corn Exchange, a handsome structure of mountain granite.

The eastern division of the city on the left bank of the Liffey occupies higher ground, and is airy and cheerful. Mountjoy-square and Rutland-square occupy the crest of the hill, and from these respectively the chief lines of communication are Gardiner-street and Sackville-street. The façade of the Lying-in Hospital and the Rotundo forms a striking termination to Sackville-street on the north. In Sackville-street, about midway between Carlisle bridge and the Rotundo, stands a fluted Doric column, on a pedestal of large proportions, bearing a colossal statue of Lord Nelson, erected in 1808. A little farther south on the west side of the street is the General Post-Office, which has a cut-granite front of 223 feet. In the centre is a portico of Portland stone, with colossal statues on the apex and extremities of the pediment. The Custom House occupies a detached plot of ground on the quay leading from Carlisle bridge to the north wall. This splendid building, founded in 1781, is 375 feet in length by 205 feet in depth, and exhibits four decorated fronts of the Doric order; the columns, &c., being of Portland stone, and the body of the building of cut granite. To the east of the Custom House are docks and stores on a very extensive scale, surrounded by a lofty wall. Near the Custom House is the terminus of the Drogheda railway.

The Roman Catholic metropolitan church, situated in Marlborough-street, is a magnificent structure, erected in 1816 at a cost of 40,000*l*. Opposite to this church is the central establishment of the National Board of Education, occupying a space of above five acres, and comprising a board-room, library, commissioner's residence, male and female Training and Model schools, and an Infant school. St. George's church, adorned with a beautiful spire, and occupying the highest ground in the district, is the most sumptuous of the modern churches of Dublin; it was erected from a design by Johnstone, and cost 70,000*l*. In Upper Gardiner-street is the Roman Catholic chapel of St. Francis Xavier, which has a handsome Ionic portico.

The western division of the city, on the left side of the river, is almost exclusively occupied by dealers, tradesmen, and labourers. The portion of it which lies along the quays and towards the Blue-Coat Hospital is however well built. The building called 'The Four Courts,' situated on King's Inn Quay in this district, was commenced in 1786, and is of great extent and splendour. In this district are St. Paul's chapel, a graceful granite structure, with an Ionic tetra-style portico facing Arran Quay; the Blue-Coat Hospital; the Royal Barracks; the terminus of the Midland Great Western railway; the North Dublin Union Workhouse; the Richmond Lunatic Asylum; the Richmond Penitentiary; the House of Industry and hospitals attached; Newgate, the Sheriffs' prison, and the city Sessions House; the Lincen Hall, opened in 1728; and the King's Inns.

West of the Royal Barracks is the entrance into the Phoenix Park, a finely-wooded demesne of 1759 acres, containing the vice-regal lodge, and the lodges of the chief and under-secretary; the Zoological Society's gardens and establishment; the Royal Military Infirmary; a powder-magazine and artillery station; and an obelisk, erected in commemoration of the victories of the Duke of Wellington.

The division of Dublin which lies west from the castle, on the right bank of the Liffey, is the oldest part of the city, and is now almost exclusively occupied by persons in trade, small dealers, and the labouring classes. The castle of Dublin, at the north-eastern extremity of this district, consists of two handsome quadrangles, surrounded, except on one side, by the apartments of state and the offices of government. West of the castle stands Christ church cathedral, a venerable cruciform structure, part of which is of a date anterior to the coming of the English. South from Christ church, at a distance of rather more than a quarter of a mile, is the cathedral of St. Patrick, situated at the foot of the declivity, the ridge of which is occupied by the castle and older cathedral. St. Patrick's is an imposing pile, consisting of nave, transepts, and choir, with a chapter-house at the east end. Attached to the cathedral are the ancient archiepiscopal palace (now used as a police-barrack), and the deanery-house, a commodious residence built in the last century. At the back of the old palace is the library founded by Archbishop Marsh in 1694. South of this division are a penitentiary, the Portobello gardens and barracks, and several hospitals; and on the west of it are the South Dublin Union Workhouse; the Royal Hospital of Kilmainham, built at the cost of the army in 1684; the Foundling Hospital; Swift's Hospital for lunatics; Steevens's Hospital; the terminus of the Great Southern and Western railway, a remarkably handsome granite structure situated between Steevens's Hospital and King's bridge; Kilmainham jail and court-house; and the artillery barracks at Island bridge. The Liffey is crossed by nine bridges, seven of which are executed in stone, and two in metal. It is lined for a space of nearly three miles with quays formed of stone embankments faced with granite.

The condition of the poorer classes in Dublin is wretched in the extreme; yet there are few cities in which charitable institutions are more numerous or better supported. The total number of charitable schools in the city of Dublin is above 200. The Lying-in Hospital in Great Britain-street, founded in 1757, is the earliest institution of the kind in the United Kingdom. Among other institutions are—the Meath Hospital and Infirmary, attached to which are an anatomical theatre and lecture-rooms; the City of Dublin Hospital; the Fever Hospital; and Mercer's Hospital, founded in 1734. The religious and charitable societies are very numerous.

The places of amusement include the Theatre Royal, the Queen's Theatre, the Hall of the Society of Ancient Concerts, the Music Hall for concerts, and the Abbey-street Theatre. The University Choral Society holds its meetings in the refectory of the college. The Portobello and the Rotundo gardens are neatly laid out, and in summer are well attended, on account of the firework displays exhibited.

The trade of Dublin consists chiefly in the supply of the midland districts with articles of import, comprising tea, coffee, sugar, tobacco, timber, deals, wine, &c. The harbour of Dublin has been greatly improved within the last 30 years. Two steam dredges are now employed cleansing and deepening the channel, so that large vessels can unload at the quays, there being a depth of 24 feet on the bar at high water, and about 12 feet at low water of spring tides. Extensive locks, with a depth of 16 feet water, and surrounded by quays and capacious storehouses, communicate with the Liffey to the east of the Custom House; and on the right side of the river the docks that communicate with the Grand Canal afford commodious wharfage for merchantmen and colliers besides that supplied by the river quays. The channel of the Liffey, in Dublin Bay, is now deep enough for vessels of 1400 tons. The number and tonnage of vessels registered as belonging to the port of Dublin on December 31st, 1852, were:—Sailing-vessels, under 50 tons, 279, tonnage 8222; above 50 tons, 131, tonnage 20,239; steam-vessels, under 50 tons, 2, tonnage 84; above 50 tons, 42, tonnage 11,269. During the year 1852 there entered the port, in the coasting and cross-channel trade:—Sailing-vessels, inwards 4746, tonnage 360,316; outwards 2267, tonnage 140,470; steam-vessels, inwards 1444, tonnage 429,659; outwards 1523, tonnage 467,122. In the colonial and foreign trade there entered 403 sailing-vessels of 78,600 tons burden, and one steam-vessel of 606 tons; and there cleared 239 sailing-vessels of 53,386 tons aggregate burden. The gross amount of customs collected at Dublin during the year ending January 5th,

1852, was 893,383*l.*; the excise-duties were 850,540*l.* Large quantities of wine are imported into Dublin. The wines are imported direct, and consist chiefly of port, sherry, cape, French, and Italian wines.

Mercantile business was formerly carried on at the Exchange, but is now transacted at the Commercial Buildings in Dame-street. There are a chamber of commerce, and an arbitration court for cases connected with shipping business. Several foreign consuls reside in Dublin. Much of the inland trade of Dublin is carried on by the Royal and Grand canals, which are noticed under DUBLIN COUNTRY. The woollen, cotton, linen, and silk manufactures, notwithstanding many efforts to revive them, are nearly all extinct. The manufacture of poplin still flourishes to some extent. Brewing, iron-casting, and cabinet-making seem to be the most prosperous branches of manufacture.

Among the learned institutions of Dublin the principal is the University, incorporated as the College of the Holy and Undivided Trinity, which was founded by Queen Elisabeth. The collegiate body consists of a provost, 7 senior fellows, one of whom is vice-provost, 18 junior fellows, 70 scholars, and 30 sizars. The number of students, usually about 2000, is said to have been considerably diminished in consequence of the establishment of the new Queen's colleges in Galway, Belfast, and Cork. The permanent income of the University arises out of landed estates, which produce a rent of 13,846*l.* 2*s.* per annum, exclusive of the provost's separate estate, which produces a rent of 2400*l.* per annum. The income accruing from the class-fees of pupils amounts to about 30,000*l.* per annum, and a large sum is annually drawn in rents of chambers and fees for commons, &c. The college possesses a fine library of above 180,000 volumes, and the number of books is steadily increasing, in consequence of the right which the college has to copyright copies of books published in the United Kingdom. Connected with the University are a museum, rich in minerals and Irish antiquities; a magnetic observatory, in the Fellows' Garden; a school of anatomy near the south-east corner of the college park; a printing-house on the north side of the park; a botanic garden near Ball's bridge; and the astronomical observatory at Dunsink, four miles north-west from Dublin.

By letters patent, dated August 15, 1850, Queen Victoria founded the 'Queen's University in Ireland,' with powers to grant degrees in arts, medicine, and law, to students who have completed their studies in any one of the Queen's colleges of Belfast, Galway, or Cork. The University consists of a chancellor and senate, named by the Crown; the meetings of the senate for holding examinations and granting degrees must be held in Dublin. The Royal Dublin Society, incorporated by George II., 1749, occupies the late residence of the Duke of Leinster, in Kildare-street. The museum of the society is open to the public twice a week; and the professors deliver public and gratuitous lectures. A considerable number of youths are instructed gratis in the fine arts in the Society's schools. The Royal Irish Academy, for promoting the study of sciences, polite literature, and antiquities, was incorporated in 1786. The academy-house is in Grafton-street: the library is rich in ancient Irish manuscripts, and the museum contains a remarkably fine collection of Celtic antiquities. The Royal Hibernian Academy of painting, sculpture, and architecture, incorporated in 1803, has its academy-house in Abbey-street; this building was bestowed on the body by Mr. Johnstone, the distinguished architect. There is here an annual exhibition of painting and sculpture.

The other chief societies for the promotion of science and general knowledge in Dublin are the Zoological, Geological, Agricultural, Horticultural, and Dublin-library societies. Among the institutions lately established is the Museum of Irish Industry, for forming complete collections of the materials for agricultural, mining, and manufacturing industry which Ireland contains. There is a valuable law library belonging to the King's Inns in Henrietta-street.

Dublin is well supplied with provisions of all kinds and of excellent quality. Smithfield, the wholesale market for cattle and hay, is deficient in accommodation; it covers a very small space, and is approached only by narrow lanes. The other markets are in general not sufficiently commodious: they are—Spitalfields for bacon, butter, and potatoes; Kevin-street for the same, and for hay; Boot-lane for fish; and Green-street for potatoes, fowls, eggs, and fruit.

Dublin gives title to an archbishop, who is styled primate of Ireland, and whose province includes the following united dioceses:—Dublin, Glendalough, and Kildare, which form the see of the archbishop; Ossory, Ferns, and Leighlin; Cashel, Emly, Waterford, and Lismore; Cork, Cloyne, and Ross; Killaloe and Kilfenora; and Limerick, Ardert, and Aghadoe. The bishopric of Dublin, founded by St. Patrick or his immediate successors, was erected into an archbishopric in 1152. In 1214 the see of Glendalough, which is now merely nominal, was annexed to that of Dublin; and by the Church Temporalities Act, passed in 1833, the bishopric of KILDARE was consolidated with the sees of Dublin and Glendalough. The archiepiscopal see of Dublin comprises 188 benefices, of which 139 are in the diocese of Dublin, and 44 in that of Kildare; it includes the counties of Dublin, Kildare, Wicklow, a small part of Wexford, and King's and Queen's counties. The chapter of Christ church cathedral consists of a dean, pro-rector, chancellor, treasurer, 3 prebendaries, and 6 vicars choral. The chapter of the collegiate and cathedral church of St. Patrick consists of a dean, sub-dean, proctor, chancellor, treasurer,

20 prebendaries, 4 minor canons, and 13 vicars choral. The income of the archbishop of Dublin is 7786*l.* a year.

(Whitelaw and Walsh, *History of the City of Dublin; Picture of Dublin; MacGlashan, Dublin and its Environs; Land We Live In*, vol. iii.; Thom, *Irish Almanac; Parliamentary Papers*.)

DUBNO, the capital of the circle of Dubno, which is the richest and most productive of the subdivisions of the Russian government of Volhynia, is situated on the Ikwa, a feeder of the Stry, in 50° 25' N. lat., 25° 40' E. long., and belongs to the prince of Lubomirsky, who takes from it a ducal title as its owner. The Polish nobility of these parts held their annual sessions at Dubno from 1774 till Western Poland was seized by Russia. Dubno is an extremely irregular town in its construction; the streets are narrow, crooked, and unpaved; the houses are built almost wholly of wood. The inhabitants, among whom are a great many Jews, number about 8000. Dubno has a ducal residence, a Greek abbey of the order of St. Basil, several Greek and Roman Catholic churches, and a grammar-school. The people carry on much traffic in corn, flax, tobacco, fish, and cattle, the produce of the adjacent country, and hold a large fair at Whitsuntide.

DUDLEY, originally written DUDELEI, Worcestershire, a parliamentary borough, market-town, and the seat of a Poor-Law Union, in the parish of Dudley, is situated in 52° 30' N. lat., 2° 4' W. long.; distant 28 miles N. by E. from Worcester, 120 miles N.W. from London by road, and 125 miles by the North-Western and South Staffordshire railways. The population of the parliamentary borough, which consists of the parish of Dudley, in 1851 was 37,962. The town is under the jurisdiction of the county magistrates, and has a mayor and bailiff appointed by the lord of the manor. For sanitary purposes it is under the management of a Local Board of Health. The borough returns one member to the Imperial Parliament. The living is a vicarage in the archdeaconry and diocese of Worcester. Dudley Poor-Law Union contains 4 parishes, with an area of 16,655 acres, and a population in 1851 of 106,480.

About the commencement of the 8th century a strong castle was built on an elevated site at this place by Dudo, a Saxon prince. In 1664 Colonel Beaumont held the castle for the king for a period of three weeks against the Parliamentary forces; a party of the Royal army arriving from Worcester relieved the besieged force. The remains, consisting of a gateway, the keep, part of the tower, the offices, &c., are of a highly interesting character. A priory for Benedictine monks formerly existed here; the ruins of the building are about half a mile from the town.

The houses in the town are generally well-built and neat in appearance, the streets are clean and well paved, and the town is lighted with gas. The parish church, dedicated to St. Thomas, is a handsome building with a lofty spire. The other churches are St. Edmund's, St. Andrew's or Netherton, St. James's, and St. John's. The Wesleyan and New Connexion Methodists, Baptists, Independents, Presbyterians, and Unitarians have places of worship. The Free Grammar school, endowed by Queen Elizabeth with land which now yields above 300*l.* per annum, educates about 40 scholars. There are National and British schools, a Blue-Coat school well endowed, a Charity school for 40 girls, and a school for 50 boys, at which others besides those on the foundation receive instruction. There are in Dudley a subscription library, a mechanics institute, a savings bank, a dispensary, and various charities for benevolent purposes.

Dudley is a place of considerable importance in connection with the iron trade. The neighbourhood abounds with iron-ore and with coal. Among the articles manufactured are fire-irons, grates, nails, vices, chain-cables, &c. There are extensive glass-works and limestone quarries. A tunnel a mile and three-quarters in length and 13 feet high, for conveying the limestone under the Castle-hill to the kilns, passes through the hill on which the castle stands. Fairs are held on May 8th and October 2nd for cattle, cheese, and wool; and on August 5th for lambs. Saturday is the market-day, and a considerable amount of market business is also transacted on Monday. A county court is held in the town.

A fossil called the Dudley Locust is found in great quantities and of various sizes in the limestone quarries in the neighbourhood; it is supposed to be an extinct species of *Monoculus*. In the vicinity of Dudley there are several chalybeate springs, as well as a spa well, held in high estimation for its efficacy in cutaneous disorders.

(Nash, *Worcestershire; Communication from Dudley*.)

DUISBURG, a town in Rhenish Prussia, in the government of Düsseldorf, is situated between the Ruhr and the Rhine, which meet about 3 miles below the town, in 51° 26' N. lat., 6° 46' E. long., 16 miles by railway N. from the town of Düsseldorf, and has about 7000 inhabitants. The site, which is ancient, was in the time of the Romans denominated *Castrum Deusionis*. The town is surrounded by walls and decayed towers on one side, and by a rampart and ditches on the other, and is situated in a fertile and agreeable country. Duisburg was in the 13th century an important member of the Hanseatic League. It afterwards was made a free town of the German empire, but lost its privileges in the last war, at the close of which it was handed over to Prussia. A canal unites the town with the Rhine on one side, and the Ruhr touches it on the other. Sailing and steam vessels are built: several of the Cologne company's steamers were constructed in Duisburg. There is a large vitriol factory in the

town, and a cloth-mill worked by steam. Duisburg contains a gymnasium founded in 1599, an orphan asylum and hospital, endowed almshouses, a monastery of Minorites, and five churches, of which St. John the Baptist's dates from A.D. 1187, and St. Salvator's, on the tower of which once stood an observatory, dates from 1415. It was the seat of a Protestant university founded in 1655 and abolished in 1802. There are considerable manufactures in the town, particularly of woollen-cloth, cottons, stockings, glue, soap, starch, and leather; and an extensive traffic in wine and colonial produce, grain, and cattle. In the neighbourhood there are several iron-works. The valley of the Ruhr is distinguished for its industrial and agricultural activity and for its coal-mines. The remains of the Duisburg Forest, mentioned by Tacitus ('Annal.' i. 60) under the name of the Saltus Teutoburgensis, are in the vicinity.

DUKINFIELD, Cheshire, a village in the parish of Stockport, is situated on the left bank of the river Tame, in 53° 29' N. lat., 2° 4' W. long.; distant 42 miles N.E. from Chester, 186 miles N.W. by N. from London by road, and 195 miles by the London and North-Western railway. The population of the township in 1851 was 12,132. Dukinfield is properly a suburb of the town of Ashton-under-Line, which is on the opposite or Lancashire side of the Tame. Some statistics on the cotton manufacture in this neighbourhood are given under ASHTON-UNDER-LINE. Extensive iron-foundries, collieries, and brick and tile works afford employment. There are in Dukinfield two churches of the Establishment; chapels for Independents, Wesleyan, Primitive, and New Connexion Methodists, Moravians, Unitarians, Roman Catholics, and Mormonites; and National, British, Infant, and local day-schools.

DULEEK. [MEATH.]

DULVERTON, Somersetshire, a market-town and the seat of a Poor-Law Union, in the parish of Dulverton, is situated in 51° 2' N. lat., 3° 33' W. long., distant 44 miles S.W. by W. from Bath, and 165 miles W.S.W. from London by road. The population of the parish in 1851 was 1497. The living is a vicarage in the archdeaconry of Taunton and diocese of Bath and Wells. Dulverton Poor-Law Union contains 11 parishes and townships, with an area of 54,758 acres, and a population in 1851 of 5748.

Dulverton is situated near the border of Devonshire, in a deep valley watered by the Barle, a feeder of the Ex. The town consists chiefly of two streets, in which are some well-built houses. The parish church, an ancient edifice, comprises a nave, chancel, and two side aisles, with an embattled tower 60 feet high at the west end. The Independents have a place of worship, and there is an Endowed school. The silk manufacture is carried on. Saturday is the market-day. Two yearly fairs are held.

(Collinson, Somersetshire.)

DULWICH. [SURREY.]

DUMBARTON, or **DUNBARTON**, the chief town of Dumbartonshire, Scotland, a royal burgh, market-town and port, in the parish of Dumbarton, is situated at the confluence of the Leven with the Clyde, about 15 miles W.N.W. from Glasgow, in 55° 57' N. lat., 4° 37' W. long. The population of the royal burgh in 1851 was 4590; that of the parliamentary burgh was 5445. It is governed by a provost and 14 councillors, and jointly with Renfrew, Rutherglen, Kilmarnock, and Port Glasgow, returns one member to the Imperial Parliament.

The town consists of one principal street running parallel to the river Leven and of several smaller streets. The houses are generally well built, and the burgh is neat and clean, well paved, and lighted with gas. The public buildings include the parish church, the Free church, chapels for United Presbyterians and Roman Catholics, and the county-hall and prison. An elegant bridge of five arches spans the Leven. The harbour is small, and owing to a bar at the mouth of the river only vessels of light burden can enter the harbour except at high water. Steamers sail regularly to Glasgow, Greenock, and Loch Long.

The Dumbartonshire railway, which extends from Bowling (a village on the river Clyde), 3 miles W. from the town, to Balloch, has a station at Dumbarton. Steamers ply on Loch Lomond in connection with the railway. There are two ship-building yards, a graving-dock, and a crown-glass and bottle work. Rope-spinning is carried on. A weekly corn-market and an annual fair are held in the town, and sheriff, burgh, and justice-of-peace courts are held. There are public libraries and reading-rooms. A large portion of the salmon fisheries of the Clyde belongs to Dumbarton.

It is supposed by some antiquaries that Dumbarton occupies the site of the Roman station called Theodosia. A mile from the town, and at the mouth of the river Leven, forming at high water nearly an island of itself, stands the steep rock so often mentioned in Scottish history, Dumbarton Castle. This rock, which rises up in two points, is inaccessible on every side, except by a very narrow passage, fortified with a strong wall or rampart. The rock is divided into nearly equal parts, the western peak, which is rather the higher, being about 200 feet above the level of the river. Within the wall at the base is the guard-house, with lodgings for the officers, and hence a long flight of stone steps leads to the upper part of the castle, where are several batteries mounted with cannon, the wall being continued almost round the rock. There are remains of a high gateway and wall, the top of which has a bridge of communication from one summit of the rock

to the other. An excellent well is constantly supplied with water. The rock on which the castle stands forms a picturesque object from the Clyde, whose waters wash its base. This castle was formerly a great object of contention, and has sustained several sieges. In the upper part where the rock divides, and in the passage between the peaks, convenient barracks have been erected, as well as a small arsenal, which contains Wallace's gigantic sword and many other curiosities. Besides the castle the only remnant of ancient times is a gothic arch, said to be all that remains of a collegiate church founded in 1456 by a countess of Lennox. This arch formerly stood in the outskirts of the town, but to make way for the railway was removed to the front of the Burgh school.

(New Statistical Account of Scotland; Communication from Dumbarton.)

DUMBARTONSHIRE, a maritime county in the west of Scotland, lies between 55° 53' and 56° 20' N. lat., 3° 54' and 4° 53' W. long. The county consists of two parts, which are separated by an intervening space of 6 miles between their nearest approaching points. The larger and western part is bounded W. partly by Argyleshire, but principally by Loch Long (which separates Dumbartonshire from Argyleshire), S. by the river and Frith of Clyde (which separates this county from Renfrewshire) and by a small part of Lanarkshire, E. by Stirlingshire, and N.E. partly by Stirlingshire, and for a short distance by Perthshire, the boundary line being in the centre of Loch Lomond. This portion of the county is about 35 miles in length from north-west to south-east, in a straight line, and in the middle about 15 miles in breadth from east to west. The small detached eastern part of the county is inclosed by Stirlingshire on the north, and by Lanarkshire on the south, and measures 12 miles in length from east to west, and 2½ to 4 miles in breadth from north to south. The area of the county is in all 297 square miles, or 189,844 statute acres. The population in 1841 was 44,296; in 1851 it was 45,103. The county returns one member to the Imperial Parliament.

Coast-line.—On the southern coast of the county, at the village of Bowling Bay, 3 miles above the town of Dumbarton, the Forth and Clyde Canal falls into the Clyde. Half a mile nearer Dumbarton, and on a rock projecting into the river, stand the ruins of Dunglass Castle. A monument has been erected on this spot to the memory of Henry Bell, the originator of steam navigation. The Leven falls into the Clyde at Dumbarton Castle. [DUMBARTON.] The remainder of the southern coast, from Dumbarton to the Gareloch, is low and sandy, and the river near it is shallow. At the small village of Cardross, there is a ferry to Port Glasgow, anciently the ferry betwixt the western highlands and lowlands of Scotland. A few miles north-west of Cardross is Helensburgh, a fashionable resort of the citizens of Glasgow for sea-bathing. Immediately to the north-west of Helensburgh, and formed by the peninsula of Rosenent, is the Gareloch, a small sea-water lake running north-west and south-east, the shores of which are embellished by numerous villas, principally the property of inhabitants of Glasgow. It is about 6 miles long, and averages a mile in breadth; and affords excellent anchorage for vessels of all sizes, and shelter from all the more prevalent winds. The western coast of the county is the eastern shore of Loch Long, an arm of the sea running north-west and south-east, and stretching northward from the Frith of Clyde. It is upwards of 20 miles long, and varies from 1 mile to 2 miles in breadth. The other coast of the county is that bounded by Loch Lomond, the principal part of which extends about 24 miles from Glen Falloch, at the extreme north of Dumbartonshire, to the bridge of Balloch, where the overflow of the lake forms the river Leven. The shore of this coast is low, and the hills rising almost immediately from the lake, make it narrow. It is in general richly and beautifully wooded. The remaining part of this coast, from Balloch to the boundary of Stirlingshire, runs then north-east; the banks are generally steep. This line of coast is about 5 miles in length.

Surface, Hydrography, and Communications.—The south-eastern part of the county which is detached from the rest is generally of a lowland character. Between this outlying portion and the main part of the county extends a flat district through which the Kelvin Water runs. Proceeding in a north-westerly direction, the county is but slightly undulated until we approach the parishes of Row and Luss, with the exception of the rock of Dumbarton and the Kilpatrick Braes; which last, though cultivated or planted to the tops, attain an elevation of 1200 feet above the sea level, intersect a fertile country, and afford extensive and delightful views from their summits. North of Bonhill and Cardross the country rises into mountains, of which the loftiest, Ben Voirlach, at the northern end of the county, attains a height of 3300 feet. Along the side of Loch Lomond lies romantic scenery, of which a part is that known as Rob Roy's country. The most northern of the parishes, Arrochar, containing about 30,000 acres, is so entirely mountainous as to afford only about 400 acres for arable cultivation. In the parish of Luss, south of Arrochar, several of the hills attain a height of 3000 feet. West of Luss are two nearly parallel ridges of hills. Of these the main range on the west is cultivated in some places, and the rest is covered with heath; it unites with the eastern range at the head of the intervening glen, which is about five miles long, and from a quarter to three-quarters of a mile broad. After uniting, they run north-west. Fumart Hill, the loftiest

of the range, attains a height of 2500 feet. The parish of Roseneath is a peninsula, having on the east the comparatively narrow inlet of the Gareloch, and on the west the wider expanse of Loch Long. Few counties possess more picturesque scenery than Dumbartonshire. Through this county lies one of the routes to the wilder and sterner landscapes of the Western Highlands in Argyleshire and Perthshire.

The numerous streams and lakes of Dumbartonshire contribute in no small degree to the comfort and prosperity of the inhabitants, the fertility of the soil, and the charms of the scenery. The chief rivers are the Clyde and the Leven, both of them in their upper courses mountain streams, and both subsiding into calm and useful rivers. The Clyde however is only a boundary stream, touching the county a little above West Kilpatrick and separating it from Renfrewshire. The Leven flows from the lower end of Loch Lomond, and passes by the foot of Dumbarton Rock into the Clyde. It is largely used for manufacturing purposes, for which the softness and purity of its waters peculiarly adapt it, in the bleaching and dyeing processes carried on at Bonhill and other places on its banks.

The other streams are of small importance, but those of Falloch, Inverglass, and Douglas, which contribute their waters to Loch Lomond near its head, are diversified by cascades as they descend from their mountain sources. Kelvin Water rises on the south-west of the Campsie fells, flows through Kirkintilloch parish, and falls into the Clyde at Partick, a little below Glasgow; in its lower course its banks become bold and elevated, and the stream rapid, which character it maintains till it joins the Clyde. The Forth and Clyde Canal skirts the northern borders of the parishes of Cumbernauld and Kirkintilloch, then crossing a part of Lanarkshire, it enters Dumbartonshire again by the Kelvin aqueduct, runs along the southern part of East Kilpatrick, and joins the Clyde at Dalnair in West Kilpatrick. The islands in Loch Lomond form parts of the parish of Luss. There are eight other fresh-water lakes in the county, of which Loch Hog, about a mile long and a quarter of a mile broad, is the largest.

The high-way and cross-roads are in general well made and kept in good order. The chief high road follows the north bank of the Clyde from Glasgow to Dumbarton, through which town one branch still following the Clyde estuary, leads to Cardross, Helensburgh, the Gareloch, and crossing a narrow isthmus between the lakes, to the banks of Loch Long, and the village of Arrochar, at its northern extremity: a second branch traverses the west side of the vale of Leven and the west side of Loch Lomond to the extreme north of the county. Another high road leads from the road between Glasgow and Dumbarton, through Bonhill along the south-eastern bank of Loch Lomond to Stirlingshire. On Loch Lomond are steamers which touch at the several villages on the banks of the lake, at all of which there are ferries. Several steamers start daily from Dumbarton, and several also from the Gareloch, to the towns on the Clyde and to Glasgow. By the Dumbartonshire railway there is communication between Glasgow and Bulloch, at the south-east end of Loch Lomond via Dumbarton. The detached portion of the county is traversed in part by the Edinburgh and Glasgow railway, which has a station at Cumbernauld and a branch to Kirkintilloch and Campsie in Stirlingshire. The Monkland and Kirkintilloch railway is entirely a mineral line. The Forth and Clyde Canal also traverses this portion of the county, passing through the town of Kirkintilloch.

Geology.—The northern part of the county, including the whole of Arrochar and the larger part of Luss and Row, consists of mica-slate, which overlies the gneiss, and is traversed by dykes of whin and greenstone. Quarzose mica-slate forms the loftiest of the hills, and also the basin of Loch Lomond, except its southern extremity, which belongs to the old red-sandstone. Talcose slate also abounds, the mica running into and blending with it. Clay-slate is wrought at Camstraddan and Luss. South of Camstraddan granwacke and grauwacke slate occur: the whole partaking decidedly of the character of the lower Silurian series. The southern portion of the singular peninsula of Roseneath is occupied by the old red-sandstone, which extends across the county in an easterly direction by Ardmore and Bonhill into Stirlingshire. The basin of the Frith of Clyde is formed by the old red-sandstone; a curious example of this formation is the rock or promontory of Ardmore, 40 feet high, and nearly insulated, which is composed entirely of old red-sandstone conglomerate, with imbedded fragments of water-worn quartz. Carboniferous limestone occurs in several places in the main portions of Dumbartonshire and forms the bulk of the detached parishes of Cumbernauld and Kirkintilloch. At Duntocher, in Old Kilpatrick, limestone is extensively worked, and coal is wrought in connection with it. The beds of coal are between 4 feet and 5 feet in depth. At Cumbernauld the limestone occupies both sides of a remarkably picturesque ravine, and is worked to a great extent; the coal of Cumbernauld and Kirkintilloch is used for making coke, as well as for burning the limestone of the neighbouring quarries. Ironstone is found in small beds in connection with the limestone. Greenstone, trap, amygdaloid, serpentine, porphyry, and basalt occur in several places. At Knockderry on the shore of Loch Long is a large dyke of greenstone about 20 feet thick, which has converted the rock through which it has protruded into a chlorite slate. Remarkable examples of columnar basalt are met with at Auchentorlie and Glenarbuck in Old Kilpatrick, where they form lofty precipices and give a very bold and romantic character to the

scenery. Columnar basalt occurs also at Dunglass and Bowling. Columnar greenstone is found at Smithson and elsewhere.

Climate, Soil, Agriculture.—The climate is in general healthy; it is mild but humid, the quantity of rain falling in the course of a year being much above the average of many other parts of Scotland. Frost is seldom severe, or long continued, and snow does not fall heavily or remain long on the ground. Westerly winds prevail during the greater part of the year.

Along the Leven and Clyde and generally in the south and south-eastern parts of the county the soil consists of a fertile black loam. In other parts the soil is chiefly light and sandy, or a light gravelly loam. The hills have for the most part a light slaty soil; those near Loch Long are entirely devoted to pasture, but elsewhere cultivation has in many parts been carried far up the hill sides. The farms vary very much in size; many do not exceed 30 acres, others include an area of 700 or 800 acres. In the larger farms the land is well cultivated; the most approved methods are practised and improvements are readily introduced. The highland cattle are commonly kept on the hills, but in the plains preference is given to the Ayrshire breed, or a cross between them and the highland cattle. The sheep on the hills are the hardy black-faced race; on the plains the Cheviots are generally found. The native horses are small but hardy.

Divisions, Towns, &c.—Dumbartonshire (except the detached portion) is within the ecclesiastical jurisdiction of the Synod of Glasgow and Ayr. It contains 12 parishes and 16 ministers of the Established Church, four of whom officiate in chapels of ease. There are 12 Free churches in the county, and several others belonging to United Presbyterians and other Dissenters. The only royal burgh is DUMBARTON. Next in importance to it is *Helensburgh*; which is a burgh of barony, with an elective council, and possesses a handsome chapel of ease in connection with the Establishment, besides the Free church, and chapels for United Presbyterians, Independents, and Episcopalians. The population in 1851 was 2341. Helensburgh is much frequented in summer for sea-bathing. *Kirkintilloch*, in the parish of the same name, is a burgh of barony, with two magistrates and a council, and a parish population in 1851 of 6342. The inhabitants are chiefly engaged in handloom weaving. There are calico bleaching and printing works, collieries, lineworks, and stone quarries.

The following villages may be mentioned, with their population in 1851, and a few other particulars:—

Alexandria, a suburb of Bonhill. [BONHILL.] *Arrochar*, or *Arrochar*, a fishing village at the northern extremity of Loch Long, population of the parish 562, is frequented during summer for sea-bathing: it contains many good houses. *Bowling*, a small village on the Clyde, about 11 miles N.W. from Glasgow, has a commodious winter harbour for vessels: there is a yard for ship-building. *Cumbernauld* is a large village in the detached portion of the county, population of the parish 3778: in the neighbourhood are some remains of the wall of Antoninus and the old castle of Cumbernauld, the ancient residence of the earls of Wigton. Handloom weaving is the chief occupation. *Duntocher*, population 3809, about 6 miles N.W. from Glasgow, has several large cotton factories, and in the vicinity are collieries and lime-works. A bridge over a stream near the town is pointed out as all that remains there of the labours of the Roman soldiers on Antoninus's wall. *Old or West Kilpatrick*, a burgh of barony, and formerly it is said a regality, now a mere village on the banks of the Clyde about 10 miles N.W. from Glasgow: population of the parish 5921. In the centre of the town stands the old baronial prison. West of the village is a mound called the Chapel Hill, where various Roman sepulchral stones containing the names of Roman legions have been found: vases and coins have also been taken out, and foundations of walls have been explored. The spot is now considered to have been the termination of the wall of Antoninus. *Luss*, a village on the banks of Loch Lomond, population of the parish 907: the inhabitants are chiefly employed in the neighbouring slate-quarries. *Renton*, population 2398, is situated between Dumbarton and Bonhill. Near the town on the river Leven are extensive bleach-fields, which afford employment to many of the inhabitants.

History and Antiquities.—There is very little in the early history of the county apart from that of Dumbarton Castle. [DUMBARTON.] Its modern history is that of the establishment within it of cotton-factories and bleaching-grounds, calico-printing works, and ship-building yards, and of extensive agricultural improvements. In this district occurred the dispersion of the followers of the Earl of Argyll in 1685, and the battle of Glenfruin, which led to the extirpation of the clan MacGregor.

The most interesting antiquities of the county are those connected with the Roman possession of the southern part of Scotland. Besides the remains of the Roman wall in West Kilpatrick parish already mentioned, there are traces of the wall and remains of forts in several other parts of the county. There are remains of ancient ecclesiastical edifices whose history is now little known. In Cardross parish are the ruins of the chapel of Kilmahew, a visit to whose shrine, it is said, conferred on the pilgrim considerable spiritual advantages. On Loch Long side, at Knockderry, is the site of a Danish fort. Stone coffins have been found at Luss, the church of which was dedicated

to St. Mackessog, a bishop and confessor, who is said to have suffered martyrdom A.D. 520, and whose tomb is still pointed out.

Cumbernauld House, Killermont, Garscube, and Glenarbuck, in the detached part of the county; Tillichewan Castle, Balloch Castle, and Strath-Leven House, on the Leven; and Batturich Castle, Ross Priory, and Rossdhu, on the shores of Loch Lomond, are the more noticeable residences of landed proprietors in the county. The Gareloch is studded from Helensburgh to the head of the lake with numerous large and handsome villas, and on the promontory opposite is Rose-neath Castle, a residence of the Duke of Argyll.

Industry.—The most important branches of industry in Dumfriesshire are those pursued on the banks of the Leven, and described under BONHILL and DUMBARTON. On Loch Long and the Gareloch a small portion of the population is employed in fishing, though their income is chiefly derived from letting out a part of their cottages during the season of sea-bathing. In 1851 there was one savings bank in the county at Dumbarton. The amount owing to depositors on November 20th 1851 was 1883*l.* 16*s.* 7*d.*

DUMFRIES, Dumfriesshire, Scotland, the chief town of the county, a royal burgh and market-town, in the parish of Dumfries, is beautifully situated upon a rising ground on the left bank of the river Nith, in 55° 4' N. lat., 3° 36' W. long., 73 miles S. by W. from Edinburgh. The burgh is governed by a provost, 3 bailies, a dean of guild and treasurer, 12 councillors, and 7 deacons of trades. It unites with Annan, Sanquhar, Lochmaben, and Kirkcudbright, in returning one member to the Imperial Parliament. The population in 1851 was 11,107; that of the parliamentary burgh was 13,166.

Dumfries is a clean and well-built town. The principal street is about three-quarters of a mile long, and about 60 feet broad. The streets and shops are well lighted with gas. There are two parish churches, a chapel of ease, and chapels for Free Church and United Presbyterians, Independents, Episcopalians, Roman Catholics, and other bodies. St. Michael's churchyard has been called the 'Westminster of Scotland,' from the character of its monuments. It is here that the remains of the poet Burns lie interred under a handsome mausoleum erected by subscription. In the middle of the High-street is Mid Steeple, erected by Inigo Jones, where the meetings of the town-council are held; opposite to it is the Trades Hall. The other public buildings are a county jail, a bridewell, an academy, several endowed schools, a theatre, assembly-rooms, an infirmary, an hospital for aged persons and orphans, and a dispensary. The Crichton Lunatic Asylum is a large and handsome building surrounded by shrubberies and gardens. It is capable of accommodating 100 patients. A second building is intended chiefly, if not exclusively, for pauper patients. There are two libraries, a mechanics institution, several public reading-rooms, and a savings bank.

Dumfries is celebrated for its weekly markets, which are held on Wednesday on the 'Sands,' an open space on the bank of the river. Besides the quarter-sessions and the usual sheriff's courts, the circuit courts for the southern districts of Scotland are held here twice a year. Maxwell Town, on the opposite side of the river, a small burgh of barony chiefly inhabited by an Irish population, is a suburb of Dumfries. The Nith is crossed at Dumfries by two bridges—one a very ancient structure supposed to have been begun by Devorgilla Douglas, mother of John Balliol, king of Scotland; the other was built in 1795.

The river is navigable up to the town, and the harbour can receive vessels of upwards of 120 tons burden. The registered vessels belonging to the port on the 31st of December 1852 were 127, of 10,221 aggregate tonnage. During 1852 there entered the port in the coasting trade 870 sailing-vessels of 26,086 tons, and 125 steam-vessels of 32,408 tons; and there cleared 399 sailing-vessels of 13,277 tons, and 116 steam-vessels of 29,747 tons. In the colonial and foreign trade the entries were 13 vessels of 2603 tons, and the clearances were 11 vessels of 2423 tons. A steam-vessel plies weekly between this port and Liverpool. The principal exports are wool, freestone, grain, potatoes, and live stock, particularly sheep. The imports are wood, wine, slate, lime, coals, and iron. Pork forms an extensive article of trade.

The prosperity of Dumfries depends in a great measure on the country trade. Hosiery and tanning have long been carried on. A large spinning and weaving woollen-mill gives employment to upwards of 100 people. Dumfries is a principal station on the Scottish South-Western railway.

Dumfries as a burgh dates from the reign of David I. Its possession was always eagerly sought by the respective monarchs in the wars betwixt the Scottish and English kings: it was in the chapel of the Minorite convent at Dumfries that Bruce slew his rival Comyn; and it was at Dumfries that Bruce's brother-in-law Seton was hanged by order of Edward I. The town was frequently plundered and burned. Dumfries participated in the religious disasters of the reigns of Charles I. and II.; in 1715 it was threatened with siege; and in 1745 its adherence to the government involved it in the penalties of highland occupation and plunder.

(*New Statistical Account of Scotland*; *McDiarmid, Picture of Dumfries*; *Tytler, History of Scotland*; *Communication from Dumfries*.)

DUMFRIESSHIRE, a southern county of Scotland lying between 55° 2' and 55° 31' N. lat., 2° 39' and 3° 53' W. long., is bounded

S. by the Solway Frith and Cumberland, N. by the counties of Lanark, Peebles, Selkirk, and Roxburgh, E. by Roxburghshire, and W. by the counties of Kirkcudbright and Ayr. Its form is an irregular ellipse: the greater diameter being about 50 miles; the lesser about 30 miles. The area is 1129 square miles, or 722,813 acres. Of the whole county little more than a fourth is under tillage. The population in 1851 was 78,123. The county returns one member to the Imperial Parliament.

Surface, Hydrography, and Communications.—The surface of the county is very irregular. About half of it is mountainous, a small part is flat sea-coast, and one-third midland, consisting of low hills, ridges, and vales. It has a general slope to the Solway Frith, and the mountain ranges are principally in the north and east. These serve to shelter the county from cold, while its comparatively inland situation protects it from the Atlantic rains, Ayrshire and Kirkcudbright intervening between it and the western coast. The extensive ranges of mountains in the northern part of the district produce also the almost innumerable streams, great and small, by which the county is watered. All these streams find their way either directly or by confluence with the rivers Nith, Annan, or Esk, to the Solway Frith. Hartfell, the highest mountain in the county, in Moffat parish, is 3304 feet above the level of the sea; Lowther Hill, near the village of Leadhills in Lanarkshire is 3130 feet; Black Larg, on the borders of Ayrshire, is 2890 feet; Ettrick Pen, in Eskdale Moor, 2220 feet; and Cairnkuina, not far from Drumlanrig, is 2180 feet above the level of the sea: these heights however must be taken as of uncertain authority.

Dumfriesshire was, until a comparatively recent period, almost destitute of timber. Year after year the slopes of mountains and other naked tracts are being gradually planted, alike for the purposes of shelter and ornament. Much good has been effected in almost every parish by draining the land.

From the Sark to the Nith, this county extends about 21 miles along the Solway Frith. The shore is generally sandy and gravelly, the sand being occasionally mixed with clay, and sometimes covered for a space with large stones called 'cobbles.' On many parts of the coast considerable portions of land have been reclaimed from the sea. The principal harbours on the coast are those of DUMFRIES and ANNAN. There is a small quay at Glencaple, a village at the mouth of the Nith, where vessels for Dumfries occasionally unload. There is also a creek at the mouth of the Lochar farther east, to which small vessels find access, these being generally traders bringing coal from the opposite coast of Cumberland. At Queensberry Bay in Cummertrees parish, still farther eastward, vessels of small burden find ready shelter from north and north-west winds; and at various spots along the coast of Dornock and Greta parishes (the most eastern part of the shore of the county), vessels of 100 tons burden discharge coals and slate: grain and potatoes being exported in return, to a large amount, to Liverpool and other places on the English coast.

The Solway Frith is narrowed by two promontories, Tordoff point on the south coast of Dumfriesshire, and Bowness on the opposite shore of Cumberland, to a breadth of two miles. Passing these points the channel inland expands rapidly, and is ultimately divided into the smaller channels of the rivers Esk and Eden; the extensive Rockcliff sands being outspread between the Scottish and English rivers. The tide of the Solway flows directly east with great rapidity, over an immense expanse of sand, and the navigation of the Frith is consequently at once difficult and dangerous. "During spring tides, and particularly when impelled by a strong south-wester, the Solway rises with prodigious rapidity. A loud booming noise indicates its approach, and is distinguishable at the distance of several miles. . . . The tide-head, as it is called, is often from 4 to 6 feet high, chafed into spray, with a mighty trough of bluer water behind, swelling in some places into little hills, and in others scooped into tiny valleys, which, when sun-lit, form a brilliant picture of themselves." (*McDiarmid's 'Picture of Dumfriesshire.'*)

The principal rivers in the county are the Nith, Annan, and Esk. The *Nith* enters the county from Ayrshire, and runs in a south-east direction in a very winding course above 40 miles, passing Sanquhar, Thornhill, and Dumfries. About 9 miles below Dumfries it falls into the Solway Frith. The surrounding mountains and ridges approach near each other above Drumlanrig castle, in the south of Durisdeer parish, and also near Blackwood, not far above Dumfries, and divide the vale of the river into three portions, which have been named the Vale of Sanquhar, the Vale of Closeburn, and the Vale of Dumfries. The tributary streams which join the Nith are the Cluden, Seaur, Shinnel, Cample, Carron, Menock, Enchan, Crawick, and Killoe. Its banks are almost everywhere adorned with gentlemen's seats and pleasure-grounds. The *Annan* rises near the sources of the Clyde and Tweed, among the mountains near Moffat surrounding Erickstane and the singular deep and caverned glen called 'the Devil's Beef-Tub,' and runs a course nearly south of about 30 miles. It enters the Solway a little below the burgh of Annan. The tributary streams that flow into the Annan are the Mein, Wauphray, Evan, Milk, Dryfe, Kinnel, Ae, and Moffat. A beautiful ridge crosses the vale of this river from Kirkwood by Murraythwaite to Mount Annan. In the bed of the Kinnel is a rock called Wallace's

Leap, near which place Wallace is said to have concealed himself after the battle of Falkirk. The *Esk* rises in the mountains on the borders of Selkirkshire, runs in a southern direction above 30 miles in the county, passes Langholm and Canonbie, and forms for one mile the boundary with England; after which it enters Cumberland, and turns westward through an open country by Longtown into the Solway Frith. This river receives in its course the Riddel, Tarns, Wauchope, Ewes, Meggot, and Black Esk. The Kirtle is a small river that enters the Solway Frith a little distance from the river Sark, a border stream, forming the boundary between England and Scotland for some distance before it enters the Solway. Both those rivers rise from the hills in the neighbourhood of Langholm, and pursue a southern course of about 20 miles. The Lochar is a rivulet which rises in Tinwald parish, a few miles north of Dumfries, runs about 13 miles in a very serpentine course, and discharges itself into the Solway, a few miles east of the mouth of the Nith, and near the ruins of Caerlaverock Castle. The larger rivers contain salmon, herlings, parr or samlet, and sea-trout. These, and also flounders and cod, and occasionally turbot, soles, and herrings are taken in the Solway Frith. Along the shore considerable quantities of cockles and mussels are gathered by the poorer people. The smaller rivers contain pike, perch, trout, and eels. In the vicinity of Lochmaben are nine lakes, five of which are of considerable size. The ancient royal castle of Lochmaben stands upon a very narrow peninsula on the south-east side of the castle-loch, which is three miles in circumference. The mountain lake called Loch Skcen, situated near the head of Moffat Water, is 1300 feet above the level of the sea, and about two miles in circumference. This lake feeds the well-known cascade called the Gray Mare's Tail, and is well stocked with delicate trout of a large size. There are several other lochs or lakes of less extent throughout the county.

Dumfriesshire is intersected in almost every direction by turnpike and other roads. The Carlisle and Glasgow road enters the county at Sark bridge, and passes through Gretna, Annan, Dumfries, and Sanquhar. Another main road to Glasgow passes through Gretna, Lockerby, and Beattock bridge. A line of road leads from Carlisle towards Portpatrick, by Annan and Castle Douglas. A turnpike road extends from the town of Dumfries to Edinburgh by Moffat. The roads in general are kept in excellent order, and safe and easy communications have been opened through several parts of the mountainous districts. The Glasgow and South-Western, the Carlisle and Nithsdale, and the Caledonian railways afford to the inhabitants of Dumfriesshire communication to every part of England and Scotland, and immediate access to the steamers which sail for Ireland from the west coast of Ayrshire.

Geology, Mineralogy, &c.—The largest portion of Dumfriesshire consists of the grauwacke rock, trap occurring here and there, but along the valleys of the Nith, Annan, and Esk there exists a great variety of other formations, while along the shore or southern part of the county a bed of sandstone extends with but little interruption. In the upper part of Nithsdale there are two coal-fields, one at Now Cumnock, a continuation of the Ayrshire strata; and one around Sanquhar of an independent formation. Below this there is an extensive bed of old red-sandstone, in which are the valuable limebeds worked at Closeburn and Barjarg: the lowest basin is that around Dumfries, which consists of the new red-sandstone alone, and which is now generally regarded as the continuation of the sandstone of Cumberland. On the borders of the lower portion of Nithsdale and Annandale, a stratum of limestone is found which runs east through Eskdale until it is merged in the great limestone formation of Northumberland; this stone is worked at Kilhead in Annandale. In the middle of the valley of the Annan there is also an extensive bed of sandstone similar to that around Dumfries, well known to geologists from the impressions of the footsteps of an animal of the tortoise kind found at Corncockle Quarry, near Lochmaben. A little lower down the vale of Annan some interesting igneous formations exist. ('New Statistical Account of Scotland,' St. Mungo, by Rev. Mr. Jamieson.) The lower portion of Eskdale contains besides the limestone already mentioned, a bed of coal which is advantageously worked at Canonbie.

At Wanlockhead, on the northern border of the county, and near Leadhills, in Lanarkshire, are extensive lead-mines. From this lead silver is extracted in the proportion of six to twelve ounces in the ton. There are three veins of mineral here varying in thickness from a few inches to 9 feet. Gold is occasionally found in the mountains in this neighbourhood in veins of quartz, or washed down into the sand of the rivulets. In the reign of Elizabeth, 300 men were employed for several summers, and are said to have collected gold to the value of 100,000*l*. The largest piece found in the neighbourhood is now in the British Museum, and weighs four or five ounces. An antimony mine, discovered at Glendinning in 1760, was wrought for five years from 1793. The ore was a sulphuret which yielded about 50 per cent., and 100 tons of metal were obtained. The vein seldom exceeded 20 inches in thickness, and contained blende, calcareous spar, and quartz. Copper-ore and manganese have been met with in small quantities; the former in the parish of Middlebie. Ironstone exists in some places in spheroidal masses, and in beds and bogs, but no iron is worked from ores in the county.

Gypsum occurs in thin veins. Floetz-trap is found on the summit of some of the mountains, and generally in the shape of mountain caps. Boulders of granite and sienite are found in various places, the latter most frequently in the low part of the county. The variety of the grauwacke in the vicinity of Moffat is peculiar, and was long regarded as of igneous origin. It forms an excellent building stone. Sir R. Murchison discovered in it some interesting organic remains. About a mile from Moffat is a celebrated mineral water similar to the sulphurous water of Harrowgate, and about 5 miles distant, in a deep ravine on the side of Hartfell, is a chalybeate spring. There are also mineral waters in the neighbourhood of Langholm, Annan, and Lochmaben, and in other localities.

Climate, Soil, and Agriculture.—That part of the county which adjoins the Solway Frith is low and warm. The mountainous district is cold and bleak, but seldom remains long covered with snow. The whole appears to be moist and in general mild and salubrious. The spring is generally late. The soil in the lower districts is light and gravelly, or sandy. Along the margins of the great rivers are considerable tracts of rich alluvial soil. Peat-moss prevails on many of the hills, and in some of the vales: the most extensive moss being that of Lochar, near Dumfries, which is 11 or 12 miles long, and between 2 and 3 miles broad. Clay is found extensively as a sub-soil, and in a few places as a soil mixed with other substances. In Annandale and Nithsdale dry soil prevails. Farms of arable land are generally let on leases of 15, 19, or 21 years. On sheep-farms the ordinary leases are from 9 to 13 years. Oats and potatoes are cultivated more extensively than any other crop, both for home consumption and for exportation. Potatoes are much used in fattening cattle and pigs. A great quantity of hams and bacon of the best quality is cured in this county, and sent to Liverpool, London, and Newcastle.

The farm implements in use are similar to those in Cumberland, with the exception of the sickle, the use of which is in some places much laid aside, and the scythe substituted for it. The horses in general are of a middle size, and are the result of many crossings of different breeds. The quality of the cattle and sheep stocks has been much improved. The Galloway breed of cattle mostly prevails, except for the dairy, for which cows of the Ayrshire breed are preferred. The sheep are of the Cheviot and black-faced breeds: these have been crossed by the Leicesters, and the offspring answers exceedingly well, and makes profitable returns to the farmer. Pigs are kept by the farmers and cottars in great numbers. Sheep-farms vary in size from 300 to 3000 acres, and two sheep for three acres may be considered an average number of stock. Arable farms extend from 50 to 600 acres; many are about 100 or 150 acres. Some farms contain both sheep-walk and arable lands, and these are considered the most convenient and productive. Arable farms, and those of small size, prevail on the low grounds and near the market-towns and villages. Those of larger extent, where pasture greatly preponderates are more distant, and situated on higher ground.

Most of the modern farm buildings are commodious and well arranged; they are constructed of stone and lime, and generally covered with slate. Great improvements have been also made in the churches, schools, roads, and fences. There are three district farming societies, to the premiums awarded by which the Highland Society of Scotland usually contributes.

Divisions, &c.—Dumfriesshire is within the ecclesiastical jurisdiction of the synod of Dumfries, which extends also over parts of some other counties, and comprehends 55 parishes, forming five presbyteries: Dumfries, Lochmaben, Annan, Penpont, and Langholm. The number of clergymen within its limits is 55, and of these 43 are in this county, in the 43 parishes into which it is divided; and seven clergymen, in connection with the Establishment, officiate in chapels of ease. There are besides about 40 chapels for Free Church and United Presbyterians, Independents, and other Dissenters. Prior to the year 1756, there were three jurisdictions in the county, namely, the sheriffship of Nithsdale, the stewardry of Annandale, and the regality of Eskdale, each comprehending the portion of territory which forms the basin of the three rivers after which they are respectively named; Esk on the east, Nith on the west, and Annan in the centre of the county. There is now one sheriff for the county, though the districts still preserve their ancient names.

Within this county are four royal burghs, ANNAN, DUMFRIES, LOCHMABEN, and SANQUHAR, which are described under their respective names. The other more important towns of the shire are Langholm, Lockerbie, and Moffat.

Langholm, population 1406, is a burgh of barony and market-town, 29 miles E.N.E. from Dumfries, well built and situated in the midst of picturesque woodland and mountain scenery on the left bank of the Esk. It consists chiefly of one street, in which is a town-hall and jail in the market-place. On the opposite side of the river is the modern village of New Langholm. Weaving and stocking-making are the principal occupations. Besides the parish church there are a Free church, two chapels for United Presbyterians, two Endowed schools, and a savings bank. A market is held weekly on Wednesday. There are two woollen manufactories. Mr. Telford, the civil engineer, who was a native of Eskdale, and was apprenticed at the age of 14 to a stonemason in Langholm, left 1000*l*. to the Langholm library. On

an eminence near the town is a monument to the late Sir John Malcolm, who was also a native of Eskdale. In the vicinity are Langholm Lodge, a seat of the Duke of Buccleuch, and Broomholm, the property of Mr. Maxwell.

Lockerbie, population 1569, is a neat and well-built market-town in the parish of Dryfesdale, situated between the rivers Annan and Milk, 12 miles E. from Dumfries. The parish church, the Free church, a chapel for United Presbyterians, two libraries, a public reading-room, the parochial school, and some other schools are in the town. Thursday is the market-day. The town has been long celebrated for its lamb and wool markets. The winter weekly markets are principally for pork. In the parish are the remains of eight Roman and British encampments. Armour and weapons have been found in the parish; and of the great Roman road from England which traversed this county and Ayrshire, there are distinct traces.

Moffat, population 1491, in the parish of Moffat, is situated near the river Annan, 20 miles N. by E. from Dumfries. It is protected on the north-east by a noble screen of lofty mountains. Moffat is much resorted to for its mineral springs. Here are baths, assembly-rooms, a Parish church, a Free church, a chapel for United Presbyterians, and subscription and circulating libraries. A weekly market is held on Friday. In the vicinity are the old caves at Newton, Earl Randolph's tower, Craigie Wood, Belleraig Rock and Linn, and the well-known fall called the Gray Mare's Tail. Since the opening of the Caledonian railway, visitors to Moffat have increased, and the town is being proportionately enlarged.

The following villages may also be mentioned:—

Dunscore, about 9 miles N.W. from Dumfries: population of the parish 1578. In the parish are the remains of a circular encampment, and the ruins of the old towers of Lag, of Bogrie, and Sundaywell. **Durisdale**, population of the parish 1795, only claims notice as containing the magnificent residence of the Duke of Buccleuch, Drumlanrig Castle, surrounded by a very beautiful demesne. **Ecclefechan**, population of the parish of Hoddam 1797, a neat village on the Glasgow and London road, at which a market is held every month on a Friday, and a pork market weekly during winter. There is here a large and beautiful bridge over the Annan. The Caledonian railway has a station here. The manufacture of ginghams is the principal employment of the inhabitants. The parish church is a mile from the village, where there are a Free church and a chapel for United Presbyterians. **Grainney, or Gretna Green**, population of the parish 1830, formerly a burgh of barony, now a small village, long celebrated for the clandestine marriages of fugitive lovers, is situated about 9 miles N. from Carlisle, within a mile of the English border; on which border also is Solway Moss, remarkable for a battle in the time of Henry VIII. **Minnihive**, a village in Glencairn parish, about 15 miles N.W. from Dumfries. The houses are neat and substantial; but there is neither trade nor manufacture. The parish, which in 1851 contained 1980 inhabitants, has a Free church, a chapel for United Presbyterians, three parochial schools, and three subscription libraries. In the village is a stone cross, dated 1638.

History, Antiquities, &c.—The Selgovie were the most ancient inhabitants of this county. In the time of the Romans, Dumfriesshire formed a part of the province of Valentia. [BRITANNIA.] In the 8th century it was under the dominion of the Picts, who dismembered Galloway and Dumfriesshire from the Northumbrian monarchy. Until the reign of James IV. this county was much harassed by the feuds of rival chieftains, and from its proximity to the borders it was also liable to the incursions of the English and to frequent predatory warfare. At a later period the contraband trade with the Isle of Man prevailed to a great extent, and the borders were for a considerable time infested with daring bands of smugglers. In the rebellions of 1715 and 1745, but particularly in the latter, the country districts endured various outrages, and the county town sustained great damage.

The remains of what are called Druidical temples exist in the parishes of Holywood, Gretna, Eskdalemuir, and Wamphray. Near Moffat are vestiges of a British encampment; and in Eskdalemuir parish of two stone circles. Two Roman roads passed through the county. Several fortifications, both circular and square, and some large Roman encampments, can be distinctly traced in various parts. There are ruins of many old towers, vestiges of forts, and a great number of cairns in different places. At Dryfesdale is a very entire British fort, and at Burnswark-hill, near Ecclefechan, are very distinct remains of Roman encampments. There are also many moats or artificial mounts: of these Rockhall moat, near Lochmaben, is one of the largest and finest. Among the antiquities, the cross of Markland, which is an octagon of solid stone, and a very curious ancient obelisk, supposed to be of Anglo-Saxon origin, found in the churchyard of Ruthwell, are deserving of notice. The obelisk is ornamented with figures in relief descriptive of sacred history, and inscribed partly with Runic and partly with Roman characters. The ancient buildings most worthy of notice are Caerlaverock Castle, on the coast of the Solway Frith; Torthorwald Castle, said to have been erected 800 years ago, and of which the walls are still standing; Closeburn Castle, also of great antiquity, but still occupied as a residence; Morton Castle, one of the finest ruins in this part of the country and

most romantically situated; and Saughar Castle. The ruins of Langholm Castle, formerly a square tower belonging to the Armstrongs, are situated near the town of Langholm. In the same locality are traces of the fosse and outworks of Wauchope Castle. Other remains exist in different parts of the county.

Industry, &c.—Agriculture and the rearing of cattle and sheep are almost the only occupations of the rural inhabitants of Dumfriesshire. Trade in coals, timber, &c., is confined to the towns and a few of the villages on the coast, from which also are exported the staple productions of the county. [ANNAN; DUMFRIES.] In 1851 there was one savings bank in the county, at Thornhill; the amount owing to depositors on November 20th 1851 was 8653*l.* 3*s.* 6*d.*

DUN-LE-ROL. [CHER.]

DÜNA (DA-UGAVA; ZAPADULA), a considerable river in Western Russia, rises from several springs not far from the source of the Volga, which flow out of marshy ground in the neighbourhood of the Volkonsky forest, near the south-western confines of the government of Tver. It winds in a west-south-westerly direction, nearly parallel with the Dnieper, until it has passed Vitebsk, having become navigable for flat-bottomed craft at Valisch or Velige, above Vitebsk. Thence it turns to the north-west, and near Düna flows almost due north for several miles, and then resumes its west-north-west course to Dünamünde, where it falls into the Gulf of Riga, or Gulf of Livonia, in 57° N. lat. From the town of Disna in 55° 27' N. lat., 23° 3' E. long., where the river a little below its junction with the river Disna begins to take a north-westerly course, it separates the governments of Vitebsk and Livonia, which lie on its right bank, from those of Minsk and Kourland, which lie on the left bank. The entire course of the Düna, inclusive of its windings, is about 655 miles; its length, in a straight line from the source to the mouth, is about 325 miles. The fall of its waters is in the upper part of its course 1 foot in every 2000 fathoms; and in its passage through the lower part, where the land is more level, 6 inches in every 2000 fathoms, its average fall being 6 inches in every 4 versts (about 2½ miles). The navigable portion of the Düna, namely, from Velige to Dünamünde, is about 405 miles in length; but the navigation, owing to the variableness of its depth (which ranges from 2 to 4 fathoms), to its shallows, and to a stratum of rock which runs across its bed just above Riga, and the sandbanks at its mouth (on which there is a depth varying from 12 to 15 feet), is extremely difficult and even dangerous for vessels of any size, except during the floods of spring and autumn. Its course above Riga indeed is not ordinarily practicable for any but the flat-bottomed craft called Strusen. At Riga its breadth is about 2400 feet. In the spring the surface is covered with rafts, logs, and planks, which are floated down from the forests of the provinces which it passes through. It contains several islands and abounds in fish. The tributaries of the Düna greatly augment its waters, though they are not of any great length: the chief of these are the Toroptsa, which is navigable from Toropez to its mouth, a distance of about 60 miles; the Ulla, which flows out of lake Beloye, and is navigable for about 56 miles; the Kasplia, which is navigable from Poritsch, about 110 miles from its mouth; the Ewst, Meshna, and Disna, the last of which rises in the government of Vilna; and the Bolder-Aa, which flows past Mittau, then skirts the southern shore of the Gulf of Riga, and ultimately falls into the Düna just above its mouth. The Narofna, which joins the Düna on its right bank, can be regarded only as an outlet for lake Peipus, and is from 37 to 42 miles in length. The river is connected by canals with Lake Ilmen, the Beresina, and the Niemen. The basin of the Düna comprehends an area of about 28,350 square miles. By the Beresinski Canal, which unites the Ulla with the Sergatcha, the Düna is connected with the Dnieper, and the Baltic with the Black Sea.

DÜNABURG, the chief town of a circle in the north-western part of the government of Vitebsk in Western Russia, was formerly the capital of Polish Livonia. It stands on the right bank of the Düna, and on both sides of the Shunitzee which flows into it, in 55° 53' N. lat., 26° 24' E. long., and has 6300 inhabitants. It was founded in 1277 by the Knights of the Sword, and while attached to the Polish crown was the residence of a bishop, voyvode, and castellan. At the present day it has become of great military importance from the strength which has been given to its fortifications. Dünaбург contains a Greek and two Roman Catholic churches, a synagogue, and a college which formerly belonged to the Jesuits. It has three fairs in the course of the year, and carries on considerable trade.

DUNBAR, Haddingtonshire, Scotland, a royal burgh, market-town, and sea-port, is situated at the mouth of the Frith of Forth, on the north-eastern coast of the county, in 56° 0' N. lat., 2° 30' W. long.; distant 29 miles E. from Edinburgh. The population of the parliamentary borough in 1851 was 8038. It is governed by a provost, 3 bailies, a treasurer, and 15 councillors; and unites with Haddington, North Berwick, Jedburgh, and Lauder in returning one member to the Imperial Parliament.

Dunbar is a very fine old town; the principal street and the smaller streets leading from it are broad and well paved. The town is lighted with gas; it is well drained naturally, and is clean and healthy. The parish church is a handsome gothic building with a stately tower. It contains a fine marble monument to the Earl of Dunbar, High

Treasurer of Scotland to James VI. There are two chapels for United Presbyterians, one for the Free Church, and one for Methodists. There are two commodious Burgh schools and two Parochial schools, a mechanics institution and library, and a subscription library. The curing of herrings is carried on to a large extent, many fishermen from the neighbourhood resorting to Dunbar with the produce of their industry. The North British railway has a station at Dunbar. The harbour has been much enlarged. A weekly corn-market and several annual fairs are held.

The principal object of antiquarian interest is the ruined castle of Dunbar, which stands upon high rocks at the entrance of the harbour. The town-house is also an old building. Dunbar was made a royal burgh by David II., and the place has been the scene of many interesting events in Scottish history. The siege and heroic defence of the castle by Black Agnes, countess of Dunbar, is one of the most remarkable incidents of the Scottish wars.

(*New Statistical Account of Scotland*; Miller, *History of Dunbar*, 1830; Wynton, *Chronicle*; Tytler, *History of Scotland*; *Communication from Dunbar*.)

DUNBLANE. [PERTHSHIRE.]

DUNDALK, the capital of the county of Louth, Ireland, a municipal and parliamentary borough, an assize, market, and sea-port town, and the seat of a Poor-Law Union, in the parish of Dundalk, is beautifully situated at the mouth of the river Castleton, in 54° 1' N. lat., 6° 24' W. long., distant 50 miles N. by W. from Dublin. The population of the borough in 1851 was 9995. The borough is governed by a bailiff and 16 burgesses, and returns one member to the Imperial Parliament. The lighting and watching of the town are managed by commissioners. Dundalk Poor-Law Union comprises 19 electoral divisions, with an area of 104,359 acres, and a population in 1851 of 58,750.

Dundalk was the scene of many battles before the final subjection of Ireland. For a short time it was the residence of Edward Bruce, who, after his conquest of this town, was crowned here, and held his court until the fatal battle in which he lost his life. The streets of Dundalk are long and spacious, and contain some good shops and houses; but a large part of the town is exceedingly poor and wretched. The parish church is a large and ancient edifice. There are places of worship for Roman Catholics, Presbyterians, and Wesleyan Methodists; three Endowed schools, an infirmary, a court-house, a jail, a market-house, a new county prison, and a savings bank. The town is paved and lighted. Tobacco, soap, leather, and pins are manufactured. Timber, coal, iron, and slate, with cattle, grain, butter, and eggs, which form the chief trade, are exported by steam-vessels, which ply regularly between this port and Liverpool. The port and harbour have been recently improved at a considerable expense. A lighthouse, on the screw-pile principle, was erected in 1849. There were on the 31st of December, 1852, registered as belonging to Dundalk 23 vessels with an aggregate tonnage of 1871, and 2 steamers with an aggregate tonnage of 844. The number and tonnage of vessels entered and cleared at the port during 1852 were:—Inwards, sailing-vessels 519, tonnage 35,928; steam-vessels 109, tonnage 47,782; outwards, sailing-vessels 224, tonnage 17,074; steam-vessels 105, tonnage 46,235. Fishing is carried on to a small extent. The assizes are held here, also quarter and petty sessions. The market is on Monday; fairs are held on the 17th of May and the third Wednesday of every other month in the year.

(Fraser, *Handbook of Ireland*; Thom, *Irish Almanac*.)

DUNDAS. [CANADA.]

DUNDEE, Forfarshire, Scotland, a royal and parliamentary burgh, market-town, and sea-port, is situated on the left bank of the estuary of the river Tay, in 56° 27' N. lat., 2° 58' W. long., distant 42 miles N.N.E. from Edinburgh by road, and 47 miles by the Edinburgh, Perth, and Dundee railway. The population of the burgh in 1851 was 78,931. The town is governed by a provost, 4 bailies, and 16 councillors, and returns one member to the Imperial Parliament.

Dundee is a place of considerable antiquity. From a fishing-village it became a fortress with walls, gates, and castle, and was the residence of several kings of Scotland. It was made a royal burgh by William I. in 1164. The Cowgate port or gate is the only trace of the ancient fortifications. In the various civil wars which desolated Scotland, Dundee suffered severely. In 1651, when it was sacked and burned, it was one of the richest towns in Scotland. It is built on ground which rises gradually from the edge of the river or estuary, the summit behind the town reaching a height of 500 feet. The town is also protected on the east side, and from the proximity of the great North Sea the temperature is considerably modified, and preserves a nearly uniform range throughout the different seasons. The town is rather irregularly built. Like the generality of old towns in Scotland, it originally consisted of one long street, and was the residence for part of the year of people of rank. The older streets are narrow, and the houses in them are packed together. From the market-place, or High-street, the other leading streets run nearly parallel with the river. In the High-street are the town-hall, a plain edifice with a steeple, and piazzas below, and the exchange and reading-room, a Grecian structure. In the Nethergate stand the old gothic tower or steeple of Dundee (156 feet high) and the three contiguous churches of the Establishment. The old cathedral of Dundee, erected, it is said, by

David, earl of Huntingdon, in 1185, stood on the site of the new churches, and contained four places of worship. The public seminaries occupy an elegant building in the Grecian style, recently erected. In Dock-street are the custom-house and a triumphal arch erected to commemorate the first landing of Queen Victoria at Dundee. Several handsome streets have been opened within the last few years, and great improvements have been otherwise effected in the appearance of the town. Including the churches already noticed, there are 8 churches of the Establishment in Dundee, 11 of the Free Church, 6 belonging to United Presbyterians, 3 to Independents, an Episcopal chapel, in which the bishop of Brechin officiates, a Roman Catholic chapel, and chapels belonging to some of the smaller bodies of Dissenters. The Infirmary, established in 1795, the Lunatic Asylum, the Ragged and Industrial school, the Orphan Institution, a savings bank, and an association for providing lodgings for the working classes, are among the benevolent institutions of the town. An extensive new building for the Infirmary, occupying three sides of a square, is in the Tudor style. Dundee is lighted with gas; a plentiful supply of water is brought from Monikie, about 15 miles distant.

The commerce of Dundee has varied considerably in its characteristic features. About 60 years ago 7000*l.* worth of shoes were annually exported. This trade is now extinct. At one time the cotton manufacture was carried on, and was succeeded by the woollen; but the permanently prosperous trade of the town has been that arising from the linen manufacture, of which it is now the chief seat. In 1745 there were imported into Dundee 74 tons of flax; in 1815 the quantity of flax and hemp imported was about 3000 tons: the annual imports amount at present to upwards of 35,000 tons of flax and hemp, and 13,000 tons of jute. In 1745 the exports of manufactured linen amounted to 10,000 pieces; in 1822 there were exported 263,403 pieces; it is calculated that the exports are now upwards of a million pieces, each piece containing on an average about 120 yards. The manufacture comprises Osnaburghs, sheetings, canvasses, and other coarser descriptions of linen cloth. The annual value of the linen manufacture is estimated at between three and four millions sterling. About 40 flax-spinning steam-power mills are in the town and vicinity.

A short distance above the town the river Tay widens into a large estuary or frith, which has much the appearance of an inland lake. Dundee has consequently been for a long period an important maritime port. On December 31st, 1852, there were registered as belonging to the port, 36 sailing-vessels under 50 tons, tonnage 1179, and 297 above 50 tons, tonnage 56,418; with one steam-vessel of 36 tons, and 8 steam-vessels of 1660 tons. During 1852 there entered the port in the coasting trade:—Sailing-vessels 1479, tonnage 123,584; steam-vessels 148, tonnage 28,704; and there cleared:—Sailing-vessels 401, tonnage 37,977; and steam-vessels 150, tonnage 28,191. In the colonial and foreign trade there entered 411 vessels, tonnage 63,249, and cleared 278 vessels, tonnage 44,806. Earl Grey's Dock, King William's Dock, and Victoria Dock afford ample accommodation for the shipping of the port. Facilities alike for building and repairing ships exist. There are several large establishments for the manufacture of machinery. Since 1815 the harbour trustees have effected great improvements in the harbour. The Frith of Tay is two miles in width opposite the town; there are many dangerous sandbanks in the estuary, but they are avoided by means of excellent charts of the soundings, two lighthouses, and several beacons.

(*New Statistical Account of Scotland*; *Communication from Dundee*.)

DUNFANAGHY, county of Donegal, Ireland, a market-town and the seat of a Poor-Law Union, in the parish of Clondehorky and barony of Kilmacreenan, is situated in 55° 13' N. lat., 7° 58' W. long., distant 150 miles N.W. by N. from Dublin. The population in 1851 was 751, inclusive of 162 in the Union workhouse. Dunfanaghy Poor-Law Union comprises 10 electoral divisions, with an area of 125,666 acres, and a population in 1851 of 17,392.

The town is situated at the mouth of Dunfanaghy Harbour, which forms part of the Sheephaven, close to the peninsula of Horn Head, and is surrounded by bold and rocky scenery of great beauty and grandeur. There is here a small fishery. The entrance to the harbour is very dangerous at low water from a bar across its mouth, but the harbour itself is perfectly secure. Large quantities of corn are exported from the quay. A market is held weekly, and fairs are held in June, August, October, and November.

(Fraser, *Handbook of Ireland*; Thom, *Irish Almanac*.)

DUNFERMLINE, Fifeshire, Scotland, a royal burgh and market-town, is situated in 56° 5' N. lat., 3° 27' W. long., about 2½ miles N. by E. from the estuary at Charlestown and at Linnekiln, two small ports in the parish, and 16 miles N.W. from Edinburgh. The population of the royal burgh in 1851 was 8577; that of the parliamentary burgh was 13,836. The affairs of the town are managed by a provost, 4 bailies, and 17 councillors. Conjointly with Culross, Inverkeithing, South Queensferry, and Stirling, the burgh returns one member to the Imperial Parliament.

Dunfermline is a neat and well-built town. The streets are paved, and the town is lighted with gas. The finest building is the New Abbey church, finished in 1821, and built in consequence of the decay of the old abbey or parish church, which now forms a porch to the new structure. The Burgh Commercial and the M'Lean schools, a poor-house, and a prison, are buildings of recent erection. An enormous

meeting-house, built for the celebrated minister Ralph Erskine, is a conspicuous object in approaching the town. In addition to the parish church and two chapels of ease there are three Free Church places of worship, three chapels for United Presbyterians, an Episcopal chapel, and several other places of worship. Several schools in the burgh are partially endowed. There are in the town a public library, a mechanics library, a savings bank, and some charitable foundations. A weekly corn-market is held on Tuesday.

The staple manufacture of Dunfermline is that of table linens. This trade originated upwards of a century ago in the making of ticks and checks. Dye-works and tanning and currying works employ some inhabitants of the burgh. Several spinning factories, chiefly for making linen-yarn; rope-works, tile-works, and breweries, also afford employment. The Stirling and Dunfermline railway unites this town with Stirling, and by junction with the Scottish Central railway it connects it with the west and south of Scotland. The same line communicates with the Edinburgh Perth and Dundee railway. *Charlestown* and *Limekilns* are two small ports in the parish principally for shipping its mineral productions.

Dunfermline is a place of great antiquity. It was the residence of King Malcolm Canmore, the vestiges of whose comparatively rude castle still exist on a small hill in a ravine near the burgh. In a romantic situation in the neighbourhood are the few remains of the once royal palace, a building of great extent and grandeur, and a favourite residence of the kings of Scotland. Charles I. was born here, and Charles II. inhabited it temporarily in 1640. It is said that besides Malcolm III. and his queen St. Margaret, their descendants till the days of Bruce, and some noble collateral connections, are buried in Dunfermline Abbey. The tombstone of St. Margaret is still pointed out. By far the most interesting tomb is that of Robert the Bruce, discovered in clearing away the ruins of the choir for the new church. The skeleton of the king was disinterred in 1818 and a cast taken of the cranium. The abbey of Dunfermline was the most eminent in Scotland; it was very richly endowed, having the patronage of no less than 37 livings, with their tithes, and many properties throughout the kingdom, and was also possessed of peculiar and extensive feudal privileges. The frater, or refectory, with its fine gothic windows, still indicates the grandeur of the original buildings.

Dunfermline was burned by both Edward I. and Richard II. David II. was born at Dunfermline. The Confession of Faith of 1581 was subscribed here by James VI. The town was made a royal burgh by this monarch, who frequently resided in the palace. In 1638, 1643, and 1650 the various solemn leagues and covenants were subscribed at Dunfermline; and in 1651 Cromwell's soldiers plundered the place, after defeating the king's troops in the battle of Fife.

(*New Statistical Account of Scotland*; Grose, *Antiquities of Scotland*; Tytler, *History of Scotland*.)

DUNGANNON, county of Tyrone, Ireland, a parliamentary borough and market-town, and the seat of a Poor-Law Union, is situated in 54° 32' N. lat., 6° 47' W. long.; distant 85 miles N.N.W. from Dublin, and 20 miles N.W. by W. from Omagh. The population in 1851 was 3835. Dungannon returns one member to the Imperial Parliament. Dungannon Poor-Law Union comprises 19 electoral divisions, with an area of 102,440 acres, and a population in 1851 of 54,220.

The town is beautifully situated on the slope of a hill, in the midst of a fertile district, and is sheltered on the west by a lofty and extensive range of hills. The streets are well built, and the town is lighted with gas and paved. Dungannon was formerly the site of a very ancient castle, which was destroyed by the Parliamentary forces in 1641. A small Franciscan monastery was erected here in the reign of Henry VII. Besides the parish church there are a Roman Catholic, a Presbyterian, and two Wesleyan Methodist chapels, an Endowed school, a school supported by the Earl and Countess of Ranfurley, a savings bank, and a fever hospital. Among the public buildings are a court-house, a district bridewell, and a market-house. The principal manufactures are of linen and coarse earthenware; there is some trade in grain, flour, flax, and coal. The market is held on Thursday, a corn-market on Monday and Thursday, and a fair is held on the first Thursday of every month.

(Fraser, *Handbook of Ireland*; Thom, *Irish Almanac*.)

DUNGARVAN, county of Waterford, Ireland, a parliamentary borough, a market and sea-port town, and the seat of a Poor-Law Union, is situated in 52° 5' N. lat., 10° 37' W. long.; distant 24 miles S.W. by W. from Waterford, and 128 miles S.S.W. from Dublin. The population in 1851 was 6849. The borough returns one member to the Imperial Parliament. Dungarvan Poor-Law Union comprises 18 electoral divisions, with an area of 94,046 acres, and a population in 1851 of 81,207.

The castle of Dungarvan, which stands in the centre of the town, was built by King John: it is now used for military purposes. The town is situated on the Bay of Dungarvan, on the point of land formed by the union of the rivers Biskay and Calligan, which here fall into the sea. A new street and a handsome square were a few years back built by the Duke of Devonshire, who also erected a bridge across the river Calligan, consisting of a single arch 75 feet in span. The church, which is modern, is situated on the shore. A Roman Catholic chapel has been erected on the site of an old monastery.

GEN. DIV. VOL. II.

some remains of which still exist. There are also a second Roman Catholic chapel, a convent, a sessions-house, a school-house, a district bridewell, a market-house, a fever hospital, a union workhouse, and the old castle, which is used as a barracks. The town is mainly supported by the summer visitors, and by the herring and hake fisheries. There is some trade in exporting corn and butter and other farm produce. A market is held on Saturday: fairs are held in February, June, August, and November, as well as on the second Wednesday in every month.

(Fraser, *Handbook of Ireland*; Thom, *Irish Almanac*.)

DUNGIVEN. [LONDONDERRY.]

DUNKELD. [PERTSHIRE.]

DUNKERQUE (*Duyn Kerche*, *Dunkirk*), a sea-port and fortified town in France, capital of the third arrondissement in the department of Nord, stands on the eastern shore of the Strait of Dover, at the junction of the canals of Bergues, Bourbourg, and Furnes, in 51° 2' 11" N. lat., 2° 22' 46" E. long., 174 miles in a straight line N. by E. from Paris, 50 miles by railway through Hazebrouck N.N.W. from Lille, and has 26,886 inhabitants in the commune. It is said to owe its origin to a chapel founded here by St. Eloi, which from its situation among the sandy downs of the coast got the name of *Duyn Kerche*, which in Flemish means 'the church of the downs.' In the 10th century it was raised by Baudouin III., count of Flanders, from a mere village to the rank of a town. Charles V., to whom the town had come by inheritance along with the rest of Flanders, built a castle to defend the port, which has since been demolished. In 1558 the English, who had rendered themselves masters of the town, were driven from it by the French; and in the following year it was given up to the Spaniards. In 1646 it was taken from the Spaniards by the French under the Duke of Enghien (afterwards the Great Condé); but it fell again shortly afterwards into the hands of the Spaniards. In 1658 Turenne, having defeated the Spaniards, took Dunkerque, which, according to a treaty previously concluded with Cromwell, was put into the hands of the English: four years afterwards Charles II. restored it to France on condition of receiving for it a considerable sum of money. Louis XIV. by the fortifications he erected enabled the town to repel an attempt made by the English to bombard it in 1695. By the peace of Utrecht the fortifications were razed and the port filled up. At the peace of Aix-la-Chapelle the port and fortifications, which had been partially restored in the previous war, were again demolished; but by the peace of 1763 they were allowed to be restored. In 1793 the town was besieged by the allies under the Duke of York; but the French obliged the besiegers to retire with great loss.

Dunkerque is nearly three miles in circuit. The streets are broad and well paved; the houses are well built of brick. The public squares are spacious, handsome, and regular. The principal of these are the Champ-de-Mars and the Place Jean Bart, which is planted with trees and ornamented with a statue of Jean Bart, a distinguished French naval hero and a native of Dunkerque. The fortifications consist of the ramparts, which are surrounded by ditches, of Fort Louis, and the citadel. The principal buildings are—the church of St. Eloi, which though a gothic structure has a handsome Corinthian portico; the detached belfry in front of this church; the town-hall; the barracks and naval storehouses; the tower of the port, on which there is a lighthouse; the college, theatre, and concert rooms. The only supply of water is from cisterns. The market is abundantly supplied with poultry, vegetables, and other kinds of provisions. The immediate neighbourhood is dreary and uninteresting.

The inhabitants are engaged in the manufacture of soap, starch, beer, beet-root sugar, cordage, and leather: there are metal foundries, gin distilleries, salt-works, and ship-building yards. As this port serves as the outlet for the great manufacturing department of Nord the trade by sea is very considerable. The harbour, which is chiefly artificial, is rather shallow and of difficult entrance; but the roadstead is large and safe. The cod and herring fisheries are prosecuted with great activity; and the town has a considerable trade in Bordeaux wines and brandies, which has greatly increased since Dunkerque was made a free port in 1826.

Dunkerque has tribunals of first instance and of commerce, a chamber of commerce, a custom-house, a public library of 18,000 volumes, an exchange, a college, a school of navigation, and two hospitals. Foreign consuls reside at Dunkerque. The town is connected by railways with all the great commercial centres of France and Belgium.

DUNLAVIN. [WICKLOW.]

DUNLEER. [LOUTH.]

DUNMANWAY, Cork, Ireland, a market-town and the seat of a Poor-Law Union, is beautifully situated on the river Bandon near its head, in 51° 43' N. lat., 9° 5' W. long., distant 33 miles W.S.W. from Cork, 190 miles S.W. from Dublin. The population in 1851 was 2232. Dunmanway Poor-Law Union comprises 15 electoral divisions, with an area of 103,917 acres, and a population in 1851 of 20,517.

The town is situated on level ground almost entirely surrounded by lofty and rugged hills. The greater part of the town was built by Sir Richard Fox, who also obtained for it a charter as a market-town. There are two churches for Episcopalians, a Roman Catholic and a Wesleyan Methodist chapel, and a district bridewell. A Charter

school was endowed by Sir Richard Fox. The market is held weekly; fairs are held in May, July, September, and October.

(Fraser, *Handbook of Ireland*; Thom, *Irish Almanac*.)

DUNMORE. [GALWAY.]

DUNMORE, EAST. [WATERFORD.]

DUNMOW, frequently called GREAT DUNMOW, Essex, a market-town and the seat of a Poor-Law Union, is situated on an eminence on the right bank of the river Chelmer, in $51^{\circ} 42' N.$ lat., $0^{\circ} 21' E.$ long., distant 12 miles N.N.W. from Chelmsford, and 38 miles N.N.E. from London. The population of the parish of Great Dunmow in 1851 was 3235, including 435 inmates of the Union workhouse. The living is a vicarage in the archdeaconry of Essex and diocese of Rochester. Dunmow Poor-Law Union contains 25 parishes, with an area of 72,281 acres, and a population in 1851 of 20,048.

The town consists chiefly of two streets, which contain some good houses. The streets are well lighted with gas and paved, and there is a good supply of water. Many Roman antiquities have been found in the vicinity. The parish church, dedicated to the Virgin Mary, is a large ancient structure, and has a lofty embattled tower. The Independents, Baptists, and Quakers have places of worship. There are National and British schools, a savings bank, almshouses, and several parochial charities. The market is held on Tuesday for corn and cattle; fairs are held on May 6th and November 8th. A county court is held.

(Morant, *Essex*; Wright, *Essex*.)

DUNNING. [PERTSHIRE.]

DUNOIS, a district of the former province of Orléanais in France, of which Châteaudun was the capital. It is now comprehended in the departments of Eure-et-Loir, Loir-et-Cher, and Loiret. In the middle ages this district was a county united with that of Blois, without giving to its owner any separate title; but about the commencement of the 14th century Hugues, count of Blois, added to his title that of count of Dunois. Guy, count of Blois and Dunois, sold his counties to Louis, duke of Orléans (brother of Charles VI. of France), whose son Charles bestowed the county of Dunois upon his natural brother Jean, who took so eminent a part in the expulsion of the English from France under the designation of the Bastard of Orléans, and through whom alone any historical interest attaches to the district.

DUNOON, Argyshire, Scotland, a watering-place situated on the Frith of Clyde and east coast of the county, about 9 miles W. from Greenock, in $55^{\circ} 57' N.$ lat., $4^{\circ} 56' W.$ long. The population in 1851 was 2229. The old village, which dated from the reign of Robert Bruce, has been supplanted by a new and well-built little town, supplied with shops of every description, and surrounded by handsome houses and villas. There is an excellent pier for the accommodation of the numerous steamers which sail between Glasgow, Dunoon, Rothery, and other watering-places on the Clyde. In addition to the parish church there are a Free church, a chapel for United Presbyterians, and a handsome Episcopal chapel.

Dunoon was formerly, and after the restoration of Episcopacy, continued for some time to be, the seat of the bishops of Lismore, now called of Argyre and the Isles. The foundations of the old castle are still traceable.

(*New Statistical Account of Scotland*.)

DUNSE. [BERWICKSHIRE.]

DUNSHAUGHLIN, county of Meath, Ireland, a market-town and the seat of a Poor-Law Union, is situated in $53^{\circ} 32' N.$ lat., $6^{\circ} 33' W.$ long., distant 18 miles N.W. from Dublin. The population in 1851 was 422, besides 653 inmates of the Union workhouse. Dunshaughlin Poor-Law Union comprises 12 electoral divisions, with an area of 108,344 acres, and a population in 1851 of 17,168.

Dunshaughlin was formerly a place of considerable trade, but is now of little importance. The church is said to have been founded by St. Seachlan, nephew of St. Patrick, in the year 439. The Roman Catholics have a chapel; and there are a court-house, the Union workhouse, and a dispensary. A market is held weekly, and fairs are held in May, July, October, and November.

(Fraser, *Handbook of Ireland*; Thom, *Irish Almanac*.)

DUNSTABLE, Bedfordshire, a market-town in the parish of Dunstable and hundred of Manshead, is situated at the intersection of the ancient Ikenield and Watling streets, in $51^{\circ} 53' N.$ lat., $0^{\circ} 31' W.$ long., distant 21 miles S. by W. from Bedford, 33 miles N.W. from London by road, and $47\frac{1}{4}$ miles by the London and North-Western railway. The population of the town in 1851 was 3589. The living is a rectory in the archdeaconry of Bedford and diocese of Ely.

Dunstable is situated at the southern extremity of the county, near the centre of the Dunstable chalk downs. Henry I. founded here a priory of Black Canons, on whom in 1131 he bestowed the town and all its privileges, the exercising of which gave rise to many quarrels between the priors and the inhabitants. In 1290 the corpse of Queen Eleanor rested at the market-place, and a handsome cross was erected to commemorate the event, but it was pulled down during the Commonwealth time as a relic of popery. The town of Dunstable consists chiefly of one main street and another which crosses it. The houses are in general built of brick; some of them are very old. The

parish church formed part of the priory buildings; the front of the edifice is chiefly Norman, and of unusual richness. The interior is richly ornamented: over the altar is a large painting by Sir James Thornhill. There are chapels for Baptists and Wesleyan Methodists, National and British schools, a Free school, a Charity school, and several almshouses. The making of straw-plait employs many females. Whiting is manufactured. During the winter months many larks of large size are caught on the neighbouring downs, and sent to London for sale. The market-day is Wednesday. Fairs are held on Ash-Wednesday, May 22nd, August 12th, and November 12th.

DUNSTER. [SOMERSETSHIRE.]

DUNWICH. [SUFFOLK.]

DURANCE (the ancient *Druentia*), a river in the south of France, rises in Mont Genèvre. At Briançon it is joined by the Guisane and the Claret, which flow from the ridge of the Alps that separates the department of Hautes-Alpes from Savoy; and just after their junction it receives the Servièrre, another small stream. From Briançon the Durance flows south-south-west above 25 miles to Embrun, receiving by the way the Gyronde and the Guil, and several small mountain-streams. The Ubaye, which passes Barcelonnette and receives the Ubayete, joins the Durance 10 miles below Embrun. From the junction of the Ubaye the Durance flows first south-west, then south, and then west by north 135 miles, into the Rhône below Avignon, receiving a great number of tributaries, of which the principal are the Buech (which joins it at Sisteron), the united streams of the Bes and the Bleone from Digne, the Asse, the Verdon from Castellane, and the Calavon from Apt. The whole length of the river is about 180 miles. No part of its course is navigable. Owing to the rapidity of its slope it resembles a torrent more than a river, and sweeps down such an enormous quantity of sand and pebbles that its bed, except at a few points where it is contracted by projecting rocks and mountains, presents a valley deeply covered with beach, through the middle of which the restless stream hurries down to the Rhône. The Durance fills its bed only in time of floods, which are frequent and often disastrous, especially on the melting of the snows on the Alps in spring, and on the fall of heavy rains in the mountains. In the lower part of its course the bed of the Durance is full of islands. Large quantities of larch, pine, and fir-timber are floated down the river either in rafts or in single trees from the Alpine forests to Arles, whence they are forwarded to different ports along the Mediterranean. The Craponne Canal is fed from the Durance, and a portion of its waters is conducted by a magnificent aqueduct recently constructed to supply the city of Marseille. [BOUCHES-DU-RHÔNE.]

DURANGO. [BASQUE PROVINCES.]

DURANGO, a town in Mexico, capital of the state of Durango, is situated near $24^{\circ} 28' N.$ lat., $105^{\circ} W.$ long., in a wide plain, 6848 feet above the sea, and at no great distance from the Sierra Madre, which rises to the west of the town. Its population amounts to upwards of 22,000, and it carries on a considerable commerce in the agricultural produce of the country lying about it, and in that of the numerous and rich mines partly situated in the Sierra Madre and partly east of the town. The town is regularly built, and presents a very handsome appearance. Among the principal buildings are the cathedral, several churches and convents, a theatre, and a mint, in which a large number of gold and silver dollars are coined. Iron-mines are worked within a quarter of a league from the town. Woollen stuffs and leather are the chief manufactures. Not far from Durango is the Breha, a tract more than 30 miles in length and about 15 miles in width, which is occupied by hills composed of basalt and covered with scoria; among them is a crater of considerable dimensions. The department of Durango is noticed under MEXICAN STATES.

DURAZZO (the ancient *Epidamnus* and *Dyrrachium*) is a town on the coast of Albania, in $41^{\circ} 22' N.$ lat., $19^{\circ} 27' E.$ long., situated on the south coast of a peninsula which projects into the Adriatic, and forms the south boundary of the Gulf of Drin. Epidamnus was a colony of Corcyra, but it afterwards changed its name to Dyrrachium. It fell under the Romans at the time of the conquest of Macedonia, and its harbour became the principal means of communication between Italy and the north parts of Greece, Macedonia, and Thrace. The Romans embarking at Brundisium, which is nearly opposite, landed at Dyrrachium, and thence by the Via Egnatia they reached Thessalonica, on the Ægean Sea. Pompey defeated Dyrrachium with success against Caesar before the battle of Pharsalia. After the fall of the Roman empire Dyrrachium came successively into the hands of the Goths, Bulgarians, and the Normans from Sicily, who made it their stronghold in their wars with the Byzantine emperors. It afterwards fell into the hands of the Venetians, from whom it was taken by Sultan Bayazid II. Durazzo has a safe harbour, which however admits only vessels of moderate draught; larger vessels must cast anchor more than a mile from the shore. Its population is variously estimated at from 5000 to 10,000. They carry on an active import trade in British manufactures by way of Trieste, and export the surplus corn which grows abundantly in the neighbouring plains, and tobacco to Italy.

John, the eighth son of Charles II. of Anjou, king of Naples, assumed, with the consent of the Byzantine emperor, the title of duke of Durazzo and lord of Albania; and from him sprung the Durazzo branch of the Angevine family, who reigned over Naples and Hungary.

Charles III., king of Naples, was a grandson of John; he died in Hungary, and left two children, Ladislaus and Joanna, who reigned in succession at Naples, but both died without issue.

Coin of Dyrrachium.

British Museum. Actual size. Silver. Weight, 469 grains.

DÜREN, the Roman *Marcodurum* (whence its former name of *Mark-Düren*), chief town of the circle of Diiren in the government of Aachen in the Prussian province of the Rhine, is situated on the Roër, 18 miles E. from Aix-la-Chapelle, in 50° 46' N. lat., 6° 32' E. long., and has above 8000 inhabitants. It is a walled town, the seat of a mining board, and possesses a Roman Catholic gymnasium or high school, three nunneries, five Catholic and two Protestant churches, and a synagogue. Düren has considerable manufactures of fine and ordinary woollen cloths, screws, nails, iron and steel ware, paper, coarse buttons, soap, leather, oil, trinkets, &c. Several paper-mills, iron-foundries, and other factories in the vicinity of the town are worked by water-power derived from the Roër. It has an extensive trade in grain, a horse market, and three large fairs in the course of the year. On this spot several cohorts of the Ubii, who had assumed the Roman name of Agrippinenses, were surprised and cut to pieces by Civilis, the Batavian leader, in A.D. 70. (Tacit. 'Hist.' iv. 28.)

Charlemagne held assemblies here on his way to attack the Saxons in A.D. 775 and 779. Charles V. took Düren by assault and burnt it in 1543. The French in 1794 made it the capital of the department of the Roër; it was ceded to Prussia in 1814.

DURHAM, one of the northern counties of England, lying between 54° 27' and 55° 1' N. lat., 1° 8' and 2° 20' W. long., is bounded N. and N.W. by Northumberland, W. by Cumberland and Westmoreland, S. by Yorkshire, and E. by the German Ocean. Its greatest length is from east to west, 48 miles; its greatest breadth, at right angles to the length, is 39 miles. Previous to 1844 there were three detached portions of the county, namely: 1. Northamshire and Islandshire (including Holy Island and the Farne Islands). 2. Bedlington parish, sometimes called Bedlingtonshire. 3. The parish of Craike. In October, 1814, by the Act 7 & 8 Vict. cap. 8, Northamshire, Islandshire, and Bedlingtonshire were incorporated with the county of Northumberland, and Craike parish with the North Riding of Yorkshire, in which it is locally situated. The area of Durham county is 973 square miles, or 622,476 statute acres: the population in 1851 was 390,997.

Coast, Surface, Hydrography, &c.—The coast of the county of Durham is generally low. There are however several ranges of cliffs, which are of magnesian limestone, except at Seaton Bents, where they are formed by rocks of the red marl or new red-sandstone formation.

Durham may be characterised as a hilly county. The western part is overspread by the branches of the great Penine chain, from the eastern slope of which the chief rivers of the county flow. The two principal branches of this chain, which belong to Durham, are separated from each other by Weardale (the valley of the Wear); from the Yorkshire Hills by Teesdale, or Teasdale (the valley of the Tees); and from those of Northumberland by the valley in which the Derwent, a feeder of the Tyne, flows. Large portions of the mountain district consist of moor-lands covered with heath, or, as it is here termed, 'ling.' The hills north of Weardale have the name of Weardale Forest, and those north of Teasdale are called Teasdale Forest; but they are bare of wood. The principal elevations in the county are Kilhope Law (2196 feet), Cross Ridge, Bolts Law, Baron Hope, Collier Law (1678 feet), and Fatherly Fell, in Weardale Forest; Piko Law, West Pike, Manner Gill Fells, and Eglestone Bank, in Teasdale Forest; Pontop Pike, on Lanchester Common, south-east of the valley of the Derwent (1018 feet); and Brandon Mount (875 feet), south-west of the city of Durham. The moors are chiefly occupied as pasturage for sheep of the black-faced kind, and for a few young cattle and horses. The best wooded part of the county is the vale of Derwent, which produces oak, ash, elm, birch, and alder, and a quantity of underwood, especially hazel.

The chief rivers are the Tyne, the Wear, and the Tees, with their tributaries. The Tyne drains the northern parts, the Wear the middle, and the Tees the southern.

The *Tyne* [NORTHUMBERLAND] forms the northern boundary of the county for about 13 miles, from the junction of the Stanley Burn at Wylam to the sea, and its navigation extends from above Newcastle to the sea, a distance of about 15 miles. Its Durham affluents are the Derwent and Team rivers and the Stanley and Hedworth burns. The *Derwent* rises in Northumberland, and flowing east, reaches, about 3 miles from its source, the border of the county of Durham, along which it flows with a winding

course north-eastward for about 30 miles, flowing into the Tyne about 3 miles above Newcastle. For about 21 miles of its course it forms the boundary between the counties of Northumberland and Durham. The Team rises on the side of Pontop Pike, and flows first east by north and then north by west about 13 miles into the Tyne, about a mile above Newcastle. The Stanley Burn and the Hedworth Burn are only 4 or 5 miles long.

The *Wear* rises near Kilhope Law, and flows east and south-east above 4 miles (in which part of its course it is known as the Kilhope Burn), to Bowertree or Burtree Ford. From Bowertree Ford the Wear flows east by south 18 miles through the wild and romantic district of Weardale, to the junction of the Bedburn River, passing the towns of Stanhope and Wolsingham, and receiving on the right bank the Irshope, Harthope, Dadree, Swinhope, Westenhope, Snowhope, and Bollihope burns; and on the left bank the Middlehope, Rookhope, Stanhope, Shittlehope, Wescrow, Houslip, and Eals burns, all of which are small. From the junction of the Bedburn, the Wear flows still east by south 6 miles to Bishop Auckland, where it receives the Gaunless, then turns to the north-east, and flows in a very winding course about 36 or 37 miles past Durham and Chester-le-Street into the German Ocean at Sunderland. Below Durham the Wear receives the Stanley Burn, united with the Cock Burn on the left bank, and the Lumley Burn on the right bank, all at or near Chester-le-Street. The whole course of the Wear may be estimated at about 65 miles, for about 18 or 20 miles of which, namely, up to the city of Durham, it is navigable. It is crossed at Sunderland, near its mouth, by an iron bridge of one arch, of 236 feet span and 100 feet above high water-mark. The importance of its navigation arises from the export of coals from the neighbouring mines.

The *Tees* rises in Cumberland, on the slope of Cross Fell (2901 feet high), and for the first few miles of its course forms the boundary between Cumberland and Westmoreland. It is joined by the Trout and Crook becks, and upon its junction with the Crook forms the boundary of the county of Durham, separating it for a very few miles from Westmoreland, and throughout the remainder of its course from Yorkshire. The general direction of the Tees till it reaches Sockburn, nearly 55 miles from its source, is east-south-east; thence it flows nearly 30 miles north-east into the German Ocean, its total course being between 80 and 90 miles. The valleys watered by the affluents of the Tees above Barnard Castle open laterally into the valley of the Tees, and many of them are remarkable for picturesque scenery. A ridge of trap rocks across which the river flows at Cudron Snout, at the junction of the Maize or Marys beck, forms a series of falls in a distance of 596 yards which offer a fine contrast to the still water of The Wheel, a pool or lake into which the river expands just above. Some miles below these falls and three miles above the village of Middleton in Teasdale, basaltic rocks form the bank of the river. Below Barnard Castle the Tees receives on its right bank the Greta from Yorkshire, and on its left bank the Grand River, or Staindrop beck. From the neighbourhood of Darlington the channel winds very much. At Croft, near Darlington, it receives on the left the river Skerne, which, rising between Durham and Hartlepool, has a very winding course to the south-south-west, of more than 25 miles, receiving several streams by the way, and passing the town of Darlington just before its junction with the Tees. Below the town of Stockton the Tees is joined by the Hartburn and Billingham becks, and at Greatham Fleet, near its mouth, by the Elmdon beck united with another from Greatham. The wide estuary of the Tees is navigable for colliers and other large vessels up to Stockton, and for small craft several miles higher up, above Yarm in Yorkshire: the navigation has been shortened by a cut, by which a considerable bend in the river is avoided.

There are several small streams which flow into the sea between the Wear and the Tees. They are called Deans, as Ryhope Dean, Seaham Dean, Dalton Dean, Hawthorn Dean, Castle Eden Dean, and Hasledon Dean.

The river navigation of Durham, comprehending only the lower waters of the Wear and of the border rivers Tyne and Tees, is confined to the eastern side of the county. There are no canals or artificial cuts, except the one already noticed, which was made to shorten the winding course of the Tees.

The old mail-road to Edinburgh, Aberdeen, Inverness, and the north of Scotland crosses this county from south to north. It enters it at Croft bridge over the Tees, and passes through Darlington, Durham, Chester-le-Street, and Gateshead, where it quits the county, crossing the Tyne to Northumberland. Two other roads from London to Durham city branch off from the Glasgow and Carlisle mail-road at Scotch Corner, in Yorkshire, and enter the county by Pierce bridge over the Tees. Here they divide, the right-hand road passing through the villages of Heighington and Eldon, and the left-hand road through Bishop Auckland. They reunite a few miles beyond Bishop Auckland and fall in with the Edinburgh mail-road near Sunderland bridge over the Wear, about 4 miles before reaching Durham. The road from London to Sunderland branches off from the Edinburgh mail-road at Thirsk in Yorkshire, and proceeds by Yarm, upon leaving which town it crosses the Tees into the county of Durham, and proceeds forward to Stockton, and thence to Sunderland. There are several other important roads in the county.

Durham has numerous railways constructed by the coal-owners for the conveyance of coals from the pits to the rivers Tyne and Wear, where they are shipped. The principal passenger lines are the York Newcastle and Berwick railway, and its branches. The main line enters the county at Croft bridge, and passes through it in a generally northern direction for about 45 miles, forming part of the great railway communication between Scotland and the Metropolis. Its principal branches in the county are the Hartlepool branch, which unites Hartlepool with the main line, the Brandling junction, which connects South Shields and Sunderland with the main line, and the Durham and Sunderland branch. The Stockton and Darlington, Wear Valley and Redcar line runs along the south and south-eastern portion of the county, from Cold Rowley to Hartlepool. The Stockton Hartlepool and Clarence railway passes from east to west through the centre of the county, and like the other trunk lines has several branches of greater or less length.

Geology, Mineralogy, &c.—The lower part of the valley of the Tees, from the junction of the Skerne, and the coast from the mouth of the Tees to Hartlepool are occupied by the red marl or new red-sandstone, the uppermost of the formations which are found in the county. Among the strata of the formation a fine-grained sandstone of a brick-red colour predominates. Some attempts have been made to find coal by boring through the red marl, but without success, though the pits were sunk to the depth of more than 700 feet. The newer magnesian or conglomerate limestone crops out from beneath the north-western limit of the red marl: it extends along the coast to the mouth of the Tyne, and along the valley of the Tees, to the junction of Staindrop beck with the Tees, between Darlington and Barnard Castle: its inland boundary is a line drawn southward from the mouth of the Tyne, gradually diverging from the coast-line to the village of Coxhoe, between Durham and Stockton; and thence south-west to the Tees. Along the coast the upper stratum of the limestone is a species of breccia, with which wide chasms or interruptions in the cliff are filled; the next strata are thin and slaty, of a white colour inclining to buff; but lower down the stratification becomes indistinct, the rock is of a crystalline and cellular texture, and of a light-brown colour. The thickness of the limestone formation varies. At Pallion, near Sunderland, it is only about 70 feet thick; near Hartlepool it has been bored to the depth of more than 300 feet without penetrating through it. Along the coast the strata dip to the south-east. Galena is the only ore that Mr. Winch observed in this limestone, and few organic remains are found in it. In this formation along the coast are caverns and perforated rocks, which appear to have been formed by the action of the sea.

Of the dykes of basalt or greenstone which intersect the coal-measures of the Northumberland and Durham coal-fields, one crosses the Tyne into Durham county, near the Walker colliery, and another crosses the bed of the Wear at Butterby, near Durham. In the south part of the county is a remarkable basaltic dyke, extending several miles from Cockfield to Bolam, where the coal-measures dip beneath the newer magnesian limestone: a dyke of similar kind and in just the same line intersects the new red-sandstone or red marl, and crosses the bed of the Tees near Yarm into Yorkshire. In Mr. Greenough's 'Geological Map of England and Wales' the Cockfield dyke and that which crosses the Tees are represented as parts of one vast dyke, extending from the upper valley of the Tees near Eglestone, through the millstone grit and limestone shale (or, as it is laid down in Mr. Winch's map, the mountain limestone), the coal-measures, the newer conglomerate or magnesian limestone, the red-sandstone, the lias, and the inferior oolite, in all 65 miles in an east-south-east direction, to the Yorkshire coast, between Scarborough and Whitby. The coal in contact with the dyke is charred and reduced to cinder; and the sulphur is sublimed from the pyrites near. Besides the fissures filled with basalt, others of a different nature intersect the coal field: these, if large, are also called dykes; but, if small, 'troubles,' 'slips,' or 'hitches,' and by geologists 'faults:' by these 'faults' the strata are thrown, that is, raised on one side or depressed on the other, many feet. Other irregularities are observed in the coal-measures. Mineral springs and chalybeate springs are found in various parts of the coal-field.

The coal-field of Durham is bounded on the west by the district occupied by the millstone grit. This district extends westward up the valley of the Tees to Eglestone, and is bounded by a line drawn thence northward to Bollilhope beck, along that stream to the Wear above Wolsingham, and thence north-west to the Derwent at Blanchland. The millstone grit extends northward into Northumberland, skirting the west side of the coal-field; and southward into Yorkshire where it extends between the districts occupied by the newer magnesian or conglomerate limestone and the carboniferous or mountain limestone. The beds of this formation may be estimated at 900 feet thick; and this is probably short of the truth. "The prevailing rock of this series is shale, known by the provincial name of 'plate,' with which various beds of sandstone, differing in hardness and texture, and, according to these differences, distinguished as freestone, hazel, whetstone, grindstone, and millstone, occur: of the millstone only one bed is worked, the thickness of which is about 30 feet. This is one of the uppermost strata on the Derwent, where it crops out, and does not occur farther west." (Phillips and Conybeare,

'Outlines of the Geol. of England and Wales.') The millstone bed is quarried on Muggleswick Fell, and between Wolsingham and Stanhope in Weardale. Towards the lower part of this formation two thin beds of limestone occur, alternating with some occasional seams of coal.

The remainder of the county, west of the district occupied by the millstone grit, is occupied by the carboniferous or mountain limestone. The limestone beds in this formation repeatedly alternate with beds of siliceous grit and slate-clay. Mr. Winch, from whose account we have largely borrowed, classes both the millstone grit and the mountain limestone formations under the common designation of the lead-mine measures. He estimates their joint thickness at from about 2700 feet to 2750 feet, and the aggregate thickness of the limestone beds at 570 feet: deducting the thickness of the millstone grit as given above, that of the mountain limestone will be about 1800 feet or 1850 feet, of which the limestone beds amount to 570 feet: this includes about 250 feet of sandstone and slate-clay, lying immediately above the old red-sandstone, which is the formation subjacent to the mountain limestone. The limestone beds are the most characteristic of this formation, and the most important to the miner. The bed called 'the great limestone' is from 60 to nearly 70 feet thick, and consists of three strata, divided by indurated clay. It is the uppermost bed in this formation, and crops out at Frosterly, in Weardale, between Wolsingham and Stanhope, where it is quarried in large quantities for agricultural uses and building cement, or for ornamental purposes: it is a brownish-black or dark bluish-gray marble, in which bivalve shells are imbedded. 'The scar limestone,' a lower bed 30 feet thick, is divided into three strata like the great limestone, which it also resembles both in colour and organic remains. 'The Tyne-bottom limestone,' above 20 feet thick, is also divided into three strata. 'Robinson's great limestone' is above 80 feet thick. All the limestones of this formation appear to contain the encrinurus, and most of them also bivalve shells: one of them (the cockleshell limestone) contains oyster-shells of 4 or 5 inches diameter. They seem to agree in every essential character, as well as in their extraneous and native fossils. The beds of sandstone which occur in this formation are thicker than those in the millstone grit: they are thickest towards the bottom of the series. The beds of shale, or as it is called 'plate,' are very numerous: they are seldom so much as 40 feet in thickness, but one bed is 60 feet. Clay ironstone is found in Teasdale.

The carboniferous limestone is the great depository of the metallic veins of the district which comprehends the great Northumberland and Durham coal-field. Lead-mines abound in Weardale and in Teasdale Forest, and there are a few in the valley of the Derwent. Some of the fissures, especially those which range from north to south, are of great magnitude, but contain very little ore; those which run from south-east to north-west are most productive. The same vein is productive in different degrees, according to the bed which it traverses: the limestones are the chief depositories of ore, particularly 'the great limestone,' which is considered to contain as much as all the other beds put together. Galena is the only lead-ore procured in abundance from this formation; but white and steel-grained ore are occasionally found: silver is contained in the ore in different proportions, varying from 2 to 42 ounces in the fother of 21 cwt.: 12 ounces may be considered as the general average; and if 8 ounces can be obtained the lead is worth refining. Newcastle and Stockton are the ports at which lead is shipped. ('Geological Transactions,' vol. iv.; Phillips and Conybeare, 'Outlines of the Geol. of England and Wales.')

Climate, Soil, Agriculture.—The climate of the county of Durham is mild for its northern situation. The sea, which bounds it on the east, moderates the cold in winter; and the surface, being hilly without any considerable mountains, presents many sheltered valleys, the climate of which nearly resembles that of the more southern parts of the island. The soil varies in different parts; its general nature is that of a rather strong loam. In the centre of the county there is a moist clay loam of moderate quality, on an ochre subsoil, which gradually becomes peaty, and joins the western portion of the county towards Cumberland and Westmoreland, the whole of which last-mentioned part of the county is a poor peat or moor, chiefly covered with heath. From Barnard Castle to Darlington there is a strip bounded by the Tees on the south, which consists of a dry loam intermixed with clay. In this there are some good pastures and productive farms. In the valleys of the Tees, Skerne, Tyne, and their tributary streams, the soil consists of a good friable loam, which is cultivated at a small expense, and under good management is sufficiently profitable to the occupier. The extent of moor and heath land is rapidly diminishing as cultivation advances. The wastes are made profitable by rearing a hardy breed of sheep and cattle.

The general state of cultivation throughout the county is above mediocrity; and improvements have been readily adopted. The farms are not in general very large: the average size is from 150 to 200 acres of inclosed land. Cattle and horses are bred to great advantage, and oxen and sheep are fattened by grazing on some of the rich upland meadows. The soil and climate of this county are not favourable to fruit-trees, and except in the gardens of gentlemen of fortune they are not much attended to. There are some good oak woods, and many new plantations, where the tenure is freehold.

The cattle bred in the county of Durham are in great repute all over England and Scotland. The Teeswater or Holderness breed is the finest of the short-horns. The cows are remarkable for the quantity.

The oxen are considered as the most profitable breed for stall-feeding, as they become fit for the butcher at an earlier age than most other breeds. The Durham cow came originally from Holland, but it has been much improved by careful breeding. The milk, although abundant, is not so rich in cream as that of some of the smaller breeds.

The horses bred in this county are of a superior description, both for draught and for the saddle. The Cleveland bays are preferred for their vigour and activity. Hunters of superior power are produced by crossing strong active mares with blood horses which have great bone as well as spirit; or better, by having a breed produced by selected half-bred stallions and mares. The young stock are kept in rich and extensive pasture, where they have plenty of food and good water. The dry pastures on the limestone rock are peculiarly adapted to rear horses, the sound soil being advantageous to the proper hardness of the hoof. The Leicester breed of sheep is generally preferred in this county. On the heaths and moors a small and hardy species of sheep is found in considerable numbers.

Divisions, Towns, &c.—The county of Durham is a county palatine—that is, a county within which some lord had a jurisdiction “as fully as the king had in his palace;” but the palatine jurisdiction having been transferred by Act of Parliament from the Bishop of Durham, by whom it was long held, to the crown, the distinction has been for most practical purposes abolished. The county of Durham is divided into four wards, as follows:—

I. Chester ward, in the northern part of the county. II. Darlington ward, which extends from the boundary of Chester ward to the boundary of the county on the west and south. III. Easington ward, which is bounded on the north by Chester ward, on the west by Darlington ward, on the east by the sea, and on the south by a line drawn from Croxdale beck eastward to the sea. IV. Stockton ward, which occupies the remaining portion of the county. Chester and Darlington wards are further subdivided into three divisions each—Easington and Stockton are subdivided into two divisions each.

The county includes one city, DURHAM on the Wear; seven borough towns, namely, BISHOP AUCLAND, on the Wear, in Darlington ward; BARNARD CASTLE, on the Tees, in Darlington ward; DARLINGTON on the Skerne, in Darlington ward; GATESHEAD on the Tyne, in Chester ward; HARTLEPOOL on the Sea, in Stockton ward; STOCKTON on the Tees, in Stockton ward; and SUNDERLAND at the mouth of the Wear, in Easington ward. To these we may add the new parliamentary borough of SOUTH SHIELDS on the Tyne, in Chester ward. These with the market-town of SEDGEFIELD are described under their respective titles. Of the market-towns of Staindrop, Stanhope, and Wolsingham, an account is here subjoined.

Staindrop, population of the township 1429, situated in a beautiful vale about 19 miles S.W. by S. from Durham, is an ancient town, and was originally a royal demesne. The houses, many of which are well-built, form one wide street ranging east and west. Staindrop beck runs at the east end of the town. The church, which was formerly collegiate, is in the early English style, and consists of a nave, side aisles, and chancel, with an embattled tower. In the church are several interesting monuments. The market is held on Saturday for provisions. There are congregations of Wesleyan Methodists, Independents, and Quakers, an Endowed Charity school, and an Infant school. Close to Staindrop is Raby Castle, the seat of the Duke of Cleveland. The castle is on the east side of the park, which is very extensive. The principal part of the building was erected by John Nevill, earl of Westmoreland, in the 14th century; a portion is still more ancient. The general effect of the building, from its extent and grandeur, is very imposing. Its situation is fine: it occupies a rising ground, with a rocky foundation, and is inclosed with an embasured wall and parapet.

Stanhope is situated on the left bank of the Wear, 21 miles W. by S. from Durham. The parish, which comprehends 55,030 acres, is one of the largest in England: the population of Stanhope quarter or township in 1851 was 2545, chiefly engaged in the lead mines. The church is a plain old building. There are in the town a chapel for Wesleyan Methodists; the Hartwell Endowed school, founded in 1724; a National school, and a savings bank. About a mile from Stanhope are the extensive works of the Weardale Iron Company. There are also important lead mines and lime works. On the west side of the town is an eminence called the Castle Hill, rising to the height of 108 feet perpendicular from the bank of the Wear. On the summit are remains of some ancient fortifications. The market is on Friday: there are three annual fairs.

Wolsingham is pleasantly situated on a point of land formed by the confluence of the Wear and the Wescrow on the left bank of the Wear, about 15 miles W.S.W. from Durham. The parish had in 1851 a population of 4585. The church contains a finely executed font of Weardale marble. The Wesleyan and Primitive Methodists and Baptists have places of worship, and there are National schools. The Free Grammar school, founded in 1614, had 55 scholars in 1851 of whom 31 were on the foundation. The income is about 83*l.* per annum. Woollen cloth, spades, and edge tools are manufactured here.

Several iron blast furnaces have been recently opened, and coal mines are worked on an extensive scale. The population has consequently been more than doubled in number since 1841. The market is on Tuesday. The views from the hill above Wolsingham are extensive and diversified. Two chalybeate springs rise near the town.

Monk Wearmouth and Bishop Wearmouth are included in the parliamentary borough of SUNDERLAND.

The following are some of the more important villages, with their population in 1851, and a few other particulars:—

West Auckland, 13 miles S.W. by S. from Durham: population of the township, 2303. The inhabitants are chiefly engaged in manufactures and mining works. Here are a Primitive Methodist chapel, an Endowed school, and a mechanics institute. *Great Aycliffe*, an ancient village on the Great North road, 14 miles S. from Durham: population of the township, 812. Besides the parish church there is a chapel for Wesleyan Methodists. There are several corn-mills, a flax-mill, a tannery, and a rope-work. The York and Newcastle railway has a station at Aycliffe. *Birtley*, 10 miles N. from Durham: population of the township 1833; chiefly occupied by persons employed in coal-mines and at the Birtley iron-works. Salt is made here from a salt spring. There are in Birtley chapels for Wesleyan Methodists and Roman Catholics, and a school. *Blaydon*, on the right bank of the Tyne, 18 miles N.N.W. from Durham, has grown into importance, chiefly from the formation of the Newcastle and Carlisle railway, which has a station here. The population is not given separately in the returns. Coal is extensively sent down to Shields by the river Tyne. A suspension-bridge crosses the Tyne at Blaydon. There are here a district church; chapels for Wesleyan, Primitive, and New Connexion Methodists, and National schools. Fire-bricks, glass, white-lead, coke, and lamp-black are manufactured; there are an extensive iron-foundry and a steam-engine factory. *Brancepeth*, about 5 miles S.W. from Durham: population of the township, 470. This village is interesting on account of its castle, formerly the seat of the Nevills, which has recently undergone a thorough restoration. The church, a cruciform structure in the perpendicular style, erected by the Nevills, is at the east end of the castle. The grounds of Brancepeth Castle are well wooded, and are stocked with deer. In the village is a National school. *Castle Eden*, population of the parish 491, about 10 miles E. by S. from Durham, is inhabited chiefly by persons employed in the neighbouring coal-mines. The colliery company have established schools for boys and girls. An extensive engine-foundry is in the neighbourhood. Several local mineral railways converge at Castle Eden and join the line to Hartlepool, which is the shipping port for this district. *Eaglescliffe*, population of the township 493, on the left bank of the Tees, about 10 miles E. by S. from Darlington. The village occupies an elevated site on the bank of the Tees, which is here crossed by a handsome cast-iron bridge of one arch 180 feet in span. Besides the parish church, which is ancient, there is a National school. *Ford and Hylton*, contiguous townships on the river Wear, about 4 miles W. from Sunderland, have gradually increased so as conjointly to form an important village: population of Ford township, 1922 in 1851; of Hylton township, 546. The principal occupation is ship-building; there are also earthenware, copperas, and paper manufactories, and an iron-foundry. At Ford is a chapel built and endowed in 1817 by Captain Malin, R.N. *Greatham*, on the road from Stockton to Hartlepool, 6 miles S. from Hartlepool: population of the township, 651. The principal object of interest is Greatham Hospital, founded in 1272 by Robert de Stichill, bishop of Durham; the present commodious building was erected by the late Earl of Bridgewater, who also laid out the grounds and plantations. The institution supports 13 brethren and a master. The parish church is modern. Parkhurst's Hospital is an institution for six poor widows or spinsters. There is an Infant school. *Heighington*, 6½ miles N.N.W. from Darlington, on the road to Bishop Auckland: population of the township, 685. The parish church, an ancient gothic structure, has a fine Norman tower. There is a Wesleyan Methodist chapel. The Grammar school, founded in 1601, has an endowment of about 70*l.* a year, and had 72 scholars in 1851. The village is chiefly dependent on the trade arising from the residence of several wealthy families in the vicinity. *Hetton-le-Hole* is pleasantly situated in a vale about 6 miles N.E. from Durham: population of the township, 5664. The coal raised from the Hetton collieries is carried by railway to the river Wear, and thence by water to Sunderland for shipment. There is also railway communication with Sunderland. The Methodists have places of worship, and there is a National school. *Heworth* is a chapelry in the parochial chapelry of Jarrow: population, 8869. It is divided into Upper and Nether or Low Heworth. The chapel at Low Heworth is a modern building. Some very ancient coins of the Saxon kingdom of Northumbria were some years since dug up in the chapel-yard. One corner of this chapel-yard contains a monument, a neat plain obelisk nine feet high, fixed on a stone base, to the memory of 91 persons killed in the explosion of Felling colliery in 1812. There is a parish school-house, built by subscription in 1815. At Heworth Shore, on the Tyne, are manufactories of Prussian blue and other colours, one for coal tar, and works for preparing alkali for soap-boilers; also ship-building yards, a pottery, a glass-house, and wharfs for the shipment of grindstones. Freestone of a porous character, called from its excellence in

enduring a strong heat 'firestone,' is quarried at High Heworth. *Hurworth*, on the left bank of the Tees, 3 miles S.S.E. from Darlington, population of the township 1154, is situated on elevated ground, and commands an extensive prospect along the valley of the Tees. Besides the parish church there are places of worship for Wesleyan and Primitive Methodists and Independents: there are also National schools and a school supported by the Primitive Methodists. *Jarrow*, or *Yarrow*, is between Newcastle and South Shields; the church is 8 miles from Newcastle, and 2½ miles from Shields; but when the tide is out a mile may be saved between Jarrow and Shields by crossing the 'Slake,' a recess in the right bank of the Tyne, which is dry at low water: the population of the joint township of Hedworth, Monkton, and Jarrow is 3835. Jarrow was the seat of a monastery established in 681 by Benedict, a noble Saxon, who had previously founded the monastery of Monk Wearmouth. Jarrow derives its chief interest from its connection with the venerable Bede, whose birth is fixed by an ancient and probable tradition at the hamlet of Monkton, which nearly adjoins Jarrow. In 870 the monastery was burned by the Danes, and after rising from its ruins was again destroyed by William the Conqueror, 1070. Some scattered vestiges of the monastery still remain. The church adjoins the centre of the monastic buildings immediately on the north. The church was in great part rebuilt in 1783. The tower, which rises from the centre of the church, retains some curious Norman features. Roman inscriptions and pavements have been dug up near Jarrow. There are large coal-works in the vicinity. Ship-building, the manufacture of canvass, and paper-making afford employment to many of the inhabitants. There are some alkali works. *St. John's Wear-dale*, although little better than a village has a market. It is about 27 miles W. by N. from Durham: population of Forest Quarter, in which the village is situated, 4358. Lead-mines in the neighbourhood give extensive employment. The market is held on Saturday; and there are fairs in April and September. *Great Lumley*, population of the township 1730, about 5 miles N.N.E. from Durham, is occupied chiefly by persons employed in the collieries. The Wesleyan and New Connexion Methodists have places of worship. An hospital for twelve poor women was founded in 1685 by Sir John Duck. Salmon-fishing is carried on in the river Wear. *Middleton-in-Teesdale*, a small market-town on the left bank of the Tees, about 25 miles S.W. by W. from Durham: population of the township, 1849. The church is a small ancient edifice. The Baptists and the Primitive and Wesleyan Methodists have places of worship, and there is a Free school. The market is held on Saturday, and there are two annual fairs. The proprietors of the lead-mines have established schools and a library. The village is situated among hills, and extends in a kind of oval form round a spacious green. *Middleton St. George*, a small village 5 miles S.E. from Darlington: population of the parish, 332. The village is situated on the left bank of the Tees, and is chiefly dependent on visitors to the neighbouring spa of Dinsdale, for whose accommodation some good dwelling-houses have been built in this village and Middleton-One-Row, a smaller village a little to the west, consisting of a row of respectable houses. *Norton*, about a mile N. from Stockton: population of the parish, 1725. This village contains many good residences. The parish church, anciently collegiate, is of mixed styles, and has a central tower. The Grammar school has an endowment of about 44l. a year, and had 41 scholars in 1853. Here is also a National school. *Painshaw*, population 2120, situated about 9 miles N. by E. from Durham. In this neighbourhood the Marquis of Londonderry's extensive collieries are situated, and give employment to a large proportion of the labouring population. There is also an iron-foundry. Numerous railways intersect each other here. There are here a chapel for Wesleyan Methodists, and an Endowed school for the children of the colliers. *Pelton*, population of the township 1207, about 8 miles N. by W. from Durham, possesses a neat gothic church, erected in 1842 by the neighbouring proprietors of land and the coal-owners. The Wesleyan and Primitive Methodists have places of worship, and there are schools for the children of the coal-miners. *Ryton*, on the right bank of the Tyne, about 8 miles W. from Gateshead: population of the township, 789. The parish church is an interesting old edifice; it has a tower surmounted with a lofty spire. The Wesleyan Methodists and Independents have places of worship, and there is a school with a small endowment. Salmon-fishing is carried on in the Tyne at Ryton. *Seaton Carew*, 3 miles S. from Hartlepool: population of the township, 728. The village consists chiefly of neat and commodious cottages for bathing visitors; the cottages are arranged on three sides of a quadrangle. There is here a National school. *Shildon*, 11 miles S. by W. from Durham: population of the township, 2144. In Old Shildon village are a chapel of ease, a Wesleyan Methodist chapel, and National and British schools; there is also a British school in New Shildon. In the vicinity are several iron-foundries, engineering factories, and collieries. *Shotley Bridge*, 14 miles W.N.W. from Durham, on the right bank of the Derwent, which here separates the counties of Durham and Northumberland: population returned with the parish of Lanchester. The Consett Iron Company's works about 2 miles from Shotley Bridge, iron-works at Black Hill, one mile distant, a paper manufactory at Shotley Grove, flour-mills, saw-mills, a brewery, and a tobacco-pipe manufactory give employment to a large proportion of the inhabitants

In Shotley Bridge is a mechanics institute; petty sessions and a county court are held here. At Black Hill are chapels for Primitive and Wesleyan Methodists, a National and a British school. *Swalwell*, a village about 16 miles N.N.W. from Durham: population of the township, 1429. Sir Ambrose Crowley established iron-works here in 1690. There are chapels for Wesleyan and Primitive Methodists and Scotch Presbyterians, a National school, and a public library. *Tow Law*, population of the village about 2000, pleasantly situated on high ground, about 10 miles W. by S. from Durham, has risen within the last ten years in consequence of the opening of iron-works in the neighbourhood. The abundance of coal, iron, and limestone in the vicinity, and the convenience of transit by railway, are elements of prosperity to this rapidly rising village. There are chapels for Wesleyan and Primitive Methodists. *Trimdon*, population of the parish 1598, about 8 miles S.E. from Durham, has much increased of late years from the opening of new collieries. The Wesleyan Methodists have a chapel at New Trimdon. The parish church is situated in Old Trimdon. *Washington*, 11 miles N. by E. from Durham, population of the township 1224, is chiefly dependent on the neighbouring collieries. Magnesia and coke are manufactured, and there are saw-mills. The parish church, a handsome edifice, was rebuilt in 1832; there is a National school. *Whickham*, about 16 miles N.N.W. from Durham, population of the township 910, is agreeably situated near the right bank of the Tyne and on the right bank of the Team. The parish church, which is ancient, has been recently repaired; it has a nave, aisles, and chancel, and a square tower with flying buttresses. There are here a Wesleyan chapel and a National school. Coke is manufactured in the vicinity. *Whitburn*, about 2 miles N. from Sunderland: population of the parish, 1203. Numerous visitors resort to this place in summer for sea-bathing. Limestone is quarried in the parish, and some coal is raised: fishing is the chief occupation of the inhabitants. Besides the parish church there are a Methodist chapel and a parochial school. *Wintaton*, population of the township 5627, is a manufacturing village between the Tyne and the Derwent, about 18 miles N.W. by N. from Durham. Sir Ambrose Crowley, an alderman of London, established here about 1690 the extensive iron-works which still bear his name. Sir Ambrose established various charities for the benefit of the workmen and their families. These charities however ceased in 1816. There is here a new church, erected in 1828, and chapels for Wesleyan, Primitive, and New Connexion Methodists and Presbyterians. *Wilton-le-Wear*, 12 miles S.W. from Durham: population of the parochial chapelry, 918. The village is situated on rising ground on the left bank of the river Wear. Coal is extensively raised, and an iron-foundry employs a considerable number of workmen. Witton Castle was burnt down several years back, but has been rebuilt; there are some good mansions in the neighbourhood. *Wolviston*, 4 miles N. from Stockton: population of the township, 750. In the neighbourhood of this village is Wynyard Hall, the seat of the Marquis of Londonderry. There are here almshouses for widows, erected in 1838 by the Marchioness of Londonderry.

Divisions for Civil and Ecclesiastical Purposes.—The county of Durham is in the diocese of Durham and in the ecclesiastical province of York. It constitutes an archdeaconry, which is subdivided into the deaneries of Chester-le-Street, Darlington, Easington, and Stockton. The richer benefices are among the wealthiest in England. Some of the parishes and parochial chapelries are of great extent. According to the 'Census of Religious Worship,' taken in 1851, it appears that there were then in the county 621 places of worship, of which 351 belonged to five sections of Methodists, 169 to the Established Church, 25 to Independents, 21 to Baptists, 20 to Roman Catholics, 14 to Presbyterians, 9 to Quakers, and 12 to minor bodies. The total number of sittings provided was 171,903. By the Poor-Law Commissioners the county is divided into 14 Unions: Auckland, Chester-le-Street, Darlington, Durham, Easington, Gateshead, Houghton-le-Spring, Lanchester, Sedgefield, South Shields, Stockton, Sunderland, Teesdale, and Wear-dale. These Unions include 311 parishes and townships, with an area of 716,019 acres, and a population in 1851 of 406,201; but the boundaries of the Unions are not strictly co-extensive with those of the county. Durham is included in the northern circuit. The assizes and the quarter sessions are held at Durham, where stand the county jail and the house of correction.

Before the Reform Act there were four members returned to Parliament from this county, two for the county itself and two for the city of Durham. By the Reform and Boundary Acts the county was formed into two divisions, each returning two members. By the Reform Act two members were given to Sunderland, including part of the parishes of Monk Wearmouth and Bishop Wearmouth; and one member each to Gateshead (including part of the chapelry of Heworth in the parochial chapelry of Jarrow) and South Shields, including the townships of South Shields and Westoe in the parochial chapelry of Jarrow.

History and Antiquities.—At the time of the Roman invasion the county of Durham was included in the territory of the Brigantes (*Brygantes*, Ptolemaeus), a powerful tribe who occupied the northern part of the island from the Mersey to the Tyne. The Brigantes were subdued by Cerealis and Agricola, but no incidents have been recorded of their subjugation which are peculiarly connected

with this county. The county remained in the possession of the Romans until they finally withdrew from the island, being defended by the wall of Hadrian or Severus, which extended from sea to sea across Northumberland and Cumberland. The notices of the district by the ancient geographers are scanty. We gather from the Itinerary of Richard of Cirencester that the Tees was known to the Romans as the Tisa, and the Tyne as the Tina; and from Ptolemaeus, that the Wear (Horsley will have the Tyne) was known as the Vedra. The Romans had several stations within the county. Vindomora and Vinovium, mentioned in the first Itinerary of Antoninus are fixed by antiquarians at Elcheater on the Derwent, and Binchester near Bishop Auckland. Ad Tisam, mentioned by Richard, is fixed at Pierce Bridge on the Tees. Gateshead was considered by Camden to be the Gabresentum of the Notitia, which others place at Drum-burgh near Carlisle. Of some other stations the precise site has not been definitely ascertained. Roman antiquities have been found at Chester-le-Street, at Coniscliffe or Concliffe, near Pierce Bridge; at Old Durham, near Durham city, at Lanchester, at Pierce Bridge, at South Shields, at Stanhope, at Thropton, near Darlington, at Monk Wearmouth, and at Whitborn Lizard. (Reynold's 'Iter Britanniarum'.)

On the establishment of the Saxon Octarchy, Durham was probably included in the kingdom of Deira, the southernmost of the two which are frequently comprehended under the general name of Northumbria. About the year 634, after Oswald had united the two kingdoms under one sceptre, Lindisfarne, or Holy Island, was selected as the residence of the first bishop. The seat of the bishopric was about 30 years later removed to York. In 678, when Northumbria was divided into two dioceses, Lindisfarne again became an episcopal seat. Fear of the ravages of the Danes caused the bishop and clergy to leave Lindisfarne about 875, and to take up their residence at Chester-le-Street. From this place another removal took place in 995, first to Ripon in Yorkshire, afterwards to Dunholm or Dunholme, now Durham, where the see has since been fixed.

For about 20 years subsequent to the Conquest, Durham suffered all the calamities of civil war in consequence of the oppressive conduct of William and his Norman followers, the resistance of the ecclesiastics and the people, and the attacks of an invading Scots army. Rapine, famine, and pestilence spread misery on every hand, and almost entirely depopulated the district.

In the early part of the 14th century Durham was frequently invaded by the Scots. The last occasion of this kind was in 1346, when under the conduct of king David, they crossed the Tyne and the Derwent, and encamped about 3 miles from the city of Durham. Edward was in France; but the northern nobles and prelates collected a powerful army, and the battle of Nevill's Cross terminated in the defeat of the Scots and the captivity of David.

In the war of the Roses, the Yorkists, under the Marquis of Montacute, marched across Durham to attack the Lancastrians before the battle of Hexham. In the invasion of England by James IV. of Scotland, who favoured the cause of Perkin Warbeck, Norham Castle, which then belonged to Durham, was besieged by the king; but when reduced to the last extremity, it was relieved by the approach of the Earl of Surrey with an army. At the time of the Reformation the see of Durham was held by Cuthbert Tunstall, a man honourably distinguished in that persecuting age by his mildness and forbearance. He was imprisoned and deprived of his bishopric under Edward VI., was restored under Mary, but finally deprived after the accession of Elizabeth. The religious establishments were not richly endowed, with the exception of the priory at Durham. Kypen and Sherburn hospitals, which were among the wealthiest, had each less than 200*l.* a year gross revenue. In the rebellion of the earls of Northumberland and Westmoreland in support of the Roman Catholic faith, they found little difficulty in raising a tumultuous force, with which they entered Durham, tore and trampled under foot the English Bibles and prayer-books, and celebrated mass in the cathedral; they were however shortly afterwards dispersed by the royal army under the Earl of Sussex. In the latter part of Elizabeth's reign the northern counties were much afflicted by a pestilence.

When the Scots invaded England, in 1640, they crossed the Tyne into this county, Lord Conway, who commanded the King's troops, retreating first to Durham, and afterwards to Northallerton in Yorkshire. When the civil war broke out in 1642, the Earl of Newcastle formed the four northern counties into an association for the king's service. During the Commonwealth the see was dissolved; but upon the restoration of Charles II. it was re-established, and bestowed on Bishop Cosins, who distinguished himself by the munificent use he made of his large revenues. The local history of the county since the Restoration is not marked by any interesting features.

Durham is one of the principal counties in which coal is raised; it does not rank very high as an agricultural county.

In 1851 there were 12 savings banks in the county: at Barnard Castle, Bishop Auckland, Chester-le-Street, Darlington, Durham, Hartlepool, Lanchester, Middleton-in-Teesdale, Monkwearmouth, South Shields, Stanhope, and Stockton-upon-Tees. The total amount owing to depositors on the 20th of November 1851, was 262,449*l.* 7*s.* 5*d.*

DURHAM, the capital of the county of Durham, a city and borough,

and the seat of a Poor-Law Union, is situated on the river Wear, in 54° 47' N. lat., 1° 34' W. long., distant 258 miles N. by W. from London by road, and the same distance by the Great Northern and York and Newcastle railways. The population of the municipal and parliamentary borough of Durham in 1851 was 13,188. The city is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. For sanitary purposes the borough is governed by a Local Board of Health. The livings are in the archdeaconry and diocese of Durham. Durham Poor-Law Union contains 25 parishes and townships, with an area of 42,163 acres, and a population in 1851 of 35,793.

About the close of the 10th century, when the monks of Lindisfarne, or Holy Island, removed from Chester-le-Street with the remains of St. Cuthbert, the legend informs us that on the arrival of the body at Dunholme the car in which it was carried became immovable. The monks proceeded to build (on the site now occupied by the church of St. Mary-le-Bow, erected in 1685) a sort of tabernacle of boughs, wherein they deposited the relics; but soon after a stone church was built by Bishop Aldun, and dedicated to St. Cuthbert, whose remains were removed and enshrined in it. The town of Dunholme, or Durham, was besieged unsuccessfully by Duncan of Scotland in 1040. By Leland it is called Duresme (the Norman name, whence Durham).

William the Conqueror and his friends and followers committed dreadful ravages in Durham and its neighbourhood, in revenge of the murder of the garrison by the inhabitants, whose feelings of hatred had been roused into action by the excesses of the Norman soldiers. In 1072 a strong castle was built here, and Walcher, a Norman, was appointed to the bishopric. This prelate purchased the earldom of Northumberland, and assumed the title of Count Palatine. In 1093 the old church built by Aldun was pulled down, and the present magnificent edifice begun by King Malcolm, Carilepho the bishop, and Turgot the prior. Durham was often the head-quarters of Edward III. and of other monarchs and commanders on their excursions against Scotland. After the battle of Newburn the city of Durham became almost depopulated.

By an Act passed in the 27th of Henry VIII. the temporal jurisdiction of the bishops of Durham was considerably abridged. In more modern times, by the 6th and 7th William IV., cap. 19, the whole of the palatine jurisdiction of the bishops of Durham was taken away, and vested in the crown as a separate franchise and royalty. The city had its first charter from Bishop Hugh Pudsey, confirmed by Pope Alexander; the last charter was granted by Bishop Egerton in 1780. The assizes for the county are held here twice a year by the judges going the northern circuit. A county court is held in Durham.

The city is nearly surrounded by the river Wear, and forms a peninsula, the centre of which rises to a lofty eminence, partially inclosed by the ancient walls, and skirted with hanging gardens descending to the river, on each side of which are delightful public walks called the Banks. The cathedral and castle crown the summit. The prospect obtained from the summit of this eminence, comprehending a large extent of fertile and wooded country, is exceedingly interesting; as are also the views of Durham city, castle, and cathedral from numerous points in the approaches on either side. The cathedral occupies the north side and the castle the south side of Place or Palace Green, a spacious square in the centre of the town. On the west side of the square is the old exchequer, comprising the offices of the Palatine court of chancery, offices for the diocesan records, &c. Other buildings connected with the ecclesiastical establishment adjoin those just named.

Notwithstanding the marring effect of so-called restorations and alterations, enough of the outline of the cathedral remains to show the majestic character of the original Norman structure. The building is in the form of a Latin cross; the dimensions are as follows:—Length, 502 feet; length of nave, 205 feet; height of nave, 69 feet; width of nave and aisles, 81 feet; middle transept, 171 feet by 33 feet; choir, 127 feet by 32 feet; eastern transept or chapel of the nine altars, 129 feet by 34 feet. The height of the great central tower is 210 feet. The principal entrance was originally at the western end, a beautiful Norman arch forming the doorway; but after the erection of the Galilee Chapel by Bishop Pudsey the northern doorway became the principal entrance. A transept at the east end called the Chapel of the Nine Altars is a fine specimen of early English architecture, and has additional interest as containing the remains of St. Cuthbert. The remains were discovered under the site of the former shrine of the saint on the 7th of May, 1847, and were re-interred the same evening. Many interesting old monuments are in the cathedral.

The castle has received many alterations and repairs from the hands of successive bishops of Durham, who used it as a place of occasional residence. The original building is Norman. The great outer gateway, which had been for some time used as the county jail, stood till 1818, when it was removed. The archway of the present entrance-gate is Norman, but the tower of the gateway is a recent structure, built or restored by Bishop Barrington. The courtyard of the castle is an irregular square, the greater portion of the buildings being on the north and west sides. Bishop Hatfield's Hall, on the western side, was originally 132 feet long by 36 feet in width; but was considerably curtailed in its dimensions by succeeding bishops. In this hall

Henry III., the Princess Margaret of England, Charles I., and many distinguished personages have at various periods been entertained by the bishop of Durham. The Norman chapel, recently repaired and altered, is the most ancient part of the building. It consists of a nave and aisles. The whole of the castle buildings are now in possession of the University of Durham.

The church of St. Mary le Bow, in the North Bailey, in which the visitations of the bishop are held, occupies the site of the oldest church in Durham. The present building, which consists only of a nave and chancel, was erected in 1685; the tower in 1702. St. Mary's church, in the South Bailey, is a small ancient edifice. St. Oswald's was partly rebuilt some years back; it is of mixed styles; the tower is of the perpendicular style. St. Giles's church is of early date; its original character has however been considerably changed by reparations. The other churches are St. Nicholas's church in the market-place and St. Margaret's chapel on Crossgate Hill. The Independents, Quakers, Primitive, Wesleyan, and New Connexion Methodists and Roman Catholics have places of worship. A Grammar school connected with the cathedral has 4 exhibitions for the sons of clergymen of 25*l.* each at the school and 50*l.* each at either of the universities; and 18 King's scholarships, worth about 40*l.* per annum each; with some scholarships for Cambridge University. The school-house has been rebuilt outside the city, with residences for the head master and the second master. The number of scholars, including King's scholars, was 106 in 1853. A Diocesan training-school had 23 students in residence in 1853. There are besides a Blue-Coat school, National and Infant schools, a Catholic Free school, a Charity school, a mechanics institute, and an atheneum. The Infirmary was established in 1791; the present handsome building was erected in 1849. Durham possesses a savings bank. There are almshouses for 4 poor men and 4 poor women, and numerous other benefactions to the poor.

Durham is lighted with gas, and is well supplied with water; the streets are partially paved. A public fountain stands in the centre of the market-place. In the market-place is the guildhall erected by Bishop Tunstall in 1555. The town-hall, a spacious and handsome edifice in the Tudor baronial style, was erected a few years ago from the designs of Mr. Hardwick. The hall is 70 feet long, 35 feet broad, and 56 feet high, and is finished with very great richness and splendour. There are in Durham a subscription library, a news-room, assembly-rooms, and a theatre. A new jail, county courts, and house of correction were erected some years back at a cost of nearly 120,000*l.* Races are held in May. At the northern extremity of the city is Framwell-gate bridge, erected about the year 1120 by Bishop Flambard. Elvet bridge was originally built by Bishop Pudsey in 1170; it was considerably widened and improved some years back. A handsome bridge of three arches, erected at the end of the last century, crosses the river at the extremity of the South Bailey.

Durham possesses manufactories of carpets, worsted stuffs, paper, and hats; with tan-works, breweries, and iron and brass foundries. The mustard made at Durham has acquired a high character in the market. The coal-field is extensive, and there are numerous coal-mines near the city. A market for corn and provisions is held on Saturday. Five fairs are held in the year; that held in March is a celebrated fair for horses.

The principal station of the Durham branch of the York and Newcastle railway is in Gilesgate; it is spacious and well arranged. Among old buildings in Durham may be named the Magdalene Chapel in Gilesgate, and the dormitory which belonged to the great monastery of Durham. This dormitory is one of the largest and finest buildings of the kind in England. Beaurepaire, or Bear Park, the summer retreat of the priors of Durham, is about two miles north-west from Durham. About three-quarters of a mile from the city is the site of the Maiden Castle, a fortress ascribed to the Romans, as also some remains of the Ermine-street. Saline, chalybeate, and sulphureous springs are found in the neighbourhood.

Durham, University of.—A college was founded here by the prior and convent of Durham in 1290, which was afterwards enlarged by the liberality of Bishop Bury and Bishop Hatfield. At the dissolution of monastic houses the endowments of Durham College were given to the dean and chapter, in the preamble to whose foundation-charter, granted by Henry VIII. in 1541, the promotion of learning is particularly referred to. Oliver Cromwell instituted a college at Durham which he endowed from the sequestrated revenues of the dean and chapter. At the restoration these arrangements were overturned, and the dean and chapter received again their alienated emoluments. The present university owes its existence mainly to the exertions of the venerable Charles Thorp, D.D., archdeacon of Durham, who on the institution of the university was appointed to the office of warden. The university was opened for students in October 1833, under the provisions of an Act of Parliament obtained by the bishop and dean and chapter in 1832. In 1837 a royal charter of incorporation granted to the institution the style and title of 'the warden, masters, and scholars of the University of Durham.' The charter gave the power of conferring degrees, and confirmed the rights and privileges assured to it by Act of Parliament, or usually enjoyed by chartered universities. The bishop is visitor; the dean of Durham is in future to be warden. There are professorships of divinity and ecclesiastical history, Greek and classical literature, and mathematics and astronomy,

with readers in law, Hebrew, history and polite literature, and natural philosophy, and a lecturer in chemistry and mineralogy. Of University College the warden of the university is master. Bishop Hatfield's Hall, instituted in 1846, is for divinity students. It has four tutors, one of whom is principal, a censor, and a chaplain. The academical year consists of three terms of not less than eight weeks each, which are called Michaelmas, Epiphany, and Easter terms. The age of admission to the academical course is from 16 to 21; and for the divinity course between 21 and 26; beyond this age students must be admitted by special leave. Care has been taken that the charges for the necessary expenses of students shall be as moderate as is consistent with comfort, and any approach to extravagance is sedulously guarded against.

The diocese of Durham is in the province of York; it extends over the counties of Durham and Northumberland, and comprises 242 benefices. It is divided into three archdeaconries, Durham, Northumberland, and Lindisfarne. The chapter consists of the dean, the archdeacons, 9 canons, 19 honorary canons, 6 minor canons, a chancellor, a sacrist, and a precentor. The income of the bishop is fixed at 8000*l.* a year.

(*Surtees, Durham; Hutchinson, History of Durham; Ormsby, Sketches of Durham; Communication from Durham.*)

DURLACH, a town in Baden, capital of the circle of Durlach in the province of Mittel-Rhein, is situated on the Pfalz, at the foot of the Thurmberg, a richly-cultivated hill, about 3 miles E. from Karlsruhe, the road to which is formed by a straight avenue of Lombardy poplars; in 48° 59' N. lat., 8° 25' E. long.; and has a population of about 5000. Durlach is a station on the Duke of Baden's railway, which runs up the right bank of the Rhein from Mannheim to Bâle. It is an old town, and was long the residence of the margraves of Baden-Durlach, one of whom, Charles William, built Karlsruhe, and removed the seat of government to that spot. The palace, called the Carlsburg, and its gardens are the chief attraction of the place. In these gardens are four stone columns once set up on the road through the land of the Decumates, in the reigns of Caracalla, Heliogabalus, and Alexander Severus, as well as an altar to Hercules, and several stone tablets with Roman inscriptions upon them. The town has a church, a training school, and a town-hall. Trade, agriculture, and horticulture, the manufacture of wine, and mechanical pursuits form the chief occupations of the people. The environs are covered with orchards. Tobacco and earthenware are manufactured, and the town has one of the most extensive markets for grain in the grand duchy.

DURROW. [KILKENNY.]

DURSLEY, Gloucestershire, a market-town and the seat of a Poor-Law Union, is situated at the base of a steep hill, in 51° 40' N. lat., 2° 20' W. long.; distant 15 miles S. by W. from Gloucester, and 106 miles from London by road. The population of the town of Dursley in 1851 was 2617. The living is a rectory in the archdeaconry of Gloucester and diocese of Gloucester and Bristol. Dursley Poor-Law Union contains 10 parishes and a chapelry, with an area of 26,270 acres, and a population in 1851 of 14,813.

Dursley consists principally of two streets, which cross each other. The houses are irregularly built. The church is handsome and commodious. The Independents have a place of worship. The market-house is a neat freestone building erected in 1738. The market-day is Thursday; there are two annual fairs. A county court is held in Dursley, and there is a savings bank. The cloth manufacture is carried on to a considerable extent. In the neighbourhood is a quarry of tophies, or puff-stone, which being soft is easily worked, but exposure to the air hardens the stone and makes it durable. The walls of Berkeley Castle, which were built of this stone some seven centuries ago, are still in good preservation.

DÜSSELDORF, a government or administrative circle in the Prussian province of the Rhine, is bounded N. by Holland, E. by Westphalia, S. by the government of Cologne, and W. by Holland and the government of Aachen. It has an area of 2065 square miles, and had at the close of 1849 a population of 907,151, among whom about 7500 were Jews, 900 Mennonites, and the rest Catholics and Evangelicals in the ratio of about seven to four. It is the most densely peopled portion of the Prussian dominions. The Rhine which enters this government near Rheinfeld, divides it into two nearly equal portions, and after receiving many small rivers quits it near Schenkenschanz, where it is 2800 feet in width. During its passage through Düsseldorf it is joined on the left bank by the Erft or Erfft, and on the right bank by the Wipper, Dühne, Düssel, Schwarzbach, Angerbach, Ruhr, Emsche, and Lippe. The northern part of the government is level, and though it contains large tracts of sand, it has also a considerable extent of good arable land and pastures. The soil of the other parts is highly productive in general, but there are many forests and barren tracts in the mountainous districts on the right bank of the Rhine, particularly in the circle of Lennep. The quantity of arable land is computed at 680,000 acres, and of meadows and pastures at 155,000 acres. There are extensive manufactures of woollens, silks, cotton, thread, leather, steel, iron, ironware and cutlery, tobacco, soap, &c. Iron, coals, and potters' clay are among the native products. Grazing and the rearing of horses and cattle are actively pursued. The government is

traversed by railroads which communicate with the Belgian, Hanoverian, and Prussian lines. The government is divided into thirteen circles, and contains many considerable towns, the inhabitants of which are extensively engaged in manufacturing enterprise. DÜSSELDORF, the capital, BARMEN, CLEVES, CREFELD, DUISBURG, and ELBERFELD are noticed in separate articles.

Among the other towns are—*Essen*, which stands 28 miles by railway N.E. from Düsseldorf, between the Ruhr and the Emsche, in a rich iron and coal district, has four churches, a gymnasium, an hospital, iron blast-furnaces, factories for steam machinery, cast-steel works, snail-factories, &c., and a population of about 7500. *Emmerich*, a frontier fortress of Prussia, which is on the right bank of the Rhine, and has 7000 inhabitants; it stands in the centre of a rich agricultural district, and has a custom-house, four churches, considerable manufactures of woollens, soap, leather, hats, &c. *Lennepe*, 20 miles E. by S. from Düsseldorf, and not far from the left bank of the Wipper, has important cloth factories, and dye-houses, and trades in wines, hats, iron-ware, &c.: population, 4900. *Mühlheim*, a pretty town on the right bank of the Ruhr, 15 miles N.E. from Düsseldorf, has large silk and cotton-factories, zinc and iron-works, establishments for the manufacture of steam machinery, and 9000 inhabitants, who are also largely engaged in the export of coals. *Neuss*, a fortress and flourishing manufacturing town, 4 miles S.W. from Düsseldorf, has 8000 inhabitants; it is said to be the *Novesium* of the Romans; up to the 13th century the Rhine flowed close past the walls, from which it is now nearly 2 miles distant; the church of St. Quirinus is the most important building; the manufactures are woollen-cloth, flannel, cotton-cloth and yarn, ribands, hats, starch, vinegar, soap, oil, &c.; there is also a good trade in corn, slates, timber, coals, quills, and stone. *Novesium* was sacked by Attila in A.D. 451; in 1254 the town joined the Hanseatic league. *Ronsdorf*, midway between Elberfeld and Lennepe, has 4000 inhabitants, who manufacture cutlery, silk, cotton-cloth, woollen-cloth, and linen. *Ruhrort*, at the entrance of the Ruhr into the Rhine, has a large trade in coals, yards for building steam-tugs, cotton-factories, workshops for the construction of steam and other machinery, and about 3500 inhabitants. A railroad $5\frac{1}{2}$ miles in length connects Ruhrort with the Oberhausen station on the Cologne-Minden railway. [ARENSBERG.] *Solingen*, 15 miles S.E. from Düsseldorf, has 6000 inhabitants, and is famous for the manufacture of sword-blades, foils, cutlery, and iron-ware. *Steele*, or *Steyle*, situated a short distance E. from Essen on the right bank of the Ruhr, and in the centre of the Westphalian coal-field, has about 2000 inhabitants. A railway 21 miles in length runs from Steele to the Vohwinkel station on the Düsseldorf-Elberfeld railway. *Vesel*, which stands at the junction of the Lippe with the Rhine, and on the right bank of the latter; is a fortress of the first class, defended by a citadel on the south side of the town, and connected by a bridge of boats with Fort Blücher, on the left bank of the Rhine; the town including the garrison has 13,000 inhabitants, who manufacture woollen and cotton-cloths, soap, hats, cordage, leather, tobacco, beer, &c., and carry on a considerable trade with Holland by the Rhine, and with Westphalia by the Lippe, which has been made navigable; the chief articles of commerce are corn, timber, coals, salt, wine, brandy, and colonial produce; it has a gymnasium, seven churches, a synagogue, a town-house, an arsenal, house of correction, and a number of distilleries.

DÜSSELDORF, the capital formerly of the duchy of Berg, now of the government of Düsseldorf in Rhenish Prussia, is situated in the centre of a fertile country on the right bank of the Rhine, at the point where the Düssel joins that river, in $50^{\circ} 13' N.$ lat., $6^{\circ} 47' E.$ long., at an elevation of about 100 feet above the level of the sea, 22 miles by railway N. from Cologne, and has, including the suburbs, a population of 31,000, who are chiefly Roman Catholics. It was raised from the rank of a village to that of a municipal town by Adolphus V., duke of Berg, in 1238; it was first united to the Prussian dominions with the duchy of Berg in 1815. The flying bridge across the Rhine dates from the year 1680. Düsseldorf having been carefully fortified, acquired the character of a fortress in the middle of the last century; but it was never tenable against a serious assault, and the defences were razed by virtue of the treaty of Lunéville in 1802. It is one of the best-built towns on the Rhine, and has more the appearance of a small German capital than any of the other Rhenish towns. The streets are broad and planted with avenues of trees, and contain many showy shops. Düsseldorf is surrounded by extensive garden-grounds, and consists of three quarters, namely: the Altstadt, on the right bank of the Düssel, which was the whole extent of the town until the beginning of the 17th century; the Neustadt, on the Rhine; and Carlstadt, the handsomest part of Düsseldorf, south of the Old Town, and on the left bank of the Düssel, which takes its name from Carl Theodore, the elector-palatine, who founded it in 1786. There are five squares or open spaces, on one of which, the old market-place, stands a colossal equestrian statue in bronze of Johann Wilhelm, elector-palatine. Among the buildings of note are the old electoral palace, which is now occupied by the Academy of Arts and the Royal Mint, and in the court-yard of which is another statue of Johann Wilhelm in marble. The town had formerly a famous picture-gallery, founded in 1710 by the elector Johann Wilhelm; but the paintings were removed to Munich in 1808, and those which it now contains are said to be of little

value, and are the present palace, where the governor of the province resides; the government-house, once a college of Jesuits; the observatory, town-hall (erected in 1567); courts of law, barracks, theatre, gymnasium, and a public library of above 80,000 volumes. Düsseldorf has seven churches, two of which belong to the Protestants; the most remarkable are St. Lambert's, and St. Andrew's (the oldest in the town, which contains some good pictures and the tombs of several of the dukes of Berg, &c.); and the church of the Jesuits, a handsome and richly-decorated structure with two steeples, beneath the main altar of which other sovereigns of Düsseldorf are interred. Besides these there are a synagogue, three nunneries, an orphan and a lunatic asylum, two hospitals, an infirmary, and various schools.

Düsseldorf is the seat of the provincial government and tribunals of justice. A court of assize is held in the town. It has manufactories of woollens, cottons, leather, hats, tobacco, jewellery, mirrors, stockings, &c., and carries on a considerable trade in cotton, wool, wines and spirits, colonial produce, coals, timber, slates, and other commodities. It has been a free port since 1829. Adjoining the town are the royal gardens and a botanic garden. The growing importance of Düsseldorf as a commercial port is shown by the increase of its imports and exports, which in 1836 were respectively 855,533 cwts. and 113,144 cwts.; in 1845, 1,535,926 cwts. and 206,370 cwts. A large portion of the imports were for the use of Elberfeld and other manufacturing towns in the neighbourhood. The establishment of railroads has increased the commercial advantages of the town. Steamers ply regularly up and down the Rhine.

DWINA, or DVINA, a river of Northern Russia, the largest that falls into the White Sea, originates in the confluence of two smaller rivers, the Sukhona and the Jug (Yug), near Veliki-Usting, in $60^{\circ} 46' N.$ lat., $46^{\circ} 30' E.$ long. The Sukhona, a considerable stream, which flows out of Lake Kubinskoi, and runs with a very tortuous channel and in a north-easterly direction through the south-western parts of the government of Vologda, describes a course (along the whole of which it is navigable), of about 285 miles between that lake and its junction with the Jug. The Jug, flowing down from a morass on the northern range of the Volga Mountains, at the southernmost point of the same government, and in the early part of its course washing the walls of Nikolsk in its progress northward to its confluence with the Sukhona, has a length of about 248 miles. These two rivers unite below Veliki-Usting, and the river is thenceforward denominated the Dwina ('double river.') The Dwina flows in a north-westerly direction through the western districts of the government of Vologda, becomes navigable before it quits them, traverses the south-western part of the government of Archangel, and discharges its waters through five arms below the town of Archangel into the Bay of Dvinskaya, in the White Sea. Its length in a straight line from the confluence of the Sukhona and the Jug to its mouth is about 312 miles, but, including its windings, it is estimated at about 736 miles. The Dwina is navigable from the close of April to the first week in November for a distance of about 240 miles; but owing to shoals at its mouth vessels of more than 14 feet draught cannot enter it. [ARCHANGEL, vol. i., cols. 439, 442.] It generally flows between high banks, and is on an average from 500 to 600 feet in width; at Archangel this width is increased to four miles. Its chief tributaries are, on its right bank, the Vytchegda and the Pinega. The source of the Vytchegda is on the declivity of the Vertshoturi range of the Ural Mountains: this river has numerous bends, and falls into the Dwina in the centre of the government of Vologda, from which point the Dwina becomes navigable. The whole length of the Vytchegda is not less than 500 miles. The Sysola, which flows northward from the mountains of Viatka, joins the Vytchegda on the left bank at Ust-Sysolsk in the government of Vologda. The Pinega rises in the north of the government of Vologda, not far from the right bank of the Dwina, in about $60^{\circ} 20' N.$ lat., and flows in a very tortuous course northward to Pineg, in the government of Archangel. From Pineg the river is navigable, and flows westward into the Dwina a little above the town of Kholmogory. The length of the Pinega, reckoning all its windings, is little short of 300 miles. Soon after it has received the Pinega on its right bank, the Dwina forms a number of islands, which extend to its mouth. On its left bank the Dwina receives the Vaga, which is navigable for about 75 miles, and joins the Dwina above Poiniskoi, in the government of Archangel, and the Emtsaor Yamza, a river navigable for about 90 miles which has its confluence with the Dwina about 36 miles above Vilsk in the same government. The tide is perceptible in the Dwina nearly 80 miles above Archangel. The basin of the river occupies an area of about 128,900 square miles; the bed is generally of clay, covered with a thin layer of sand. The Dwina abounds in fish. [ARCHANGEL.]

DYLE. [SCHELDE.]

DYRRACHIUM. [DURAZZO.]

DYSART, Fifeshire, Scotland, a royal burgh and sea-port, is situated on the northern shore of the Frith of Forth, about 16 miles N. by E. from Edinburgh, and 14 miles E. from Dunfermline, in $56^{\circ} 7' N.$ lat., $3^{\circ} 6' W.$ long. Dysart unites with Kirkcaldy, Burntisland, and Kiung-horn in returning one member to the Imperial Parliament: the

population of the burgh in 1851 was 1610; that of the parliamentary burgh was 8041.

The tower of the old church of Dysart is still entire. The town consists chiefly of three streets and a small square. The square contains the public offices. The town is lighted and cleansed under police regulation. Dysart has a small harbour, attached to which is a large wet dock. Besides the parish church there are a Free church and a United Presbyterian meeting-house. A school-house has been erected by subscription, aided by a government grant. At Pathhead, a populous village in the neighbourhood of Dysart, a school has been

similarly erected, and 200 children are there also clothed and educated in an institution, the munificent endowment of Mr. Philp, a merchant in Kirkcaldy, who left 80,000*l.* to be devoted to establishing schools in Kirkcaldy, Pathhead, Abbots hall, and Kinghorn. At Pathhead are a chapel of ease, a Free church, and a Dissenting chapel. At Dysart is a station of the Edinburgh, Perth, and Dundee railway; and there are packet-vessels twice a week to Leith. The chief manufacture is the spinning of flax and weaving of cloth. Limestone, sandstone, and ironstone are quarried.

(*New Statistical Account of Scotland.*)

CABELLO. [PUERTO CABELLO.]
 CABES, GULF OF. [KHARR.]
 CABRA. [CORDOVA.]
 CAHREIRA. [BALKARIC ISLANDS.]

CABUL (pronounced and sometimes spelt Cabool, also Kabool), the capital of the State of Cabul in the north of Afghanistan, is situated on the Cabul River, in a wide plain between 6000 and 7000 feet above the sea, in 34° 30' N. lat., 69° 6' E. long., at a distance of about 60 miles N. from Ghuznee, 200 miles N.E. from Candahar, and 120 miles W. from Peshawur: population about 60,000. The city is flanked on three sides by low hills, and inclosed by a wall. The north-eastern quarter forms the Bala Hissar (Palace of Kings), a fortified inclosure comprising the residence of the Khan of Cabul, the government offices, the palace gardens, and a small town. The outer town is about three miles in circuit, compactly built, chiefly with sun-dried bricks and wood to avoid the consequences of the frequent earthquakes. It is entered by four gates placed at the ends of the two principal streets that cross the city. One of these streets, running northward, led to the once magnificent bazars destroyed by the British on their evacuation of Cabul, on which occasion also the Bala Hissar was greatly damaged. The city is divided into separate districts, each of which is walled, and may form on occasion a separate fortress. In general the streets are crooked, badly paved, and narrow; so much so, that two horsemen can with difficulty pass in some of them. The houses are two and three stories high, and, as in most parts of the east, they have flat roofs: those of the wealthy are built round courtyards, and surrounded by gardens. The tomb of the emperor Babur who made Cabul his capital is on a hill outside the city; it is surrounded by large beds of flowers, and commands a noble prospect: the tomb of Timur-Shah is a brick octagon surmounted by a cupola. The plain about the city is laid out in orchards and gardens, which in some seasons of the year are very beautiful. The climate of Cabul, owing to its great elevation above the sea, is very cold in winter, which is long and severe. [AFGHANISTAN.] The summer is delightful. Cabul is the centre of a very active transit trade in Russian, Chinese, and other northern products, which are sent by caravans to Hindustan and Persia. The routes by which this trade is conducted and the items of which it consists are given in the article on AFGHANISTAN. Cabul has also important markets for the sale of corn, horses, cattle, and fuel; it is particularly celebrated in the east for the excellence and abundance of its fruits and vegetables.

Cabul occupies probably an ancient site; some think it to be the Caburn of Ptolemy. The Arabic historians mention it as the residence of a Hindoo prince in the 7th century. It was taken by Tamerlane about 1394, and again in 1739 by Nadir-Shah, who plundered it. On the death of Nadir-Shah, Ahmed Khan, the founder of the Duranee monarchy, took possession of Cabul, and his son Timur made it in 1774 the capital of Afghanistan. The events that occurred in the city during the late Afghan war are noticed under AFGHANISTAN.

CABUL RIVER. [AFGHANISTAN.]
 CACERES. [EXTREMADURA, SPANISH.]

CACHA'R, a province in the north-east quarter of Hindustan, is bounded N. by the Brahmaputra River and Assam, E. by Manipoor and the Burmese territory, S. by Silhet and Tipperah, and W. by the principality of Jyntia. This province is situated between 24° and 27° N. lat., and between 92° and 94° E. long.: its length from north to south is about 140 English miles, and its breadth from east to west about 100 miles.

Cachar, the ancient name of which was Hairumbo, is divided into Cachar Proper and Dharmapore; the first occupying the south and the second the north part of the province. The country in general is mountainous; the greater part of the mountains is covered with forest trees, bamboos, and jungle, which frequently render them inaccessible; the passes are not practicable at all seasons, and few roads have been made in the district.

A great number of small streams have their sources in the high lands of Cachar. Those in the eastern mountains unite and form the

C

rivers Capili and Barak, both of which join the Megna or Brahmaputra: the Barak at the point (24° lat., 91° long.) where that river takes the name of the Megna. During certain parts of the year the Barak can be navigated; in the dry season it is fordable, the channel being obstructed by rocks; but soon after the rains have set in the river has a depth of from 30 to 40 feet of water. From June until November considerable tracts are inundated, and the difficulty of travelling is consequently increased.

The jungle fever, often fatal to Europeans, is common in Cachar. It does not however attack the natives with equal violence. The country is thinly inhabited. The entire population has been estimated at about 300,000, but the numbers are liable to constant fluctuation. The best peopled districts are those nearest to the south-west, and a level tract in the north near the Capili River and adjacent to the town of Dharmapore.

Cospore, the modern capital, is 20 miles south from Golbarga, the ancient capital of Hairumbo, in 24° 45' N. lat., 92° 45' E. long., on the banks of a small stream called the Madhura. The Raja of Cachar having in 1811 removed his residence to Doodputtee, a small town about 18 miles farther north, Cospore has since considerably fallen off. The town of Dharmapore, in the northern division of the province and about 60 miles from Cospore, was formerly a place of some strength, and enjoyed a considerable trade; but the fort has now fallen into decay, the trade has in a great measure left the place, and its population has decreased.

Cachar was invaded by the Burmese in 1774, but the force first sent was destroyed by the jungle fever. A second expedition reduced the raja to submission, and forced him to become a tributary of the King of Ava. In 1810 the Raja of Cachar placed himself under the protection of the British. Some twenty years later the province became the scene of trouble and confusion. In 1830 the Raja Govind Chandra was murdered by his own guard. By desire of the people, as well as to insure peace on the north-east frontier, it was determined to annex the province to the British empire. The affairs of the province are administered by a native raja under the protection of the Company's government.

(Hamilton, *East India Gazetteer*; Wilson, *History of British India*; *Parliamentary Papers*.)

CADER IDRIS. [MERIONETHSHIRE.]
 CADIZ, PROVINCE OF. [SEVILLA.]

CADIZ, a city and sea-port, is situated on the south-west coast of Spain, in 36° 31' N. lat., 6° 17' W. long., 70 miles S.W. from the city of Sevilla. It is the capital of the modern province of Cadiz, which is included in the ancient province of Sevilla and great division of Andalusia. It is the see of a bishop, suffragan to the archbishop of Sevilla. The population in 1845 was 53,922.

Cadiz is built on the end of a low and narrow isthmus or tongue of land, which extends from the island of Leon (Isla de Leon), about 5 miles in a north-north-west direction. The rocky extremity on which the city is constructed is considerably higher than the isthmus which connects it with the Isla de Leon; it has a circuit of six or seven miles, and is surrounded by the sea on all sides except where it joins the isthmus. The whole of the western sides of the city, the isthmus, and the Isla de Leon, are open to the Atlantic Ocean; to the north and north-east the projections of the mainland form with the isthmus the Bay of Cadiz, which includes a circuit of more than thirty miles. The outer bay, the entrance to which is between the city and the promontory of Rota, distant about five miles, is exposed to the south-west, but the inner bay is well sheltered, and affords in most places good anchorage. Some dangerous rocks called Las Puercas (the Sows) are scattered opposite the city, in the direction of Rota. The Guadalete enters the sea at Puerto de Santa Maria, where the inner bay may be said to commence, and within this portion the harbour is formed by a well-constructed mole, but is not of sufficient depth to allow large vessels to come close up to the city. From Puerto de Santa Maria the coast trends south, and the bay becomes narrower, the mouth being defended by the cross-fires of the forts of Matagorda and Puntales. Here an islet, which contained Fort San Luis, is divided from the mainland by a channel called the Trocadero.

From the Trocadero the bay sweeps inwards, forming a small bay in the mainland, where the town of Puerto Real is situated, and opposite the narrow channel called the Rio de Santi Petri, which divides the Isla de Leon from the mainland, and is crossed by a bridge called the Puente de Zuazo. On the mainland, at the entrance of the Rio de Santi Petri, is La Carraca, one of the chief naval arsenals of Spain, formerly a station for the carracks, or galleons, and from the dock-yards of which were subsequently floated the grand three-deckers, most of which were destroyed by the British fleets during the last war with Spain. The Rio de Santi Petri is very deep, and at the entrance from the Atlantic is defended by a rock-built castle. Fort San Luis, in the islet of the Trocadero, was much injured by Marshal Victor, and afterwards utterly destroyed by the Duc d'Angoulême. The fortifications generally are at present in a state of neglect and dilapidation.

The city of Cadiz is in form nearly a square, each side of which is about a mile and a half in length. It is surrounded by ramparts, and has five gates, one of which opens on the isthmus, which is itself intersected about the middle by a deep entrenchment called the Cortadura. Between the ramparts and the bay public walks have been formed. The principal walk, the Alameda, is on the eastern side of the city. It is planted with trees and provided with seats, and is thronged on the fine evenings. The streets are regularly laid out, mostly crossing each other at right-angles; they are in general narrow, but are well paved and lighted. The principal street however is of good width; it contains the Exchange (Bolsa), the houses of the nobility and chief merchants, and is the great resort for men of business and loungers during the early part of the day. It is connected with the principal square (Plaza San Antonio), which though not large is handsome, surrounded by large houses, and planted with trees, with marble seats beneath them. The houses of Cadiz are built of a white stone, which gives the city a remarkably bright and clean appearance, and the fronts of most of them are painted, and have balconies furnished with curtains to shade the inmates from the sun. The supply of water for general purposes is from rain collected in cisterns, but good water in abundance is brought in boats from Puerto Santa Maria. The lighthouse of San Sebastian is on the western side of the city; it rises 172 feet from the base, and is visible in clear weather at a distance of 20 miles. From the top of the Torre de la Vigia the white and smokeless city, with its look-out towers (miradores), its flat roofs, and flags, is seen to great advantage.

Cadiz contains two cathedrals. The old one was built in 1597. The new one (La Nueva Catedral) was commenced in 1720, by the corporation, to supply the want of dignity of the old one, but was not completed till about 1840. It is however of small size and poor architecture. There are two theatres (in the larger of which operas are sometimes performed), and a new bull-arena (Plaza de Toros). The Museo contains about 100 paintings by Zurbaran, Murillo, Giordano, and others, but they are not of the highest class. The chapel of the suppressed convent of San Francisco contains the last work of Murillo, who fell from the scaffolding while painting it, and died in consequence at Sevilla. There are artillery-barracks, a naval college, a custom-house, a House of Refuge (Casa de Misericordia), which sometimes contains 1000 inmates, and several smaller charitable establishments. The city also contains a college, a school of navigation, and several other educational institutions.

Cadiz for a long period enjoyed a very high degree of commercial prosperity. In 1792 the imports from Spanish America amounted to 7,295,833*l.*; but this commercial activity was almost wholly destroyed by the defection of the Spanish colonies at the commencement of the present century. The foreign trade, which is now in a state of great depression, arises out of the importation, in Spanish ships, of colonial produce from Cuba, Puerto Rico, and the Philippine Islands; hides, cocoa, indigo, and other produce from South America; salt-fish from Newfoundland, in English vessels; and manufactured goods from England, France, and Germany; but a great amount of this last branch of trade is contraband. The exports consist mostly of wine, olive-oil, fruits, salt, and quicksilver. In 1849 the export of sherry amounted to 139,170 butts. The annual value of the exports is under 2,000,000*l.*, and that of the imports (exclusive of the contraband trade) is not much more than 1,000,000*l.* Mail-steamers go once a week between Cadiz and the Canary Islands. The coasting trade is carried on in small craft, not exceeding 60 tons burden, which import provisions, grain, charcoal, &c. from the other maritime provinces, and export colonial produce, and linen and woollen goods. The manufactures carried on in the city consist of soap, glass, coarse woollen fabrics, cotton and silk goods, and hats. There are also some sugar-refineries and tanneries.

Cadiz is one of the most ancient towns in Europe. It was founded by the Phœnicians several hundreds of years before the Christian era, and was the great mart whence the tin of Britain and other products of western Europe were distributed over the eastern world. The Phœnician name of the town was *Gadir*. The Greeks named it *Γαδίζα*; the Romans *Gades*, and under them it was made a municipium, and became one of the richest cities in the Roman empire. It then received the title of 'Augusta Urbs Julia Gaditana,' and was the seat of one of the four *Conventus Juridici* of Bœtica. It was taken by the Goths, and from them by the Moors. From the Moors it was recovered by

Alonso el Sabio, September 14th, 1262. It has often been besieged. It was taken by assault, pillaged, and burnt by the English in 1596. It was long blockaded by admiral Blake, who there captured two galleons laden with treasure, and sunk eight others. Two English expeditions against it failed, one in 1628, and another in 1702. It was invested by the French during the Peninsular War in 1810, and the investment continued till August 25th, 1812, when, in consequence of the movements of the Duke of Wellington, the blockade was discontinued, and about 1000 guns were destroyed, as well as the vast works at Chiclana, Puerto Santa Maria, and the Trocadero. In August, 1823, it was besieged by the Duc d'Angoulême, and in October the same year was delivered up to him. The French troops retained possession of it till the summer of 1828.

CADORE. [BELLUONO.]

CADSAND. [ZEELAND.]

CAEN, the capital of the department of Calvados, in the north of France, the seat of a high court of appeal for the departments of Calvados, Manche, and Orne, of tribunals of first instance and of commerce, of a chamber of commerce and exchange, of a provincial university, an endowed college, and an inferior school of navigation, is situated at the confluence of the Odon with the Orne, 127 miles W. from Paris, in 49° 11' N. lat., 0° 21' W. long., and has 40,569 inhabitants including the whole commune.

The city stands at a distance of 7 miles from the mouth of the Orne in the English Channel. There is no evidence of its existence before the 9th century, when it was called Cathou or Cathem, from which the modern name is said to be derived. When Charles the Simple in 912 ceded Neustria to the Northmen, Caen was a large and important town. The Conqueror and his wife Matilda resided in it for some time, and contributed greatly to its embellishment. The Conqueror commenced the castle of Caen, which was finished by Henry I. of England, and the town became the capital of Lower Normandy. In 1346, soon after it had been walled in perhaps for the first time, Edward III. took Caen after a siege, and plundered it. "The town was then," says Froissart, "large, strong, and full of drapery and all other sorts of merchandise, rich citizens, noble dames and damsels, and fine churches." The English took it again in 1417, and held it till 1450, when it capitulated to Count Dunois. Since that time it has belonged to the French.

Caen is situated in a level tract, almost wholly consisting of uninclosed fields of buck-wheat and other corn, extending with monotonous continuity as far as the eye can reach. The appearance of the town from a distance is grand, both from its extent and the number of towers and spires that rise from it. The streets are wide and clean, and the houses are built of stone. The finest streets are those of St-Jean and St-Pierre, which cross each other at right-angles, and lead right through the town. The city is intersected by a canal from the Odon, which drives the machinery of several factories. The banks of the river are in many places formed into walks, and adorned by avenues of noble trees. There are some ancient houses with the gable to the street, and presenting on the front elaborate carvings of wood. The town has few fountains, the want of which is supplied by wells. There have been considerable improvements of late years in the outskirts of the town, which are facilitated by the circumstance of stone being quarried in the immediate neighbourhood. Much of this stone is exported for building purposes to England. There are but slight remains of the ancient walls and towers by which the town was defended. The bed of the Orne forms a tide-harbour, and its banks are lined with quays. Vessels of 200 tons only can come up to the town owing to the sand-banks at the mouth of the Orne, but a canal is in course of construction which will admit larger craft; the funds for its completion were voted in 1853.

In the town there are several squares; the finest are the Place St-Sauveur and the Place Royale, in which is a statue of Louis XIV. The public buildings are interesting as well for their architecture as for their historical associations; and, owing to the solidity of the Norman masonry, most of them date from an ancient period. The cathedral, one of the finest ecclesiastical edifices in Normandy, is the ancient church of the abbey of St-Etienne, which was founded by the Conqueror between 1061 and 1070. It consists of nave and aisles, transept and choir, terminating in a sanctuary of circular plan, shut off by a screen, and surrounded by eleven chapels of symmetrical construction. Galleries run along the whole length of the aisles. The deep portal, flanked by two majestic towers, is greatly admired. The abbey, called also *Abbaye aux Hommes*, being outside the town, was regularly fortified in the 14th century. It was sacked in 1562 by the Protestants, on which occasion they demolished the tomb and dispersed the bones of the Conqueror, who was buried in the abbey church; a second monument erected soon after subsisted till 1742, when the few remains that had been recovered were removed into the interior of the abbey, and a third monument erected over them; this in its turn was demolished at the revolution of 1793. The abbey buildings are now occupied by the college.

The church of La-Trinité belonged to the former abbey of La-

Trinité, called also Abbaye-aux-Dames, which was founded by Matilda, the Conqueror's wife, in 1066. This structure is built in the form of a Latin cross; it is remarkable for the severe elegance of its architecture, and for the beauty of its nave; the sanctuary is raised several steps above the pavement, and is canopied by a cupola painted in fresco. Under the sanctuary is a crypt, the vault of which is supported by thirty-four massive pillars. A magnificent mausoleum long stood in the centre of the choir in memory of Matilda, who was buried in this church; in 1562 her coffin and bones shared the same fate as the Conqueror's. A second monument erected to her in 1708 was destroyed in 1793. The buildings of this abbey have been turned into an hospital since 1823. The church of St. Pierre is a structure of different ages; its tower erected in 1308 is considered a masterpiece. The church of St. Jean dates from the beginning of the 14th century, and is remarkable for its tower, which leans sensibly to the north. The church of St. Nicholas is considered the purest specimen of the Norman architecture of the 11th century extant. It has long been desecrated, and is now used as a shot-factory. The castle commenced by the Conqueror, finished by Henry I., and afterwards repaired by Louis XII. and Francis I., still ranks as a place of defence, though the keep and some of the towers were destroyed in 1793. The church of Notre-Dame, built by the Jesuits in 1684, in the Italian style, is a very elegant structure. The angel hovering over the grand altar is considered to be finely executed. The Prefect's hotel, and the court-house, are elegant modern structures.

Other remarkable objects at Caen are the Hôtel-Valois, now used as an exchange; the public library, which contains 25,000 volumes, the museum, the botanical garden, the new fish-market, the abattoir, and the granite bridge over the Orne. The city contains many beautiful promenades, the finest of which are the Grand Cours, which runs along the Orne; the Petit Cours; the boulevards, which are shaded by horse-chestnut trees; and the Cours Caffarelli, which run along both banks of the new canal, and are bordered with fine trees.

The town is famous for the manufacture of Angora gloves, &c. A writer in the 'Dictionnaire de la France' says that these gloves are made of the down of the Angora rabbit, great numbers of which are reared in the country about Caen; they are plucked (plumés), he adds, every year, and the fur, which is gray or sometimes white, is worked up without either washing or dyeing. Its industrial products comprise also hosiery and lace, broadcloths, flannel, fine and table linen, cotton cloths, fustians, druggets, straw hats, cotton thread gloves, glazed pottery, porcelain, room paper, cutlery, &c. There are several dye-houses, breweries, timber-yards, tan-yards, and slips for building small coasting vessels in the town.

Caen is an entrepôt for salt. There is a considerable coasting and export trade in paving granite, and building stone. Other articles of trade are corn, wine, brandy, cider, clover-seeds, hemp, cattle, horses, poultry, butter, fish, salt provisions, ironmongery, steel and hardware, and millstones. A railway in course of construction from Rouen near Mantou on the Paris-Rouen line to Cherbourg passes through Caen.

(*Dictionnaire de la France; Annuaire pour 1853; Official Papers.*)

CAERGWRLEY. [FLINTSHIRE.]

CAERLAVEROCK. [DUMFRIESSHIRE.]

CAERLEON, Monmouthshire, a market-town in the parish of Llangattock and lower division of Usk hundred, is situated on the right bank of the river Usk, in 51° 37' N. lat., 2° 56' W. long.; distant 22 miles S.W. by S. from Monmouth, 148 miles W. from London by road; Newport station of the South Wales railway, which is 158 miles from London, is about 4 miles from Caerleon. The population of the town of Caerleon in 1851 was 1281; that of the entire parish of Llangattock was 1539. The living is a vicarage in the archdeaconry of Monmouth and diocese of Llandaff.

Caerleon is believed to have been at an early period the capital of Wales, and the seat of an archbishopric shortly after the introduction of Christianity into Britain. The Romans had here a station named by them Isca Silurum. Its site is now for the most part covered with fields and orchards. A space of ground 222 feet by 192 feet, which has received the name of Arthur's Round Table, is conceived to have been a Roman amphitheatre. Portions of the ancient walls remain, about 14 feet in height and 12 feet in thickness. The ruins of a fortress, said to be Norman, existed here about a century ago: portions of the buildings then standing were 40 feet high. On an eminence by the river Usk are the remains of the ancient castle of Caerleon. Antiquities of various kinds, chiefly Roman, have been dug up in the town and vicinity. Previous to the Reformation there existed at Caerleon an abbey of Cistercian monks.

The parish church has a tower of early English date and style; the nave, aisles, and chancel are perpendicular. The interior has been modernised. The Wesleyan and Primitive Methodists and Baptists have places of worship in the town. There are an Endowed school, a National, and an Infant school. A handsome building has been erected as a museum for Roman and other antiquities. There is little trade in the town; tin-plate works give employment to some of the inhabitants. The market-day is Thursday; there are fairs on the third Wednesday in February, May 1st, July 20th, and September

21st. St. Julian's, the residence of the celebrated Lord Herbert of Cherbury, is about a mile and a half from Caerleon.

(*Cliffe, Book of South Wales; Communication from Caerleon.*)

CAERMARTHEN, or in Welsh CAER FYRDDYN, the capital of Caermarthenshire, a municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated in 51° 51' N. lat., 4° 19' W. long.; 218 miles W. by N. from London by road, and 246 miles by the Great Western and South Wales railways. It stands on the right bank of the river Towy, or Tywi, near where that river bends to the south to empty itself into Caermarthen Bay. Caermarthen is a borough and county of itself. The population of the county of the borough of Caermarthen in 1851 was 10,524. Caermarthen returns one member to the Imperial Parliament. The corporation consists of 6 aldermen and 18 councillors, who annually elect a mayor. For sanitary purposes the borough is governed by a Local Board of Health. The living is a vicarage in the archdeaconry of Caermarthen and diocese of St. David. Caermarthen Poor-Law Union contains 29 parishes and townships, with an area of 156,459 acres, and a population in 1851 of 38,119.

Caermarthen has been identified with the Maridunum of Ptolemy, one of the towns of the Demetæ. Remains of two Roman camps and several other vestiges of the Roman occupation have been discovered in and near the town. It was afterwards the residence of the princes of South Wales. In the contests between the neighbouring Welsh chieftains for the possession of the district, and in the wars between the natives and the Anglo-Saxons and Normans, the castle of Caermarthen was a post of importance, and frequently changed hands; in these struggles it suffered much. In the time of Charles I. the castle was garrisoned by the Royalists, from whom it was taken by the Parliamentarians. It was probably dismantled shortly afterwards, and allowed to go to decay; part of it was however occupied as the county jail till towards the close of the last century.

The situation of Caermarthen is very beautiful, and the inequality of its site gives it a picturesque appearance. The streets are irregular and steep, and many of them narrow; the leading streets however are well paved, and lighted with gas. The principal edifice is the guildhall in the centre of the town, a capacious modern building, raised on pillars, with a covered market underneath. The county jail occupies part of the site of the castle. There is a good market-place out of the town. A substantial bridge of several arches crosses the Towy, by which the road from Swansea enters Caermarthen. The parish church, dedicated to St. Peter, is a plain large building, with a square tower. Sir Richard Steele lies buried here. Some remains of a former church dedicated to St. Mary are still left, as also of two religious houses, a priory of the canons of St. Augustine, and a house of Franciscan or Gray Friars. There are several places of worship belonging to Baptists, Wesleyan Methodists, Calvinistic Methodists, Independents, and Unitarians; in most of these chapels service is performed in the Welsh language.

Sir Thomas Powell's Grammar school, founded in 1720, is free to boys dwelling in Caermarthen and its neighbourhood, and had 25 scholars in 1852. The college for the education of young men for the Presbyterian ministry had 25 students in 1852. The South Wales Training College, established in 1848 at Caermarthen by the Welsh Education Committee in connection with the National School Society, had 42 students in residence in the college in 1852. There are also in the town National, British, and Infant schools; an infirmary; and a literary and scientific institution.

There are tin works and iron foundries in the neighbourhood, and the trade of the place is considerable. The chief fisheries, which are mostly of salmon and sewin, are here carried on in coracles with dragnets. The quay extends along the banks of the Towy: the vessels which come to Caermarthen are chiefly coasters: the communication with Bristol is great. Vessels of from 50 to 150 tons burden are built here. Among the exports are timber, bark, marble, slates, lead ore, bricks, grain, butter, and eggs.

General Sir Thomas Picton and General Lord Nott were natives of Caermarthen. A monument to the memory of Picton was erected on an eminence adjoining the town, but having fallen into a dilapidated state it was taken down in 1846, and rebuilt on a smaller scale.

(*Cliffe, Book of South Wales; Communication from Caermarthen.*)

CAERMARTHENSHIRE, a county of South Wales, situated in the western part of that principality, between 51° 41' and 52° 9' N. lat., 3° 38' and 4° 48' W. long., is bounded N. by Cardiganshire, E. by Brecknockshire, S.E. by Glamorganshire, S.W. by the sea, and W. by Pembrokeshire. Its greatest length is about 53 miles, its greatest breadth about 33 miles. The area of the county is 606,331 acres; it is the largest of all the Welsh counties. The population in 1841 was 106,826; in 1851 it was 110,632.

Surface, Hydrography, Communications.—Caermarthenshire partakes of the mountainous character which is general in Wales, but the elevation of the mountains is not so great as in some other counties. In the northern part of the county a range, distinguished by different names, runs nearly parallel to the boundary between this county and Cardiganshire, about four miles within the county. This range separates the vale of the Teify from that of the Cotby, a feeder of the Towy. The highest point is probably New Inn Hill, 1168 feet above

val of the sea. Nearly parallel to this range, but more to the south-east, is another smaller range, separating the valley of the Cothy from that of the Towy. To the south-east of the last river is the range of the Mynydd Dd, or Black Mountains, of which the highest point, Caermarthenshire Van, more correctly Y Fan or Ban Sir Gaei (the Caermarthenshire Beacon), has an elevation of 2596 feet. Besides these there are to the north-east Talsarn and Trecastle Mountains and several detached eminences.

The coast-line of Caermarthenshire is wholly included within Caermarthen Bay. This noble bay is 15 miles across, and affords good anchorage. The western side, where it is sheltered by Caldy Island which forms a natural breakwater, serves as a secure harbour for shipping, except during easterly gales. The principal river of Caermarthenshire is the Tywi, or Towy, which rises in Cardiganshire in a large morass near or upon the border towards Brecknockshire; whence, flowing southward, and receiving the waters of many brooks, it enters Caermarthenshire near the north-eastern extremity of the county. Near Llandovery it receives the united stream of the rivers Braen and Gwydderig, or Gwthrigrig, and thus augmented runs to the south-west past Llangadock and Llandilo-vawr, receiving many small feeders on each bank. Below Llandilo-vawr the Towy bends more to the west, and flows to Caermarthen; this bend takes place at Grongar Hill, celebrated by the pen of the poet Dyer. Between Llandilo-vawr and Caermarthen, the Towy receives the waters of the Cothy or Gothy, the most important of its feeders, and the waters of several other streams. From Caermarthen the river flows southward into the Bay of Caermarthen, its estuary being combined with those of the Gwendraeth-vawr and the Tawe. The whole course of the Towy is about 60 miles, of which about 50 miles are in the county of Caermarthen. It is navigable to Caermarthen town, about eight or nine miles up the river. This river abounds with fish, especially salmon, sewin, trout, and eels; also lampreys and lamperns in the months of June and July. It affords great diversity and beauty of scenery. Its banks are in many places well wooded. The Cothy rises on the border of the county towards Cardiganshire, and has a south-west course of about 25 miles before its junction with the Towy. The *Tare* rises in Pembrokeshire, east of Precelly Mountain, but has only a small part of its course in that county. The valley through which it flows is well wooded. Near the village of St. Clear it receives the Cathgenny and the Cowin or Cowen. The Tawe becomes navigable at St. Clear, and flows into Caermarthen Bay just below the town of Laugharne; its whole course is about 26 or 28 miles. The *Gwendraeth-vawr* (or Great Gwendraeth) rises in the hills which occupy the south-east part of the county towards Glamorganshire, and flows south-west into Caermarthen Bay. The mouth is much obstructed by sand, which by its accumulation has formed a dangerous bar, much to the injury of the trade of Kidwelly. Its course is only about 15 miles. The *Lloughor* rises in the Mynydd Dd, or Black Mountains, and flowing south-west forms, during the greater part of its course, the boundary between Caermarthenshire and Glamorganshire. It is a very copious stream from its source, near which it has a fall of 18 feet; and it receives several tributaries. Its estuary has the name of the river Burry. It is navigable to above Lloughor, which is on the Glamorganshire side. It has been supposed that the Lloughor really issues from a lake near the Caermarthenshire Van; and the supposition was confirmed by the circumstance that some husks of corn thrown into the lake reappeared six hours afterwards at the apparent source of this river. The *Tefy* divides this county from Cardiganshire.

There are no lakes of any extent in Caermarthenshire. One on Mynydd-mawr (the Great Mountain) which overlooks the valley of the Towy is of circular form, about half a mile across, and abounds in fine perch and other fish. Another lake of very limpid water lies at the foot of the steep declivity of the Caermarthenshire Van: it is remarkable for the beauty of the scenery by which it is surrounded. Its greatest depth is 16 fathoms, and its greatest diameter about a mile: it abounds with fine perch and eels of extraordinary size. It is the source of the Sawddy, a feeder of the Towy.

There are properly only two navigable rivers in the county, the Towy and the Tawe: the navigation of the Lloughor and the Gwendraeth-vawr is confined in reality to their estuaries. There is one short canal from Kidwelly to Llanelli, with a cut to Pembrey Harbour; one (the Caermarthenshire) railway 16 miles long from the limestone quarries of Castell y Garreg to Llanelli, where is a small dock for shipping; and another (the Llanelli) railway little more than 2 miles long, with a dock or basin at its termination at Machynis Pool, near Llanelli. These railroads are chiefly designed for conveying the mineral produce of the county to the sea. The South Wales railway enters Caermarthenshire at its south-eastern extremity near Llanelli, and after passing Kidwelly proceeds up the valley of the Towy to Caermarthen, and through the south-western side of the county in a nearly western direction. It quits the county near Whiteland Abbey, a few miles from Lampeter.

Caermarthenshire is intersected in almost every direction by turnpike-roads. Two mail-roads, both leading to Haverfordwest and Milford, cross the county; one passes through Oxford, Gloucester, and Brecon, enters Caermarthenshire between Trecastle and Llandovery, and runs by Llandovery and Llandilo-vawr to Caermarthen; the

other through Bath, Bristol, Cowbridge, and Neath, enters Caermarthenshire near Pontarddulais, and runs to Caermarthen. This road is the chief communication between Swansea and Caermarthen. There are several other important roads in the county.

Geology and Mineralogy.—The southern part of the county bordering upon Glamorganshire and the sea forms part of the great coal-field of South Wales and the most extensive of the coal-fields of Great Britain, though yet comparatively little worked. The coal is chiefly what is called stone-coal; the large coal of this quality is used for drying hops and malt; the small coal called culm for burning limestone. Towards the coast the coal is more bituminous. Culm constitutes the principal fuel of the district; it is mixed with clay till it acquires the consistence of mortar, and is then formed into balls of a moderate size, which are piled in the grate and give out a strong heat. Iron-stone is procured from the coal-measures near Llanelli, where are considerable iron-works. The northern outcrop of a basin of carboniferous limestone crosses the county in a waving line, and at Caermarthen Bay divides the coal-field into two parts, separating that which is in Pembrokeshire from that in Caermarthenshire and Glamorganshire. From this belt of limestone the farmers of this county obtain their lime for manure. Some marble of a blue colour slightly veined with white, which bears an excellent polish, is quarried in it: it is wrought into chimney-pieces and sent to Bristol. The tombstones in the neighbourhood are all made of it.

The old red-sandstone, which rises from beneath the mountain limestone, occupies in the county only a comparatively narrow strip of the surface bounding the coal-field and the limestone district to the north. About Caermarthen the rocks are chiefly of the Silurian system. Clay-slate and grauwacke-slate underlie the sandstone, and rising from beneath it occupy the rest of the county. (Conybeare and Phillips, 'Geology of England and Wales'; Murchison, 'Silurian System'; 'Memoirs of the Geological Survey of Great Britain'; 'Ordnance Maps'; 'Geological Map of the Society for the Diffusion of Useful Knowledge'.)

Divisions, Towns, &c.—Gough, in his additions to Camden, says that Caermarthenshire contains six hundreds; but this is not correct. There are altogether eight hundreds, namely, Cathinog and Cayo in the north, Perfedd in the east, Iskennen in the south-east, Carnwallon and Kidwelly in the south, Derillys in the west and south-west, and Elvet in the north-west. The three hundreds of Iskennen, Carnwallon, and Kidwelly form a district distinct from the rest of the county, having a coroner of its own.

There are in this county one borough, CAERMARTHEN, with its contributory borough LLANELLY, and six market-towns, besides the two already mentioned:—Kidwelly, Laugharne, LLANDILO-VAWR, LLANDOVERY, Llangadock, and NEWCASTLE EMLYN. Those printed in small capitals will be described in separate articles; the remainder we shall briefly notice here.

Kidwelly, or *Cydweli*, a borough, is upon the Gwendraeth-vechan, or Lesser Gwendraeth, near its junction with the Gwendraeth-vawr; 8 miles S. from Caermarthen: the population of the parish in 1861 was 1648. Old Kidwelly was once surrounded with walls and had three gates, one of which is yet standing. The trade of New Kidwelly has declined, owing to the sand obstructing the navigation of the river. The church, dedicated to the Virgin Mary, is in the new town, and is a plain ancient structure containing an aisle and two ruined transepts: there is a tower at the west end surmounted by a spire 165 feet in height. A good stone bridge crosses the Gwendraeth-vechan. The ancient castle occupies a rocky eminence on the western side of the Gwendraeth-vechan: its external appearance is grand and imposing; it is on the whole in tolerable preservation. The magnificent gateway towards the west which formed the principal entrance is yet standing. This fortress is said to have been built about the close of the 11th century by a Norman knight who had assisted in the conquest of Glamorganshire. There is a Free school. Some slight remains of a religious house are traceable. Kidwelly has several Dissenting meeting-houses.

Laugharne is on the right bank of the estuary of the Tawe, about 2½ miles from Caermarthen: the population of the parish in 1861 was 2011. The town is built on the edge of a marsh open to the sea, and backed by high grounds: it contains a considerable proportion of respectable houses. The parish church, dedicated to St. Martin, is large and handsome. The castle of Laugharne is a picturesque and noble ruin. It was probably built by some of the Norman lords who invaded this coast soon after the Conquest: it was an object of frequent hostility in the wars between the Welsh and the English, and was again contested in the war between Charles I. and the Parliament. There are also the remains of a building called Roche's Castle, but supposed to have been really a monastery. The town of Laugharne is incorporated. The trade of the place consists chiefly of the export of small quantities of butter and corn. There are several Dissenting places of worship and some parochial endowments. This town was the birthplace of an eminent political and theological writer, Dean Tucker, who died in 1799.

Llangadock, or *Llan Gadog Fawr*, is in the vale of Towy, near the junction of the Sawddy with that river, about 8½ miles from Llandilo-vawr: the population of the hamlet of Above Sawthe, which contains the town of Llangadock, was 825 in 1861. The town occupies a

delightful situation, and has a very respectable appearance. The church, an old and substantial edifice, is dedicated to St. Cadog, whence the name of the town is derived. There are several Dissenting meeting-houses. A modern bridge of five arches crosses the Towy. Coal and limestone are worked in the neighbourhood. The coal is sent partly by canal to Swansea, and exported from thence. A short distance to the south of Llangadock is a hill called Tri Chrdg, or the Three Hillocks; on the summit are three barrows, whence it has received its name; near them are vestiges of a British encampment.

The village of *St. Clear*, 9 miles from Caermarthen towards Milford, is situated at the confluence of the Gynan with the Taf, and exports a considerable quantity of corn, butter, and other agricultural produce: the parish had in 1851 a population of 1240. There are some remains of an alien priory of Cluniac monks. *St. Clear* had once a strong castle, the site of which is indicated by an artificial mound of earth. This village attained considerable notoriety a few years back from having been the head-quarters of the 'Rebecca' rioters. *Abergwili*, two miles E. from Caermarthen, is a small town, in which is the palace of the bishop of St. David's. There is an Endowed school in the town: the population of the parish in 1851 was 2325. *Pembrey*, on the right bank of the Burry estuary, 12 miles S. from Caermarthen: the population of the parish in 1851 was 3310. In this parish is Pembrey Harbour, or Burry Port, which has been rendered capable of containing 80 large coasting vessels. A small mineral railway connects some mines with the harbour, and a canal unites Pembrey with the Kidwelly and Llanelli Canal. The coal-mines and iron-works furnish considerable employment. *Ferryside* is a small watering-place on the left bank of the estuary of the Towy, about 8 miles S. from Caernarvon. The parish of St. Ismael's, in which it is situated, had in 1851 a population of 968. Ferryside is a good deal resorted to for bathing by the inhabitants of Caermarthen, and is a very quiet pleasant little village.

Divisions for Ecclesiastical and Legal Purposes.—This county is in the diocese of St. David's, and for the most part in the archdeaconry of Caermarthen; a very small part is in the archdeaconry of Cardigan. The number of parishes, according to the population returns, is 76. The county is divided by the Poor-Law Commissioners into five Unions:—Caermarthen, Llandilo-vawr, Llandovery, Llanelli, and Newcastle-in-Emlyn. These Poor-Law Unions include 83 parishes and townships, with a population in 1851 of 123,738. The area included within the boundaries of the Unions is larger than that of the county. The county is in the South Wales circuit; the assizes are held at Caermarthen, also the Epiphany, Easter, and Michaelmas sessions; the Midsummer sessions are held at Llandilo-vawr. County courts are held in Caermarthen, Llandilo-vawr, Llandovery, Llanelli, and Newcastle-in-Emlyn. The county returns two members to the Imperial Parliament; before the Reform Act it returned only one. Caermarthen with Llanelli returns one member; and Newcastle is united with Adpar (Cardiganshire) as a contributory borough to Cardigan.

History, Antiquities, &c.—To the Roman general Julius Frontinus are ascribed two Roman roads, the 'Via Julia Maritima' and the 'Via Julia Montana,' which cross this county; the first near the coast, probably through Neath and Loughor (Glamorganshire), and Caermarthen; the second, more inland, by Llangadock and Llandilo-vawr. These roads seem to have united at Maridunum (Caermarthen), and thence to have been continued to the neighbourhood of Monapia (St. David's), probably in a direction nearly due west. Other Roman roads have been traced. Near Llanboidy, west of Caermarthen, are the remains of a British or Roman camp, at the entrance of which in 1692 were found 200 Roman silver coins, of early date, buried in two leaden boxes just under the surface of the ground.

The Romans appear to have been aware of the mineral riches of Caermarthenshire. On the left bank of the Cothy, near Pumpant, is a mine called the Gogofau, or Ogofau, which, according to the traditions of the county, was wrought by the Romans in search for gold.

After the departure of the Romans this district was included in the principality of Ceredigion (Cardigan); but in the 9th century it was subject to Rhodri Mawr, or Roderick the Great, who united the whole of Wales into one kingdom. Upon the division of his territories among his three sons, Ceredigion, including Caermarthenshire and nearly all the rest of South Wales, fell to the lot of Cadell, the son of whose government was at Dinas Fawr, or Dynevor, where Rhodri had built a palace. The division of Wales among the sons of Rhodri was a fatal step; dissensions broke out among the brothers; Cadell conquered Powis (a district between the Wye and the Severn), the heritage of his brother Merfyn. He was himself subsequently attacked by his other brother Anarawd, king of Gwynedd, or North Wales; and in this war Caermarthenshire was ravaged by Anarawd with a powerful force supported by some Saxon auxiliaries. Cadell was succeeded in 907 by his son Hywell, who subsequently united the whole of Wales under his sceptre; and became, under the name of Hywell Dda (or Howell the Good), celebrated as the legislator of his kingdom. A fresh division of the kingdom after Hywell's death brought new troubles; the occasional re-unions, which resulted from mere force were not permanent; and to the misery of these civil broils were added the ravages of Danish invaders. In these contests

Caermarthenshire had its share, and two remarkable engagements were fought within its borders; one in 1020 at Abergwili, near Caermarthen, in which Llewellyn, at that time sovereign of the whole of Wales, defeated and slew a Scottish adventurer, Run, who personating one of the Welsh princes had raised a force among the disaffected chieftains; another in 1021, in which Llewellyn defeated two native princes, who were supported against him by the Irish and Scots, but fell himself in the action through treachery. This battle was fought near Caermarthen. Throughout these contests Dynevor continued to be the seat of government for South Wales.

Some years after the conquest of England by the Normans, the great feudal lords whose possessions bordered upon Wales began a series of encroachments upon the principality of South Wales, by which it was gradually reduced to the counties of Caermarthen and Cardigan; even these were for some time in the possession of Henry I. of England. A considerable part of the principality of Dynevor was given up by Henry I. to a Welsh prince who appears to have been a feudal subject of the crown of England. Gradually the princes of Wales sunk into the character of subjects of England, and their hostilities with each other and with the neighbouring Norman lords assumed more the character of the struggles between a powerful and restless nobility for territory or pre-eminence than of the resistance of one nation to the aggression of another. In the wars between Llewellyn, prince of North Wales, and Henry III., Caermarthenshire became the scene of contest; and in a severe action the English, who were besieging Dynevor castle, were entirely defeated by the troops of Llewellyn, aided by some chieftains of South Wales. In the final contest between Llewellyn and Edward I. the Welsh were entirely defeated near Llandilo-vawr, and Llewellyn was subsequently beset by the English and killed while apart from his army. When the complete subjugation of Wales took place in the reign of Edward I., Caermarthen became the seat of courts of law which that prince established for South Wales. The subsequent revolts of the natives were repressed and punished as acts of treason. During the revolt of Owen Glyndwr, at a subsequent period, Caermarthen castle was taken by a body of French sent to support that chieftain.

Of the troublous period which preceded the conquest of South Wales this county possesses several memorials in the baronial castles, the remains of which are so numerous. Those of Caermarthen, Kidwelly, Laugharne, Llangadock, Emlyn, and St. Clear, have been already noticed; Dynevor and Carreg Cennen are noticed under LLANDILO-VAWR, and Llandovery under LLANDOVERY. Two others call for notice here, Llanstufan, or Llan Stephan, on a rock of great height on the right bank of the Towy, near its mouth; and Dryslwyn, in the vale of Towy, on the right bank of the river between Llandilo-vawr and Caermarthen. Llan Stephan Castle commands the entrance of the river; and from it there is a fine prospect on the one side towards Caermarthen, and on the other towards Tenby in Pembrokeshire, across a fine bay. The ruins form a picturesque object, whether viewed from the land or the water; and there is sufficient of them to show that the area inclosed by the castle walls must have been large. The ecclesiastical ruins at Caermarthen, Kidwelly, and St. Clear, have been mentioned; to these we may add Tullagh or Talley Abbey, in the vale of the Cothy, founded by Rhys ap Gruffydd, prince of South Wales, who died in 1197, for Premonstratensian canons; Alluland, or Whiteland Cistercian Abbey, on the left bank of the Tave, the time of whose foundation is disputed; the yearly revenue at the dissolution was 153*l.* 17*s.* 2*d.*

In the civil war of the 17th century this county, together with the counties of Pembroke and Cardigan, was held for the king by Richard earl of Carberry. The Parliamentary forces opposed to him were commanded by General Laugharne, who took from the Royalists the castles of Caermarthen and Laugharne. At a subsequent period Laugharne went over to the Royalists; and upon his defeat with his coadjutors by Colonel Horton, several skirmishes took place in Caermarthenshire as the defeated party retreated towards Pembroke castle, where they were besieged by Cromwell and forced to surrender.

There were in 1851 three savings banks in Caermarthenshire; at Llandilo, Llanelli, and Newcastle-Emlyn. The total amount owing to depositors on the 20th November 1851 was 30,162*l.* 17*s.* 4*d.*

CAERNARVON, the chief town of Caernarvonshire, and the capital of North Wales; a port, borough, market-town, and the seat of a Poor-Law Union, in the parish of Llanbeblig and hundred of Llan-gorfa, is situated on the east side of the Menai Strait, in 53° 9' N. lat., 4° 15' W. long.; distant 255 miles N.W. by W. from London by road. Bangor, the nearest railway station, 8 miles from Caernarvon, is 238 miles from London by the North-Western and Chester and Holyhead railways. The population of the borough of Caernarvon in 1851 was 8674. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor, and with the contributory boroughs of Pwllheli, Nevin, Criccieth, Conway, and Bangor, returns one member to the Imperial Parliament. The living of Llanbeblig is a vicarage held with the curacies of Caernarvon and Wael-fawr in the archdeaconry and diocese of Bangor. Caernarvon Poor-Law Union contains sixteen parishes and townships, with an area of 43,405 acres, and a population in 1851 of 30,211.

At Llanbeblig, about half a mile from Caernarvon, are the remains of the Roman station Segontium, or Caer-seiont. Only some fragments

of the walls now exist, of which on the south side there are extensive portions in a tolerably perfect state. In 1845 a Roman villa and baths were traced, and a number of coins found, including one struck on occasion of the subjugation of the Jewish people by Vespasian. A well in the neighbourhood still bears the name of Helena, the mother of Constantine. In the local museum are deposited numerous specimens of gold and copper coins, personal ornaments, and other Roman remains discovered on the site of the ancient Segontium. A Roman road is still traceable leading to Dinas Dinordwig, a Roman station a few miles to the east. On the left bank of the Seiont is a Roman fort still nearly entire. The walls are about 11 feet high and 6 feet thick, with three parallel rows of circular holes about 3 inches in diameter running all round the walls.

Caernarvon owes its importance, if not also its origin, to the erection by Edward I. of the castle, a great part of the remains of which still exist. The erection of the castle was commenced in 1283 or 1284, and the work was carried on during the succeeding 10 years: the walls of Segontium furnished a part of the materials; limestone was brought from Anglesey, and other materials from Vaelol, between Caernarvon and Bangor. At Caernarvon, in 1284, the first English 'Prince of Wales,' afterwards the unhappy Edward II., was born. Upon an insurrection of the Welsh in 1294, under Madoc, an illegitimate son of Llewellyn prince of Wales, the castle and town were taken by the Welsh, the English inhabitants massacred, and the place burnt. After this the works appear to have been commenced afresh, and continued till their completion. The tower called the Eagle Tower, from the figure of an eagle carved on it in stone, was completed in 1317; it could not therefore have been, as popularly supposed, the birthplace of Edward II., the first Prince of Wales. The castle was defended for Henry IV. against Owen Glyndwr, by two Welsh captains, to whom it had been intrusted. In the civil war of Charles I. and the Parliament the castle was alternately in the hands of the opposing parties, but in 1640 it was taken by the Parliamentarians who retained possession of it.

The external walls of the castle are nearly entire, inclosing a space of 3 acres, of an oblong shape: they are from 8 to 10 feet thick, and have within their thickness a covered gallery with loopholes for the discharge of arrows. There are in the circuit of the walls 13 embattled towers with turrets: some are pentagonal, while others have six or eight sides. The principal entry to the castle is by a gateway originally defended by four portcullises, under a massy tower, on the front of which is a statue of Edward I. The interior of the castle is much dilapidated: but the walls have been recently repaired under the direction of Mr. Salvin, and it is now carefully preserved. The mayor of Caernarvon is during his term of office deputy-governor of the castle.

Caernarvon was made a free borough by Edward I. The charter dated September 1284 was the first granted by Edward I. to Wales. The name of the borough, *Caer-yn-Arfon*, signifies the town or fortress in Arfon, the district opposite Anglesey. The town walls are defended by round towers, and had originally only two gates: other openings have been subsequently made to form a communication with the suburbs on the east, which have so far increased as to make a new town. The streets are narrow but regularly laid out, crossing each other at right angles; they are well paved and lighted. Much improvement has taken place in the appearance of the town of late years. Outside the town wall and along the shore of the Menai is a terrace extending from the quay to the north side of the town; there is here a landing-pier, recently built. Another pier projects into the Seiont. The guild-hall is over one of the ancient gates of the town. The county-hall in which the assizes are held is a commodious building; the county prison is small. A county court is held in the town. There are a market-house and a corn-market. An establishment for warm and cold baths, with reading-room, &c., has been constructed at a cost of about 9000*l.* by the Marquis of Anglesey.

At the parish church of Llanbellig divine service is conducted in the Welsh language; at St. Mary's, the chapel of ease in Caernarvon, the services are in English. There are seven places of worship for Dissenters, at one of which (the Wesleyan) the services are conducted in English. Model National schools were erected in Caernarvon in 1843 at a cost of 3000*l.* There are two other National schools, a British school, an infant school, and a Ragged school. An institution for training Welsh national schoolmasters had 21 students in 1852. A mechanics institution and two reading-rooms are supported in Caernarvon, and there is an excellent local museum in connection with the Caernarvon, Anglesey, and Merioneth Natural History Society.

There is no manufacture of any importance in Caernarvon: the chief trade is the exportation of copper-ore and of slates from the quarries of Llanberris and Llanllyfni in the interior. The average annual amount of slate exported is 90,000 tons. The number and tonnage of vessels registered as belonging to the port of Caernarvon on December 31st 1852 were—under 50 tons 177, tonnage 5697; above 50 tons 245, tonnage 21,573; and 1 steam vessel of 88 tons. During 1852 there entered at the port in the coasting-trade 1342 sailing vessels, tonnage 50,190; and cleared 283 of 9814 tons: of steam vessels there entered 44 of 3822 tons; and cleared 30 of 2688 tons. In the colonial and foreign trade there entered 28 vessels of 3966 tons; and cleared 90 of 8656 tons. The port has been much improved, and

there is a railroad from the slate-quarries of Tallysaeu and Llanllyfni to the town. There is an extensive iron and brass foundry. Ship-building is carried on. Some of the inhabitants are engaged in fishing.

Caernarvon is resorted to as a bathing-place, and many genteel families reside in the town and neighbourhood. It is also one of the towns generally visited by tourists in Wales, for whose accommodation there are excellent hotels. The communication with Anglesey is kept up by a small steamer which plies every half-hour during the day. Caernarvon has two weekly markets, on Wednesday and Saturday; that on Saturday is of most importance. There are five annual fairs.

(Parry, *Cambrian Mirror*; Bingley, *North Wales*; Cliffe, *Book of North Wales*; *Communication from Caernarvon*.)

CAERNARVONSHIRE is situated at the extremity of the mainland of Wales, being farther to the north-west than any other county, except the island of Anglesey. It lies between 52° 47' and 53° 21' N. lat., 3° 40' and 4° 45' W. long. It is bounded on the N. by the Irish Sea; on the N.W. by the Menai Strait, which separates it from Anglesey, and by Caernarvon Bay; on the S. it is bounded by the great Bay of Cardigan, which forms on this coast the smaller bays of Aberlaron, Holl's Mouth, Coiriad Road, and St. Tudwal's Road; on the S.E. it is bounded by Merionethshire; and on the E. by Denbighshire, from which, for a large part of the boundary, it is separated by the river Conway. Caernarvonshire is thus on every side, except the east and south-east, washed by the sea; while inland the boundary is for the most part formed by two streams, the Conway and a stream which separates Caernarvonshire from Merionethshire. There are three detached portions on the east or Denbighshire side of the Conway: one of these at the mouth of the river comprehends the promontories of Great Orme's Head and Little Orme's Head. The form of the county is an irregular oblong, having its greatest length about fifty-five miles and its greatest breadth about twenty-two miles. The county contains 370,273 acres: the population of the county in 1841 was 81,093; in 1851 it was 87,870.

Coast and Islands, Surface, Hydrography, and Communications.—There are no remarkable headlands on the coast, except Great Orme's Head, near the mouth of the Conway. Penmaen-mawr, a lofty mountain, rises abruptly from the beach, between Conway and Bangor; the high road winds along its side, and the Chester and Holyhead railway is carried through it by a tunnel and cuttings. From the foot of Penmaen-mawr the Llan sand extends towards Bangor, and contract the navigable part of the otherwise wide north-east entrance of the Menai channel. South-west of Caernarvon a tongue of low land projects into the Menai, and with its connected sands, narrows the navigation of that channel in the south-west entrance. In the south-western extremity of the county the Braich-y-Pwll, the promontory of the Cancani (*Kaykanōn akpon*) of Ptolemaeus, abruptly rises from the ocean. To the north of this craggy coast, there are numerous little creeks or inlets which form safe retreats for fishermen; about this part is abundance of samphire, which sheep and cattle eagerly feed on and grow very fat. The herring, the lobster, and the dory are caught on this coast. Opposite to the headland of Braich-y-Pwll is the small island of Bardsey, on which was a religious establishment of very early date. The south-eastern boundary of the county is more irregular than that to the north-west: nearly half of it is washed by the sea. From the headland of Penrhyn Dŷ the coast stretches to the north-east, being for the most part low and sandy, especially at the point where Caernarvonshire and Merionethshire meet, where a sandy inlet or wash is traversed by one or two streams which here find an outlet to the sea. Across these sands is a passage dangerous indeed, but shorter than round the head of the inlet. Not far from the promontory of Penrhyn Dŷ are the two small islands of St. Tudwal; on the larger of the two, now inhabited only by sheep and rabbits, and in the season by puffins, was formerly a religious house dedicated to St. Tudwal.

Caernarvonshire is traversed in its whole length by mountains, some of which are the loftiest in South Britain. From the western side of the mouth of the Conway the mountains run south-west, receding gradually from the coast, and presenting in succession the following summits; Tal-y-Fan and Penmaen-mawr (1540 feet), Carnedd Llewellyn (3471 feet), Carnedd Dafydd (3429 feet), Glider Vochan and Glider-vawr, Snowdon (3571 feet, the highest mountain in South Britain). From Snowdon the mountains vary their direction a little, so as gradually to approach the coast; the chief summits are Craig Goch, Bwlch-mawr (1673 feet), Gyrngoch, and Rivell (1867 feet), which is close upon the shore. These summits may be considered as belonging to the main range of the Caernarvonshire or Snowdonian mountains. From the main mass of Snowdon, a branch running in the direction of the town of Caernarvon has the summit Moel Kilio (2366 feet). Other branches from the central mass occupy the greatest part of the interior of the county, and extend into Merionethshire.

The name of Snowdon is the Saxon translation (*Snawdun*, 'Snow-mountain') of the ancient Welsh name *Creigie'r-Ria*, according to Pennant; but some other Welsh writers make the native name to signify the eagle's rock or hill. Snowdon is the centre of the great mountain range which traverses Caernarvonshire from north-east to south-west. Its highest point is named Y Wyddfa, the Conspicuous,

and is 3571 feet above the level of the sea. From this central point proceed four great buttress-like ridges, separated from each other by deep cwms, or hollows, their sides in many places forming lofty precipices; in the hollows lie several tarns or mountain lakes. Llyn Llydaw, the largest of the lakes, is rather more than a mile long. The view from the summit of Snowdon is of extraordinary extent. Besides a large part of North Wales (including the Isle of Anglesey which lies like a map at your feet), the view is said to embrace the Ingleborough Mountains in Yorkshire, the mountains of Westmorland and Cumberland, the Highlands of Scotland, the Isle of Man, the mountains of Wicklow, and a large part of the Irish coast. The whole of this wide space cannot of course be seen at any one time when the sun is above the horizon; but a large portion may be seen on a clear day. Some of the other mountains of the range are, as already shown, very lofty, and form noble and picturesque objects. The almost inaccessible fastnesses of this district formed the last stronghold of the native Welsh; and when Edward I. penetrated into the recesses of Snowdonia the struggle was virtually at an end. To secure the passes, Edward erected the castles, the ruins of which still attest the importance attached to the possession of this wild district. The Snowdon mountain tract he converted into a royal forest, and it continued a royal forest till 1649, when it was disafforested: but a ranger and deputy-ranger are still appointed.

From the small size and peninsular form of this county, and the consequent nearness of the mountains to the sea, the rivers are small though very numerous. Many of them rise from or expand into lakes or mountain tarns, which bear the general native name of Llyn, lake or pool. The *Conwy*, or *Cyn-wy*, that is, 'chief water' (the *Tofnabina* of Ptolemy), rises in that part of the county which lies between Merionethshire and Denbighshire. Llyn Conwy, from which it flows, is about a mile long and three-quarters of a mile broad, surrounded with deep bogs and masses of rock, and producing a sort of char or red trout. From the south corner of this lake the river flows with great rapidity, and is swelled by many small streams from the neighbouring hills, some of which, as well as the Conwy itself, are distinguished by several fine cataracts. Below the junction of the Llugwy, near Capel Curig, the Conwy passes the town of Llanrwst (Denbighshire), where the navigation commences, and receives on the left several streams which flow from the llynns or lakes of Caernarvonshire, and render it navigable to vessels of about 100 tons, with freights of timber and slates. Near its outfall the river widens into an estuary, and flows under the walls of Conway Castle into the Irish Sea. Its length is about 28 or 30 miles, for 12 or 13 of which it is navigable. The *Glas Llyn* rises from the Ffymon Idus, and flows for the most part to the south-west into Cardigan Bay, between Criccieth (Caernarvonshire) and Harlech (Merionethshire). Near its source it forms a very lofty cascade, and is altogether one of the most romantic rivers of Wales. It passes through Llyn Gwymu and Llyn-y-Dinas, two lakes in a most beautiful valley. A portion of the sandy soil at the mouth of this river has been reclaimed by means of an embankment. The whole course of the Glas Llyn is about 16 or 17 miles. It is navigable to Pont Aberglaiddyn. The *Gurfai* rises on the west side of Snowdon, and flows north-west through Llyn Cywellyn into the Menai, south-west of Caernarvon. The *Seiont*, rising from the same mountain, flows in a similar direction through the two lakes of Llanberis into the Menai at Caernarvon: the *Llyfai*, which has its source also in Snowdon, flows west through the lakes Llymian Nant-y-llef, or Nantle pools, into Caernarvon Bay: and the *Ogwen* rises in Mount Trevaon, and flows through Llyn Ogwen into the Menai near Bangor.

There are no canals in Caernarvonshire. A railroad connects the Penrhyn slate quarries with Port Penrhyn, near Bangor; another connects the slate quarries of Llanllyfni with Caernarvon; and another connects the slate quarries of Glogwyn-y-Gigfran with Port Dinorwig, north of Caernarvon. The Chester and Holyhead railway skirts the northern part of the county from Conway to about two miles beyond Bangor, where it crosses the Menai by the Britannia tubular bridge, and enters Anglesey. The parliamentary road from London through Shrewsbury to Holyhead crosses the county in a north-west direction from the river Conwy, near Bettws-y-Coed, to the suspension-bridge over the Menai near Bangor. From this road there is a branch on the right from Bettws to Llanrwst and Conway, and another branch on the left from Capel Curig to Caernarvon. There are several other important roads.

Geology and Mineralogy.—The rocks of Caernarvonshire belong chiefly to the lower Silurian system. Almost the whole of the county is composed of the Cambrian slates and related rocks. Slate is quarried extensively at Nantfrancon, Llanberis, and elsewhere in this county. Roofing-slates and writing-slates are procured, and chimney-piers and a great variety of fancy articles are made. Slabs are procured large enough for tomb-stones and paving-slabs. Grauwacke, serpentine, porphyry, hornblende, indurated slate, and various metamorphic rocks with veins of quartz occur in the mountainous region, at Snowdon, and elsewhere. Along the coast-line of the Menai Strait between Caernarvon and Bangor is a strip of carboniferous limestone of which also the Great and Little Orme's Head are composed. Mica and chlorite slates, of the primary or Cambrian slate system, are met with along the south-western coast from Porth-dynllaen to Braich-y-Pwll; and also by the Menai Strait south-west of Bangor. Between

Conway and Bangor the old red-sandstone is found: it also forms the headland of Braich-y-Pwll. Copper is the chief metal of Caernarvonshire. Extensive copper mines are worked at Orme's Head and on the sides of Snowdon. Lead is worked on the slopes of Snowdon and between Llanrwst and Capel Curig.

Divisions, Towns, &c.—Caernarvonshire is divided into ten hundreds. The south-west extremity of the county is occupied by the hundred of Cominitmaen or Cymytmaen; adjacent to this are the hundreds of Dinlaen or Dinlleyn on the north-west coast, and Gallogian or Gyfflogion on the south-east; the hundred of Ewionydd or Yfionydd occupies the remainder of the coast of Cardigan Bay; and those of Uwch-Gorfai or Gwrfai, Is Gorfai, or Gwrfai, and Llechwedd Uchaf, occupy the north-west coast, each extending far inland: the upper part of the vale of the Conwy is occupied by the hundred of Nant Conway, the lower part by that of Llechwedd Isaf; and the parts on the coast east of the Conwy form the hundred of Creuddyn.

The county town is CAERNARVON, on the shore of the Menai Strait, 235 miles N.W. by W. from London. There are one city, BANGOR, four market-towns, PWLLHELI, CONWAY, NEVIN, and Criccieth, and the new town of Tremadoc. Criccieth, Nevin, and Tremadoc may be noticed here: the other towns will be found under their respective titles. *Criccieth* or *Crickieth* lies on the Bay of Carligan, about 24 miles south from Caernarvon by the road. The population of the parliamentary borough, which is contributory to Caernarvon, was 530 in 1851. It is a poor straggling place, with houses built without any regard to order, and having nothing worthy of notice save the ruins of the ancient castle, which was rebuilt by Edward I. about 1286. The castle stands on an eminence jutting into the sea. It was probably of some importance from its position. There is a Free school. *Nevin* or *Nefyn* lies on a small bay on the N.W. coast of the county, 21 miles from Caernarvon along the coast. The population of the parliamentary borough, which is contributory to Caernarvon, was 1854 in 1851. It was made a free borough by Edward the Black Prince. Edward I. had previously held a grand tournament here, just after the conquest of Wales. The town consists of a few straggling houses; it has a small port, but little or no commerce. The church is a plain building; and there are several dissenting meeting-houses. The market is on Saturday, and there are four annual fairs. The little harbour of Porth-yr-Lleyn, or Dymhnen, near Nevin is supposed to have been used by the Romans, as strong entrenchments, apparently the work of the Romans, may be observed in the neighbourhood. The bay affords excellent shelter, for which purpose a thousand vessels have availed themselves of it in the course of a year. The pier serves as a breakwater.

Tremadoc, a place of quite modern date, is 30 miles S. by E. from Caernarvon. The population of the parish of Ynyseyrnaiarn, which includes both Tremadoc and Portmadoc, was 2347 in 1851. It stands upon a portion of the Traeth-mawr, a sandy wash at the mouth of the river Glas Llyn, recovered from the sea by the enterprise of W. A. Madocks, Esq., who built the town, to which he gave his name, Tremadoc (tre, a house, home, township, or village). Mr. Madocks laid out the town in the form of an oblong square, having a market-house on the east side, a handsome building, with the upper story laid out in good assembly-rooms. On the other sides of the area are well-built houses: a church in the pointed style, a place of worship for Dissenters, a bank, and a good inn are to be found here. There is a market on Friday. A mile and a half from Tremadoc is *Portmadoc*, which has come to be a place of considerable size, and one of the chief ports for the export of slates. It is also in some repute for sea-bathing. There are good quays at Portmadoc, at which vessels of 300 tons can lie. Slates, lead, and copper-ore are exported. Timber coal, and lime are the principal imports.

A few of the villages may be briefly noticed: *Aberdaron* lies in the hollow of a bay near the extremity of the promontory of Lleyn—the south-western termination of the county. The entire parish contained 1230 inhabitants in 1851, but the village itself consists merely of a few mean houses. A decrease of 111 in the population of the parish since 1841 is accounted for by emigration. The coast scenery here is remarkably fine. The deserted church, a Norman structure, stands close by the sea, and is a picturesque building. A few miles from Aberdaron is a crinolech of much interest from the peaked form of the cap stone. *Beddylert*, 13 miles S.S.W. from Caernarvon, population 947, one of the head-quarters of tourists in North Wales, is very retired, and in the midst of much grand scenery. The celebrated pass of Aberglaiddyn is in the neighbourhood. In this village was a priory of Augustine monks. There is an excellent hotel at *Beddylert*. *Bethesda*, about 12 miles E. from Caernarvon, is a modern village which has grown rapidly: the population of Llandwrog parish, in which Bethesda is situated, was 2823 in 1851. Bethesda owes its rise to the neighbouring slate quarries of Braich-y-Cefn, in Nantfrancon, the largest in the kingdom. Bethesda has a broad street, numerous shops, a church, and several places of worship for Dissenters. *Bettws-y-Coed* (the 'Station in the Wood'), 23 miles E. from Caernarvon, population 478 in 1851, is situated on the Llugwy near the picturesque bridge of Pont-y-Pair, and is one of the places visited by tourists. The river scenery here is remarkably fine. *Moel Siabod* is seen to great advantage. Six miles west from Bettws-y-Coed is *Capel Curig*, a very small village consisting of hardly a dozen houses,

with a little church, it being a chapelry of the extensive parish of Llandegai. It possesses however one of the largest and best hotels in the principality, and is a favourite station with tourists and anglers. A fine view of Snowdon, across the lakes, is obtained here. Many celebrated or picturesque scenes and objects are in the vicinity. *Clynnog*, 9 miles S.W. from Caernarvon, population 1650 in 1851, is situated in a picturesque spot on the coast of Caernarvon Bay, and is sometimes chosen for a summer residence. The church is an ancient cruciform edifice. Here is said to have been a religious establishment as early as the 6th century, founded by St. Ruano. An ancient chapel is now used as a school-room. In a field between the church and the sea is the Bachwen cromlech: several other antiquities are in the neighbourhood. *Llanberis*, 10 miles W. by S. from Caernarvon, population 1111 in 1851, is generally chosen as the point from which the ascent of Snowdon is commenced. There are two hotels at Llanberis. The village is a poor struggling place. The church has been recently restored. There are extensive slate quarries here, and also copper mines. The Llanberis lakes form the largest sheet of water in the county. Dolbadern Castle stands on a rocky eminence at the head of the narrow strip of land which divides the lakes. The magnificent pass of Llanberis is at the east of the village. *Llandudno* is a village on the eastern side of the promontory forming Great Orme's Head: the population in 1851 was 1131. Llandudno is a very sequestered place in a rather wild spot; but the bay is open, very beautiful, has a good sandy beach, and is said to be well adapted for bathing. There are several British antiquities in the vicinity.

Divisions for Ecclesiastical and Legal Purposes.—The number of parishes given in the population returns is 68, and there are five parishes which are partly in this and partly in the adjoining counties, Denbigh or Merioneth. Nearly the whole of the county is in the diocese and archdeaconry of Bangor. Caernarvonshire is divided by the Poor-Law Commissioners into four Unions—Bangor with Beaumaris, Caernarvon, Conway, and Pwllheli. The Unions contain 88 parishes and townships, with a population in 1851 of 97,710; but the boundaries of the Unions are not strictly co-extensive with those of the county.

Caernarvonshire is in the North Wales circuit. The assizes and sessions are held at Caernarvon. The county returns one member to the Imperial Parliament. The borough of Caernarvon, with its contributory boroughs of Conway, Criccieth, Nevin, and Pwllheli, and the city of Bangor, returns one member. County courts are held at Bangor, Caernarvon, Conway, Pwllheli, and Portmadoc.

History and Antiquities.—There is some difficulty in determining by what tribe of native Britons Caernarvonshire was inhabited at the Roman conquest. The neighbouring districts of North Wales were peopled by the Ordovices, and we incline to comprehend Caernarvonshire in the territory of that tribe. Ptolemy mentions the Conway under the name of *Toisobius*. The Romans crossed this county under Suetonius Paulinus when they attacked Mona (Anglesey), about A.D. 59. The Ordovices were not however subdued until the time of Agricola, who nearly extirpated them about A.D. 78. In the 'Itinerary of Antoninus' two stations within this county are given; Segontium, now Cae Seiont [CAERNARVON]; and Conovium, now Cae-Rhin, near Conway, where Roman bricks have been found inscribed *LEG. X.*, and the foundations of buildings discovered. The British or Celtic remains are numerous. Vestiges of camps and hill forts occur in several places, especially about Snowdonia. Castell Cae Lleion, on the summit of the Town Hill, about 2 miles from Conway, exhibits considerable remains of a British citadel. Braich-y-Dinas, on the summit of Penmaen Mawr; and Tre'r- Ceiri, on the summit of Yr Eidd, are also remarkable examples of British fortresses. There are several cromlechs and stone circles. In the division of the territories of Rhodri Mawr, or Roderick the Great, between his sons (A.D. 877), Caernarvonshire formed part of the kingdom of Gwynedd (Latin *Venedotia*) or North Wales, allotted to Anarawd. When the cessation of the northern piracies allowed the English kings (now of the Norman race) to turn their arms against Wales, this county, from its remote situation, difficult access, and mountainous character, became the last asylum of the independence of Wales. It was however subdued by Edward I. in 1283. In the subsequent revolt of the Welsh under Madoc, the illegitimate son of Llewellyn, prince of Wales, Caernarvon was taken, and the English settlers massacred. Conway castle was besieged, but without effect.

Dolbadern Castle, supposed to be of British origin, is on a rocky eminence near the junction of the two lakes of Llanberis. Of Dolwyddelan Castle, the residence in the 12th century of Yorwerth Drwudwn, and the birth-place of the famous Llewellyn the Great, little more than one of the towers remains. The foundations of Diganwy Castle, near Great Orme's Head, may be traced. The older part of Penrhyn Castle, near Bangor, is of the time of Henry VI., and up to the period of the alterations made some years since presented a fair specimen of the domestic architecture of that time.

Caernarvonshire has very few monastic ruins. There was a priory of Black or Augustine Canons at Beddgelert, supposed to be the oldest religious foundation in Wales except Bardsey, but there are few remains of it. Bardsey Isle also possessed an extensive religious establishment, but of it also there are few vestiges remaining.

There were in 1851 savings banks at Portmadoc and Pwllheli. The

total amount owing to depositors on the 20th of November 1851 was 14,692*l.* 9*s.* 3*d.*

CAERPHILLY. [GLAMORGANSHIRE.]

CAERWYS. [FLINTSHIRE.]

CÆSAREA-PHILIPPI. [PANAIA.]

CÆSAREIA, a city and sea-port of ancient Palestine, founded by Herod the Great, and so named in compliment to Augustus Cæsar, was situated on the coast of the Levant, about 22 miles S. from Mount Carmel, near the point 32° 32' N. lat., 34° 54' E. long. A town named *Turris Stratonis* previously occupied part of the site: this was enlarged and embellished with white marble palaces and other large buildings common in important Roman provincial towns. The city, which had a temple to Cæsar and Rome, a rock-hewn theatre, and a circus, was built round a large harbour, the greatest wonder of the place, which was formed here by Herod, at a point of the coast where before there was only an open roadstead. The entrance to the harbour was on the north, and it was sheltered from the south-west winds by a massive mole, constructed with enormous blocks of stone. These great improvements raised Cæsareia to be the metropolis of Palestine, and here Roman præfects and titular kings of Judæa had their seat of government. It received the name of Flavia from Vespasian, who planted a colony in Cæsareia, but the old name always prevailed. It was at Cæsareia that "the door of faith was first opened to the Gentiles;" the city early became a metropolitan see, and was conspicuous for the firmness of its martyrs and confessors during the persecutions of the Christians. Eusebius, the father of ecclesiastical history, was made bishop of Cæsareia about A.D. 315. Cæsareia continued to be a place of considerable importance during the crusades, and it was one of the Christian strongholds along the coast. Among the ruins which now cover all the site may be traced the ancient walls; the wall and ditch of the Crusaders' town, which was of less extent than the ancient city; the substructions of a cathedral which stood on a platform near the centre of the town, previously occupied by the temple to Cæsar and Rome; massive fragments of the towers and substructions of the mole; and prostrate columns of granite, porphyry, and marble, which formed the portico of the terrace-walk along the harbour. The ruins of Cæsareia have long served as a quarry, and its stones have been carried away to build the houses and fortifications of Jaffa, Acre, and Sidon. (*Dictionary of Greek and Roman Geography.*)

CÆSAREIA. [KAISARIYEH.]

CAFFA. [KAFFA.]

CAFFRARIA. [KAFFRARIA.]

CAFFRISTAN, properly KAFFIRISTAN, a region of Asia extending eastward from the valley of the Panschir, between Hindu-Koosh and the Himalaya Mountains, which respectively separate it from Kunduz and Badakhshan on the north, and Cabul on the south. Its boundary to the east is probably the Kunur River, which rising in the Hindu-Koosh near 36° 10' N. lat., 72° E. long., runs south-west, and breaking through the Himalaya Mountains joins the Cabul River below Jullahabad. To the east of the Kunur is the mountain region of Chitral. The Hindu-Koosh runs like a gigantic wall along the north of Kaffiristan, its crest rising far above the snow-line; the depressions in it which form the passes into Kunduz and Badakhshan being open only during a few months in summer. The Himalaya on the other hand is rent by many deep breaches, and numerous rivers which drain the valleys of Kaffiristan break through it on their way to join the Cabul River. As may be supposed, Kaffiristan is a land of mountains and valleys, and exhibits great extremes of temperature and climate. On the Hindu-Koosh the snow remains throughout the summer, while the thermometer in the nearest valley stands at 113° Fahrenheit. There are no roads, properly speaking, the only travelling being along foot-tracks, which are frequently obstructed by rivers and mountain-streams, and these are crossed either by wooden bridges or by swing bridges made of the pliant withes of trees.

No cultivation is carried forward on the hills, some of which are covered with pine forests, while others afford sustenance to numerous flocks of goats. The valleys are mostly of small extent but very fertile, and produce abundant crops of wheat and millet with large quantities of grapes, which form an important object of cultivation. These valleys besides furnish pasturage for sheep and cattle. The wild animals of the country are similar to those mentioned under BADAKHSHAN.

The accounts we have of the character and habits of the Kaffirs are chiefly derived from the various tribes of Mohammedans by whom they are surrounded, and with some of whom they are frequently at war. In their persons the Kaffirs are a fine race of people, with handsome features, blue eyes, and fair complexions; the distinction made between different tribes, some of whom are called Siah-Posh, or Black-vested Kaffirs, and others White Kaffirs, is derived from a peculiarity in the dress of the former, who clothe themselves in black goat-skins with the hair outside; other tribes wear dresses made of white cotton.

As regards their civil government the Kaffirs seem to be divided into clans, each of which is governed in all things by its own chief, and engages at times in feuds with other tribes. The name Kaffir (unbeliever) is that by which the Mohammedans distinguish them, as they have never been able to convert them to Islamism. Lieutenant

Wood says that they are part of the wide-spread race of the Tajiks, who sooner than conform to the religion of the early Moslem invaders retired to the plain country northward, and finally settled down in this inaccessible region. Their hostile feelings towards their Mohammedan neighbours are no doubt of ancient date, and they are kept alive and embittered by the incursions which these are constantly making for the purpose of carrying off the Kaffirs as slaves. The governor of Badakhshan is bound by the conditions on which he holds his power of the Meer of Kunduz to make a yearly incursion into Kafiristan for slaves. The Kaffirs in their turn are not slow to retaliate, and entering Badakhshan by the valley of the Kokcha they plunder villages and sometimes massacre the inhabitants. Peace is sometimes made between the Kaffir tribes and their neighbours, when they are ready to extend towards their former enemies all the rites of hospitality. Their warlike weapons are a bow about 4½ feet long and arrows of reed with barbed heads, which are sometimes poisoned. For closer conflict they are each provided with a dagger and a knife: recently they have begun to adopt the use of swords and muskets.

The Kaffir villages are mostly built on the slopes of hills, the houses, which are made of wood, being placed one above another, the roof of the lower house forming a pathway to the one above it. The Kaffirs sit on chairs or stools, never cross-legged like other eastern peoples. Their Mohammedan neighbours testify to their intelligence, and say that one Kaffir slave is worth two of any other nation.

In their religion the Kaffirs are said to believe in one supreme God and in a future state; but they worship numerous idols, the representatives of great men of former times, and who are supposed to intercede with the Deity in favour of their worshippers. When he dies the Kaffir is dressed in his best clothes, and is placed upon a bier with his weapons beside him; his male relations then carry him about with singing and dancing, while the females give themselves up to lamentation, after which the body is inclosed in a sort of coffin and left in the open air, usually under the shade of a tree.

A Kaffir man procures his wife by purchase; paying to her father sometimes as many as twenty head of cattle, or sheep and goats in proportion. Domestic slavery is practised, the slaves being natives of Kafiristan, sometimes taken in feuds with hostile tribes, and sometimes being orphans of their own tribe, it being not uncommon for the more powerful men to seize children who are unprotected, and either to sell them to some neighbouring country or to retain them in slavery.

The more usual food of the people is bread, cheese, butter, and milk; they likewise eat beef, mutton, and bears' flesh. They have a variety of fruits, among which are grapes, apricots, apples, almonds, and walnuts. Honey and wax are exchanged with the Badakhshians for salt. Wine is very abundant. They make three sorts of wine—red and white, and a kind having nearly the consistence of jelly, which is very strong: both males and females are said to drink occasionally to excess. The favourite amusement when they meet together is dancing: their music consists of a pipe and tabor.

Several dialects are spoken by the different clans; but the base of their language, as among all the Tajiks, is Persian. No estimate has been made of the numbers of the people.

(Elphinstone, *Cabul*; Lieutenant Wood, *Journey to the Source of the Oxus*.)

CAGLIARI (the Roman *Caralis* or *Cavades*), the capital of the island of Sardinia and of the province of Cagliari, is situated on the south coast on the bay of Cagliari, in 39° 13' N. lat., 9° 7' E. long., and has about 28,000 inhabitants. The town is divided into four districts. It is built partly on the sea-shore and partly on a hill, on the highest part of which is the castle-citadel, the vice-royal palace, the cathedral, and the residence of the nobility. From the Castello district to the shore is the Marina, a well-built region, in which the principal merchants and foreign consuls reside; here also are the bonding warehouses, arsenal, and lazaretto. The two other districts of the city are called Stampace and Villanova; and besides these there is a suburb named St. Avandré. Cagliari is an archbishop's see, which dates from the beginning of the 4th century. It has a university with faculties of theology, law, medicine, and philosophy and belles-lettres; a library of 15,000 volumes; a museum with good collections of minerals, birds of the island, and medals; a college for the nobility; a diocesan seminary; a grammar school; a theatre; and a mint. The cathedral, a large building rich in marbles, was built by the Pisans during their possession of the island. There are nearly 30 other churches, 20 convents, several hospitals, and an orphan asylum. The real audiencia, or high judicial court for the south division of the island, sits at Cagliari, as well as the commercial tribunal. The town enjoys great municipal privileges and revenues. The harbour is safe, and large ships find good anchorage in the bay. Cagliari is the chief port of Sardinia, and almost the only one frequented by foreign vessels. It exports cheese, wine, oil, salt, flax, hides, and horses. The industrial products of the town are tobacco, cotton manufactures, soap, furniture, leather, gunpowder, &c. Near Cagliari are extensive salt-works.

Carales was founded by the Carthaginians, who no doubt selected the spot not only on account of its well-sheltered roadstead, but also

because of its opportune situation for communication with Africa. After the Roman conquest of Sardinia it became the chief naval station of the Romans in this land, and the residence of the prætor. In the war between Caesar and Pompey Carales declared for the former; it was subsequently taken after a short siege by Menas, lieutenant of Sextus Pompeius. It continued to be the capital of the island during the Roman empire, after the island fell into the hands of the Vandals, and all through the middle ages. A large salt-water shore-lake to the west of the town, and communicating with the bay by a narrow channel, appears to have been used in ancient times as an inner harbour. Among the remains of the ancient city are an amphitheatre, an aqueduct, vast cisterns, a small circular temple in ruins, and on a hill outside the town numerous sepulchres.

The Bay of Cagliari extends northward from a line joining Cape Carbonara with Pula; the length of this line is about 22 miles, and the depth of the bay is about 10 miles. It affords good anchorage and shelter from all winds except the south. Vessels lying close in near the shore are further sheltered by Cape St. Elias. Along the shore of the bay a great deal of salt is made.

The province of Cagliari includes the southernmost part of the island, with a population of 106,388. It is bounded N. by the province of Isili, N.E. by that of Lanusei, and W. by that of Iglesias. The principal town besides Cagliari is *Quarto*, which stands on the salt-marsh of Quarto, about five miles east from Cagliari: population 6000. It is known for its Mulmsey wine. The east and west districts of the province are mountainous, but the central tract north of Cagliari is a fine and rich plain called Campidano, watered by the Ulla and its affluents. The Ulla enters the sea west of Cagliari. The air of the plains is rather unwholesome in the summer months. A good carriage-road leads from Cagliari to Sassari and Porto Torres through the whole length of the island.

CAHERSIVEEN, county of Kerry, Ireland, a market- and post-town and the seat of a Poor-Law Union, in the parish of Caher and barony of Iveragh, is situated in a valley embracing an arm of the sea which runs inland from the northern extremity of Valentia harbour, in 51° 57' N. lat., 10° 13' W. long., distant 227 miles S.W. from Dublin and 23½ miles W. by S. from Killorglin. The population in 1851 was 3155, but this number included 1293 persons in the Union workhouse which is situated in the town. Cahersiveen Poor-Law Union comprises 22 electoral divisions, with an area of 107,541 acres, and a population in 1851 of 29,090.

The valley in which the town is situated is bounded on the north by mountains of considerable elevation, which separate it from Dingle Bay. To avoid these elevations the coast-road from Tralee strikes off from the shore of Dingle Bay at Drung, from whence it passes inland through the valley of Cahersiveen. The road for a considerable distance is carried along the precipitous declivities of Drung Mountain at a height of 200 feet above the sea. A late eminent traveller states that this road "in the magnificence of its mountain and sea views is little inferior to any of the celebrated roads along the shores of the Mediterranean, and is in every way superior to the road from Bangor to Conway in North Wales." (Ingles's 'Tour in Ireland.') The town consists of one principal street, with a cross street leading to the creek, on which there is a quay with a small breakwater, and higher up is a pier for small craft. The roadstead for vessels of burden is two miles farther west, at Rinard Point, where the Cahersiveen creek joins the harbour of Valentia. The court-house and bridewell, and the Roman Catholic chapel and convent, are grouped together at the eastern end of the town. The parish church stands at the west end near the new quay. The chief trade carried on is in the import of timber, salt, and iron, and in the manufacture of flour, for which there are extensive mills half a mile east of the town on the river Cashan.

CAHIR, Tipperary, Ireland, a market- and post-town, is pleasantly situated on the banks of the river Suir, at the eastern end of the valley between the Galtees and the Knockmeledown Mountains, at the intersection of the roads from Dublin to Cork and from Waterford to Limerick, 10½ miles S. from Cashel; population 3719 in 1851. The town is remarkably neat and clean. The parish church and the Roman Catholic chapel are both handsome edifices; and the sessions-house, the bridewell, the market-house, and the schools are tastefully built, and add greatly to the appearance of the town: for much of this improvement the town is indebted to the exertions of the Earls of Glengall, whose seat, Cahir Castle, is on an island in the Suir, and its extensive and beautiful grounds lie along both sides of the river. This castle is of very ancient date, and of large size; it was taken by the Earl of Essex, by Sir G. Carey, and by Oliver Cromwell. It afterwards fell into a dilapidated state, but has been recently restored in a substantial manner and in correct taste. There are a Quakers' meeting-house, a fever hospital, a dispensary, a loan-fund office, and a police-station. A cavalry barracks is about a mile from the town. The market is well attended. Fairs are held on February 8th, April 12th, May 26th, July 20th, September 18th, October 20th, and December 7th, at which considerable business is done, particularly in corn. Several flour-mills in the neighbourhood employ many of the inhabitants. A few miles up the river are the ruins of Cahir Abbey, founded, it is said, in the reign of John.

CAHORS, a city in the south of France, capital formerly of the district of Quercy, now of the department of Lot, is situated on the

right bank of the river Lot, on a small peninsula formed by a bend in the stream, in $44^{\circ} 26' 52''$ N. lat., $1^{\circ} 26' 52''$ E. long., 105 miles E. by S. from Bordeaux, 358 miles S. by W. from Paris, and has 12,102 inhabitants including the whole commune. Cahors is a very ancient place. Its name is erroneously written *Ribona* in the Theodosian table. Ausonius in his 'Clarus Urbis' gives it the true Celtic name, *Dironu*, and explains the meaning to be 'a fountain sacred to the gods.' It was the capital of the Cadureci, from whom the modern name of the town, Cahors, and that of the province, Quercy, are both derived. On the downfall of the Roman empire it came successively into the hands of Goths and Franks; was afterwards subject to the counts of Toulouse, then to its own bishop; was taken by the English during their wars in France, and retaken from them; and carried by assault and pillaged in 1580 by Henry IV.

The town is situated partly on a rocky eminence, and has steep, narrow, crooked streets. The houses in what is called the upper town are commonly built with terraces commanding a wide prospect. There are few remarkable buildings: the cathedral is supposed to be the remains of an ancient temple, with the addition of a portico and other parts of modern date; the theological seminary is a fine and large building. The other noteworthy objects in the town are—the former episcopal palace, now the residence of the prefect of the department; the theatre; the public library; and an obelisk erected in memory of Fénelon in 1820, who studied in the university of Cahors, which was founded by Pope John XXII., and has been long suppressed. Four Roman roads met at Cahors, and one of the greatest of Roman aqueducts brought water to the town from a distance of 19 miles by a very winding course across valleys and along mountain sides. It crossed the valley of La Roque, near Cahors, by a bridge of three tiers of arches, the summit of which was nearly 180 feet high. There are still some remains of this magnificent work. There are also a ruined theatre and baths; a marble altar in honour of Iacetus Leo, a native of Divona, has been found in Cahors, and some beautiful mosaics on the site of the Roman baths. The fountain Divona is still an abundant spring, now called Des-Chantrenx, from its having formerly belonged to the Cistercian convent. The stream from it drives several mills before its clear blue waters join the muddy Lot. This fountain is outside the modern town. The Lot is crossed at Cahors by three bridges, one of which called Pont Louis-Philippe replaces the old bridge of Notre-Dame. The Pont Valoutré, so called from the person who constructed it in the 13th century, is surmounted by three square towers, one at each end and one in the centre. The old ramparts are formed into a public promenade. Cahors has given title to a bishop since about A.D. 257; the diocese includes the department of Lot. The town is the seat of tribunals of first instance and of commerce, of a provincial university and an endowed college. The chief manufactures of Cahors are china-ware and delft, cotton-yarn, some woollen stuffs, and leather; there is also a considerable trade in leaf-tobacco, wine, brandy, truffles, oil, cattle, and hides. The wine of the neighbourhood of Cahors combines deep colour with good flavour and strength: a great quantity is sent to Paris.

CAICOS ISLANDS. [BAHAMAS.]

CAIRNGORM. [ABERDEENSHIRE; BANFFSHIRE.]

CAIRO. [KAHIRA.]

CAISTOR, or CASTOR, Lincolnshire, a market-town and the seat of a Poor-Law Union, in the parish of Caistor, chiefly in the wapentake of Yarborough (a portion of the parish being in the wapentake of Walscroft) and in the parts of Lindsey, is situated in $53^{\circ} 30'$ N. lat., $0^{\circ} 18'$ W. long., distant 24 miles N.N.E. from Lincoln, and 153 miles N. by W. from London by road: the population of the parish of Caistor in 1861 was 2407. The living is a vicarage held with the curacies of Holton-le-Moor and Clixby in the archdeaconry and diocese of Lincoln. Caistor Poor-Law Union contains 76 parishes and townships, with an area of 164,890 acres, and a population in 1851 of 34,073.

Caistor is supposed to have been the site of a Roman station. It was called by the Saxons *Theng Castor*. Roman and Saxon antiquities have been discovered in the vicinity. The town stands on an elevated site. The parish church, dedicated to St. Peter and St. Paul, stands on Castle Hill, within the area inclosed in ancient times by a fortress. The lower part of the tower is Norman, the nave and chancel are early English, with insertions and additions in the decorated and perpendicular styles. The Independents and Wesleyan and Primitive Methodists have places of worship. The Grammar school, founded in 1680, open to all boys, has an income of 200*l.* a year for the head master and 105*l.* for the second master: the number of scholars in 1851 was 25. Caistor has improved in appearance of late years. The manufacture of chairs of elm and ash is carried on to a considerable extent. Saturday is the market-day, but the market is small. Fairs, chiefly for cattle, are held on the Saturdays before Palm Sunday and Whit-Sunday, and on old Michaelmas Day: these fairs are well attended.

CAISTOR. [NORFOLK.]

CAITHNESS, the most northern county of the mainland of Scotland; bounded W. by Sutherlandshire and N. and S.E. by the North Sea, lies between $58^{\circ} 5'$ and $58^{\circ} 40'$ N. lat., $3^{\circ} 0'$ and $3^{\circ} 55'$ W. long. In form it is triangular, having its greatest length along the coast on the south-east. Its length from north to south is about

40 miles, and its breadth from east to west about 30 miles. The area of Caithness is 618 square miles, or 395,680 acres, of which upwards of 100,000 are cultivated or in pasture, the rest being moor and mountains. The population in 1851 was 33,709.

Coast-line.—The coast line is in general bold and rocky, and presents numerous indentations or bays. On the north, where it is separated from the Orkneys by the Pentland Frith, the projections of the coast form two bold precipitous headlands; the one on the north-east, called Duncansbay Head ($58^{\circ} 39'$ N. lat., $3^{\circ} 1'$ W. long.), the other on the north-west, called Dunnet Head ($58^{\circ} 40'$ N. lat., $3^{\circ} 21'$ W. long.), and the most northern point of Great Britain. The distance between these two promontories is about 13 miles. The small island of Stromay, which is part of the county, and is about a mile in length and half a mile in breadth, lies about 3 miles off the mainland. The navigation of the Pentland Frith is somewhat dangerous from the strength of the currents, and the reefs. On the north side of Stromay there is a small vortex or whirlpool, named Swulchie, and nearer the mainland there are breakers, called the Merry Men of Mey, which are probably produced by a current setting strongly on a hidden reef. The tall white steeple of Canisbay, near Duncansbay Head, serves as a landmark, and there is a lighthouse on Dunnet Head. The Stalks of Duncansbay are two insulated columns of freestone, detached from the cliff, of which they originally formed a part; they are inhabited during the summer by thousands of aquatic birds. Near Duncansbay Head is the ferry to the Orkneys, a village consisting of a few houses, and a place of entertainment, called the Honna Inn. What is termed John O'Grout's House is a piece of green turf on the east side of Duncansbay Head, on which it is possible a house may have stood, but there has long ceased to be any trace of it.

Formerly the only harbour on the east coast was at the mouth of the river of Wick, $58^{\circ} 24'$ N. lat., $3^{\circ} 5'$ W. long. It was small and inconvenient. In 1810, a harbour capable of containing a hundred decked vessels was constructed at a cost of 14,000*l.*, but being found inadequate, a new one was planned and completed in 1831, at a cost of upwards of 40,000*l.* There are small harbours at Sarslet, a few miles to the south of Wick, and at Staxigoe a few miles to the north. On the north coast, in addition to the harbour of Thurso ($58^{\circ} 35'$ N. lat., $3^{\circ} 32'$ W. long.) where vessels of 12 feet draught of water may lie, a commodious harbour has been constructed by the enterprise of a private gentleman, at Sandside Bay ($58^{\circ} 32'$ N. lat., $3^{\circ} 47'$ W. long.). On the south-east coast of the county, at Clyth ($58^{\circ} 18'$ N. lat., $3^{\circ} 13'$ W. long.) there is a small pier, and at Lybster ($58^{\circ} 17'$ N. lat., $3^{\circ} 16'$ W. long.) a small stone pier has been built, forming a convenient harbour. Scrubber roads, in the Bay of Thurso, afford good and safe anchorage for vessels of any size.

Surface and Geology.—The surface of Caithness is in general flat and uninteresting; the greater portion being moorland, and there being but few trees. The mountain-range which separates the tableland of Sutherland from the plains of this county attains a mountain character in the southern parts of Caithness, where it turns to the east, forming two distinct and high ridges, of which the northern contains the Maiden Paps, with the high summit of Morbhein or Morven, rising about 2334 feet above the sea; and the southern terminates on the east coast with the Ord of Caithness, which advances into the sea. The plain of Caithness, which lies between the ridge of the Maiden Paps, the Pentland Frith, and the mountains that bound the county on the west, comprises about four-fifths of the county, but it is not a level. Where it borders on the mountains to the south it contains many small hills, which form nearly a continuous chain terminating in the Cape of Clyth Ness. North of this range the county extends in wide levels, covered with moors, and slopes gradually to the beds of the rivers. A few insulated hills are of moderate elevation. Agriculture is confined to the tracts of level land along the water-courses, and to the slopes of the elevated plains. These elevated moorlands sink lower towards the north-east, and terminate in a low plain between Sinclair Bay on the east coast, and Dunnet Bay on the north coast. From the innermost part of Dunnet Bay there extends a very low tract of land, covered with heath and rough grass, and about two miles wide, in a straight line to Keiss Castle on Sinclair Bay. North of this tract the peninsula inclosed between Sinclair and Dunnet Bays runs to the Pentland Frith and terminates in Duncansbay Head and Dunnet Head. The greater and more elevated part, which may be 100 feet above the sea, has a light sandy soil, and contains a considerable amount of land under cultivation. Limestone is found on the north coast and is much used in agriculture. Sandstone is found in some places; and slate, freestone, and flagstone quarries are wrought in two or three parts of the county. These stones are shipped to Leith, Aberdeen, London, Newcastle, and Glasgow.

Hydrography.—There are several sheets of water throughout the county, but none are of any extent or remarkable for beauty. Many of them contain excellent trout. There are no navigable rivers. The waters of Dunbeath, Berriedale, and Langwell rise in the mountains in the south-west part of the shire, and fall into the sea, the former at Dunbeath, a small bay capable of being formed into an excellent harbour, and the two latter at Berriedale, both places on the south-east coast. These streams abound with trout. The river of Wick, from the inland loch of Wattin, falls into Wick Bay; in its progress

it receives several small tributaries. The water or river of Thurso rises in the hills in the south-west bounding Sutherland, traverses from south to north three-fourths of the county, and after a course of 80 miles falls into Thurso Bay.

Communications.—From Wick, which is nearly in the centre of the eastern coast of the county, a steamer runs twice a week to the Forth, calling at Aberdeen. Between Thurso and the Forth there is weekly steam communication during the summer, besides regular sailing vessels. The post road runs along the whole eastern and western coasts of the county; and there are two cross roads, one from Wick to Thurso, on which runs the daily mail-coach, the other from Wick to Castletown, a village about 5 miles east of Thurso: the roads are good. There is a daily dispatch and arrival of mails from the south at both Wick and Thurso, the latter being the most northern post-town in the empire. The postal communication with the neighbouring villages is less frequent.

Climate.—On the north coast the atmosphere is variable but healthy. From September to June the prevailing winds are from the north and north-west. During the remainder of the year the winds vary between the south-east and south-west. In winter and spring the north and north-westerly winds are frequently hard gales, and the exposure of the coast makes the inclemency of the weather to be severely felt. On the east and south-east coast westerly winds prevail. In winter the weather is frequently very tempestuous. Snow seldom lies for more than a day or two, and thunder is rare. The aurora borealis is visible almost every night.

Soil and Agriculture.—The soil of Caithness where under cultivation is generally a strong clay, mixed with earth and capable of producing green crops of all kinds. Since the improvements introduced by the late Sir John Sinclair, who was a large landowner in Caithness, the county has made great progress in agriculture and husbandry generally. Many farms are now of as large extent and as well cultivated as in any other district of Scotland. Cattle of the Highland and Teeswater breeds are reared for the southern markets; sheep of the Leicester and Cheviot breeds are also much kept. A considerable part of the land is still in the hands of small farmers, and a part is held by a class of persons who trust more to the results of the fisheries than to the cultivation of the soil. Many of both classes however raise green crops and endeavour to follow a kind of rotation of cropping. Leases of large farms extend from 7 to 19 years; small farms are held without leases; the farm buildings are generally good and comfortable. Crops are late in ripening, being generally about 20 days behind those of the Lothians. There are weekly corn markets at Thurso and Wick.

Industry.—Throughout the county the several quarries of flagstones, freestone, and slate engage the labour of a considerable portion of the population, but the general employment of the people is in agriculture or in fishing, with the attendant occupations of coopering, curing, and packing. On the coasts all are fishermen. After spring sowing comes the lobster fishing, chiefly for the London market. In May and June turf is cut for the winter fuel. In July the herring fishing begins, and lasts for two months; then the crops are cut and potatoes dug; and after that the fishing for cod, ling, and large sea-fish is resorted to. The herring fishery however is the principal business of the county. "The herrings are got all round the coast; but Wick and the surrounding fishing villages are the principal places of resort. . . . The number of persons partially or wholly employed is about 12,000. The number of boats employed may be about 1000, of which 700 are owned in the county, and the rest come from the Frith of Forth and various places in the Moray Frith. Each boat is manned by five men." ("New Statistical Account of Scotland.") There are several salmon fisheries on the coast and on the rivers; that on the coast of Thurso let formerly at 1000*l.* per annum. Salmon are dear in the county, nearly all being 'kitted' for the London market.

Divisions, Towns, &c.—The county of Caithness forms a Presbytery, and is within the ecclesiastical jurisdiction of the synod of Sutherland and Caithness. Of 28 clergymen within the bounds of the synod Caithness possesses 13. In addition to the 13 churches of the Establishment there are about 20 other places of worship, the greater proportion of which belongs to the Free Church, the others to United Presbyterians, Roman Catholics, and others. The county contains one royal burgh, which is the county town, Wick. The only other town besides Wick is Thurso, a post- and market-town on the north coast, about 20 miles N.W. from Wick: population 2908 in 1851. It lies in a valley or bay formed by the two promontories called Holburn Head and Dunnet Head. Thurso Water enters this bay close to the town. The town has been a burgh of barony since 1633. It consists of an old and a new town. The church is a handsome building, and the new town contains a few regular streets and some well-built houses. There are a Free church and two other places of worship for Presbyterian Dissenters. Thurso is a post-town, and courts are held there for the northern part of the county. Striped plait, leather, ropes, and lincen and woollen cloths are manufactured. At a short distance from the town the late Sir John Sinclair erected a low circular building surmounted by a sort of embattled parapet, intended to mark the grave of Harold, an earl of Caithness, who was killed somewhere about this spot many centuries ago. It is a con-

spicuous object, in a country comparatively bare and desolate. The parish of Thurso, owing to Sir John Sinclair's exertions, is considered to be the most improved district in the county.

The following villages may be mentioned:—*Broadhaven*, a small fishing station on the east coast about 1 mile N. from Wick. *Castletown*, a populous village on Dunnet Bay on the north coast, about 5 miles E. from Thurso. *Louisburgh* and *Pulteneytown*, two villages adjacent to and forming suburbs of Wick. *Sarclet*, a small fishing village 5 miles S. from Wick, where there is a good harbour for fishing boats. *Stacigoe*, another village 2 miles N. from Wick, with a good natural harbour.

Population, &c.—The language generally spoken is the Scottish dialect of English. Gaelic is still talked and understood by the older inhabitants, especially in the inland districts. In a majority of the churches a portion of the service is conducted in Gaelic. The county gives the title of earl to the family of Sinclair; it returns one member to the Imperial Parliament: the constituency in 1852 was 652. In 1851 there were two savings banks in the county, at Thurso and Wick: the total amount owing to depositors was 9018*l.* 16*s.* 2*d.*

History and Antiquities.—The earliest inhabitants of Caithness are supposed to have been Celts. These were succeeded by the Picts, who in their turn gave way before the repeated descents of colonies of Danes and Norwegians. As early as the reign of David II. of Scotland the Caithness weights and measures were ordered to be adopted as the standards of the whole kingdom. At that time Scotland traded through Thurso with Norway, Sweden, and the Baltic, and these weights and measures being those of the chief and nearly sole trade of the country were considered the most convenient. About 1350 the Keith family acquired lands in Caithness by marriage, and in the same way the Sinclairs and Sutherlands became lords in the district. Its history and traditions present the usual annals of mutual robberies, treacheries, and murders. Sinclair is now the prevailing name. The names of localities are principally Norwegian. There are a great many remains of round towers and small forts which are attributed to the time of the Danish possession. The ruins of Catholic chapels are to be met with in every parish, and till comparatively a late period in the history of the Reformed Church the inhabitants seem to have formed pilgrimages to different holy spots, to which tradition assigned peculiar virtues. On the Pentland Frith, the northern shore of the county, is Barrogill Castle, a seat of the earls of Caithness; and on the eastern coast north of Wick are to be seen the ruins of Bucholie Castle, mentioned by Pausanias, and some ruins of buildings attributed to the Picts and the Danes, of the tower of Keiss, and of the castles of Girnigoe and Sinclair. Lord Duffus has a seat on the Bay of Keiss about 6 miles N. from Wick. The ruins of Auld Wick Castle are on the south side of the Bay of Wick. In the parish of Halkirk, and about 6 miles S. from Thurso, are the very remarkable ruins of the castle of Brul, popularly stated to have been the residence of the ancient bishops of Caithness and Sutherland. On the south-east coast of the county are the ruins of eight castles, all of them possessing their own traditions of war and bloodshed. These are Clyth, Swiney, Forse, Latheron, Knockinuan, Dunbeath (still inhabited), Achastle, and Berriedale.

CALABAR, OLD, a river of Africa which falls into the Bight of Biafra about 52 miles N. by W. from Fernando Po. It is the largest river on this coast, and forms an estuary 3 miles wide, which is full of shallows and sand-banks. The Cross River, which used to be considered a feeder of the Old Calabar, was discovered to be the main stream by Captain Beccroft in 1841-2. The river is navigable by steamers for 200 miles above its mouth. The principal place on the river is called Duke's or Ephraim Town, which stands on the estuary about 5 miles from the entrance. Twelve miles above Duke Town is another large village, called Creek Town. The United Presbyterian Church of Scotland has several missionary agents in Old Calabar.

The river is very winding, and the shores are low and swampy. The country is overrun with bushes, principally of the mangrove species, and there are few cleared spots on the banks of the river. The right bank is much intersected by creeks, through which the natives assert they can in their canoes communicate with all the rivers that fall into the Gulf of Guinea between this and the Benue, forming the great delta of the Quorra. To the eastward of the Calabar is the high land of Cameroons. The river abounds in alligators: there are few fish. The water is not considered good.

CALABAR, NEW, a branch of the Quorra, which enters the Atlantic 52 miles E. from Capo Formosa by the same estuary with the Bonny. It is a wide but sluggish stream with a bar across the entrance, which renders it accessible only for vessels drawing about 12 feet: 5 miles up however there is an average depth of 30 feet. By the Portuguese it was called Rio Real. The town of New Calabar stands on an island formed by two branches of the river.

The district to which the name of Calabar is given is very undefined and variable, as the chiefs are generally at war with each other, and overrun the neighbouring territories whenever they feel themselves sufficiently powerful. All this part of the African coast is low and swampy for 40 or 50 miles inland from the sea-coast, with few places fit for cultivation, though on these spots the soil yields plentifully not only yams, which are the chief food of the natives, but also the sugar-cane and other tropical productions. Polygamy is customary

among the natives, and human sacrifices are often made to propitiate good and evil spirits at funerals, and likewise periodically to the Spirit of the River, when the victims are carried out to the bar and there thrown overboard to be devoured by the sharks. Every eighth day is a holiday, and is passed by both sexes in drinking palm-wine in a state of fermentation till they become quite intoxicated.

CALABRIA, a division of the kingdom of the Two Sicilies, extending southward from Basilicata to the Strait of Messina between the Gulf of Taranto and the Mediterranean Sea. Its length from Monte Pollino on the southern border of Basilicata to Cape Spartivento at the extremity of the Italian peninsula is about 145 miles. The country consists of two peninsulas of very nearly equal length, joined by a narrow neck only 16 miles broad, between the gulfs of Squillace and Sant' Eufemia. The greatest breadth of the northern peninsula from sea to sea is about 60 miles, and that of the southern peninsula is in few places above 30 miles. The total area of Calabria is 5923 square miles, and the population in 1851 was 1,136,650.

The Apennines run southward through Calabria, forming large and irregular masses with numerous offsets towards both seas, and occupying the greater part of the surface. In the north the main ridge runs close to the Mediterranean coast as far as the Savuto, to the south of Cosenza, where it spreads eastward across the breadth of the peninsula, forming a mountain region of about 35 miles in length from west to east, and 25 miles in breadth from north to south. This region, which is called La Sila, and from which in ancient times the Athenians and Sicilians supplied themselves with masts and ship-timber, is a table-land traversed by numerous ranges of high hills, the summits of which are covered with pine forests, and the lower slopes with oaks, beeches, and elms. The plains between the hills are watered by numerous streams, and produce rich pasture. The whole region abounds with beautiful scenery, combining forest and mountain, rock and glen, river and plain. Landed proprietors from all the neighbouring towns migrate annually in the spring with their families, shepherds, and flocks to this healthy and beautiful table-land. In these mountains the rivers Crati, Neto, Savuto, and many smaller streams have their rise. Near Nicastro, and between the sources of the Lannato and Corice, the Apennine ridge becomes narrow, and as it approaches the isthmus above mentioned the elevation is so small that Charles III. of Naples proposed to cut a canal through it to connect the gulfs of Sant' Eufemia and Squillace. To the southward of this remarkable depression the mountains rise again and form another large mass called Aspromonte, which fills nearly the whole width of the country above Reggio. The Aspromonte is a very imposing range as seen from the coasts of south Italy: its sides are covered with forests of beech and oak, and its crest with pines. The highest summits of the Calabrian Apennines do not exceed 5000 feet, except Monte Pollino on the borders of Basilicata, which rises to 7000 feet. The highest point of La Sila is nearly 6000 feet, and the summit of Aspromonte is 4500 feet above the sea. The Calabrian Apennines are chiefly of limestone; primary rocks appear only in the southern portion of the chain, particularly in the range of the Aspromonte, which in its geological structure and physical character more nearly resembles the neighbouring mountains of Sicily than the Apennines. Between the various mountain masses and their offsets are some extensive valleys along the banks of the principal rivers, which terminate in plains near the sea. The valleys of Cosenza and Monteleone, and the plain of Gioja, are the most extensive and fertile. The olive, the vine, the mulberry, the orange, and the lemon grow luxuriantly. Calabria produces a variety of good wines, some of which keep very well for years. Raw silk and oil are the staple productions of the country. Manna is gathered in large quantities in several districts from a species of ash. Cotton is also grown, and the sugar-cane succeeds. Vast quantities of liquorice are produced. Saffron grows wild in the pasture-grounds about Cosenza, and the caper on the stony districts of all three provinces. The climate is suitable for the production of raisins and currants; the best are those grown in the island of *Dino*, close to the coast between the mouth of the Lao and the Trecchina, and on the little island of *Circella*, a few miles south of the Lao. Calabria has a fine breed of horses of the true classical shape; they are not very numerous, mules being in more request from the nature of the country. Other stock includes milk cattle, oxen, buffaloes, and pigs. Bees are very numerous.

Calabria is divided for the purposes of administration into three *intendenze*, or provinces, Calabria Citra, Calabria Ultra II., and Calabria Ultra I., which are severally governed as already explained in the article *Basilicata*.

Calabria Citra, which is the most northern part of the division, formerly had an extensive trade in timber, but from waste and improvidence in the management of the forests this source of wealth has rather declined. The destruction of the timber, besides enhancing the price of fuel, has caused in many places the drying up of the mountain springs, and exposed the vegetable soil, formed by the decomposed foliage of the forests for thousands of years, to be washed away by torrents during the winter rains. The lowland rivers are thus in many instances choked with alluvial deposits, and once fertile districts are converted into unhealthy marshes. The ship-timber of La Sila is brought to Corigliano, near the coast of the Gulf of Taranto, which is also the centre of the manna trade, and has several

liquorice factories. In Calabria Ultra II. there is also a considerable trade in manna and saffron; silk is manufactured in its capital Cautanzaro. At Briatico, on the Gulf of Sant' Eufemia, to the north of Monteleone, and at Maida, near the great depression in the Apennine chain above noticed, coal has been found; at Maida antimony also and alabaster occur. There are iron-furnaces in the south-east of the province for smelting the iron-ore from the mines of Lo Stilo, which are situated just within the boundary of Calabria Ultra I. The iron is formed into cannons at the foundries of La Serra, a little further inland. The ores of Lo Stilo are said to be very rich; they form part of the royal domain, and are not profitably worked. The prince of Satriano has a foundry on his own estate, at which a small quantity of iron is smelted. Iron is found also in the southern part of the Aspromonte range. At Reggio, the neighbourhood of which is famous for its dried fruits, cedrat and other essential oils are produced. Other industrial products are silk stuffs at Scylla and its neighbourhood, and soap. The sea-fisheries give employment to many of the inhabitants of the coast towns; vast quantities of tunny, sword-fish, anchovy, and mullet are taken. The tunny, which measures 6 to 8 feet in length, and as much in circumference, frequently weighs above 4 cwt. The fish swim in shoals, and are caught in chambered nets. The sword-fish always attends the tunny shoals, which frequent the Mediterranean between June and August, and is sometimes taken in the chambered nets, but is more frequently harpooned during the passage of the shoals through the Strait of Messina. Its length including the sword varies from 8 to 12 feet, and it weighs about 2 cwt.; the flesh is more delicate than that of the tunny, and somewhat resembles veal. The anchovy is taken in nets from March to May, cured and packed on the spot, and exported to all parts of Europe. The mullet abounds on all parts of the coast, especially at the mouths of the rivers; it is taken chiefly for the roe which is salted and dried like caviare, and under the name of *bottarga* eaten as a delicacy with oil and lemon-juice.

The northern boundary of Calabria Citra is formed by the little river Canna, which flows into the Gulf of Taranto to the north of Rocca Imperiale; by the offset of the Apennines which runs southward from the source of the Canna to the source of the Sinno and Monte Pollino; and thence by a line westward to the Neco or Trecchina, and along this river to its mouth in the Gulf of Policastro. The province extends southward to an irregular line, running in a general direction of west-south-west from the Lacanica or Fiumenica which falls into the Gulf of Taranto, a few miles north of the promontory of Punta dell' Alice, to the mouth of the Savuto. The northern part of the province includes a portion of ancient Lucania (which extended south as far as the Crati and the Lao): the rest of this province, and the whole of the other two Calabrias anciently belonged to Bruttium. The principal rivers of Calabria Citra are the Crati and the Neto. The *Crati* (ancient *Crathis*) rises to the south of Cosenza, within about 12 miles of the Mediterranean coast, and runs north between the Apennines and the region of La Sila to below Bisignano, where it receives the *Mucone* (which drains the north-west part of La Sila) on its right bank. Below Bisignano, it turns north-east to its mouth in the Gulf of Taranto. About three miles from its mouth it is joined on the left bank by the *Coscile*, the ancient *Sybaris*, which drains a large district. The whole length of the Crati is about 60 miles. The *Neto* rises east of Cosenza in the Sila region, of which it drains the central parts. It flows rapidly in a broad channel and in a general eastern direction into the Adriatic, about midway between Punta dell' Alice and Cape Nau or Colonna. The *Savuto* rises at the foot of Monte Spineto, one of the highest summits of the Sila, and flows with a deep impetuous stream westward to the Mediterranean. The eldest son of the emperor Frederick II. was accidentally drowned in the Savuto. The rest of the rivers are short, being for the most part mountain torrents running directly into the sea. None of the rivers is of any importance to navigation.

The province of Calabria Citra contains an area of 2613 square miles, and had a population of 435,841 in 1851. It is divided into four districts or *arrondissements* named from the chief town of each—Cosenza, Rossano, Paola, and Castrovillari—and into 146 communes.

Cosenza, the capital of the province, occupies the site, and retains the name of the ancient *Cosentia*, the chief city of the Bruttii. It is situated at the junction of the Busento with the Crati, 160 miles S.S.E. from Naples, and has about 9000 inhabitants. The city stands partly in a deep glen and partly on higher ground, on the left bank of the Crati. The lower part of it is exposed to malaria, the higher part is healthy, and contains the tribunale, or court-house, a fine building, several public establishments, and many mansions of the opulent proprietors of the province. The streets are generally narrow and crooked, but the shops are good. There are important silk-factories in the town. Philip the Hardy on his return from Tunis with remains of St. Louis lost his wife, Isabella of Aragon, in Cosenza. Cosenza gives title to an archbishop. The cathedral contains the tomb of Duke Louis III. of Anjou. Alaric, king of the Goths, was buried in the bed of the Busento.

Among the other towns the following may be noticed:—*Acri*, north-east of Cosenza, on the *Mucone*, a feeder of the Crati: population about 7000. *Aprigliano*, situated on a steep hill, a few miles

S.E. from Cosenza: population, 5000. *Bisignano*, an episcopal town, with about 4000 inhabitants, built on a high hill near the junction of the Mincione with the Crati. *San Giovanni-in-Fiore*, near the southern frontier, in the fork between the Neto and its feeder the Arvo: population, 5000. *Rende*, north-west of Cosenza, at the foot of the Apennines: population, 4000. *Scigliano*, south of Cosenza, on a height near the Savuto, is a collection of seven agricultural villages, which form as many separate quarters, and have a total population of 12,600. The environs are very fertile in corn, wine, and silk.

Rossano, an archiepiscopal town, north-east of Cosenza, and on the road that skirts the Adriatic shore, is the capital of the district of Rossano. It is situated on a rocky height, and has 12,300 inhabitants. It is a well-built walled town defended by a castle; and contains a fine cathedral, 14 other churches, a diocesan seminary, and an hospital. Among the other towns of the district are the following: *-Cariati*, a small episcopal town situated on a lofty hill, 5 miles N. from the Finnenica; the town is entered by a gate and draw-bridge; and at one extremity of it are ruins of a feudal castle: population, 2000. *Corigliano*, a handsome town of 13,000 inhabitants, is built in form of an amphitheatre on the side of a steep hill, the summit of which is crowned by a fine feudal castle, and commands magnificent views. The town which is 7 miles W. from Rossano, is supplied with water by an aqueduct, and is considered the most agreeable place of residence in Calabria next to Reggio. It contains many liquorice-factories and extensive timber-yards, in which the ship-timber of the Sila is stored for the supply of the shipwrights of Naples. The castle is a residence of the Duke of Corigliano; it is a square building flanked with massive towers, and surrounded by a deep moat. *Longobucco*, a small place on the eastern flank of the Sila, near the source of the Trionto, deserves mention on account of its silver-lead mines. It has a population of about 5000, most of whom have employment connected with the mines and with charcoal-burning.

Paola, the capital of a district which lies north of the Savuto and between the Apennines and the shore of the Mediterranean, is 14 miles N.W. from Cosenza, and has 5000 inhabitants. The town stands on the shore and on the edge of a deep ravine, which is crossed by a handsome bridge. It contains some good houses and a feudal castle, and has extensive silk-factories, and a pottery. The Apennines in this district are very difficult to pass; the only road that traverses the chain is the new cross-road from Cosenza to Paola; the mountain passes are infested by brigands, so that many interesting towns along the coast are inaccessible to travellers, and many of them communicate with each other only by water. Among the most important of these coast-towns are *Ajello*, population, 3800; *Aniunton*, 2800; *Belvedere*, 3900; *Cetraro*, 5700; *Fiumefreddo*, behind which rises the conspicuous and lofty peak of Monte Cocuzzo, population, 2800; *Foscaldo*, 7000; *Scaleo*, 3000; and *Verbicaro*, 4500.

Castrovillari, the capital of a district which comprises the territory north of the Crati and east of the Apennines, is situated on an eminence surrounded by lofty mountains on the great Calabrian road from Naples to Reggio, 30 miles N. from Cosenza, and has 7000 inhabitants. The modern portion of the town has handsome streets, and contains the mansions of the rich proprietors of the district. The town is defended by a massive feudal castle, supposed to be of Norman erection. A cross-road leads from Castrovillari to Rossano, where it joins the Via Trajana, which runs along the Adriatic coast. Of the other towns the most important are the following:—*Cassano* is a well-built episcopal town, beautifully situated on the Ejauro, a feeder of the Coscile, 8 miles E. from Castrovillari, and has 6000 inhabitants. The scenery and climate of Cassano are not surpassed in South Italy. It has hot sulphureous baths. On the summit of the rocky mass round which the city is built are the ruins of a feudal castle, one of the strongholds of the Serra family. The view from the castle commands the beautiful valleys of the Coscile and the Crati. *Cassanoda* said to be the Roman Cosa, at the siege of which T. Annus Milo was killed by a stone thrown from a tower, which still stands and bears the name of Torre di Milo. The village of Civita, higher up the valley and near the Ragonello, is according to others the site of Cosa; there are some ancient buildings near it. The district between the mouths of the Ragonello and the Crati, or according to others the fork between the Coscile and the Crati, is the site of the ancient *Sybaris*, founded by the Achæans and Trezenians, B.C. 720. It traded extensively with Carthage, numbered at the time of its greatest prosperity and luxury (for which it was proverbially notorious) 300,000 inhabitants, and was utterly destroyed by the Crotonians, B.C. 510. *Terranova*, higher up the Crati and on its left bank, is a small place of about 2500 inhabitants, but important as marking the site of the ancient *Thuri*, which was founded by the Athenians, B.C. 446, in order to supply the place of the destroyed city of Sybaris. Herodotus, the historian, and Lysias, the orator, were among the first colonists of Thuri. The city soon rose to eminence. It submitted B.C. 190 to the Romans, who made it a colony and gave it the name of Copia. A few miles north of Castrovillari is *Morano*, a town of 9000 inhabitants, situated on a conical hill crowned by a fine feudal castle at the western base of the Monte Pollino ridge. In the neighbourhood of the town are some beautiful wooded dells, up

one of which, to northward, the great Calabrian road is led by well constructed zig-zags to the bleak dreary plain of Campotenese, which extends to the frontier of Basilicata. *Morano* has some silk and woollen manufactures. In the north-east of the district near the Canna, which here forms the boundary, is *Rocca Imperiale*, a small place of 2000 inhabitants, built like most of the towns along the coast and in other parts of Calabria round a conical hill.

Calabria Ultra II. extends southward from Calabria Citra, to the mouth of the Mesima in the Gulf of Gioja on the west, and to the mouth of the Callipari on the east shore of the peninsula. It contains an area of 2099 square miles, and had 381,147 inhabitants in 1851. The province is divided into four districts—Catanzaro, Crotone, Nicastro, and Monteleone—and into 151 communes.

Catanzaro, the capital of the province and the seat of one of four Gran Corti Civili, or Courts of Appeal, in the continental dominions of the king of the Two Sicilies, is a well-built and important city, situated a few miles from the Gulf Squillace, 26 miles S. by E. from Cosenza, and has 12,000 inhabitants. It is built on the slope of a high and rocky hill that rises above a deep ravine between the Alli and the Corace and at the southern extremity of the Sila. The city gives title to a bishop, and is the residence of numerous wealthy proprietors. It is defended by a castle originally founded by Robert Guiscard; and contains a cathedral, several other churches, and a new theatre. The court of appeal of Catanzaro has jurisdiction over the three Calabrias; the lyceum established in the town confers academical degrees, and is one of the largest and best conducted colleges in the kingdom. *Squillace*, a small ill-built episcopal town, situated on a steep rocky eminence 9 miles S. from Catanzaro, has 2600 inhabitants. This town gives name to the Gulf of Squillace and represents the ancient Scyllaceum which had the epithet of 'Navifragum,' from the bold precipitous promontory (now Monte Moscia) which projects opposite Squillace into the sea. There are fine views near Squillace, comprising the isthmus and the shores of the gulfs of Squillace and Sant' Eufemia. Squillace is the birth-place of Cassiodorus, the enlightened minister of Theodoric and historian of the Goths, who died here in a monastery founded by himself about A.D. 560. *Badoletto*, a small town built on a hill a few miles N. from the Callipari, has a population of 3400. The Callipari is said to be the ancient Helleporus, on the right bank of which Dionysius the Elder totally defeated the Crotonians and other confederate Greeks in B.C. 389.

Crotone, the capital of the north-eastern district of the province, derives its name from the ancient Croton or Crotone, one of the most famous Greek cities in Italy, celebrated for its powerful athletes and for the beauty of its women, the residence of Pythagoras, and the seat of one of the earliest schools of medicine. The town has given title to a bishop since the earliest age of the church; Dionysius the Areopagite is said to have been its first bishop. It is now a small place with only about 5000 inhabitants; but is important for its castle and fortifications founded by Charles V. Crotone is 37 miles N.E. from Catanzaro. It is built on a projecting point of land near the mouth of the Esaro, which partly surrounds the town. It has a small harbour, which is formed by a mole built with materials from the temple of Juno on the Lacinian Promontory, now Cape Nau or Colonne, which is a few miles S.E. from the town. One of the Doric columns of the temple still stands erect, whence the cape has received the name of Cape Colonne. The *Esaro*, now almost choked with weeds and little better than a stagnant ditch, is the ancient *Esarus*, the scene of one of the Bœoties of Theocritus.

Among the other towns of the district is *Ciro*, said by some to occupy the site of the ancient Crimissa, founded by Philoctetes. It is a small place of 3000 inhabitants, situated near the Punta dell' Alice, the ancient promontory of Crimissa, on which Philoctetes is said to have built a temple to Apollo and to have suspended therein the bow and arrows of Heracles. *Isola*, a small town of 2000 inhabitants, chiefly rich proprietors, stands between Crotone and Cape Rizzuto. *Santa Severina*, a small place of only 1000 inhabitants W. of Crotone on the cross road to San Giovanni-in-Fiore, gives title to an archbishop. *Strongoli*, an episcopal city with 2000 inhabitants, situated on a barren height near the coast north of Crotone, is supposed to occupy the site of the ancient Petilia, another city founded on the coast by Philoctetes. The town was burnt by the French in 1806; it now contains many good houses. Two stones let into the exterior wall of the cathedral are covered with Latin inscriptions, which if genuine confirm the opinion that this was the site of Petilia. A steep descent leads down from Strongoli to the plain of the broad and rapid Neto, the Neæthus of Theocritus, in which the Trojan women are said to have set fire to the Grecian fleet in order to put a stop to the wanderings of their conquerors. *Umbriatico*, a small ill-built episcopal town with only one church (the cathedral) and 2500 inhabitants, is situated a few miles W. from *Ciro* on a steep hill in which gypsum and alabaster are quarried.

The north-western district is named from its chief town *Nicastro*, which is situated to the north-west of Catanzaro on the slope of a mountain commanding extensive views of the plain and the coast to southward. The town gives title to a bishop, and has a population of 6600. In the castle, which is now in ruins, Henry, the eldest son of the emperor Frederick II., was confined on account of his taking part with the Guelphs against his father. Among the other towns of

the district are the following:—*San Biaggio*, a few miles west from Nicastro, is famous for its hot sulphurous baths and its wine: population 3000. Nearer the coast is *Santa-Eufemia*, a small town built near the site of the monastery of Santa-Eufemia, founded here by Robert Guiscard and swallowed up in the great earthquake of 1838. The monastery gave name to the Gulf of Sant' Eufemia, which extends from Cape Suvero on the north to Cape Zambrone near Brinitico on the south. *Filadelfia* in the plain south of Nicastro: population 3200. *Maida*, further south, is situated between two feeders of the Lamato, which is the principal river that falls into the Gulf of Sant' Eufemia: population 2800. Sir John Stuart, at the head of a British force, defeated the French under General Regnier in the plain of Maida in 1806. *Martorano*, not far from the Savuto in the north of the province, is an episcopal town with 2000 inhabitants.

Monteleone, capital of the south-western district, is situated on the road to Reggio, 25 miles S. from Nicastro, and has 7200 inhabitants. It is a flourishing place and stands in a commanding situation rendered picturesque by the feudal castle which was erected by Frederick II., and overlooks the town. Between the town and the sea is the village of *San Pietro di Virona*, which marks the site of the ancient Hipponium, a colony of the Locri Epizephyrii, which afterwards became a Roman colony under the name of Vibona. Cicero resided here previous to his exile from Italy. In the neighbourhood was a celebrated grove and temple of Proserpine. Six miles S. from Monteleone is *Mileto*, a small episcopal city with about 1500 inhabitants. It was originally built by the Normans, and was a considerable and well-built town till 1783, when it was totally destroyed by an earthquake. The abbey of the Holy Trinity was founded by Count Roger of Sicily, who embellished it with marble columns from the temple of Proserpine mentioned above. The count and his wife were buried in the abbey church; the sarcophagi containing their remains are now in the museum of Naples. A few miles east of Mileto are numerous villages with Greek names, and inhabited by the descendants of Albanian and Greek colonists. In the same direction and in a valley among the Apennines are the ruins of the monastery of San Stefano del Bosco, in which St. Bruno first established his order of monks. *Nicotera*, near the coast of the Gulf of Gioja and a little north of the mouth of the Mesima, gives with Tropea title to a bishop. It is a thriving place with 3800 inhabitants, built on the slope of a hill about a mile from the sea. It was destroyed in 1783 by the earthquake, and the present town has been erected since then. Nicotera is famous in the province for the beauty of its women. *Il Pizzo*, 6 miles N.N.E. from Monteleone, a port on the shore of the Gulf of Sant' Eufemia, has about 5700 inhabitants, who are engaged in the fisheries and the coasting trade. Joachim Murat landed at Il Pizzo in 1815, in his vain endeavour to recover the throne of the Two Sicilies. The people of the town took him prisoner and lodged him in the castle of Pizzo, in an apartment of which he was shot on the 13th of October. His body lies in the vault of the church of Il Pizzo. *Soriano*, 8 miles E. by S. from Monteleone, is situated among rugged mountains near the course of the Mortaro, a feeder of the Mesima, and has about 3000 inhabitants. *Tropea*, an episcopal town situated on a deep well-sheltered bay 8 miles S.W. from Monteleone, midway between Capos Zambrone and Vaticano, has 4300 inhabitants. The city is built upon cliffs, which rise behind the beach that lines the shore, and presents a beautiful appearance from the sea with its lofty churches and conventual buildings. Behind the city lower slopes are richly cultivated and well-wooded, and behind those rises a line of higher hills. Tropea is famous for its mild and healthy climate; the vicinity produces abundantly wine, fruits, cotton, silk, aromatic plants, and flowers of all kinds. The town is surrounded by walls flanked with towers and pierced by three gates with draw-bridges. The cathedral, six churches, one of which is built on a cavernous coralline rock in front of the city, the diocesan seminary, an hospital, and a poor-house are the most noteworthy objects in the town. Steamboats from Naples to Messina and Malta touch at Tropea.

Calabria Ultra I., the most southern province of Italy, includes all the rest of the peninsula south of the Mesima and the Callipari. It has an area of 1251 square miles, with a population of 319,662 in 1851. It is very rich in iron ore, which is found in the mountains between the Alaro and the Callipari, and also at the southern end of the Aspromonte range, not far from Reggio; but the Aspromonte mines are not now worked. Raw silk, cotton, oil, fruits of all descriptions, liquorice, manufactured silk, soap, perfumery, essential oils, wine, brandy, orange and lemon and citron quicks, &c., are the most important products. The province is divided into three districts—Reggio, Gerace, and Palmi—and into 104 communes.

Reggio, the capital of the district of Reggio and of the whole province, is the ancient Rhegium, and is described in a separate article. [RHEGIUM.] It may be enough here to say that for salubrity of climate and beauty of scenery this city is hardly surpassed in Europe. The plain around it is for miles covered with plantations of the orange, lemon, and citron: the American aloe and cactus grow luxuriantly along the road-sides: the castor-oil plant and the date palm flourish; and the fruits and flowers of both hemispheres and of temperate and tropical countries are here produced. The city has extensive silk manufactures, and produces 70,000 lbs. of essential oil

yielding 18 ducats a pound; it has besides an important general commerce. The Bay of Reggio is remarkable for the singular phenomenon called the Fata Morgana. The distance across the strait from Reggio to Messina is not quite $7\frac{1}{2}$ miles.

Among the other towns of the district we notice the following:—*Bova*, situated on a hill at the southern base of the Aspromonte and not far from Cape Spartivento, the ancient Herculis Promontorium, and the most southern point of Italy, is an episcopal city with 3000 inhabitants. Bova is said to have been founded by one of the numerous Albanian colonies that settled in Calabria after the death of Scanderbeg. It was destroyed by the earthquake of 1783, and has been since rebuilt. *Scylla* or *Scilla*, built on the sloping sides of a rock which connect the mainland with the famous rock or promontory of Scylla at the northern entrance of the Faro or Strait of Messina, has important silk factories, and a population of about 5000, many of whom are skilful mariners and intrepid divers. The wine of Scylla is of good quality; and the town derives some profit from the mushroom-stone found in the neighbourhood. The fishery of the tunny and the sword-fish is actively plied during the season. The town is built in zigzag terraces rising one above another from the sandy bays which lie on each side of the promontory. The streets are consequently steep; there are many fine buildings and handsome fountains in the town, which has been rebuilt since 1783, when it was almost entirely destroyed by the earthquake. The castle of Scylla is built on the edge of the cliff at the extremity of the promontory, and is considered an important military post. The British held it for some time during the last French war, but were forced to evacuate it in 1808 by the French. The Rock of Scylla, whose terrors to the ancient mariners are immortalised by the poets, inspires no fear in modern seamen; even the whirlpool of Charybdis opposite to Scylla is now represented by mere currents, which produce some rotation in the water, not of a dangerous character, but at times strong enough to turn a ship quite round. A whirlpool below the port of Messina, called *Galeoso*, answers the description of Charybdis given by the ancient poets; but its distance from Scylla prevents us from pronouncing it to be the same. The distance from the castle of Scylla to the Faro Point on the Sicilian coast is 6047 yards, or nearly $3\frac{1}{2}$ miles. A beautiful road runs close along the shore from Scylla to Reggio, commanding splendid views of the strait and the broken shores of Sicily. It is diversified by villages and neat country houses; the shore is almost lined with the cottages of fishermen, and inland the country glows with the foliage of the orange, the pomegranate, the palm, the aloe, and the chestnut. A few miles south from Scylla is *Villa-San-Giovanni*, a small but thriving town of 3000 inhabitants, delightfully situated on the shore of the Faro and much frequented on account of its salubrious climate. It is the nearest point of embarkation for Messina. The town has large silk factories.

The district of Gerace is named from its chief town *Gerace*, a town of about 4800 inhabitants, situated on a hill between the Apennines and the Ionian Sea, at a distance of 30 miles N.E. from Reggio. The town is supposed to have been built from the ruins of Locri. It was greatly injured by the earthquake of 1783, when its gothic cathedral and strong citadel were reduced to ruins. It gives title to a bishop and contains several silk manufactories and some good buildings. Its wines are in high repute; in the neighbourhood are several mineral springs. In the plain between Gerace and the sea are ancient ruins supposed to mark the site of Locri Epizephyrii, founded by the Locri Ozæci, B.C. 750, immortalised by Pindar, and celebrated for the code of Zaleucus, the earliest collection of written laws possessed by the Greeks. Coins of Locri have been found on the spot. The city derived its surname from its position near the Zephyrium Promontorium, now Cape Bruzzano. A cross road leads over the Apennines from Gerace to Gioja on the western coast. The scenery of the pass combines the richest forest scenery with the wild and rocky glens of the mountains. The highest part of the pass commands wide and splendid prospects, embracing both seas, and extending in fine weather westward as far as the Lipari Islands. *Castelvetere*, on the right bank of the Alaro north of Gerace, has a population of above 5000. The Alaro is the ancient Sagras, on the banks of which 130,000 Crotonians were defeated by 10,000 Locrians, B.C. 360. Among the other towns of the district along the coast are *Gioja*, population 7600; *Grotteria*, 4500; *Mammola*, 7300; *Lo Stilo*, celebrated for its iron mines, 2600; *Roccella*, 5000.

Palmi or *Palme*, the capital of the third district of Calabria Ultra I., is beautifully situated on a steep cliff that rises from the Gulf of Gioja, above a narrow creek which shelters the fishing-craft of its inhabitants. In construction and in situation this is one of the most beautiful towns along this remarkable coast. The platform on which it stands is covered with gardens and plantations of oranges and olives, and the higher hills in the background are clothed with forests of chestnut-trees. The streets, wide, straight, and well built, about a central square decorated by a fine fountain representing a palm-tree; and from various points of the town are seen the entrance to the Faro, the town and harbour of Messina, the rock and castle of Scylla, and the summit of *Ætna* to the south; the north coast of Sicily and the Lipari Islands to the west; and the shore of the Gulf of Gioja as far as Cape Vaticano to the north. The town contains several houses of fine architecture, three churches, one of which is

collegiate, and several silk factories: population, 8000. *Bagnara*, on the shore road, south of Palmi, is famous for the beauty of its women, and has about 3000 inhabitants. *Casalmuro*, finely situated at the western base of the mountains, high enough to be above the influence of malaria which in summer and autumn infects the plain of Gioja, on the cross-road from Gerace to Gioja, is almost entirely built of wood, having been destroyed by the earthquake of 1783: population, 8500. *Gioja*, supposed to occupy the site of the ancient Metaurum Bruttiorum, gives name to the Gulf of Gioja. It is a small town situated near the coast and the mouth of the Marro: population about 5000. The Marro is the ancient Metaurus Bruttiorum, in whose seven head-streams Orontes is fabled to have purified himself from the stains of his mother's blood. The mouth of the river is famous now as in ancient times for its tunny fishery. *Oppido*, an episcopal town, on the western flank of the Aspromonte, and east of Palmi, has a population of 8000. It is supposed to occupy the site of the ancient Mamortium. The earthquake of 1783, which damaged so many towns in this part of Italy, has left numerous marks of its violence throughout the whole district, consisting of landslips, subsidences and chasms in the earth, funnel-shaped hollows (some of them filled with water), and suddenly-formed deluges. In Oppido several houses were ingulphed, and in the neighbourhood an olive-plantation for a width of 500 feet subsided 200 feet below the surrounding surface. Among the other towns are *Rosarno*, picturesquely seated among olive-groves, near the Mesima, population 2000; *Laureana*, a thriving village situated on an eminence at the junction of the Metoro with the Mesima; *Polistena*, in a high plain watered by a feeder of the Marro, N.E. from Palmi, population about 4000; this town is built since 1783, the old Albanian town of Polistena was then thrown bodily by the earthquake into the ravine between the two hills on which it stood; *Seminara*, close to Palmi, population 3000. The French under D'Aubigny defeated the Spaniards under Gonsalvo de Cordoba in the plain of Seminara in 1495; and on the 21st of April 1503 the French army under D'Aubigny was signally defeated by the Spaniards commanded by Ugo de Cardona, one of Gonsalvo's best generals. The low parts of the coast along the Gulf of Gioja and near the rivers are subject to malaria.

The extensive region now known by the name of Calabria was in the Roman times chiefly occupied by the Brettii or Bruttii, whom some historians have represented as runaway slaves and outlaws, and others as a wild aboriginal race, living in the extensive forests which then extended over the greater part of the country. The eastern coast was early colonised by the Greeks, and became known, with the rest of the coast as far as Thurium, by the general denomination of Megalé Hellas, or Magna Græcia. But the oldest name of the most southern peninsula of Calabria (that bounded on the north by the gulfs of Squillace and Suint' Eufemia), was Italia, a term which was afterwards extended to comprise the country as far as Thurium (Turris or Thurium), and finally became the name of the whole peninsula of Italy. (Aristot. 'Polit.' vii. 10.) The name of Calabria was given by the Greeks to quite a different country, namely, the north-eastern coast of the Iapygian or Messapian peninsula from Brundisium to Hydruntum; the Salentines occupied the southern part of the same peninsula. The name of Calabria, as applied to that part of Iapygia, continued in use under the Romans, and afterwards under the Byzantine emperors, as we find in Paulus Diaconus in the 8th century, and Luitprand of Cremona in the 10th, who both speak of Apulia and Calabria as one province, while they call the modern Calabria by the name of Bruttia, which by Constantine's division of the empire made one province with Lucania. How the name of Calabria came to be transferred to the country of the Bruttii is not clearly ascertained; but it would appear that the Byzantines having lost in the 11th century the old Calabria, and still retaining several towns on the coast of the former Magna Græcia, transferred the name of the former province to their last remaining possessions in Southern Italy. The first Norman conquerors took the title of Dukes of Apulia and Calabria. Under the Angevins the presumptive heir to the throne was styled Duke of Calabria, which custom has continued to this day. Calabria made a determined resistance against the French, first in 1799, when the Calabrians under Cardinal Ruffo reconquered the kingdom, and afterwards in 1806-7, when they waged a partisan warfare against the invaders. They were not ultimately subdued till 1810.

The Calabrians are a proud, thoughtful, and warm-hearted fiery race. They are personally brave and faithful to their word; are generally good marksmen, and make good soldiers under proper discipline. Their dialect resembles the Sicilian. The crimes which in former times were frequent in Calabria have greatly diminished; murders are no longer frequent; and banditti have all but disappeared. The higher orders are sociable, well-informed, and hospitable. "Most of their towns," says Keppel Craven, "are built on conical hills, which they crown to the very top; the lower houses being joined together by thick walls, constitute a kind of rampart. The women wear a body with the full shirt sleeves, and a thickly-plaited petticoat of coarse cloth; and on the head a cloth folded like a napkin, as in other parts of the Neapolitan and Roman states. The men wear short jackets and close hose, generally of black cloth, leather gaiters or coarse stockings, with shoes of undressed skin tied by thongs half-way up the leg, sandal fashion. Their hats are conical and high, with hardly any brim to them. The principal deficiencies

of Calabria are want of harbours along the coasts, and the malaria which prevails in most of the large villoys. By embanking the rivers and draining the marshes the atmosphere is in parts improving. The great carriage-road from Naples, which has been continued to Reggio through the whole length of Calabria, with branch roads towards both seas, is another essential improvement.

(Strabo; Gibbon, *Decline and Fall*; H. Gully Knight, *Normans in Sicily*; Keppel Craven, *Tour in the Southern Provinces of Naples*; *Dictionary of Greek and Roman Geography*; Blauvitt, *Handbook for South Italy*; Afan di Rivera, *Considerazioni sulle Due Sicilie*; Collotta, *Storia del Reame di Napoli*; Serrao, *De' Terremoti di Calabria*; *Dictionary of Classical Biography*; *Biographie Universelle*.)

CALAHORRA. [CASTILLA LA VIEJA.]

CALAIS, a fortified town and sea-port of France, in the department of Pas-de-Calais, is situated on the south shore of the Strait of Dover, 20 miles N.E. from Boulogne, 22 miles S.E. from Dover, and 190 miles N. from Paris (by railway as far as Boulogne), in 50° 58' N. lat., 1° 51' E. long., and has about 13,000 inhabitants, many of whom are English. The first mention made of Calais occurs in certain title-deeds of the 9th century, when it was a mere fishing village. The harbour, which was naturally formed by a small stream called De Hames, was improved by order of Baldwin IV., Count of Flanders, about the year 997. Philippe of France, count of Boulogne, surrounded the town with a wall flanked at regular distances by small towers and defended on the outside by wet ditches. Such was the solidity of the masonry that this wall still remains. In 1227 Philippe also erected a vast keep, which was called the castle of Calais; this was demolished in 1560, when the present citadel was erected. After the battle of Crecy Edward III., king of England, on the 1st of August 1346 invested Calais, which was defended by the townsmen commanded by Jean de Vienne. After the siege had lasted eleven months, the King of France at the head of an army of 60,000 men approached to relieve the town, but judging the English position to be unassailable he left Calais to its fate. The townsmen, pressed by famine, offered to capitulate, having nobly defended their town for above twelve months. The cruel terms imposed by Edward, the noble self-devotion of Eustache de St-Pierre and his companions, and the generous and successful intercession of Queen Philippa, are well known. Edward entered the town on the 29th of August 1347, drove all the inhabitants from the town, re-peopled it with English, and sent the garrison prisoners to the Tower of London. The English improved the town and added to its defences; they held it till 1556, when the Duke of Guise stormed it after a seven days' siege, and drove all the English from the town. Since that time Calais has remained in the hands of the French, with the exception of about two years—1566-8 when it was held by the Spaniards till the peace of Vervins.

The ramparts, forts, and citadel which defend the town render Calais a fortress of the first class. The sea washes it on the north and west, and on the south and east low marsh-land, which can be easily flooded, stretches up to the walls except for a space of about 250 yards, and this approach is commanded by the cross fire of the forts.

The town and citadel form a parallelogram, having one of the longer sides towards the sea. The citadel is at the western end of the town; it is large and strong, and commands at once the town, the port, and the country around. The harbour, which is a tidal one, small and shallow, is entered by a channel formed by two moles built of stone and three quarters of a mile long; it admits vessels of 400 to 500 tons, and has steam communication with Dover twice a day, and with London. The spot on which Louis XVIII. landed in 1814 is marked by a pillar. From the port the town is entered by a draw-bridge and gate erected by Cardinal Richelieu in 1685. The town is pretty well built; the streets are straight, clean, and well paved; the houses constructed of stone and brick. The centre of the town is occupied by the Place-d'Armes, a spacious square which serves for a market-place. In this square stands the Hotel-de-Ville, in front of which are statues of Eustache de St-Pierre, the Duke of Guise, and Cardinal Richelieu. A tower 124 feet high stands in the centre of the Place-d'Armes, which serves as a landmark by day and a light-house by night. The cathedral was built during the English occupation of the town; it is a handsome gothic building, contains 11 side chapels, and a picture of the Assumption by Vandyke. The other remarkable objects in the town are the Hotel-de-Guise, in which Henry VIII. used to lodge, the public library, the theatre, and the barracks. The outer ramparts and the mole afford excellent promenades. The town is entered from the land side by a strongly defended gate and drawbridges.

Calais possesses a tribunal and chamber of commerce, and schools of design and hydrography; it has some foreign and a brisk coasting trade; vessels belonging to the town are employed in the cod, herring, and mackerel fisheries. Corn, wine, oil, brandy, linen, wool, coal, eggs (of which above 50 millions are annually sent to England), and colonial produce are the principal articles of commerce. The town has communication by canals with Arras, Dunquerque, Gravelines, and St. Omer; and by railroad with Belgium and with Paris through Lille and Douai. It has instantaneous communication with Dover by submarine electric telegraph-wires, which were first employed for messages, September 27, 1851. Calais used to be the principal landing-place for English travellers in France, but in this respect it is now

surpassed by Boulogne. The town however has still a considerable share in this traffic; as many as 53,864 travellers to and from England passed through Calais in 1850. The English and French mails pass by the route of Calais. Calais is becoming a manufacturing town, and mills are encroaching upon the inner ramparts. The principal fabric is bobbin-net; this manufacture gives employment to great numbers in the town, the suburb of St. Pierre, and the villages of the neighbourhood. Other articles of manufacture are soap, straw bonnets, and leather. There are also steam flour and oil mills, salt and sugar-refineries, and yards for boat and ship-building. The herring and mackerel-fisheries give employment to a good many hands.

(*Dictionnaire de la France; Macgregor's Statistics.*)

CALAIS, ST. [SARTHE, Department of.]

CALATAYUD. [ARAGON.]

CALATRAVA, formerly a town of Spain, was situated on the south bank of the Guadiana. In the middle ages the town was strongly fortified, but is now reduced to a single tower, with the appellation of Calatrava la Vieja (Old Calatrava), in contradistinction to the great convent (erected in 1214) for the military order called Knights of Calatrava, three leagues from it, and named Calatrava la Nueva (New Calatrava).

CALCUTTA, the capital city of Bengal, and the seat of the supreme government of British India, is situated on the left or east side of the river Hoogly, in 22° 23' N. lat., 88° 28' E. long.; about 100 miles from the sea.

In the beginning of the last century Calcutta was only an insignificant village, inhabited by native husbandmen; and a great part of its present site was completely covered with jungle. The proximity of the low and damp region of the Sunderbuds, a woody tract containing eight mouths of the Ganges, is necessarily unfavourable to the salubrity of the city, which is still further impaired by a dense forest on the east, and some extensive muddy lakes on the south. The English have somewhat mitigated this evil by draining off the surface-water near the town, by filling up stagnant ponds, and by clearing away the surrounding jungle to a considerable extent.

In 1698 the English factory was removed from Hoogly to this place, then occupied by the village of Govindpore, but in 1756 there were not more than seventy houses in it occupied by Europeans. Suraja ud Dowlah, the sonbahdar, or viceroy of Bengal, attacked the place in June 1756. On this occasion the factory was deserted by the governor, the commandant, and many other of the European functionaries and residents. On the capture of the place the English who had remained to defend the factory were thrust into a small unwholesome dungeon called the Black Hole, and of 146 individuals who were thus shut up at night only 23 were found alive in the morning. In the beginning of the following year a squadron consisting of five ships of war, accompanied by 2400 troops under the command of Colonel Clive, arrived in the Ganges from Madras and re-took the town of Calcutta, from which the garrison of the sonbahdar retired, after an attack of only two hours' duration. The citadel, to which the name of Fort William was given, was constructed by Clive soon after the battle of Plassey, fought in June 1757. This fort stands on the bank of the Hoogly, about a quarter of a mile below the city. Its form is octagonal; five of the sides which are towards the land are regular, and three which front the river have their lines varied according to local circumstances. Fort William is the most regularly constructed fortress in India. The works are low and mount 619 guns, and there are but few buildings within the walls, which are so extensive that it is said 10,000 men would be required to defend it in case of attack; the citadel contains accommodation for 15,000: it is computed to have cost in its construction altogether two millions sterling, of which one-half was paid by Meer Jafir. Its principal batteries are towards the river, from which side only an attack is to be apprehended. The space between the fort and the city, called the Esplanade, contains the Government-House, built by the Marquis Wellesley, which is the finest building in Calcutta; it consists of a centre with four wings, one at each corner, connected together by circular passages. The centre building contains two very fine rooms. The lower of these, the hall, is paved with marble, and supported by Doric columns; over this is the ball-room supported by Ionic pillars. The private apartments, the council-room and other offices are contained in the wings. On a line with this building is a range of magnificent dwelling-houses with spacious verandahs.

The town extends for above six miles in the direction of the river: the average breadth is about two miles. The parts in which Europeans reside are mostly occupied by handsome detached houses, built of brick and stuccoed with chunam, which gives them the appearance of marble palaces. The principal square measures 1500 feet on each side, and in the middle has a large tank, from which it takes its name. This tank, which is 60 feet deep, is surrounded by a handsome wall and balustrade, and has steps in the interior reaching to the bottom. During the administration of Lord Hastings large sums were expended in improving the ventilation of Calcutta; a street 60 feet wide was opened through the centre in its longest diameter, and several squares were made, which, like the one already described, have each a tank in the middle surrounded by planted walks. A quay, called the Strand, between two and three miles long, was formed,

which extends upon the river-bank along the city. This quay is 10 feet above low-water mark, and is furnished with many ghauts, or broad flights of steps, which are useful for the landing of goods, and for the accommodation of the natives in making the frequent ablutions prescribed by their religion.

The principal public buildings, besides the government-house, are—the town-hall, the mint, the courts of justice, numerous Protestant churches, a cathedral, Roman Catholic chapels, a Greek and an Armenian church, several Hindoo colleges and pagodas and Mohammedan mosques, and a Sikh temple. There are also the Ochterlony monument; the Cossipore foundry; the Asiatic Society's rooms; the Bishop's college, and numerous other buildings. On the south side of the town are an hospital and a jail. The quarter in which the natives principally reside is to the north, and consists of narrow streets, with lofty houses whose lower apartments are usually occupied as shops or stores. The upper portions are pierced with loop-holes, and the backs of the houses usually look on the street. This quarter swarms with inhabitants. The total number of inhabitants in the city and suburbs has never been regularly estimated; and several calculations which have been attempted vary in their results between 82,000 and 2,225,000. There are no public registers of births, except irregular ones under the orders of the superintendent of police, and the memoranda of deaths noted at the burning ghauts of the Hindoos. Of the Christians and Jews there is no enumeration. From careful calculations prepared by Captain Birch in 1837 the population is stated at 229,705 residents in the city, which added to the immense numbers dwelling in the suburbs, who daily pour in vast crowds to their occupations in the town, must make the whole nearly 400,000. The population is divided into numerous classes, the Eurasians, or progeny of white fathers and native mothers, the Portuguese, the French, the Chinese (almost all of these are shoe-makers), the Armenians, the Jews, the Moguls, the Parsees, the Arabs, the Birmese, the Madrasers, the native Christians, and the English. With so large and varied a population, Calcutta presents at all times an animated scene. The great mass of the population speak the Bengali language; and many, including the servants attending upon Europeans, speak the Hindustani also.

The botanic garden, a splendid establishment of the East India Company, is situated on the right side of the Hoogly, where that river makes a bend, to which the name of Garden Reach has been given. Above is an extensive plantation of teak, which wood does not occur naturally in this part of India. The introduction of this species of tree is considered desirable, as ship-building forms an important branch of industry. On the right bank of the river, both above and below as well as opposite to the city, there are several private yards for ship-building.

The soil in and about Calcutta is so deficient in water, that after boring to the depth of 140 feet no springs have been found. The city however is supplied with plenty of good drinking water from numerous extensive ponds or tanks situated within and without it. The periodical rains annually fill them. Many trunks of trees have been discovered 60 feet under the surface standing erect, with their roots and branches perfect. Thin strata of coal and blue-clay have been met with between 50 and 60 feet below the surface.

The external trade of the province being almost wholly carried on at Calcutta, its nature and amount have been given in our description of the province. [BENGAL.] The river is about a mile wide at high-water, and trading vessels of the largest size ascend as high as the town. The attention of strangers is much excited on first visiting Calcutta, by the number of vultures, kites, crows, and a species of crane, which from its stately walk has received the name of 'adjutant.' These birds clear away the surplus food provided for Europeans, which is thrown at night into the streets, as it cannot be kept in that climate, and there are few poor persons to consume it whose religious prejudices will allow of their doing so. These scavengers are assisted by numerous foxes, jackals, and wild dogs from the neighbouring jungles, who prowl through the city at night, and whose mingled howlings produce a very unpleasant effect. The markets are abundantly supplied with game, meat, fish, vegetables, and fruits, the whole of which are sold at moderate prices. The game consists of wild-ducks, teal, ortolans, snipes, hares, and venison. Among the fish is one—the mango fish—which is described as a great luxury: it has derived its name from the fact of its appearing in the river only at the season when the mangoes ripen. Fruits are furnished in an infinite variety, and of delicious flavour; pine-apples, melons, mangoes, oranges, guavas, peaches, loquats, and strawberries are among the more usual descriptions. The inhabitants indulge largely in these luxuries, and their pleasure is greatly enhanced by the abundant store of ice always contained in the ice-house of Calcutta.

The European inhabitants have established several institutions for literary, scientific, and educational objects. The Asiatic Society, formed by Sir William Jones, was founded at Calcutta in 1784. The Metcalfe Hall for the accommodation of the Agricultural Society of India, and the Calcutta Public Library, are of recent date. The theatre was erected in 1841, after the destruction by fire of one built many years ago. Among the institutions for promoting education are the Bishop's College, founded in 1819, and the College of Fort William, a government establishment for the instruction of young men who have

been partially educated in the college at Haileybury. A Sanscrit college, a Mohammedan college, and an Anglo-Indian college, are likewise supported by government. The residents of Calcutta support a variety of charitable institutions and of societies for religious objects. Calcutta is the seat of the supreme court of judicature for the presidency of Bengal. This court is under the control of a chief justice and three puisne judges appointed by the queen. The courts of Suddur Dowanny Adawlut, and Nazamut Adawlut, established in Calcutta, the first for civil, the last for criminal causes, are courts of appeal from the provincial courts in all parts of India.

In 1814 a bishop's see was erected within the company's dominions in India; the bishop, under the title of Bishop of Calcutta, has his residence in that city: his salary was fixed by Act of Parliament at 5000*l.* per annum.

(Rennell, *Memoir of a Map of Hindustan*; Mill, *History of British India*; Tennant, *Indian Recreations*; Reports of Committees of House of Commons on the Affairs of India.

CALDER, one of the rivers of Yorkshire, rises in the high grounds on the borders of Lancashire, in a marsh in Cliviger Dean, south-west of Burnley; and from the same marsh rises a branch of the West Calder, which runs in an opposite direction and joins the Ribbles. The course of the Yorkshire Calder is easterly, through the deep valley of Todmorden: at Sowerby the river passes within two miles of Halifax, and by Dewsbury and Wakefield, at which latter place it is crossed by a bridge of nine arches. From Wakefield the course of the Calder is nearly north-east to Castleford, near Pontefract, where it joins the Aire, which enters the Ouse five miles from Snaith. A little below Salterhebble, about two miles south-west from Halifax, the Calder receives the Hebble, a small but rapid stream, which rises above Ovenden, and passes round the north and east sides of the town of Halifax; and a few miles farther east it receives the river Coln, which rises near Holm Moss, and runs past Huddersfield. The Calder is an important feature in the canal system of Yorkshire and Lancashire, and forms part of the line of internal navigation between the eastern and western coasts. The Rochdale Canal, 31½ miles in length, commences in the Calder and Hebble navigation at Sowerby bridge wharf, and terminates by a junction with the Bridgewater Canal at Manchester. The Calder and Hebble navigation is 22 miles long, from its junction with the Aire and Calder navigation, about a quarter of a mile from Wakefield, to the basin at Sowerby bridge, in which it terminates. The Calder forms a considerable portion of the line, except where cuts are made to avoid the circuitous course of the river. There is a branch to Halifax. The Burnley Canal commences in the lower part of the Calder, near Wakefield, and joining the Dearne and Dove Canal, which terminates in the river Don navigation, opens a communication with Sheffield and Rotherham. The Runsden Canal commences in the Calder and Hebble navigation, and terminates at Huddersfield, from which a line of canal, called the Manchester, Ashton, and Oldham Canal, extends to Dukinfield in the parish of Ashton-under-Lane, near which place it is joined by the Peak Forest Canal. The canals of Lancashire and the West Riding of Yorkshire are connected with the Ouse by the Aire and Calder navigation, which includes the Selby Canal and the new canal from Ferrybridge to Goole. In 1625 an attempt was made to obtain an Act "for the making and maintaining the rivers Ayre and Cawlder," but no Act was passed before 1699. The clothiers of Leeds and Wakefield, in a petition presented to the House of Commons in favour of the bill, complained heavily of the difficulty of transporting their manufactures: "the expense whereof," they state, "is not only very chargeable, but they are forced to stay two months sometimes while the roads are impassable to market, and many times the goods receive considerable damage, through the badness of roads, by overturning." Within the present century the Aire and Calder navigation has been rendered one of the most efficient lines of water communication in the kingdom. The Aire is not navigable above Leeds. A little above Leeds bridge the Leeds and Liverpool Canal locks down into the Aire. The branch of the Aire and Calder navigation to Wakefield is 12½ miles in length from the junction of the two rivers at Castleford; and with the Calder and Hebble navigation and Rochdale Canal forms the line of communication with South Lancashire, while the Leeds and Liverpool Canal is carried through the middle and western parts of that county, and terminates at Liverpool. At Huddersley, 4½ miles from the Ouse, the Aire and Calder navigation has a branch to Selby, which facilitates the interchange of commodities between Leeds and Wakefield and the populous districts to the west, and the agricultural districts of the East and North Ridings of Yorkshire. A fine canal, 60 feet wide at top, and 18½ miles in length, has been formed from Ferrybridge to Goole. At Goole capacious docks have been constructed, and a custom-house established, so that goods can be shipped thence to foreign parts. [GOOLE.] About 1828 further improvements were effected in the Aire and Calder navigation, by which vessels of 100 tons burden can go to Leeds and Wakefield. Additional cuts have also been made in order to avoid the circuitous course of the river, and the line has by this means been rendered several miles shorter. But the commercial value of this important water communication has been considerably affected by the great development of the railway system in this part of the country. Many of the above-mentioned canal-branches have been purchased by railway companies;

and those which have not been so purchased are exposed to the competition of railways running very near them.

CALEDONIA, the name given by Tacitus and other ancient writers to the most northern part of Britain, north of the estuaries of Glota and Bodotria (the Clyde and the Forth), which formed the permanent boundaries of the Roman province. Tacitus calls the natives the "Britons who inhabit Caledonia," and he says that the reddish colour of their hair and their large limbs denoted them to be of German extraction. ('Agricola Vita' 11, 25, 4. Agricola was the first Roman general who came in contact with the Caledonians. In the sixth year of his government he advanced beyond Bodotria by land, while his fleet followed along the coast. He met with a sharp resistance, and the ninth legion was surprised by night in its camp by the natives, who were at last repulsed after much loss on both sides. In the following year Agricola marched again into Caledonia as far as the Grampians, where more than 30,000 of the natives were posted under the command of Galgacus, their principal chief. The battle, which was won by Roman tactics, and attended with a dreadful slaughter of the Caledonians, is described in a most lively manner by Tacitus. In the night the natives retreated into the interior, after burning their houses or huts, and Agricola could not tell which way they had gone. Accordingly he moved back his army to the south of the borders of Glota and Bodotria, the line between which he had fortified by strong outposts. [ANTONINUS, WALL OF.] There is no evidence of the Romans having ever after advanced much beyond those limits. The name of Caledonia has been often applied to Scotland in general, though improperly.

CALEDONIA, NEW. [NEW CALEDONIA.]

CALEDONIAN CANAL, a connected series of lakes and canals extending through Glenmore, or the 'Great Glen of Albion,' and connecting the Western Ocean with the North Sea. In 1773 the trustees for forfeited estates employed the celebrated James Watt to report on the practicability of a canal from sea to sea through Glenmore. Watt's report was most favourable; but the forfeited estates having been soon after restored to the families to which they had formerly belonged, the office of trustee was abolished, and the project dropped. In 1802 the scheme was revived, and government employed Mr. Thomas Telford, the civil engineer, to re-survey the district, and to report the result of his investigations. This report was in favour of the construction of the canal, and the work was immediately proceeded with under Mr. Telford's direction. Operations were commenced in 1803. In 1820 the eastern division of the canal was opened for navigation. The whole line was opened towards the close of 1823. The Caledonian Canal commences on the south-west on the shore of Loch Eil at Corpach near Fort William, in 56° 50' N. lat., 5° 12' W. long., and joins Loch Lochy by a cutting 8 miles in length; a short cutting of about 2 miles connects Loch Lochy with Loch Oich; a canal nearly 6 miles long continues the navigation from Loch Oich to Loch Ness; from the north-east end of Loch Ness a canal of about 7 miles in length continues the passage to Glacmaharty near Inverness; whence by another short artificial cutting, it opens into the Moray Frith on the shore of Loch Beaully, in 57° 26' N. lat., 4° 15' W. long. The length of this communication between the west and east seas is in all about 60 miles, of which rather more than 37 miles are through natural lochs or lakes, and about 23 miles through artificial cuttings. The summit level is at Loch Oich, which is about 94 feet above high water on the east coast at spring tides. There are 28 locks in the range, 14 being to the west of Loch Oich and 14 to the east. The locks are about 170 feet in length and 40 feet in width, the rise at each lock being 8 feet. The width of the canal at the water surface is 120 feet; at the bottom 50 feet; the depth of water is 17 feet. There were considerable engineering difficulties to be overcome in the construction of the canal. The object proposed in this national work was the avoidance of the tedious and often dangerous voyage by the Orkneys and Cape Wrath. From Kinnaird's Head on the east coast to the Sound of Mull on the west coast the passage by the Orkneys and Cape Wrath is about 500 miles, while by the inland navigation the distance is only 250 miles. By the Cape Wrath passage also many shipwrecks had occurred. A large amount of public money has been expended on the works. The returns have been very small in comparison with the cost; one chief source of expected revenue was indeed cut off by the act of the legislature in imposing duties upon the import of timber from the Baltic in order to encourage the employment in this country of timber of Canadian growth. For a number of years after the opening of the canal-vessels were often detained in the lochs by calms and contrary winds: since 1817 this has been remedied by the establishment of steam-tug vessels, causing a considerable increase in the number of vessels using this line of navigation. The amount of public money granted by Parliament at various periods from 1803 to 1847 was 1,232,387*l.* 8*s.*; the amount received for canal dues, shore dues, &c., to 30th April, 1849, was 57,134*l.* 18*s.* 0*d.*; for towages, 1216*l.* 9*s.* 8*d.*; for rent of houses, stables, lands, materials sold, &c., 9119*l.* 12*s.* 3*d.*; for interest on Exchequer bills, interest from bank, &c., 11,417*l.* 15*s.* 2*d.* The cost of construction, repairs, management, law expenses, shipping, roads, &c., from 20th October, 1803, to 5th May, 1849, was 1,296,846*l.* 11*s.* 7*d.*; cost and maintenance of steam-tug vessels, 13,127*l.* 8*s.* 2*d.* The canal rates are in most cases one farthing per

ruile per ton for the whole passage, the rate for towage being similar. The charge on steam-vessels passing wholly through the canal is 2s. per register ton, whether laden or unladen. In 1848 the commissioners, with the view of inducing a greater number of the Baltic traders to use the passage by the canal, reduced the dues on trading sailing vessels exceeding 125 tons register to 1s. per register ton for the through passage; and to encourage the traffic connected with the fisheries, the towage rates on vessels laden with herrings or salt were reduced by one half. The opening of the Caledonian Canal has given rise to an increased intercourse and traffic between Inverness and Glasgow, and generally between the northern and western districts of Scotland. Much damage was sustained by the works of the canal in December 1848 and January 1849 by a severe storm and heavy rains. The damage was repaired with great skill and promptitude, and at less cost than was anticipated, under the direction of Mr. Walker, consulting engineer to the commissioners, and Mr. George May, their resident engineer. To cover the expense, Parliament granted 10,000*l.* to the commissioners in 1849.

(*New Statistical Account of Scotland; Forty-fourth Report of the Commissioners for Making and Maintaining the Caledonian Canal; Life of Telford, edited by Rickman.*)

CALEMBERG. [HANOVER.]

CALICUT, a sea-port town in the province of Malabar, in 11° 15' N. lat., and 75° 50' E. long. Calicut was the first Indian port visited by Vasco de Gama in 1498. The name of the place is properly *Calicut*. Previous to the Mussulman invasion it was the chief residence of the Tamuri rajah, and was a very flourishing city, owing to the success that its lords had in war, and the encouragement they afforded to commercial pursuits. In 1766, the town was taken by Hyder Ali, when he enlarged the fort. His son Tippoo afterwards destroyed both the fort and the town, and removed the inhabitants to Nelluru, the name of which place he changed to Furruckabad. When the province of Malabar was conquered by the English, in 1790, the former inhabitants of Calicut returned to their old abode. Before its destruction by Tippoo the town contained between 6000 and 7000 houses. In 1800 Calicut again contained more than 5000 houses. The inhabitants are mostly Moplahs, who are of Arab descent and profess Mohammedanism. The manufacture of cotton goods was formerly carried on here to a great extent and furnished a considerable supply of those goods to Europe; but at the present time the greater part of the clothing used in the country is imported. The exports now consist principally of cocon-nuts, betel-nuts, pepper, ginger, turmeric, teak-wood, sandal-wood, cardamoms, and wax.

(Remell, *Memoir of a Map of Hindustan*; Mill, *History of British India*; Dr. Hamilton (Baclunian), *Journey through Mysore, Canara, and Malabar.*)

CALIFORNIA. The country formerly known as California extended along the shores of the Pacific Ocean from 22° 45' N. lat. to 42° N. lat. It consisted of two parts, Upper or New California and Lower or Old California, and formed the north-western portion of the territory of the republic of Mexico. By the treaty of February 1818, Upper California, the northern and larger part of this territory, was ceded to the United States of North America, and now forms the State of CALIFORNIA, the Territory of UTAH, and, in part, the Territory of NEW MEXICO, under which titles it will be found described. Lower California still belongs to the republic of Mexico, and will be most conveniently noticed here.

Lower California is a peninsula divided from the mainland by the Gulf of California, and extends from Cape San Lucas, 22° 45' N. lat., to the northern extremity of the gulf, 32° N. lat., where it is bounded by the State of California. Its area is upwards of 60,000 square miles: the population, which consists principally of Indians, is probably much under 10,000. This tract of country may be considered as a continuous mass of high, bare, and steep rocks, with numerous ravines intersecting them. With the exception of two or three places, it hardly contains any level ground that can be called a valley. Nearly all the places which contain a small tract of cultivable ground are on the eastern declivity of the mountains; the western side generally sinks with a rapid descent to the Pacific; the shores are consequently steep and rocky. Towards the northern extremity of the gulf, from about 30° N. lat., the mountains recede to a considerable distance from the shore, and leave a large tract of flat country between them and the sea; but this surface, being composed of fine sand, is entirely sterile.

The barrenness of the rocks is chiefly owing to the climate, which is exceedingly dry and hot. Only the southern portion has the annual rains, which last for six weeks or two months, in September and October. At Loreto it only rains at intervals of from five to six years, when the rains descend in great abundance, but do not last for a long time. Farther north, as far as is known, it never rains. The heat is excessive. The thermometer rises to 100° Fahr., and even higher. Lower California may consequently be considered one of the hottest countries of America. Earthquakes are not known, but there is a volcano near 28° N. lat., in a group of mountains called Castres Virgines.

The vegetation is very scanty, occurring only in sheltered valleys which are watered by the mountain streams. The number of trees is small, but some of them are valuable, such as the mosquito-tree, on whose leaves cattle feed when there is no grass, which happens very

frequently. The bark of some of the trees is used for tanning; and others produce edible fruits, which grow very well in the hot and dry valleys, especially figs, quinces, olives, dates, and grapes, which have been introduced by the Spaniards. A good sort of wine is made. In a few places maize, mandioc, and some other plants are cultivated; but the produce is not sufficient for the consumption of the scanty population, and therefore maize and wheat are brought from the mainland and exchanged for fruit, spirits, soap, salt, pearls, and tortoise-shells.

Cattle, horses, and mules are rather numerous in proportion to the population. Hogs are still more numerous. Among the wild animals are wolves, foxes, deer, and different kinds of goats, of which one, called *beronda*, is distinguished by enormous horns. Ground-squirrels, rattle-snakes, lizards, and scorpions abound.

The mineral riches are supposed to be considerable, but they have been little worked. Gold is extracted near La Paz, but the metal is not abundant. It is supposed that the western declivity of the mountains contains a considerable quantity of minerals, but if this be the case they will probably not be worked, as this part of the peninsula is quite uninhabitable. Lead is said to have been found towards the southern extremity of the peninsula. The pearl-fishery was formerly prosecuted along the Gulf of California south of 38° 30' N. lat. with considerable success; but the pearl-beds appear to have been for some time unproductive.

Though Lower California was discovered by Hernando de Grijalva in 1534 no settlement was formed by the Spaniards before 1698, when the Jesuits established themselves here, and began to collect the wandering Indians into their missions, and to convert them. But the population was scanty, and so it is still. All the Jesuit stations have been abandoned. The Indians belong to several tribes, of which the Perienes, Monquis, and Colimies are the most known. They speak different languages, and go nearly naked.

Loreto is considered the capital of Lower California. It is situated on a bay in the Gulf of California, about 26° 20' N. lat., at the foot of a valley between 2000 and 3000 feet wide, and surrounded by wild and sterile mountains, of which La Giganta (the Giantess) perhaps rises to 5000 feet. The town is small, and inhabited by only about 300 persons. Two gardens in the valley belong to the community, and their fruits supply the principal article of trade. The anchorage of the bay is open to the winds from north-north-west and south-east.

La Paz, the most important town, is farther to the south (about 24° 10' N. lat.). It stands at the head of a deep bay, but is a place of little trade. In its vicinity is a considerable quantity of cultivated land, and near it is the gold mine of St. Antonio. Fruit and vegetables of excellent quality are raised. Its whole population is about 2000. The harbour of Pichilnigo, which lies near La Paz, is good; but only small vessels can enter it, the water being shallow. At the latter end of 1853 an attack was made on La Paz by an armed party of about thirty Americans from Upper California, who landed, overcame what little resistance was made by the inhabitants, declared a republic, and nominated a government; but on a force being assembled in the neighbourhood the expedition was re-embarked, and sailed away.

CALIFORNIA, GULF OF, which was first visited by Hernando de Grijalva in 1531, and received the name of the Sea of Cortes, extends along the west coast of America, between the mainland and the peninsula of Lower California, beginning on the south between Cape Pabuo on the peninsula (about 23° 10' N. lat.) and the port of Mazatlan on the mainland (about 23° 30' N. lat.), and extending north-west to the mouth of the Rio Colorado (32° N. lat.). Its length is above 700 miles, and its breadth varies between 150 and 40 miles. To the north of 27° N. lat. it is hardly more than 80 miles across at any place.

Its western shores are in general rocky and high, except to the north of 30° N. lat., where the coast is sandy and flat. This low coast continues on the east side of the gulf to the island of Tiburon, where it begins to be somewhat higher, and continues so as far as the mouth of the Rio Yaqui. From this point to the vicinity of Punta Arriçifes the coast is again low and sandy. At the Punta Arriçifes it is rocky and lined with cliffs. Between this cape and the port of Mazatlan it is of moderate height, but in general not rocky. The eastern shores are lower and less rocky than the western, but like them they decline towards the northern end, where they are flat and sandy. Along the western coast, principally towards its southern end, are numerous islands, most of them of small size. Nearer the middle of the gulf, though still towards the western shore, is the island of Angeles, by far the longest island in the gulf, extending from 29° 5' to 29° 40' N. lat.; somewhat south-east of it is one of larger area, the island of Tiburon, which lies at the mouth of Bruja Bay on the east coast.

Fish are plentiful, and among them are some species of enormous size, which are much dreaded by the pearl-divers of the Californian peninsula. These are especially the meros, tintareros, and the sharks. The sharks as well as seals are most numerous to the north of the island of Tiburon. Turtles and tortoises also abound, principally along the shores of the mainland north of Tiburon, where the shells of the latter are collected by the Indians. The sea at the entrance of the gulf is much frequented by the spermaceti whale, and on that

account is annually visited by a few English and American vessels. The southern portion of the gulf is visited by a few foreign vessels, which supply Sonora with European goods, and take the produce of its copper-mines to China. These vessels go principally to the harbour of Guaymas on the east coast (28° N. lat.). The same part of the gulf is also navigated by a few Mexican vessels, which carry maize in exchange for the produce of the peninsula. A few small vessels are employed in the pearl-fishery. The northern portion of the gulf is seldom visited, the coasts being only inhabited by wandering tribes, who have nothing to offer in exchange. The navigation in the gulf is entirely interrupted in the month of September by the terrible hurricanes called *cordonazos* (gales), which blow at that time with great violence.

CALIFORNIA, STATE OF, one of the United States of North America, is bounded N. by the United States territory of Oregon, N.E. by that of Utah, S.E. by that of New Mexico, and S. by the Mexican territory of Lower California. Its western boundary is the Pacific Ocean, along which it extends from 32° to 42° N. lat.; its eastern boundary is defined by a line which runs along 120° W. long. from 42° to 39° N. lat., thence in a south-eastern direction till it intersects the Rio Colorado in 35° N. lat., whence it is continued down the mid-channel of that river to its mouth in the Gulf of California, 32° N. lat. The area is 188,981 square miles: the population in 1852 was about 300,000. The tract of country which now forms the State of California was until lately the coast section of the territory of Upper (Alta) or New (Nueva) California, the north-western part of the Mexican republic. It was ceded to the United States of North America by treaty in February 1848, and has since been admitted into the Union as a sovereign state. The extraordinary increase of its population will be seen by the following statement:—In 1802 Humboldt, from materials supplied by the padres at the head of the missions, estimated the entire population of Upper California, which included, besides the present State of California, the territory of Utah and (in part) that of New Mexico, at 16,862, of whom 15,562 were 'converted Indians.' The official return of persons resident in the missions of Upper California in 1828 was 23,105, of whom 18,763 were converted Indians. After the suppression of the missions the Indians became more scattered, and no official statement of the population was made. The first federal census after the cession of California to the United States was in 1850, when the State of California had a total population of 117,538. In 1852 a census was taken by the State authorities, when the agents' returns gave the population as 264,435; but the Secretary of State in his official Report states that all the census agents declare their inability to obtain the numbers of 'the whole population of their respective counties,' and he thinks it necessary, in order to render an approximately correct statement, to add one-sixth to the number returned. He therefore gives 308,507 as the population in 1852: of whom 210,858 were whites, little more than 30,000 being females, and 105,344 being citizens over 21 years of age; 2090 were negroes, of whom the females were under 300; 572 mulattoes; 33,539 domesticated Indians; and 59,991 foreign residents, of whom about 25,000 were Chinese. California sent in 1853 two members to the Congress of the United States, and like each of the other states two members to the Senate.

Coast-line, Surface, Hydrography.—The State of California owes its characteristic features to two great ranges of mountains, the Sierra Nevada and the Coast Range, which traverse it from north-west to south-east, leaving between them the splendid valley of the Sacramento and the Joaquin; on the eastern side wide sandy plains, and on the western the narrow strip of coast. The coast of California is generally rugged and precipitous. Beginning at its southern extremity, it makes a bold semicircular sweep to the north-west as far as Point Concepcion. Off this part of the coast there are several small islands and rocks, and the coast-line is indented by several bays and harbours. The only valuable one of these is San Diego Bay (32° 41' N. lat.), which has an excellent natural breakwater at its mouth, formed by a narrow strip of shingle beach projecting into the sea. The bay itself is wide and spacious, and forms an excellent though at present little-used harbour. The harbours of San Pedro and Santa Barbara are also available for craft of considerable burden. From Concepcion Point the coast bears north-north-west to Point Pinos, the southern extremity of Monterey Bay, one of the safest and most capacious harbours on this coast; it is said to be capable of containing at one time the navies of the world. From Monterey Bay the coast continues as before for about 70 miles, in a direct line, to the almost unrivalled bay of San Francisco. The entrance, which is nearly in the centre of San Francisco Bay, is only about a mile wide, but the bay itself opens out for more than 30 miles both on the right and left; its entire length is 70 miles, with an average breadth of 8 miles, and it has a coast of 275 miles. By projecting points of land several small inner bays are formed, the principal being San Pablo and Suisun bays. It is land-locked on every side and quite safe within, but a bar at the mouth renders the entrance sometimes dangerous. This harbour is the natural outlet of the valleys of Sacramento and Joaquin, with their wondrous mineral riches and vast agricultural capabilities. Beyond San Francisco Bay is Port Bodega, where was formerly a Russian station. From thence the coast continues in the same north-west direction, but less broken than before, to Point Delgado, beyond

which is the bold headland of Capo Mendocino, 40° 21' N. lat., which forms the southern point of the Bay of Trinidad, in which the coast of California terminates.

The mountain masses which constitute the peninsula of Lower California extend undivided into the State of California as far north as the snow-capped peak of San Bernardino, 34° N. lat., where they divide into the two great ranges already mentioned. These ranges both run in a north-western and generally parallel direction. The eastern range, called the Sierra Nevada, or Snowy Range, is by far the loftiest, many of its peaks being above the line of perpetual snow: the Saddle Peak is 7200 feet high, the Table Mountain 8000 feet, the Butte 9000, Mount St. Joseph above 10,000, and Mount Shasta at the northern extremity of the range (41° 34' N. lat.) 14,300 feet above the sea. This range is traversed by few and those very elevated passes. North of 39° N. lat. its slopes, especially on the western side, have vast forests of pine, and lower down of oak. The distance of the Sierra Nevada from the coast averages about 200 miles. The Coast Range runs at a short distance only from the coast, to which it is generally nearly parallel. Its usual height varies from 2000 to 3000 feet: its highest peak, Monte Diavolo, at the head of San Francisco Bay, is 3770 feet above the sea. This range is broken near Monte Diavolo by the united Sacramento and Joaquin rivers; decreases in altitude towards the north; and finally re-unites with the Sierra Nevada near Mount Shasta. From this point northward the surface of the country is wholly mountainous and little known; the Sierra Nevada with its offsets and connected ranges occupying the entire breadth of northern California, and extending northward till it is lost in the Cascade Range of Oregon. Between the highest mountains of the Sierra Nevada and the great valley is a line of lower mountains; and from both the Sierra Nevada and the Coast Range lesser lateral ranges and offsets diverge throughout California, forming numerous narrow valleys and ravines.

The basin included between the two main ranges, though really one geographical formation, bears the names of the Sacramento and Joaquin valleys, from the rivers which rise respectively at its northern and southern extremities, unite near the centre of the valley, and flow into San Francisco Bay. This fine valley is upwards of 500 miles long and 50 miles wide. It has evidently at some remote period been the bed of a vast lake of which the Sierra Nevada and Coast Range formed the margin. The water of this great lake has been drained by some convulsion of nature having broken a passage through the Coast Range at San Francisco Bay. At the southern extremity of the valley are the Tulare (Balsash) Lakes, which during the wet season extend above 100 miles in length, but in the dry season have little water, and are fordable in many places. Within the last year or two a commencement has been made towards embanking these lakes and draining the rich tract of country hitherto subject to the annual floods. The soil and climate of this great valley vary considerably, but a large part of it is very fertile, including most of the eastern side, which is intersected by numerous streams, along which the land is extremely rich and productive. The surface of the valley is greatly diversified, being broken into rugged hills at its northern end, and in many places along its eastern side by well-wooded spurs from the Sierra Nevada. Towards its southern end by the Tulare Lakes, and along the banks of the two great rivers, it is low and level, rising gently at some distance from the rivers into undulating slopes, which break into low hills as they approach the bases of the mountains. The richest and most picturesque part of this fine valley is that central portion of it which incloses San Francisco Bay and the delta of the Sacramento.

The coast district west of the Coast Range—almost the only part of California inhabited previous to the American occupation, but now by no means the most populous part of the country—is full of narrow fertile valleys, the seats in former days of the mission stations, around which the industry of their occupants had caused most of the cereals and fruits of temperate climes to flourish abundantly. Along a good part of the coast the mountains come close down to the sea; but along a still larger portion there extends a tract of low sand-hills, which in some places reach many miles inland. The country east of the Sierra Nevada, and west of the Rio Colorado, comprising the remaining portion of California, is mostly level, and a good part of it is sandy and barren. It is however but little known, owing mainly to the superior attractiveness of the mountains and great valleys, and partly to its being occupied by hostile tribes of Indians. It is believed that while much of it is of comparatively small account, there are very extensive tracts of valuable and hitherto unappropriated land. The country along the Colorado is supposed to have a rich alluvial soil; but near its entrance into the California Gulf the country about it is dry and barren, and the climate extremely hot.

The two most important rivers of California are the Sacramento and the San Joaquin: the value of the Colorado remains to be fully ascertained. The Sacramento rises at the northern extremity of the valley of the same name; its head-streams issuing chiefly from Mount Shasta or some of its spurs. Its course throughout is generally south, and it receives on its left bank a great number of affluents from the Sierra Nevada. Most of these are more mountain torrents; but several of them, as the Feather, the American, Cosumnes, and the San Juan rivers are of some importance. Near Monte Diavolo the

Sacramento receives the San Joaquin, and the united river turns abruptly to the west, and soon after expanding to a considerable width opens into San Francisco Bay. The entire length of the Sacramento is about 300 miles; its width for many miles above its junction with the Joaquin varies from 200 to 300 yards, and it is navigable at all seasons up to Sacramento city, 150 miles from its mouth. The Sacramento is subject to great floods during the wet season, and on the melting of the snow on the Sierra Nevada. The San Joaquin issues from the Tulare Lakes at the southern end of the great valley. Its course is north and north-west, and like the Sacramento it receives numerous tributaries from the Sierra Nevada. During the wet season the San Joaquin is greatly augmented, and apt to flood much of the lowland on its borders. It is navigable for vessels drawing 9 feet of water up to Stockton, 3 miles above its junction with the Sacramento, and for vessels under 15 tons up to the Tuolumne River. The San Joaquin abounds in fine fish, and the taking and curing of salmon afford employment to many persons. The banks of the river and its tributaries are generally extremely fertile, and agriculture is pursued with much diligence. The country watered by the San Joaquin and its affluents is becoming rapidly settled. The Colorado, the lower part of which drains the south-eastern portion of California, and which falls into the Gulf of California, belongs rather to New Mexico, under which it will be noticed. Except during the wet season this river, though draining a vast extent of country, is said to have a depth of only 6 feet of water for some distance above its mouth: that part of California which lies in its basin is almost unknown. Along the coast are numerous rivers which rise in the Coast Range and after a short course fall into the Pacific. Among these are the San Buenaventura, San Felipe, San Pedro, and the Smith; many of them are of considerable value for irrigation, and may at some future period be rendered available for mechanical purposes, but none are navigable.

Numerous roads have been formed in the state since its cession by Mexico in addition to those previously existing, and many bridges have been built and ferries established across the principal rivers; but the communications of the state are of course yet very incomplete. Of the railways planned the most important is the Great Pacific and Atlantic line; but besides it the Benicia and Marysville and the Oro City and Bear River railways are spoken of as determined on; neither has however been constructed.

Geology, Mineralogy, &c.—The Sierra Nevada, with its connected ranges, has for its substratum schistose or talcose slate; quartziferous rocks are the prevalent strata covering the slate. In many places a fine white quartziferous granite occurs. In the Coast Range quartz also abounds. Sandstone is found throughout the lower ranges of hills. Bituminous coal is worked in the neighbourhood of San Francisco Bay; it has also been found about San Diego Bay, and is believed to occur in various other localities.

Sir Francis Drake, who visited California, which he named New Albion, in 1578, received such reports of the existence of gold from the natives that he declared it to be his conviction that there was "no part of this country wherein there is not some special likelihood of gold." Yet thought his statement was often repeated in the subsequent collections of travels, and occasionally in geographical works, no search seems to have been made for the precious metal. The remarkable discovery of the auriferous wealth of California was at last made by mere accident in December 1847, by a Mr. Marshall, who was engaged in erecting some saw-mills on the estate of Captain Suter, a wealthy American settler on the Sacramento River. The effect of the publication of this discovery was most extraordinary. The rush of adventurers to the 'diggings' and of immigrants into the country was quite without parallel in the history of the world. California was at this time occupied by American citizens, and its formal cession soon after to the United States happily placed it in the possession of a people as distinguished for capacity of self-government as for energy, instead, as it had hitherto been, of a singularly indolent and incapable race; thereby affording as it were opportunity for the full development of its marvellous capabilities, and at the same time providing against the frightful anarchy which might else have ensued. As it was, towns and cities as they were termed, though the houses were commonly only of wood or canvas, sprang up with a rapidity hitherto unknown; the magnificent San Francisco Bay was for the first time alive with vast fleets of merchant vessels, crowded with anxious adventurers from almost every part of the world. All ordinary labour was neglected in the rage for gold seeking, which seized indiscriminately on all classes, and the value of food and labour rose to almost fabulous prices. The quantity of gold discovered continued for awhile to increase even beyond the proportion of new searchers for it. By the end of the year 1851 it was estimated that gold to the amount of nearly 150 millions of dollars had been found. No correct estimate is possible, as no official account has been taken of the gold obtained, but from what appear to be unexaggerated estimates the quantity found in 1849 was valued at 40 millions of dollars, and it is believed that the average yearly find has since increased to between 50 and 60 millions of dollars. The quantity of gold-dust and coin manifested and shipped on board steamers and sailing vessels from San Francisco during 1852 was 46,256,574 dollars; but this does not show the entire amount exported, as

large quantities are taken abroad in ships without being entered on the manifests. If 10 millions be added for this the total quantity shipped in 1852 from San Francisco would be about 56 millions of dollars. The quantity received at the mint of the United States and its branches up to September 30, 1852, was 136,747,935 dollars. Since that date an Act of Congress has been passed for establishing a mint in California. What is known as the Gold Region of California extends for some 500 miles in length, with a breadth of from 40 to 50 miles, following the range of the Sierra Nevada. It occupies the lower mountains of that range lying between the central mountains and the valley of the Sacramento and the San Joaquin. These mountains average from 4000 to 5000 feet in height, and the gold is generally found either in the gulleys and ravines, or in the sandy beds of the mountain streams on their way towards the two great rivers. The geological formation of this region is very similar to that of the gold mountains of Australia and the Ural Mountains of Russia. [AUSTRALIA.] Wherever the gold has been found *in situ* it has been in connection with quartz; and the water-worn gold found in the debris of the rocks and the sands of the rivers in like manner shows, by its frequently being attached to small particles of quartz, that it was derived from a quartzose bed. The main gold region as we have said is the lower mountains on the western side of the Sierra Nevada, but gold has been also found in the loftier central heights of the Sierra Nevada, and on its eastern side. Gold is likewise reported to have been found in the Coast Range, especially in the narrow valleys on its western side, and also in the connected ranges. Indeed Drake's words seem now singularly applicable; for there appears to be hardly any "part of this country where there is not special likelihood of gold."

Nor is gold the only important metal which abounds, though it is the only one to which much attention is at present given. A mine of quicksilver has long been worked in the neighbourhood of San José, in which the cinnabar from which it is produced lies near the surface and is easily procured. But the metal is believed also to be widely spread and in valuable veins in other parts of the state. Silver ore of great richness has been found at Monterey and elsewhere. Copper, iron, and other of the more important metals are also believed to abound. Coal is profitably worked at San Francisco, and is supposed to exist in extensive beds in other parts.

Botany and Zoology.—The botany of California is of a peculiar and interesting character. It contains among other striking plants some noble pines, especially one called from its discoverer, the Douglas pine (*Pinus Douglasii*), which occurs on the mountains about San Francisco Bay, and grows frequently to the height of 240 feet, with a circumference at the base of the trunk of 60 feet. The cones are eaten by the Indians. The *P. Sabiana*, *P. Lambertiana*, and *P. nobilis* are of less magnificent but still very large dimensions, and great beauty. The live oak (*Quercus virens*) grows to a considerable size on the lower hills of the west side of the Sierra Nevada, and on it Fremont found unusually large quantities of mistletoe. The white oak is common in the valleys. The maple, ash, beech, and chestnut are the other more usual denizens of the Californian forests, which however do not generally extend south of 39° N. lat. Two or three kinds of *Arbutus* abound on the banks of the rivers and the margins of the forests. The *Scilla esculenta* grows everywhere along the coasts; its root is the quinaash of the Indians, with whom it is a common article of food. The fibres of the *Heliconia tenax* are made by the natives into a very tough cord for suaring deer, &c.; and the amule and samule are used by them for soap. Large numbers of *Polemoniaceæ*, especially some beautiful specimens of the *Leptosiphon* and *Gilia*; some curious plants belonging to the genera *Nemophila* and *Emmenanthe*; several new genera of poppies, *Eschscholtzia*, lupines, *Calochortus*, *Cyclobotrys*, *Calliprora*, *Bradleya*, &c., stamp the vegetation with a character quite unlike that of any other part of America.

The black bear, the grizzly bear, and the barren-ground bear; racoon, American badger, glutton, ermine, weasel, mink, martin, and skunk are common in many parts; as are also the beaver and the muskrat about the mouth of the Sacramento: all of these are much sought after for their skins. Several kinds of wolves, foxes, and lynxes abound in the denser forests of the north, where they prey on the numerous deer and other animals which frequent those regions. Of the deer the moose, the black-tailed, and the long-tailed or jumping-deer, the elk, and the prong-horned antelope (*A. furcifer*) are the most plentiful. Mountain sheep abound. The bison is only occasionally met with.

Among birds the first place is due to the great Californian vulture (*Stercorarius Californianus*), which is inferior only to the South American condor in size, and very similar to it in its habits. The black vulture, the turkey buzzard, the golden eagle, the bald eagle, the peregrine falcon, the jer falcon, the osprey, and several other hawks and connected species as well as owls are more or less common. Most of the ordinary European singing birds, swallows, woodpeckers, &c., or birds to which similar names have been given, also abound. The humming-bird is common in the south. Grouse are said to be more numerous, and of more various kinds than have been found in any other country. The bays and inlets of the coast swarm with swans, geese, ducks, curlews, and most of the other ordinary wading

and swimming birds. Large numbers of white pelicans frequent the coast, and albatrosses are sometimes shot, measuring 10 or 12 feet across the wings.

The coasts and rivers of California alike yield an astonishing number and variety of fish. In some of the rivers as many as 3000 salmon, many of them weighing from 20 to 30 lbs., are often taken in a single day. Salmon-trout and trout also largely abound. Sturgeons are sometimes taken in the mouths of the rivers measuring 8 or 10 feet long and weighing nearly 500 lbs. Mackerel, pilchards, and sardines swarm off the coast. The halibut, skate, turbot, bonito, &c. are caught. Oysters of excellent flavour and most other shell-fish are found. But though fish is so abundant, the fisheries are at present little heeded.

Climate, Soil, Agriculture, &c.—California has a dry and a wet season; the dry season lasting from about the middle of May to September or October, the wet season setting in early in November and lasting till May. But there are considerable variations, both in the temperature and in the amount of moisture in different parts of this extensive tract of country. In its northern part, north of 39° N. lat., for example, the air during the dry season is much less parched, and rains occur earlier than in the southern districts. Along the coast the climate is much more temperate than in the great valley; while east of the Sierra Nevada the air is excessively hot and parching. In summer the coast is visited by heavy fogs, and a cold wind sets in regularly towards noon from the Pacific, and continues to blow with increasing force and keenness till late at night. Some few miles inland the cold is modified, and the temperature becomes equable and agreeable. Throughout the great valley of the Sacramento and San Joaquin, the mid-day heat is so great as to render labour in the open air everywhere unpleasant, and in many places impracticable.

The soil along the great valley is generally extremely rich. This valley has evidently been at some remote period the bed of a vast lake, and the rich alluvial soil only needs judicious irrigation to render it capable of producing almost every variety of crop. The banks of the rivers however require proper embankments to prevent the present often destructive floods, and to permit the full development of its agricultural capabilities. Tobacco, rice, maize, and most

all other fruits of a moderately warm climate thrive admirably. The grasses are luxuriant and nutritious, affording excellent pasturage for cattle. North of 39° N. lat. are extensive forests of pine and oak. The valleys along the coast produce all the cereals, and all or nearly all of the fruits and vegetables of the temperate and colder parts of Europe. Onions are grown in large quantities; the produce from nine counties in 1852 was returned at 5,553,655 lbs. Potatoes are extensively cultivated in parts of the great valley; 1,039,800 lbs. were raised in 1852 in Sacramento county alone, and in the same county 385 acres were planted with melons. In the county of Santa Barbara, on the southern part of the coast, 1370 barrels of olives were gathered; and in this and the adjoining county of Los Angeles 73,462 gallons of wine, and 73,056 gallons of brandy were made. Agriculture has however hitherto been comparatively neglected, but as more attention is being paid to it the various capabilities of the soil are becoming more apparent, and there can be little doubt that California is destined to take high rank as an agricultural country.

It is usual in taking the census of the various states of North America to ascertain the quantity and value of the various productions. In the state census of California for 1852 these returns are very incomplete, but they were sufficient to enable the Secretary of State to "take a comparative view of the position of California in reference to other states of the Union," which is at once so curious and interesting that it may be worth while to quote a few of the items. In barley California surpasses every other state in the Union except New York, and already raises half as much as is produced in the whole Union besides: in oats it cultivates more than three fourths of its sister-states; in wheat it surpasses ten of the states; of maize it produces less than any other; in potatoes it stands next to New York, and grows one-fifth of the quantity produced by the rest of the Union; in beans it surpasses nine of the states; in hay, though only half of the counties made returns, it surpasses nine states; and in fruits it exceeds all the states in variety, and one-half in quantity. In the number of horses it exceeds 15 of the states; of mules 26; of milch-cows 12; of work-oxen, 8; of sheep 4, and of swine (though the returns of both these are very imperfect) 3. In live-stock it surpasses 22 of the states. In trade and merchandise it already exceeds half of the states. The number of horses returned in the state in 1852 was 64,773, mules 16,574, cows 104,339, oxen 344,457, sheep 82,867, hogs 38,976, poultry 96,230—of the last three the returns are from only 20 counties.

The vast and rapidly increasing extent of the commerce of the State of California, is partly shown by the statement of the number and tonnage of the vessels which entered and cleared at San Francisco in 1852:—

Entered—Sailing vessels	876	of	326,138 tons.
Steamers	127	"	118,876 "
Total	1003		445,014

Of these, 40 vessels of 18,286 tons burden were British, and 594 vessels of 317,262 tons burden were American.

Cleared—Sailing vessels	1333	of	356,092 tons.
Steamers	158	"	127,047 "
Total	1491		483,139

Of these, 1121 vessels of 361,166 tons burden were American. In 1849 the tonnage of the vessels entered at San Francisco amounted to 313,351 tons, of which 247,417 tons belonged to the United States. The number of passengers arriving at San Francisco in 1849 was 41,709. In the year ending December 28, 1852, there arrived 64,140, of whom 5223 were females; and there departed 22,946, of whom 390 were females.

Of the manufactures we have no very exact account. At present, owing in a great measure to the high price of labour and the superior demands of other branches of industry, the articles manufactured are chiefly such as cannot be profitably imported. Bricks for example are now made in immense quantities to meet the enormous demand for new buildings: the county of Marin alone reported to the census agents the manufacture of 1,500,000 bricks a month during 1852, of the value in the year of 360,000 dollars; the total population of Marin county during the same year was only 1036.

Divisions, Towns, &c. The state is divided into 35 counties. The original capital of the state was San José, the present nominal capital is Vallejo, but the Legislature of 1853 sat at Benicia. The chief town is SAN FRANCISCO on the bay of the same name, which had a population in 1852 of 34,786; and next in importance to it is SACRAMENTO CITY, the capital of the 'digging,' which had 10,000 inhabitants in 1852; these will be noticed under their respective titles. Numerous other towns and 'cities' have sprung up in various parts of the state, but most of them are built only of wood, or even canvas, and many of them disappear almost as rapidly as they arose. The following are among the more important and may require a brief notice:—

Stockton, on the Stockton Slough or Canal, formed by the junction of the Sacramento and Joaquin rivers, 100 miles E. from San Francisco by water, was founded in 1848; population about 3000. It is the port of the southern mining district and of the valley of San Joaquin, and is likely to remain one of the first towns in the state. Vessels drawing 9 feet of water can discharge their cargoes alongside the shore. Constant steam communication is maintained with San Francisco. At present there is no public building of any consequence, but a state hospital is erecting. *San José*, population 1200, the original capital of the state, is pleasantly situated near the south extremity of San Francisco Bay about 50 miles S. from San Francisco city. It has some trade, but is chiefly agricultural. Near this town is the principal quicksilver mine. *Vallejo*, the present capital of the state, is situated on the Napa Strait, 25 miles N.N.E. from San Francisco. It is merely an agricultural village and the site marked out as the future 'capitol' as yet bears only its sounding title. The legislature of 1853 adjourned its sittings to an equally unimportant village, *Benicia*, on the west side of Suisun Bay, about 5 miles E. from Vallejo. *Monterey*, population about 1600, on the south side of Monterey Bay, was one of the largest and most frequented towns of Upper California prior to its cession by Mexico, and will eventually become again an important commercial place when the fine bay on which it stands is resorted to, as no doubt it will be, by shipping. At present being away from the mining districts it is comparatively deserted. *San Diego* is another old town which has fallen into neglect, but will doubtless again grow into importance. It stands on the safe and spacious bay of the same name near the southern extremity of the coast. Coal has been found near it. *Marysville*, on the Yuba, 98 miles N.N.E. from Vallejo, is a busy new town with a court-house, several hotels, mills, and stores, two newspapers each having "tri-weekly and weekly issues," and nearly 8000 inhabitants. *Oro City* on the Feather River, the capital of the Placer mining district, has 3000 inhabitants. *Placerville*, 112 miles N.E. from San Francisco, was one of the oldest and most flourishing of the gold district towns, but the 'diggers' have deserted its neighbourhood, its newspapers have ceased to be published, and the place itself is worn out and fallen into decay: in 1852 its population had decreased from 4000 to 2000. Among the other towns which either have been, are, or are expected to be flourishing and important places, it must suffice to name Auburn, Downieville, Los Angeles, Mariposa, Napa, Nevada, Santa Barbara, Santa Cruz, San Luis Obispo, Shasta, Sonoma, Suisun, Tuolumne, Vernon, and Yuba: in all of these the population is constantly shifting, and a statement perfectly correct to-day would be wholly inaccurate in a month or two.

Government, Judicature, &c.—The constitution of California resembles in its general features the constitutions of the other states of the Union. Slavery is not permitted. The legislative power is vested in a General Assembly, consisting of a Senate of 16 members, elected for two years, and a House of Representatives of 36 members, elected for one year; the sittings of the General Assembly are held annually. The governor is elected for two years; his salary is 10,000 dollars per annum. The

annual expenditure is about 500,000 dollars. The public debt was 485,460 dollars in 1853.

The judicial power is vested in a supreme court and district and county courts. The supreme court consists of a chief justice and two associate justices, each of whom has a salary of 8000 dollars a year. The justices are elected by the people for six years, and are so classified that one goes out of office every two years. The senior judge in office is the chief justice. The first judges of the district courts were chosen by the legislature, but all future judges are to be elected by the people: there are eleven district judges, each having a salary of 7500 dollars. A county-court judge is elected in each county for four years.

The constitution directs that a superintendent of public instruction shall be elected, to hold office for three years; and that the legislature shall establish public schools, in which instruction shall be given during at least three months in the year: it also provides funds for their support. A superintendent of public instruction has accordingly been elected; but few schools have as yet been established.

History.—California was discovered by Cabrillo in 1542. It was next visited in 1578 by Sir Francis Drake, who named it New Albion. It was first colonised in 1768 by the Spaniards, who established in various places, chiefly west of the Coast Range, military posts (presidios) and religious stations (misiones). There were four of these military stations and twenty-one missions; and while California remained subject to Spain the actual direction of the country was in the hands of the priests, the governor having scarcely any civil authority. The priests collected the native Indians in villages, and taught them to cultivate the soil, but gave them little other instruction either religious or secular. According to the latest account published by the priests there were above 18,000 of these nominally 'converted Indians,' who spoke twenty different languages. On the separation of Mexico from Spain the missions were broken up, and the Indians returned pretty generally to their native state. After the declaration of Mexican independence a good many Americans and other foreigners visited California for the purpose of hunting or traffic, and several Americans settled in the neighbourhood of San Francisco Bay. The governors appointed by Mexico were unable to maintain tranquillity in the province, and the discontent increased till, in 1836, it issued in a successful revolt, mainly excited it is said by the foreign residents. The government was overthrown without bloodshed, and the governor and other officials were put on board a schooner and shipped off to Mexico. The Mexican government agreed to permit the Californians to choose their own governors, and the country continued nominally subject to Mexico. It remained however in a state of anarchy, and for some time before its cession had become virtually under the control of American citizens. On the termination of the war between Mexico and the United States California was, as already mentioned, formally ceded to the United States by treaty in February 1848; and on its rapid growth in wealth and population, consequent on the gold discoveries, it was a year or two later admitted into the Union as a sovereign state.

CALLAH, EL. [ALGERIE.]

CALLAN, county of Kilkenny, Ireland, in the parish and barony of the same name, a market and post-town and the seat of a Poor-Law Union; 82 miles S.W. by S. from Dublin, and 10 miles S.W. from Kilkenny. It lies in 52° 33' N. lat., 70° 23' W. long. The population in 1851 was 2038, besides 2102 in the Union workhouse. Callan Poor-Law Union comprises 20 electoral divisions, with an area of 104,011 acres, and a population in 1851 of 32,730.

Callan is situated in a flat and open district on the Owenree, or King's River, a tributary of the Nore. It was formerly a walled town, and the remains of some of the ancient fortifications are still standing. The four principal streets intersect on the south side of the river. The principal objects on the north side, on which the smaller portion of the town is situated, are the barracks and the ruins of an Augustinian friary, including a tower 90 feet high. These ruins are connected by a wooden bridge with a convent and chapel of the same order on the opposite side of the river. In the chapel are some good sculptures and a well-painted altar-piece. The parish church, formerly an abbey of the Augustinian order, is a large and interesting building. The parochial Roman Catholic chapel is situated on elevated ground opposite the court-house and jail at the southern extremity of the town. Quarter sessions are held at Callan in rotation. By the encouragement of the guardians of the proprietor, a minor, the Earl of Clifden, the town has recently been much improved. Callan was formerly a municipal and parliamentary borough, but was disfranchised in both respects by the Act of Union and the Irish Municipal Reform Act. The care of the streets is now vested in seven commissioners under the Act of the 9th Geo. IV. c. 82.

CALLANDER. [PERTSHIRE.]

CALLA'O, on the coast of Peru, in South America, is situated in 12° 4' S. lat., 77° 10' W. long., distant about 6 miles W. from Lima, the capital, of which it is the sea-port. The two places are united by a good level road skirted on each side by trees; along this road there is regular communication by omnibuses. The population of Callao is

estimated at 20,000. The bay is formed by the islets of San Lorenzo and Fronton, and a low sandy point projecting from the main, between which however there is a safe passage half a mile wide, called the Boqueron. Vessels are well sheltered from all winds, except between the north and west, which seldom blow with violence. Callao is the safest and most convenient port along the coast to Concepcion in Chili. The sea is always tranquil, and there is anchorage everywhere in the bay from 7 to 10 fathoms without any danger. A shoal extends about 400 yards from the beach, except immediately opposite the town, where a mole has been formed by sinking old hulks, within which vessels of large burden may lie and discharge their cargoes. During the war of independence they were secured by a boom across, and it was from this situation that Lord Cochrane in 1820 so gallantly cut out the Esmeralda Spanish frigate. The heavy surf on the beach renders it generally impracticable to land to the southward of the mole. Supplies of all sorts may be had in abundance—meat, live stock, vegetables, and fruit, cocoa, sugar, and spirits; but good water and wood are very scarce.

The commerce of Lima causes an influx of vessels from Europe, chiefly from Great Britain, into Callao Bay, besides which there is a large traffic with the other states of western America. Bullion, specie, copper, cotton, bark, soap, vicuña wool, and hides are exported. The exports for the year 1840 amounted to nearly a million of pounds sterling: the customs duties on British goods, chiefly cottons and linens, amounted to about a quarter of a million. The total value of imports into Callao in 1840 was estimated at 1,171,642*l.* The vessels entering the port in 1841 were 498, of 101,084 tons; the departures were 494, of 99,944 tons.

The town was originally built in the reign of Philip IV., and stood farther out on the point than its present site. In 1746 it was entirely destroyed by an earthquake, which demolished three-fourths of Lima itself; of the inhabitants about 4000 perished, and nineteen vessels were lost, some of which were thrown to a considerable distance inland. Vestiges of the old town are still on the point, buried in the sand. Callao has been rebuilt on the same plan as before, but farther removed from the sea, and on a much firmer soil. The houses are flat-roofed and slightly constructed of cane wicker-work, plastered with mud, on account of the frequency of earthquakes, which take less effect on such frail edifices. The rare occurrence of rain in Peru, and its generally mild climate, render substantial dwellings unnecessary. Very heavy dews at night supply the want of fertilising showers.

Callao consists almost entirely of the forts, barracks, custom-house, and other government buildings; the other houses, or rather huts, being chiefly pulperias (a low wine and chandler's shop); but Bellavista, a suburban village, offers more convenience for residence. The fortifications of Callao consist of two round castles connected by a curtain, and another on the point stretching towards San Lorenzo, all commanding the bay, towards which they present a battery of above sixty pieces of cannon, chiefly of large calibre. The principal fort was called San Philip, but is now named La Independencia; beneath its walls is the arsenal. The great strength of the forts enabled the Spaniards to hold out long after Lima had fallen into the hands of the patriots, to whom however they ultimately surrendered in September 1821, supplies being cut off both by land and sea. Their fall may be said to have determined the independence of Peru.

The tides in Callao Bay are very uncertain and irregular, being greatly influenced by the strength and direction of the wind.

CALLINGTON. [CORNWALL.]

CALMAR, or KALMÄR, Sweden, a fortified town, sea-port, and the seat of a bishopric, is situated about 56° 40' N. lat., 16° 20' E. long., distant about 190 miles S.S.W. from Stockholm. The town stands on the island of Qarndöla in the straits or sound of Calmar, by which the island of Öland is separated from the Swedish continent. It is included in that part of the ancient province of Småland, which now forms the political division of Calmar län. The population of the town is about 5600. Calmar is united by a bridge of boats to the suburb on the continent. This suburb, built on the site of the ancient town which was burnt in 1647, contains the old castle in which the union of Calmar was agreed to in 1397, by which Sweden, Denmark, and Norway were united under one sovereign. The castle, which is still a strong building, is now used as a house of correction. Calmar town is regularly built, but the houses are chiefly constructed of wood, though there are excellent stone-quarries in the island of Öland, distant about five miles across the sound. The cathedral, the castle, and a few other principal public buildings are of stone. The cathedral, a handsome edifice, stands in the middle of the great square. It contains an altar-piece by Ehrenstahl. Calmar has a good grammar school and several other educational institutions. The library of the academy contains about 4000 volumes. The harbour is good, and the commerce of the town is still active, although it has declined in amount of late years. The exports consist of iron, alum, pitch, tar, timber, &c., and stone in large quantities from the Öland quarries. Ship-building is carried on. The manufactures include woollen stuffs, tobacco, snuff, and potash.

CALMONT TOWN. [SIEIRA LEONE.]

CALNE, Wiltshire, a municipal and parliamentary borough and

market-town and the seat of a Poor-Law Union, in the parish and hundred of Calne, i. situated on the Bristol road, in $51^{\circ} 26' N.$ lat., $1^{\circ} 59' W.$ long., distant 31 miles N.N.W. from Salisbury, and 87 miles W. from London. The population of the municipal borough in 1851 was 2544; that of the parliamentary borough was 5195. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and returns one member to the Imperial Parliament. For sanitary purposes the borough is under the care of a Local Board of Health. The living is a vicarage in the archdeaconry of Wilts and diocese of Salisbury. Calne Poor-Law Union contains eleven parishes and townships, with an area of 27,689 acres, and a population in 1851 of 9173.

This place is of remote antiquity; many Roman remains have been found in the neighbourhood. The West Saxon kings had a palace at Calne, and an hospital of black canons existed here. In 977 a synod was held here for adjusting the differences between the monks and the secular clergy, at which the celebrated Dunstan presided: the floor of the room gave way, and the whole assembly, with the exception of Dunstan himself, fell with it. Calne is described in Domesday Book as 'Terra Regis,' and is called 'Cauna.' The town is built in one of the numerous valleys hollowed out of the great chalk escarpment. The high ground east and north of the town forms the table-land of Marlborough Downs and Salisbury Plain. The Calne brook rises about three miles to the north-west of the town in a hollow near Compton Bassett, and is joined by two other streams near the town. The brook divides the town. Calne is paved and is lighted with gas. The houses are fronted with stone, and the town has a cheerful appearance.

The church is a lofty and handsome edifice of great length; the nave is narrow; exhibiting various styles of architecture, the round Norman arch and billet moulding being found along with the pointed gothic. The tower, which stands at the north side of the church, and contains a peal of eight deep-toned bells, is remarkable for the beauty of its proportions: it was built by Inigo Jones after 1628, in which year the tower and spire standing on the transept of the church fell.

A new church called Christ church was built about twelve years back on Derry Hill at the extremity of the parish, to which was annexed a district containing 1511 inhabitants in 1851. There are chapels belonging to Wesleyan Methodists and Baptists. The Grammar school, founded in 1660 by John Bentley, Esq., has attached to it two exhibitions at Queen's College, Oxford, given by Sir Francis Bridgeman in 1730; but these have not been claimed for many years. There are National and Infant schools, and a school for training female servants.

The town-hall was repaired a few years ago at the expense of the Marquis of Lansdowne. In this building the public business of the town is conducted. A county court is held in the town. Calne formerly possessed a share of the Wiltshire clothing trade; but the cloth-mills have been closed or converted into corn-mills. A branch of the Wilts and Berks Canal comes up to the town. The market is held on Wednesday. Fairs are held on May 6th and September 29th. The air is salubrious, and the views of the adjacent country are very fine. At Cherhill, about three miles east of the town, is the figure of a white horse 157 feet in length, remarkable for the symmetry of its proportions, cut in the chalk down about the year 1780 under the direction of C. Allsup, Esq., surgeon. Bowood, the delightful residence of the Marquis of Lansdowne, is about a mile west of the town.

CALOTSA (also Kálotza and Kálosen), county of Pesth, Western Hungary, an archiepiscopal town, is situated in a marshy flat on the Vayaz, an insignificant arm of the Danube, in $46^{\circ} 32' N.$ lat., $19^{\circ} 3' E.$ long., about 74 miles S. from Pesth. Calotza was known to the Romans, and was of much greater importance before the Turks overran the country. It has several handsome public buildings, the most spacious of which is the archbishop's residence, with its extensive library; a chapter-house and cathedral, an ecclesiastical seminary on a large scale; a college and gymnasium of the Piarist order, &c. There are fine gardens attached to the archbishop's seat: an artificial hill in them is laid out as a vineyard. The town once possessed a celebrated printing establishment. The inhabitants, about 6000 in number, carry on extensive fisheries on the Danube, and rear much cattle. The steam packets which ply on the Danube call at Calotza.

CALPENTYN. [CEYLON.]

CALTURA. [CEYLON.]

CALVADOS, a department in the north of France, formed out of portions of the former province of Normandie, lies between $48^{\circ} 46'$ and $49^{\circ} 25' N.$ lat., $0^{\circ} 26' E.$ and $1^{\circ} 10' W.$ long.; and is bounded N. by the English Channel (called by the French La Manche), E. by the department of Eure, S. by that of Orne, and W. by that of Manche. Its greatest length from east to west is 65 miles, from north to south 44 miles. The area is 2132 square miles, and the population according to the census of 1851 was 491,210, which gives 230.39 to the square mile, being 55.68 in excess of the average per square mile for the whole of France. The population of the department in 1840 was 496,198, and in 1846 it was 498,385; but in those years the area is returned at 2147 square miles. It seems probable then that a portion of Calvados has been recently annexed to some of the neighbouring

departments, probably to that of Manche, the area of which, as given in the returns of 1851, is considerably in excess of the amount stated in previous returns.

One of the vessels of the Armada, named Calvados, was wrecked in 1588 on a ledge of rocks that runs parallel to the coast for about 15 miles, and at the distance of a mile from the shore to the west of the mouth of the Orne. The ledge soon came to be known by the name of the Spanish ship, which has been extended to the whole department. The districts of Normandie out of which Calvados is formed are the following:—*Bessin*, extending between the Dive and the Vire, and consisting of Bessin Proper, which had Bayeux for its capital; the *Bocage*, or southern Bessin, of which Vire was the chief town, and which has been always remarkable for the very moderate stature of its inhabitants; and the plain of Caen: *Auge*, which comprised the valley of the Touque below Lisieux, and extended westward to the Dive; and the western part of Lieuvin, of which Lisieux was the capital. The eastern part of Lieuvin is included in the department of Eure.

The south-western angle of the department is crossed by offsets from the range of hills which separates the basins of the Loire and the Seine. The rest of the department consists of extensive plains, separated by low hills, and each drained by one or more rivers. The plains all incline from south to north, and all the rivers fall into the English Channel. The coast, which extends from the mouth of the Seine to that of the Vire, is generally high and difficult of access; but on either side of the mouth of the Dive the shore is lined with sand-hills. At the mouths of the Vire, the Orne, and the Dive are tide harbours for vessels of considerable size. [CAEN.]

The principal rivers are—the Touque, which rises at Champhaut, in the department of Orne, and, running past Lisieux and Pont-l'Évêque, enters the Channel a little below the town of Tonques after a course of 50 miles: the Dive, which also rises in the department of Orne and enters the Channel below the town of Dives; it is joined by the Vire, which drains the country between it and the Touque: the Orne, which rises at Annou, in the department of Orne, flows north-west past Sées, Argentan, and Pont-l'Œuilly, where it enters Calvados; then turning north-north-east it passes Caen, and falls into the Channel after a course of 62 miles: and the Vire, which rises in the south-west of the department, and passing Vire, Pont-Parcy (where it enters the department of Manche) and St.-Lô, falls into the Channel below Isigny in Calvados. All these are tide rivers, and are navigable for several miles from the sea at high water; on the left of the embouchure of each lighthouses are established. The Seulles and the Drôme (which receives the Auro below Bayeux), flow into the Channel through the plain between the Orne and the Vire. The department is crossed by 9 national and 18 departmental roads. The most important of the national roads is that from Paris to Cherbourg, which passes through Lisieux, Caen, and Bayeux. The parish roads also are numerous and well kept up. A railroad in course of construction from Rosny (near Mantou on the Paris-Rouen line) to Cherbourg crosses the department and passes through Lisieux, Caen, and Bayeux. A branch line, also in course of construction, leaves this railway about midway between Lisieux and Caen, and runs south through Faldise and Alençon to the Paris-Brest line at Le-Mans.

In its agricultural productions the department maintains a high rank. It contains 1,364,251 acres, and all this surface, with the exception of a small portion of heathland, is productive; but except in the plains corn-growing is not the principal object of the farmers' care. On the rich pastures great numbers of cattle and horses are reared. The system of green feeding is extending rapidly, and large numbers of cattle are fattened for the markets of Paris and the interior. Dairy farming is extensively followed, and a great quantity of fresh and salt butter is made for export. The centre of this trade is Isigny at the mouth of the Vire. The horses are of the true Norman breed, and much valued for their shape and serviceable qualities. The poultry of the department is abundant and excellent. Great numbers of capons are sent to Paris. Wheat, potatoes, and cider apples are grown in large quantities: early potatoes especially and other vegetables are largely grown for export. Of cider, the annual produce is 30,272,000 gallons. The best kind is that made in the Auge district; it will keep for years, and contains a large proportion of alcohol. Melons, haricots, onions, &c., are extensively cultivated. Building stone, marble, slate, brick, potter's clay, and iron are found. Marl abounds in the arrondissement of Lisieux and Pont-l'Évêque, and is used for manure. Coal mines are worked at Litry, in which several steam-engines are employed. Coal is also imported from Belgium and England.

The chief industrial products of the department are cotton and woollen yarn, fine and coarse woollen cloths, linen, flannel, blankets, shawls, calicoes, lace, porcelain, and cutlery. [CAEN.] Throughout the department the manufacture of lace alone gives employment to 50,000 persons, and the value of the lace annually exported amounts to many millions of francs. The department contains several paper-mills, sugar refineries, tanneries, oil-mills, and establishments for the manufacture of chemical products and bleaching linen. The commerce of the department consists of its industrial products, together with horses, fat cattle, wheat, butter, cheese, poultry, cider, honey,

brandy, clover-seed, hemp, flower-bulbs, wood, oil, &c. The imports are iron, wool, raw cotton, hides, and colonial produce. Great quantities of lobsters, oysters, and other fish are taken along the coast and conveyed to the markets of Paris and of the interior. Above 180 fairs are held in the year.

The department is divided into six *arrondissements*, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Caen	9	188	139,922
2. Falaise	5	121	60,534
3. Bayeux	6	113	79,976
4. Vire	6	97	87,073
5. Lisieux	6	125	67,059
6. Pont-l'Évêque	5	116	56,614
Total	37	702	491,210

1. Of the first *arrondissement* and of the whole department the capital is Caen. [CAEN.] *Douve* on the coast, 8 miles from Caen, population 2100, and *Villiers-Bocage*, population 1146, which exports great numbers of eggs, are the only other towns worth mention.

2. Of the second *arrondissement* the chief town is Falaise, 20 miles S.E. from Caen, on the Ante, a feeder of the Dive. It stands on very uneven ground, and is divided into three distinct parts—the suburb of Guibray, which is built on the top of a hill; the town itself, which occupies the slope; and the fanbours of Val-d'Ante and St-Laurent, which are situated on the low ground. The churches of St-Laurent, St-Gervais, and Guibray; the hospital, the public library, and above all the ancient castle, which contains the apartment where-in the Conqueror was born, are the most remarkable buildings in the town. Falaise has tribunals of first instance and of commerce, a college, and a population of 8109. Cotton, hosiery, bobbin-net, and coarse calicoes are manufactured; there are also tanyards, paper-mills, dye-houses, and bleaching establishments. In the suburb of Guibray an important fair is held from the 10th to the 25th of August, at which great numbers of horses, cattle, and manufactured goods are sold. At Harcourt-Thury, a small place of under 1000 inhabitants, which formerly gave the title of Duke to the family of Harcourt, the ducal castle, a vast structure, still stands in a beautiful situation near the Orne; it is surrounded by well-laid-out gardens, and contains a large picture gallery.

3. In the third *arrondissement* the chief town is Bayeux. *Isigny*, at the mouth of the Vire and the Auro, has a harbour for small vessels, and exports butter, cider, hams, cattle, and other agricultural produce. It has a tribunal of commerce, and a population of 2500. The Vire is here crossed by a fine granite bridge. *Litry*, 10 miles W.S.W. from Bayeux, has 2482 inhabitants, many of whom are employed in connection with the coal-mines of the neighbourhood.

4. In the fourth *arrondissement* the chief town is Vire, the capital of the Bocage, which is built on two steep hills, separated by the river Vire. The largest portion of the town stands on the right bank; here are the general and the foundling hospitals. The part on the left bank contains the sub-prefect's hotel and several large well-built houses. The other remarkable buildings are the church of Notre-Dame, the Hôtel-Dieu, founded by the dukes of Normandy, the public library, and the corn-market. The town has a college, tribunals of first instance and of commerce, and contains a population of 7400, who manufacture fine linen, woollen cloths for the army, woollen yarn, and paper; and trade also in corn, wine, brandy, flax, hardware, and iron. There are the remains of an ancient castle at Vire, the possession of which was often contested by the English, French, and Bretons. *Coudé-sur-Noireau*, at the junction of the Duraue and the Noireau, is 14 miles E. from Vire, and has 5976 inhabitants. It was held by the English till 1449, and was one of the first places to embrace the reformation. It is a very ancient looking place. The churches of St-Sauveur and St-Martin are the most remarkable buildings. The town has a tribunal of commerce; manufactures woollens, calicoes, cotton-yarn, cutlery, and leather; and trades also in cattle, flax, yarn, and honey.

5. In the fifth *arrondissement* the chief town is Lisieux (*Noviomagus, Civitas Leuciorum*), which was also the capital of the Lieuvin. It stands in a beautiful valley, watered by the Orbec and the Touque. The road from Caen to Evrenx runs through the best and widest street in the town. The other streets are narrow and winding, the houses high, old, and mostly timber-framed. The gothic cathedral, a structure of the 12th century, which contains a beautiful Lady chapel (built by Pierre Cauchon, bishop of Beauvais, afterwards of Lisieux, and one of the judges of Joan d'Arc), and the former episcopal palace, are the finest buildings in Lisieux. The old ramparts have been formed into promenades. The town contains 11,378 inhabitants, and has tribunals of first instance and of commerce, a college, and an ecclesiastical seminary. Linen, woollen cloth, flannels, swan-skins, horse covers, tape, woollen and cotton yarn, are manufactured. There are also tanyards, paper-mills, dye-houses and fulling-mills. These products, together with corn, cider, butter, hemp, flax, and cattle, form the items of a brisk trade, which is much facilitated by the Touque, this river being navigable at high water from Lisieux

to its mouth. *Orbec*, 12 miles from Lisieux, stands in a lovely valley on the Orbec, a feeder of the Touque, and has 3350 inhabitants, who are engaged in agriculture and in the manufacture of hosiery, tape, woollen stuffs, and leather.

6. In the sixth *arrondissement* the chief town is Pont-l'Évêque, the capital of Auge, which stands in a wide plain at the junction of the Touque and the Calonne, 25 miles E. from Caen, and has 3300 inhabitants. It was in this town that the Conqueror held the meeting of the states of Normandy, at which it was resolved to invade England. Lace is the principal manufacture. Cider, cheese, butter, fat cattle, and wood, are the chief articles of trade. The town has a tribunal of first instance. *Honfleur* stands at the foot of a high hill on the south shore of the estuary of the Seine. It has a small harbour, which consists of two basins; the entrance to it is formed by jetties. A third basin is now nearly completed. The town is irregularly built; it has two churches, a royal school of navigation, and a population of 9580. The public buildings of Honfleur are remarkable for the oddness of their ancient architecture. Vessels belonging to the town are engaged in the cod, herring, and mackerel fisheries. Hosiery, lace, chemical products, ironmongery, and hardware are manufactured. There are also saw-mills, sugar refineries, rope-walks, and ship-building yards. Corn, cider, melons, snuggers, and fish are the chief articles of trade. There are two lighthouses at Honfleur. *Dives*, at the mouth of the Dive, from which the Conqueror sailed against England in 1066, is now a mere fishing village with about half a thousand inhabitants.

The population of the department is scattered over the surface, living mostly in hamlets and farm-houses. This accounts for the small number of towns of any considerable size. The department forms the bishopric of Bayeux. It is included in the jurisdiction of the high court of Caen in which town there is a provincial university of high repute with faculties of law, science, and languages; and it belongs to the second Military Division, of which Rouen is head-quarters.

CALVARY. [JERUSALEM.]

CALW, or CALBE, the chief town of the bailiwick of Calw in the Württemberg circle of the Black Forest, is situated in 48° 42' N. lat., 8° 44' E. long., on the river Nagold in the bottom and on the side of a narrow valley of the Black Forest: the population is about 4300. The town is of very ancient date, and was until the early part of the 14th century the capital of the former earldom of Calw. It was burned by the French under Melac in 1692. The ruins of the castle of the former counts of Calw stand on the hill above the town. The river divides the upper town from the lower town. Calw contains several churches. It has long been the seat of a considerable trade. The inhabitants are employed in the woollen and kerseymer manufactures, in the spinning of woollen yarn, in dye-works, and in manufactures of stockings and leather. Lime and charcoal form considerable items of traffic. The charcoal is prepared in the surrounding districts of the Black Forest. The roads in the neighbourhood are very imperfectly attended to, so that travelling is difficult. Calw was the birth-place of Pope Victor II., one of the counts of Calw, and of Weese, the surgeon who saved the life of Augustus, king of Poland, at Bialystock in 1727.

CALYCADNUS, RIVER. [ANATOLIA.]

CAMARÈS. [AVEYRON.]

CAMARQUE. [BOUCHES-DU-RHÔNE.]

CAMARINA (*Kamapina*), a town in the south of Sicily, on the river Hipparis, very near the sea. Camarina was a Dorian town (Thucyd. iii. 86), the most considerable of the Syracusan colonies (Strab. vi. p. 272, a, Casaub.), founded B.C. 600 (Clinton, F. H., vol. i. p. 226, 2nd edit.), 135 years after the foundation of Syracuse from Corinth (Thucyd. vi. 5). The situation was unhealthy, owing to the neighbourhood of a marsh which was formed by the river Hipparis; this marsh however was so great a safeguard against the attacks of enemies, that it was considered that the draining of it would be fatal to Camarina. Hence the proverb *μὴ κίρῃ Καμαρίνα* (*ne morcas Camarinam*); which implied that, although the marsh was an evil, the danger which would attend its removal would be a greater one. Only a few ruins now remain, bearing the ancient name. Few towns have undergone so many and so remarkable revolutions as Camarina. About 46 years

Coin of Camarina.
Brit. Mus. Actual size. Silver. 266 grains.

after its foundation it revolted from the mother state, and the town was destroyed. The Syracusans were afterwards forced to cede Camarina to Hippocrates, tyrant of Gela, who however colonised it afresh. Gelon, the successor of Hippocrates, destroyed the town again

(Herod. vii. 156), and removed the inhabitants to Syracuse. The town appears to have been again rebuilt by the people of Gela about B.C. 461. In the great Carthaginian invasion of Sicily the territory of Camarina was ravaged by Himilco in the spring of B.C. 405; the city itself was not attacked, but Dionysius, unable to protect it from the Carthaginians, induced or constrained the inhabitants to remove from it to Syracuse, which they afterwards left for Leontium. (Diodor. Sicul. xiii. 108, 111, 113; Xen. 'Hell.' ii. 3, § 5.) By a subsequent treaty the inhabitants were allowed to return to their homes, but only as tributaries to Carthage. Camarina afterwards assisted Dionysius in his war with the Carthaginians. On the death of the older Dionysius the people of Camarina supported Dion in his march upon Syracuse. Camarina was afterwards restored and enriched by Timoleon (Diodor. Sicul. xvi. 83), B.C. 336.

The inhabitants of Camarina took the side of the Romans early in the first Punic War. In B.C. 258 the town was betrayed to the Carthaginians, but being recovered by the Romans, many of the citizens were sold as slaves as a punishment for their defection.

In B.C. 255 a serious disaster befel the Roman fleet on the coast near Camarina: of 364 ships 284 suffered shipwreck in a violent tempest. The town existed in the 2nd century of the Christian era, but its history is not traceable to a later period. Its site is now desolate. The remains of the town include only some scattered portions of the old walls, and a church, which was originally a temple. Remains of the port and portions of buildings on the shore were still visible in the 17th century; these are now for the most part buried in sand.

CAMBAY, a large city, supposed to be the *Camano* of Ptolemaeus, situated at the mouth of the Mhyo River and at the head of the Gulf of Cambay, in 22° 21' N. lat., and 72° 48' E. long. When Gujerat was an independent state, Cambay, as the sea-port of its capital Ahmedabad, enjoyed a high degree of commercial prosperity, which it has since lost. The city contains several mosques and Hindoo temples, and the remains of many more religious edifices, the greater part of which appear to have belonged to the sect of Jaina, whose religion was formerly predominant in this part of India. The trade of Cambay formerly embraced the export of silk and chintz goods, jewellery, and indigo, but at present nearly all its export trade consists of grain sent to Bombay. The surrounding country is fertile, and furnishes oil, seeds, wheat, and other grains. The silversmiths of Cambay still retain their superiority in the art of embossing. Until the beginning of the present century, the city and territory of Cambay were governed by a native prince, who was tributary to the Mahrattas, but on the overthrow of the Peshwa the British succeeded to his rights, and the prince now pays tribute to the East India Company. The territory includes an area of 500 square miles, with a population of 37,000, and a public revenue of about 30,000*l*. The amount of tribute paid to the British government is about 6000*l*., besides half the customs duties of the port of Cambay. The Nawaub maintains a force of 200 cavalry and 1500 infantry.

CAMBAY, GULF OF, formerly known as the Gulf of Barygaza, is situated on the north-west coast of India, and extends from the southern extremity of the peninsula of Gujerat, in 20° 40' N. lat., and 71° 7' E. long., to the city of Cambay, a distance of 130 miles. In consequence of the currents and the bore which occur in this gulf, its navigation is dangerous. The waters of the Saubermutty, the Mhye or Mahy, the Dhandur, the Norbudda, and the Tapti rivers discharge themselves into this gulf.

CAMBERWELL. [SURREY.]

CAMBODIA. [COCHIN CHINA.]

CAMBORNE. [CORNWALL.]

CAMBRAI, a fortified city of France, in the department of Nord stands on the right bank of the Escant (Schelde), 100 miles N.E. from Paris, 19 miles S. from Douai; in 50° 10' 37" N. lat., 3° 13' 32" E. long., and has a population of about 20,000.

In the latter period of the Roman empire this city rises to notice under the name of *Camuracum*, by which it is mentioned in the 'Itinerary of Antoninus' and the Theodosian table. It was one of the chief towns of the Nervii; Turnacum (Tournay) being the other. Cambrai is said to have been the capital city of Clodion, the son of Pharamond (A.D. 427-448), and to have given title to his kingdom. Charles-magne fortified the town, and Charles the Bald ceded it to its bishops, by whom the sovereignty of it was long retained. In 1510 the emperor Maximilian I. erected Cambrai into a duchy and principality of the empire in favour of the then bishop and his successors. In 1543 the emperor Charles V. rendered himself master of the place, and erected the citadel, one of the strongest in Europe, on a height at the eastern extremity of the city. The fortifications were much strengthened by Vauban. The English took Cambrai by escalade, June 24, 1815.

The city is large. It is entered by four gates. The streets are of tolerable width, but not regularly laid out, and there are a great number of old houses with their gables to the streets. The Place d'Armes is capable of containing all the garrison drawn up in order of battle. There are some handsome public buildings, among which is the cathedral church of St. Sepulchre, which contains the remains of a monument by David of Fénélon the great archbishop of Cambrai; and is surmounted by a steeple remarkable for delicacy of architecture. In the first French revolution Fénélon's remains were torn from the grave, and the leaden coffin which contained them converted into

GEOG. DIV. VOL. II.

bullets by the sacrilegious madmen of the time. The principal of the other buildings are—the church of St. Gery; the public library which is established in the church of the former hospital of St. Jean, and contains 30,000 volumes besides a large number of manuscripts; the town-house; the theatre; and the archiepiscopal palace. Among the educational establishments of the town are—a college, a school of anatomy, and an ecclesiastical seminary. Tribunals of first instance and of commerce are held in Cambrai. The town was founded in the 11th century; it was erected into an archbishopric in 1559, suppressed at the first French revolution, and re-established in 1811. The only suffragan of the archbishop of Cambrai is the bishop of Arras; his own diocese is formed by the department of Nord.

Cambrai is favourably situated for trade, in consequence of its position on the Escant (which here begins to be navigable), and the canal of St. Quentin, which connects the town with the Oise and the Seine. The chief manufactures are cambric (which derives its English name from the town), lawn, linen, thread, and cotton-yarn, lace, rosery, fine muslin, leather, black soap, starch, beet-root sugar, beer, brandy, salt, and saltpetre. The commerce of the town consists of these articles, and of corn, wine, wool, iron, cattle, coal, hops, &c.

(*Dictionnaire de la France*.)

CAMBRESIS, a district formerly in the Low Countries, now forms the greater part of the arrondissement of Cambrai, in the department of Nord in France. It is a small district with a level surface, watered by the Escant and its tributaries (the Senset and the Selle), and by the Sambre, a tributary of the Meuse. It produces grain of all sorts, and flax, and affords pasturage to many sheep and horses.

It was in ancient times part of the territory of the Nervii. On the downfall of the Western empire it came into the hands of the Franks. Being subsequently comprehended in the Germanic empire it was erected by the emperors into a county, held for 400 years by laymen, but afterwards ceded to the bishops of Cambrai. It was appropriated by Charles V., and remained in possession of the Spaniards till 1677, when it was conquered by Louis XIV. and confirmed to France by the peace of Nimeguen in 1678.

The capital was Cambrai, or according to some Le Cateau. The small town Crovecourt was also in Cambresis. [CAMBRAI; NORD.]

(*Dictionnaire de la France*.)

CAMBRIDGE, the county town of Cambridgeshire, a municipal and parliamentary borough, university town, and forming of itself a Poor-Law Union, is situated in 52° 13' N. lat., 0° 7' E. long., distant 50½ miles N. by E. from London by road, and 57½ miles by the Eastern Counties railway. The population of the town of Cambridge, comprising 14 parishes and including the University, was 27,815 in 1851. The borough is governed by 10 aldermen and 30 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. Cambridge is in the archdeaconry and diocese of Ely. Cambridge Poor-Law Union, which is co-extensive with the 14 parishes comprised within the borough, includes an area of 3470 acres.

Cambridge is situated on the river Cam, from which the town derives its name. The town is called Grentebriige in the Domesday Survey; Granta was the ancient name of the river, and the name is retained by it above Cambridge. A small village about 2 miles S.W. from Cambridge is still called Grantchester. It appears certain that the Romans had a station here, and there is little doubt that it was the *Camboricum* of Richard of Cirencester, the *Camboritum* of the 'Itinerary of Antoninus,' though Hordley supposes the site of *Camboricum* to have been at Icklingham in Suffolk. [BRITANNIA.] The Roman town appears to have occupied the site of the north or castle end of the present town. Some entrenchments are still traceable. Bede speaks of Cambridge as being at the close of the 7th century a deserted city. It was burned by the Danes in 871, and again in 1010. While the Isle of Ely was held against William the Conqueror by the English nobility, that monarch built a castle at Cambridge—Grose says in the first year of his reign; but according to Ordericus Vitalis in 1068. That the town had risen to considerable importance at the time the Domesday Survey was made is evident from the description of it in that record. In 1088 Cambridge shared the fate of the county in being laid waste with fire and sword in the cause of Robert Curthose. In 1174 a fire happened at Cambridge which, among other extensive damages, injured most of the parish churches and destroyed that of the Holy Trinity. King John among other privileges granted the townsmen of Cambridge a mercatorial guild, and the liberty of being governed by a provost to be chosen annually by themselves. The style of their government was afterwards altered by King Henry III. to that of a mayor and four bailiffs. The town has sent members to Parliament from the earliest period of our parliamentary records. King John was at Cambridge on the 16th of September, 1216, about a month before his death. On his departure he intrusted the defence of the castle to Fulke de Bront, but it was soon after taken by the barons; and after the king's death a council was held at Cambridge between the barons and Louis the dauphin. In 1249 we have the first notice of serious discord between the townsmen of Cambridge and the scholars of the University. Subsequent dissensions between them frequently occur in different periods of their annals. From about 1266 to 1270 the town appears to have suffered on several occasions from the attacks of the turbulent inhabitants of the Isle of Ely. On one occasion they

plundered and burnt the town, and the king (Henry III.) came with an army to the relief of the inhabitants. In 1381 in consequence of the lawless proceedings of the townsmen in destroying the charters of the University and those of Corpus Christi College, King Richard II. deprived the burgesses of their charter, and bestowed the privileges with which they had been invested upon the University. The charter was however renewed to the corporation in the following year, the privileges formerly enjoyed being to some extent taken away. The mayor is required upon entering into office to take an oath to maintain the privileges, liberties, and customs of the University. Confirmations of the charter have been granted to the corporation by successive sovereigns on numerous occasions from Henry IV.'s time downwards. Queen Victoria and Prince Albert visited Cambridge in October, 1843, and again in July, 1847, on occasion of the installation of Prince Albert as Chancellor of the University.

Upon the first symptoms of an approaching war between King Charles I. and his Parliament, the University of Cambridge demonstrated its loyalty; but in 1648 Cromwell, who had twice represented the borough, took possession of the town for the Parliament, and put in it a garrison of 1000 men.

Of the parish churches the most remarkable is that of St. Sepulchre, usually called from its form the Round church. It was built in imitation of the church of the Holy Sepulchre at Jerusalem, and was consecrated in 1101. The building was restored in 1843 with the greatest possible care and at considerable cost. Great St. Mary's is the University church; it stands in Trumpington Street, near the centre of the town. It is a spacious and externally a rather handsome edifice in the perpendicular style. The first stone of the church was laid in May, 1478, and the body of the church was finished in 1519; the tower was not completed till 1608. The church consists of a nave, two side aisles with a chapel at the end of each, a chancel, and a tower at the west end in which is a peal of ten bells. Service is performed in this church on Sundays in the morning for the parishioners; and a sermon is preached in the afternoon to members of the University, and on holidays by graduates appointed by the University. In this parochial church the University has certain seats by faculty. The gallery, added to accommodate the members of the University, is no addition to the architectural beauty of the interior. Great St. Mary's church is so called to distinguish it from another called St. Mary the Less, near St. Peter's College. St. Benedict's or Benet's may be noticed for its tower, one of the few remaining examples of Anglo-Saxon church architecture. St. Botolph's, St. Michael's, Trinity, and Little St. Mary's churches are among those most worthy of notice for their architectural merits. St. Michael's church was a short time back greatly injured by fire; it has since been restored and improved. Most of the churches contain monuments of interest.

There were formerly as many as 77 ancient edifices in the town, consisting of guilds, priories, convents, hostels, &c. Among the religious foundations not connected in their origin with the University were the house of Austin Canons, founded in 1092, originally placed in or near the church of St. Giles; the Benedictine nunnery of St. Rhadegund, now forming a part of Jesus College, founded in 1130; the Gray Friars or Franciscans, founded soon after 1224; the Bethlehemite Friars in 1257; the Friars de Sacco, 1258; the Dominican, or Black Friars, founded before 1275; the house of Brethren of St. Mary, in the parish of All Saints, 3 Edward I.; the Austin Friars, founded in or near the Fish-market, called Nase Hill, about 1290; the White Friars, brought from Newenham in 1291; the Gilbertine Canons, established about the same time; the Hermitage of St. Anno and Hospital of Lepers, founded by Henry Tungmer before 1397; and the ancient Hospital of St. Mary Magdalene for Lepers at Stourbridge.

There are in Cambridge places of worship for Baptists, Independents, and Wesleyan and Primitive Methodists. The Free Grammar School, founded by Stephen Perse, D.M., Senior Fellow of Caius College, in 1615 for 100 scholars, is open to natives of Cambridge, Barnwell, Chesterton, and Trumpington. The system of tuition has recently been considerably improved and extended, and the school buildings have undergone extensive repairs. Scholars who have been educated at the school for three years have a preference to the Perse Fellowships and Scholarships at Caius College. The school has an income of 450*l.* a year, with houses for the master and usher rent free: the number of scholars in 1851 was 100. There are National schools, with which have been united Whiston's Charity schools founded in 1703. Several new schools have been erected within the last few years. An Industrial school has lately been established. Addenbrooke's Hospital, opened in 1766, is so called from its founder, John Addenbrooke, M.D., Fellow of St. Catherine's Hall: the number of patients annually amounts to about 1000. In 1813 a bequest of 7000*l.* in the three per cent. consolidated annuities was made to the institution by Mr. John Bowtell, a bookbinder and stationer in Cambridge, for enlarging the building and extending its benefits. Crane's Charity, founded in 1660, is for the relief of scholars of the University in the time of sickness; for affording temporary loans without interest to young men to set them up in trade; for relief of persons confined for debt, and of poor men and women of

good character. Nine sets of almshouses provide in all for 64 poor persons. The Victoria Friendly Societies' Asylum, established in 1837, provides a retreat for the infirm members of friendly societies. The buildings are adapted to accommodate 12 families. A mechanics institute, and a literary institution called the Philo-Union have each a news-room and a small library.

The town of Cambridge is situated on level ground; the greater portion of the town being on the right side of the river. The leading street crosses the river by a neat cast-iron bridge of one arch, erected in 1823 by subscription. The market-place, which has been considerably enlarged and improved within the last three years, is situated nearly in the centre of the town; it is now probably one of the finest market-places in England. At the south end of the market-place is the Guildhall. The front part of this structure was built in 1747 at the cost of the county. The other portion of the building was renewed in 1782. It contains a large court-room, with other rooms for committee meetings and for the transaction of public business. Close to the iron railings of the market-place and opposite to the guildhall stands the conduit, erected chiefly from the bequest made by Thomas Hobson, the Cambridge carrier, whom Milton has immortalised in a well-known epitaph. The conduit was erected in 1614, and ever since that time has supplied the inhabitants of Cambridge with a tolerably ample supply of wholesome water. The sewerage of the town has been lately much improved. The town is lighted with gas. The numerous public walks connected with the grounds of the colleges are of very great benefit to the town, and a plot of ground nearly 20 acres in extent, denominated Parker's Piece, has been appropriated for the recreation of the inhabitants. At the north-western extremity of the town stands the county court house, a rather elegant structure of recent erection. Near this building is the new county jail. The castle was suffered to go to decay as early as the reign of Henry IV. The gate-house, the last important relic of the ancient edifice, was pulled down a few years back to make way for the new county court.

The University buildings and the colleges will be noticed under CAMBRIDGE UNIVERSITY.

From Castle Hill an interesting view of the town and colleges and of the surrounding country is obtained. Ely cathedral may be discerned from it by the naked eye. Quarter sessions for the county and town and the assizes for the county are held in Cambridge. A county court is also held here. The town possesses a savings bank.

A fair was held at Cambridge from very ancient times in Rogation week. It was recognised and confirmed in a charter of the 2nd of King John. Another at the festival of the Assumption of the Virgin Mary was granted by King Henry VI. to the nuns of St. Rhadegund in 1438. In the parish of Little St. Andrew, or Barnwell, are held the Midsummer fair and Stourbridge or Sturbridge fair, which are annually proclaimed by the principal officers of the University with much solemnity; the former was held for a fortnight on a common called Midsummer Green; Stourbridge fair, supposed to be of great antiquity, is proclaimed on the 18th of September, and used to continue for three weeks. The duration of both fairs has been considerably shortened. The chartered market-days are Wednesday and Saturday, but there is a market every day in the week except Monday for vegetables, poultry, eggs, and butter. Abundant supplies of provisions are furnished for the market, but the consumption being great in consequence of the number of residents connected with the University the prices are comparatively high. Corn, brawn, and Stilton cheese are considerable articles of trade. By means of locks the Cam is navigable up to Cambridge, and by it the town is supplied with coals, &c., through Lynn, where the Ouse enters the sea.

(Gough's edit. of Camden's *Britannia*; Lysons, *Magna Britannia*; Ingram, *Memorials of Cambridge*.)

CAMBRIDGE, UNIVERSITY OF. The first establishment of this University is involved in much obscurity. It seems probable that Cambridge first became a seat of learning in the 7th century, when, as Bede (*'Hist. Ecc.'* lib. iii. c. 18) informs us, Sigobert, king of the East Angles, with the advice of Felix the Bishop, instituted within his kingdom a school for learning, in imitation of what he had seen in France: this school is presumed to have been fixed at Cambridge. It is certain that from a very early time Cambridge was the residence of numerous students, who at first lived in apartments hired of the townsmen, and afterwards in inns or hostels, where they formed a community under a principal at their own charge. Some say that Edward the Elder, when he repaired the ravages of the Danes at Cambridge, erected halls for students and appointed professors; others maintain that a regular system of academical education was not introduced till the year 1109, when the Abbot of Croyland having sent some learned monks well versed in philosophy and other sciences to his manor of Cottenham, they repaired to the neighbouring town of Cambridge, whither a great number of scholars flocked to their lectures, which they arranged after the manner of the University of Orleans. Recent inquiries have shown that there was a resemblance between the earliest known arrangements of the Universities of Cambridge and Orleans; and there appears to be reason to believe that there was some connection between them. There is no reference in the Domesday Survey to any university or important school of learning at Cambridge at the Conquest. The first charter known to have been granted to Cam-

bridge as a university is that of the 15th Henry III., which grants the privilege of appointing certain persons called Taxors to regulate the rent of lodgings for the students, which had been raised to an exorbitant height by the townsmen. This was almost 50 years before the foundation of Peter House, the first endowed college. In 1583 King Edward VI. granted the University some important privileges. These favours made the townsmen still more jealous of the University; and their discontents broke forth into open violence in the succeeding reign, when emboldened by the temporary success of Wat Tyler and his associates they seized and destroyed the university charters. In 1430 Pope Martin V. determined from the testimony of ancient evidences that the University was exclusively possessed of all ecclesiastical and spiritual jurisdiction over its own scholars. Queen Elizabeth in the third year of her reign granted an extensive charter to this University; and by an Act of Parliament, 13 Eliz. c. 29 (for the incorporation of both the English universities), this and all preceding grants were confirmed, and the University of Cambridge was declared to be incorporated by the name of the Chancellor, Masters, and Scholars. The office of Chancellor, as chief magistrate of the University, had existed from a very early date: it was only annual till 1504, when Bishop Fisher was chosen chancellor for life. At present the office is biennial, or tenable for such a length of time beyond two years as the tacit consent of the University may allow. The other principal officers are the High Steward; the Vice-Chancellor; a Commissary, who holds a court of record for all privileged persons under the degree of M.A.; a Public Orator; an Assessor to assist the Vice-Chancellor in his court; two Proctors, whose business it is to regulate the discipline and preserve the peace of the University; a Librarian; a Registrar; two Taxors, who regulate the market, examine the assize of bread, and inspect the weights and measures; two Moderators, who superintend the exercises in the schools and the examinations for degrees of arts; two Scrutators, who regulate the business of the congregations; two Pro-Proctors; three Esquire Bedels; and some inferior persons.

The University may be regarded as a commonwealth resting upon the union of the several colleges; though it is an error to regard it, as is often done, as a mere aggregate of colleges. It is in fact a sort of federal union of which the colleges are members. There are 17 colleges and halls in Cambridge, all of which possess equal privileges. Each college is a lay corporate body bound by its own statutes; but the members of each college are also subject to the general laws of the University. The present university statutes were given by Queen Elizabeth in the 12th year of her reign, and are the foundation upon which all new laws are framed. Each of the 17 colleges furnishes members both for the executive and legislative branch of university government. The place of assembly is the senate-house. All persons who are masters of arts or doctors in one of the three faculties, namely, divinity, the civil law, or physic, having their names upon the college boards, holding any university office, or being resident in the town of Cambridge, have votes in this assembly. The Senate is divided into two houses, denominated the Regent and the Non-Regent house: the Regent, or Upper house (or, as it is frequently called, the White Hood house, from the members wearing their hoods lined with white silk), consisting of the doctors of less than two and the M.A.'s under five years' standing; the Non-Regent, or Lower house, or Black Hood house, consisting of the M.A.'s above five years. The doctors of more than two years' standing vote in either house at pleasure. There is also a council called the Caput, chosen annually on the 12th of October, by which every university grace or proposition must be approved before it can be introduced to the Senate. The Caput consists of the vice-chancellor, a doctor in each of the faculties, and two masters of arts, who are the representatives of the Regent and Non-Regent houses. Any single member of the Caput has the power of putting a veto upon any grace that is proposed.

The annual income of the University arises from various sources, including the rectory of Burwell and a farm at Barton, which produce about 1000*l.* per annum, fees at matriculations, for degrees, &c., and the trading profits of the university press. The whole income from every source is believed scarcely to exceed 5500*l.* per annum. The funds are managed by the Vice-Chancellor, or by specific trustees; and the accounts are examined annually by three auditors appointed by the Senate.

Some of the public professors of the University are paid from the university chest, others by her Majesty's government, or from estates left for that purpose. They are the Lady Margaret's Professor of Divinity; the Regius Professors of Divinity, Civil Law, Physic, Hebrew, and Greek; two Professors of Arabic, one of whom is called the Lord Almoner's Reader; the Lucasian Professor of Mathematics; Professors of Moral Theology, or Casuistry; Chemistry; Astronomy and Experimental Philosophy; Anatomy; Modern History; Botany; Geology; Astronomy and Geometry; the Norrisian Professor of Divinity; Natural and Experimental Philosophy; the Downing Professors of the Laws of England, and of Medicine; the Professors of Mineralogy, Political Economy, and Music; besides which there are various endowed lectureships. By a grace of the Senate, October 31, 1848, a Board of Mathematical Studies was appointed, to consist of the Lucasian Professor of Mathematics, the Plumean Professor of Astronomy, the Lowndean Professor of Geometry and Astronomy,

and the Jacksonian Professor of Natural and Experimental Philosophy, as well as the Examiners for Mathematical Honors, "whose duty it is to consult together from time to time on all matters relating to the actual state of mathematical studies and examinations in the University, and to prepare annually and lay before the Vice-Chancellor a report, to be by him published to the University in the Lent or Easter term of each year." The Cambridge Philosophical Society was established in 1819, and incorporated by royal charter dated 3rd of August 1832. It includes most of the resident graduates of the University.

The privilege of sending two representatives to Parliament was conferred upon the University by charter, in the 1st of James I. The right of election is vested in the members of the senate, in number about 3900. The Vice-Chancellor is the returning officer.

The number of members on the boards of the University in 1748 was 1500; in 1840 it was 5696; in 1853 it was 7338. The number of resident members averages about 2000. The number of undergraduates (students) is usually about 1700.

It does not belong to the present work to describe the course of study through which the students at Cambridge have to pass. As is generally understood it comprises Theology, Natural and Moral Philosophy, and the literature and languages of Greece and Rome.

There are three University terms which are fixed by invariable rules. They are—the Michaelmas or October term, which begins on the 10th of October and ends on the 18th of December; the Lent or January term which begins on the 13th of January and ends on the Friday before Palm Sunday; and the Easter or Midsummer term, which begins on the 11th day after Easter Sunday, and ends on the Friday after Commencement day, which is always the first Tuesday in July.

Before a candidate can proceed to the examination for Bachelor of Arts, he must, after having been duly matriculated into the University and entered on the boards of one of the colleges, have resided ten terms or the major parts of them, have undergone the "previous examination," or "little-go," and made a declaration that he is *bona fide* a member of the Church of England. The candidates are divided into two classes: "questionists for honors," and "questionists, not candidates for honors," who are familiarly known as the *παιδαί*. The examination extends over a period of 20 days. The candidates of both classes are examined in the higher branches of arithmetic and mathematics, and in the Greek and Latin languages and literature: the examination for honors being of course much the most comprehensive and searching. The names of those who obtain honors are arranged in lists in the order in which they distinguish themselves. The lists are called Triposes. The names of the three classes of merit in the Mathematical Tripos are Wranglers, Senior Optimes, and Junior Optimes: the first man being termed Senior Wrangler. In the Classical Tripos the names are placed under first, second, and third classes; the first man being known as First Classic. These Triposes are published regularly in the University Calendar. In accordance with the terms of a grace adopted by the Senate, October 31, 1848, a similar examination in the moral sciences was commenced in 1851, the names of the successful candidates being arranged in lists called the Moral Sciences Tripos. The subjects of examination are Moral Philosophy, Political Economy, Modern History, General Jurisprudence, and the Laws of England. By a grace which passed the Senate on the same day, an examination for honors in the Natural Sciences was likewise commenced in 1851. The subjects in the Natural Sciences Tripos include Anatomy, Comparative Anatomy, Physiology, Chemistry, Botany, Geology, and Mineralogy, excluding the Mathematical part of Crystallography.

The public buildings belonging to the University are the senate-house, the university library and schools, the university or Pitt press, the Fitzwilliam museum, the anatomical museum, and the observatory. The Senate-house, an edifice of the Corinthian order, erected in 1722, from a design by Sir James Burrell, is a large building, forming the north side of the spacious square, of which the west side is formed by the university library and schools; the east by St. Mary's church; and the south by King's College. In the grand-room of the senate-house all the more important public ceremonies take place. The original building known as the Schools was erected about the middle of the 15th century; the part which fronts the square was rebuilt in 1775, at the expense of the University, assisted by liberal benefactions. The noble library of the University, a collection comprising about 170,000 volumes of printed books, and 2000 valuable manuscripts, is contained partly in the upper story of the public schools; the remainder is in the new University Library, a handsome edifice, erected from a design by C. R. Cockerell, Esq., R.A. The Botanic Garden occupies three or four acres; the ground with a large and ancient edifice, formerly belonged to the Augustine Friars: it was purchased by the late Dr. Richard Walker, vice-master of Trinity College for 1600*l.* This site having become insufficient, an Act of Parliament was obtained which empowered the University to procure a fresh one and dispose of the former. A piece of ground of about 30 acres, within a mile of the town, was accordingly purchased, and has been in part laid out and planted. The old schools still remain and belong to the Jacksonian professor for the time being; and a new building has been erected for the use of the lecturers in chemistry,

botany, and anatomy. The Geological Museum, and the Mineralogical Museum, both very extensive and valuable collections, are now deposited in one of the wings of the new library. The valuable Anatomical Museum has been placed in a commodious building erected by the University. The Observatory was erected between 1822 and 1824, after the designs of Mr. J. C. Mead, at an expense of upwards of 18,115*l.*; about 6000*l.* of which was raised by subscriptions, and the remainder was granted from the university chest. The building is considered to be well adapted for its purpose. There is an excellent collection of astronomical instruments; the great telescope, of nearly 12 inches aperture and 20 feet focal length, made by M. Cauchoit of Paris, and presented to the University in 1835 by the Marquis of Northampton, stands in a building erected especially for it near the observatory. The Pitt press or University Printing-house, was begun in 1831 and finished in 1833, from a design by Mr. Blom.

Richard Viscount Fitzwilliam, who died in 1816, bequeathed to the University his collection of books, paintings, engravings, &c., with the interest of 100,000*l.*, South Sea Annuities for the erection and endowment of a museum. The building was commenced in 1837, from the designs of Mr. G. Basevi, but that gentleman having been killed by a fall from the tower of Ely cathedral, it was completed, in 1847, under the superintendence of Mr. Cockerell. The Fitzwilliam Museum is a spacious and ornate structure of the Corinthian order, with a noble portico, and is by far the most splendid modern building in Cambridge. The Fitzwilliam collection is a very valuable one. Many of the paintings are undoubtedly original specimens of some of the great masters. The engravings fill 520 folio volumes, and there is a numerous collection of drawings. The books also form a rich library. The pictures bequeathed to the University by Mr. Mosman are now placed in the Fitzwilliam Museum; as well as various other pictures, statues, models, books, manuscripts, &c., which have been presented to the University.

The following are the colleges of this University; with the date of foundation and a few other particulars:—

St. Peter's College, commonly called Peter House, the most ancient college or hall in Cambridge, was founded in 1257 by Hugh N. Balsham, bishop of Ely, for a master and 14 fellows. Besides the 14 foundation fellows, there are 10 bye-fellows, and 62 scholarships. The buildings of St. Peter's College are not remarkable for architectural beauty. A new wing was added a few years back by the Rev. Francis Gishorn, who also founded two bye-fellowships and four scholarships. Cardinal Beaufort, Colonel Hutchinson, the celebrated parliamentary officer, Gray the poet, and Jeremiah Markland the critic, are among the eminent men educated at St. Peter's College.

Clare Hall was founded in 1326 by Lady Elizabeth, sister and co-heir of Gilbert, earl of Clare. The present society consists of a master, 10 senior or foundation fellows, 9 junior, and 3 bye-fellows; and about 50 scholars and exhibitioners. Geoffrey Chaucer was, it is said, a student of Clare Hall. Archbishop Tillotson and John Parkhurst are among its eminent men.

Pembroke College was founded in 1347 by Mary de St. Paul, the widow of Aymer de Valence, earl of Pembroke, under the name of Valence Mary. There are 14 foundation and 2 bye-fellows, 30 scholars, and several exhibitions, chiefly for students from Christ's Hospital, London. Spenser, Gilbert Harvey, and Crashaw, the poets, Ridley the martyr, and William Pitt are among the eminent men of Pembroke College.

Gonville and Caius College, originally styled Gonville Hall, was founded in 1348 by Edmund Gonville, for a master and three fellows. The college was in 1353 removed to its present situation and much added to by William Bateman, bishop of Norwich, who is considered its second founder. But it was re-founded under a royal charter in 1558 by John Caius, M.D., and entitled Gonville and Caius College. It is commonly known as Caius College. It has now 29 fellowships, 42 scholarships, and 26 exhibitions. William Harvey, the discoverer of the circulation of the blood, Bishop Jeremy Taylor, and Dr. Samuel Clarke are among the eminent scholars of Caius College.

Trinity Hall was founded in 1350 by William Bateman, bishop of Norwich, but has been largely indebted to subsequent benefactors. There are 13 fellowships and 15 scholarships. Four law scholarships were established by the college in 1849. Trinity Hall is more particularly appropriated to the study of the civil law.

Corpus Christi College was founded in 1351 by two Guilds in Cambridge, named 'Gilda Corporis Christi' and 'Gilda Beate Marie Virginia.' There are 12 fellowships and 59 scholarships. Among the treasures possessed by this college is a remarkably fine collection of manuscripts left to the college by Archbishop Parker. The principal part of the college building is modern. It was erected from a design by Wilkins. Archbishops Parker, Tenison and Horring; Sir Nicholas Bacon and Fletcher the dramatic poet are among the more eminent of the scholars of Corpus Christi.

King's College was founded in 1441 by Henry VI., about which time he also founded and endowed Eton College. The society of King's College consists of a provost and 70 fellows and scholars; the vacancies in the scholarships being supplied by a regular succession from Eton. "Some peculiar privileges appertain to King's. The provost has absolute authority within the precincts, and by special

composition between this society and the university its undergraduates are exempt from the power of the proctors and other university officers within the limits of the college: and they are in no way examined by the university for their Bachelor of Arts' degree." ('University Calendar.') The whole of the buildings, &c., of King's College are on a scale of great grandeur. The chapel is the finest gothic building in Cambridge, and the finest of its kind in existence. It is the standard example of the perpendicular style. The extreme length of the chapel is 316 feet; the breadth 84 feet. The stone-vaulted roof, 76 feet high, is unsupported, save by the walls. The building is lighted by 26 windows, each nearly 50 feet high, and filled with stained glass. The erection of the chapel was commenced by Henry VI.: the architect appears to have been one Close or Klaus, the father of Nicholas Close, bishop of Lichfield. The remainder of the buildings are mostly of more recent date. The hall, screen, &c., were constructed from the designs and under the superintendence of Mr. Wilkins; they were intended to accord with the chapel in style, but are wholly unworthy of it. Sir Francis Walsingham, Sir William Temple, Sir Robert Walpole, and Bishop Pearson are among the eminent men who have been educated in King's College.

Queen's College was founded in 1446 by Queen Margaret of Anjou, consort of Henry VI., and re-founded in 1465 by Elizabeth Widville, consort of Edward IV. There are besides the president 20 fellows and 21 scholars on the foundation. Thomas Fuller, the author 'British Worthies,' belonged to Queen's College.

St. Catherine's Hall was founded by Dr. Robert Wodeharke, chancellor of the University and provost of King's College, in 1473. The society consists of 14 fellows and bye-fellows, and 13 scholars. Archbishop Sandys, Dr. John Lightfoot, and Ray the botanist were students of St. Catherine's Hall.

Jesus College was founded in 1496 by John Alecock, bishop of Ely. There are 16 fellowships and 49 scholarships and exhibitions. The buildings are pleasantly situated and very interesting. The chapel, the most attractive feature of the college, is of the 12th century, but has been altered a good deal at different times. It was the church of the nunnery which occupied the site of the college. Archbishop Cranmer, Flaustead the astronomer, and the poet Coleridge are among the more famous men of this college.

Christ's College was originally founded by Henry VI. under the name of God's House; but in 1505 Lady Margaret, countess of Richmond and Derby, mother of Henry VII., incorporated the former society and changed the name; at the same time endowing it liberally for the maintenance of a master, 12 fellows, and 47 scholars. The present society consists of a master, 15 fellows, and 54 scholars. There are besides about 38 exhibitions, most of which are tenable by the foundation scholars. Bishop Latimer, Archbishop Bancroft, Henry More, and Paley are among the eminent men of Christ's College: but the most famous of its scholars is John Milton. The college possesses several relics of the great poet. In the garden is a mulberry-tree which is affirmed to have been planted by him.

St. John's College was founded in 1511 by Lady Margaret, countess of Richmond, the foundress of Christ's College. This, after Trinity, is the most important college of Cambridge. The present society consists of the master, 57 fellows and 114 scholars. There is a considerable number of exhibitions. The buildings consist of four extensive courts, three of which are ancient, while the fourth or new court is of recent date. The New Court was constructed from a design by Rickman. Among the eminent men of this college may be named Cecil, Lord Burleigh, the Lord Keeper Williams, and the celebrated Earl of Strafford; Ben Jonson, Otway, and Matthew Prior; Cave the ecclesiastical historian, and Richard Bentley the famous critic.

Magdalene College was founded in 1519 by Thomas Baron Audley. There are 4 foundation and 13 bye-fellowships, and 43 scholarships. The college possesses a very valuable and curious library bequeathed to it by Samuel Pepys, who was a student of Magdalene.

Trinity College was originally endowed by Henry VIII. out of the funds of some suppressed religious houses, and afterwards augmented by his daughter, Queen Mary, for maintaining a master, 60 fellows, and 69 scholars. It occupies the site of several ancient halls and hostels, and is by far the most magnificent establishment in Cambridge. The master is appointed by the crown. The buildings comprise three very spacious quadrangles and one of smaller size. The chapel and the hall are the most remarkable of the old buildings. The library, designed by Sir Christopher Wren, is the most interesting of the more modern buildings: it is a noble room, of its kind perhaps unsurpassed; and it contains a splendid collection of books and manuscripts. The master's lodge, an extensive edifice, is the official residence of the sovereign when visiting Cambridge. The walks of Trinity are very beautiful. Among the eminent men of Trinity are Bacon, Newton, Barrow; the celebrated Earl of Essex, Sir Edward Coke, Donne, Herbert, Dryden, Cowley, Marvell, and Byron.

Emmanuel College was founded in 1584 by Sir Walter Mildmay, Chancellor of the Exchequer and Privy Counsellor in the reign of Queen Elizabeth. There are 15 fellowships, about 50 scholarships, besides several exhibitions. The buildings, which are mostly modern, are neat and spacious. Bishop Bedell, Ralph Cudworth, Joshua Barnes, and Dr. Samuel Parr are among the eminent men of Emmanuel.

Sidney Sussex College was founded in 1598 by Lady Frances Sidney, countess of Sussex. The present society consists of a master, 12 fellows, and 26 scholars. There are several exhibitions. Oliver Cromwell was a student of Sidney Sussex College.

Downing College, the most recent in the University, was founded by Sir George Downing, who bequeathed funds for its endowment in 1717: but it was not till 1800 that the University obtained an order from the privy council empowering the establishment of the college. Eventually the college is to consist of a master, two professors (one of the laws of England, and one of medicine), 16 fellows, and 6 scholars. At present only the master, professors, and three fellows are appointed. The appointment of the remaining fellows and the scholars is reserved until the completion of the buildings. The college was opened in 1821. The buildings are to consist of a spacious quadrangle. Two sides only of this quadrangle are completed: the cost was upwards of 60,000*l*. They were designed by Wilkins and are in a so-called Greek style, but are by no means a favourable example of architectural taste.

(Camden, *Britannia*, edited by Gough; Lysons, *Magna Britannia*; Fuller, *History of the University of Cambridge*; Dyer, *Hist. of University and Colleges of Cambridge*; Carter, *Cambridge*; *Memorials of Cambridge*, by T. Wright, and H. J. Jones; Deighton, *Cambridge Guide*; *Cambridge University Calendar*, &c.)

CAMBRIDGE, Massachusetts, United States, a city and the capital of Middlesex County, is situated in 42° 23' N. lat., 71° 8' W. long., distant 3 miles N.N.W. from Boston, with which it is connected by bridges and by railway across Charles River: the population in 1850 was 15,215. When founded by the New England settlers this place was called New Town; but after the founding of Harvard college the town received its present name, in compliment to the English University of Cambridge. For particulars in reference to Harvard college, now university, we refer to the article BOSTON. Mount Auburn cemetery, which is situated at Cambridge, is also noticed under Boston. The city possesses an observatory and several fine public buildings. A weekly newspaper with several monthly and quarterly literary journals are published in Cambridge. The first printing executed in British America was performed at Cambridge in 1639, with an apparatus sent from England in the preceding year by the Rev. J. Glover, a Dissenting minister. The first thing printed was 'The Freeman's Oath'; the second was an almanac. The first book that issued from the Cambridge press was a version of the Psalms in metre, printed in 1640. In 1663 an edition of the Bible, translated into the Indian language, was printed. Cambridge was for thirty-five years the only place in New England in which printing was carried on.

CAMBRIDGESHIRE, an inland county of England, lying between 52° 1' and 52° 45' N. lat., 0° 31' E. and 0° 16' W. long. It is of an irregular oblong form, having its greatest length about 51 miles, and its greatest breadth 32 miles; and is bounded N. by Lincolnshire; E. by Norfolk and Suffolk; S. by Hertfordshire and Essex; and W. by Bedfordshire, Huntingdonshire, and Northamptonshire. Cambridge, the county town, is 48 or 49 miles in a direct line N. by E. from London. The area of the county is 893 square miles, and the population in 1841 was 164,459; in 1851 it was 185,405.

Surface, Hydrography, and Communications.—The whole northern part of the county and a considerable part of the centre are comprehended in the vast tract of fen-land known as the Bedford Level. The inclosures in this part are chiefly formed by ditches, and the country presents few trees except pollard willows. The towns and villages are on spots which rise above the general level of the fens, and the churches crowning these slight elevations may be distinguished at a considerable distance. To those insulated eminences the designation of 'ey' (island) appears to have been applied; and hence Thorn-ey, Whittlesey, Rams-ey (Huntingdonshire), and other places, derive part of their name. The designation of 'the Isle of Ely' was at first restricted to the insulated eminence on which Ely stands, though it has now a much more extended signification. The southern part of the county has gently-rising hills, with some wood in the parts bordering on Suffolk. The Gogmagog hills, south-east of Cambridge, are the highest in the county. Coach and Horses hill, or Orwel hill, south-west of Cambridge, is about 302 feet above the level of the sea; and Madingley hill, west of Cambridge, 238 feet.

The chief rivers of the county are the Nene and the Ouse, with its tributaries the Cam, Lark, &c. The Nene has only the lower part of its course in this county, the border of which it touches just below Peterborough, where it is divided, and flows in three channels. One arm, under the name of Catswater and the Shire Drain, winds to the north-east and forms the boundary between Cambridgeshire on the one hand and Northamptonshire and Lincolnshire on the other. Another arm, under the names of Whittlesey Dyke and the Well Creek (or the Old Nene River) passes to the east by Whittlesey and March, and joins the Ouse at Salter's Lode Sluice. The third arm (Morton's Leam) proceeds in a tolerably direct line east-north-east to Wisbeach, and from thence north into the Wash. The Shire Drain joins this just at its outfall. The natural channel of the river can now hardly be distinguished, so much has the river become connected with the immense system of artificial drainage and navigation carried on in this part of the country. The Ouse first joins this county below St. Ives, and winds north-east to the Hermitage Sluice, dividing

Huntingdonshire from Cambridgeshire. At Hermitage Sluice the river in its natural course turns to the south-east, and again gradually to the north-east, receiving the river Cam. It then passes the city of Ely, below which it is joined by the Lark. From the junction of the Lark it flows north-east for a few miles, receiving the Little Ouse from Thetford and Brandon; at this point it leaves Cambridgeshire and enters Norfolk, through which county it flows northward till it enters the Wash below Lynn. From Hermitage Sluice a navigable cut, called the New Bedford River, runs north-east in a direct line across Cambridgeshire into Norfolk, after entering which it joins the Ouse at Denver Sluice, where the Old Nene River also joins the Ouse. The natural channel between Hermitage and Denver Sluice is now only navigable, or at least is only used for navigation, so far as is requisite for the navigation of its tributary streams, the Cam and the Lark. A canal from Wisbeach to the Old Nene River connects the navigation of the Nene and the Ouse.

The Cam, or Granta, is formed by the junction of several small streams which rise in Essex, the principal one of them rising between Saffron Walden and Dunmow. From Cambridge, where the navigation commences, the Cam runs north-north-east and falls into the Ouse about three miles above Ely. The Lark, navigable as far as Bury St. Edmunds, properly belongs to Suffolk. It separates that county from Cambridgeshire for about seven miles from its junction with the Ouse; and the Kennet brook, a feeder of the Lark, forms the boundary between these two counties about seven miles before it falls into the Lark.

The canals of these counties are not numerous, except those connected with the fen district, the principal one of which have been already noticed. [BEDFORD LEVEL.] There is a canal from the neighbourhood of Ramsey, Huntingdonshire, called the Forty Foot, or Vermuden's Drain, to the Old Bedford River, which is a cut now scarcely used for navigation, parallel to the New Bedford River. There are navigable cuts from the Ouse to Soham and Reche, and a canal running nearly north and south (the London and Cambridge Junction Canal) connecting the Cam below Cambridge with the Stort (at Bishop Stortford) and the Lea, and ultimately with the Thames. There is a branch from this canal at Great Shelford to Whaddon, between Royston and Huntingdon.

The chief coach roads are those from London to York and Edinburgh (the Great North Road), to Norwich by Newmarket, and to Cambridge; from Cambridge to Huntingdon, Newmarket, and Lynn; and from the Great North Road by St. Ives to Wisbeach. The Great North Road enters the county at Royston, 38 miles from London, and traverses it in a direction about north by west through Huntingdonshire. The road from London to Cambridge through Royston turns off from the Great North Road at Royston and runs north-east to Cambridge, about 13 miles. Another road to Cambridge, branching off from the Great North Road at Puckeridge in Hertfordshire, enters Cambridgeshire near Fulmers or Foulmire, and unites with the road through Royston at Hawkston, about five miles short of Cambridge. The Norwich and Newmarket road enters the county just beyond the village of Great Chesterford, about 46 miles from London, and runs north-east to Newmarket, and finally quits the county to enter Suffolk about five miles beyond Newmarket and 66 miles from London. The north part of the county is traversed by a road which branches off from the high North Road just where this leaves Cambridgeshire to enter Huntingdonshire, and running north-north-east through St. Ives, re-enters Cambridgeshire at Chatteris' Ferry, runs through March to Wisbeach, and to Holbeach, Spalding, and Boston in Lincolnshire. There are several other roads in the county.

The Yarmouth branch of the Eastern Counties railway enters the southern border of Cambridgeshire near Great Chesterford, runs past Cambridge to Ely, where it turns eastward and soon after quits the county. But the East Anglian line continues the railway communication northward to King's Lynn. From the Eastern Counties line a branch belonging to a separate company diverges at Chesterford to Newmarket. But the Newmarket line, although completed, is at present closed: the receipts not having been found sufficient to meet the working expenses, and the affairs of the company being in confusion. From Cambridge there are branch lines eastward to Newmarket, and north-west to St. Ives and Huntingdon: from St. Ives the line is continued northward to March, re-entering Cambridgeshire near Chatteris. From Ely a line which is wholly in this county is open to March; from March it is continued westward to Peterborough, and northward to Wisbeach. A branch of the Great Northern railway leaves the main line at Hitchin in Hertfordshire, and proceeding north-east passes Royston and joins the Eastern Counties line at Cambridge.

Geological Character.—The south and south-eastern parts of the county are occupied by part of the great chalk formation which extends, within the limits of Cambridgeshire, from Newmarket heath to Royston: it forms the mass of the Gogmagog hills, south-east of Cambridge, and of the Royston downs, which are connected with the Luton and Dunstable downs (Bedfordshire), and by them with the Chiltern hills (Bucks). There are also in Cambridgeshire two masses of this chalk detached from the principal mass—the Coach and Horses hill, near Orwel, south-west of Cambridge, and Madingley hill, west of Cambridge. The chalk of Cambridgeshire consists of

two varieties, the upper containing an abundance of the common black flint, and the lower or gray chalk, which contains little or none. The upper is found in the south-east part of the county: the lower chalk forms the principal hills, and occupies the north-west part of the chalk range. The chalk is furrowed transversely by the depression through which the London and Cambridge Junction Canal passes, and which separates the Gogmagog hills from the Royston downs. The district north-east and east of Cambridge is the most level chalk district in England; its flatness alone gives importance to the otherwise inconsiderable eminences of the Gogmagog hills. The chalk district of Cambridgeshire dips gently to the south-east. The chalk rests upon a blue clay, called in the county 'galt,' which is considered as a variety of the chalk-marl formation that crops out from beneath the north-western boundary of the chalk. This formation occupies a considerable extent of surface, extending to the boundary of Huntingdonshire and Bedfordshire; its thickness is variable, averaging perhaps 200 or 220 feet. It is nearly impervious to water. In a few places the iron-sand, which underlies the galt, rises to the surface. It forms excellent garden ground. Throughout the whole of this formation many fragments of mineralised wood are found; when dry they crumble into a fine powder, but when moist and fresh from the earth are definite in form, and have the bark in the utmost state of preservation. The whole of the northern part of the county is over-spread with the fens [BEDFORD LEVEL]; the greater part of which in this county is comprehended in the Isle of Ely. The marshes south of the Old Ouse, about Soham, Wicken, and Reche, are not included in the Isle of Ely.

Surface, Soil, Climate, &c.—The soil of this county is extremely various, consisting of clay, loam, and chalk, both in the uplands and the fens. Although there are some poor commons and heaths, the greater part of the land is fertile. In some spots called white land, which have chalky subsoils, great crops of wheat and beans are raised. The Burwell wheat is in great request for seed in many parts of England, and the cheeses of Cottenham indicate considerable richness in the pastures. The climate in the uplands is mild and healthy, but in the fens agues and fevers prevail when the water has evaporated and left the land in a half-dry state. In proportion as the fens are drained and the land is cultivated, the air becomes more healthy. The upland district is sufficiently varied to afford good situations for residences; but until the beginning of this century a very small proportion of the land was inclosed. During the last thirty years many common-fields, heaths, and fens have been inclosed. Many of these inclosures have taken place under special Acts of Parliament. The villages were mostly situated in hollows, between gentle elevations, where the soil was naturally most fertile; and being scattered through an open country, with their small inclosures and orchards, presented insulated green spots, which formed a strong contrast with the surrounding open fields entirely destitute of trees. The fen district is a dead flat intersected with ditches, canals, and sluggish streams. The soil consists of mud mixed with decayed and half-decayed vegetable matter. When the superfluous water has been removed, a soft spongy surface is left, which is much improved by burning. The ashes thus produced by being mixed with the soil greatly enrich it, and the most luxuriant crops are obtained without any other preparation. When a judicious rotation is adopted, and the ground is not too much exhausted to be restored by proper manures, this land, which is reclaimed from a state of comparative unproductiveness, becomes very valuable. The fens, where they have not been brought into cultivation, produce turf for fuel, and reeds and sedges for thatching and lighting fires. Osier-beds are likewise formed in some places, and give a good return. By the introduction of sainfoin on some of the thin chalky lands, a soil naturally unproductive now supports a great quantity of cattle and sheep, and also bears good crops of corn after having been some years in grass. By judicious surface-draining many soils in the county now too wet to bear turnips or to allow heavy cattle to be depastured upon them in spring or autumn, would become dry and sound; and the water being carried off by the drains, would not stagnate below the surface and keep the ground in a soft state, equally prejudicial to the growth of all plants not usually found in marshes, and to the cattle and sheep depastured on them. A convertible husbandry might then be introduced, the expenses of cultivation much diminished, and the produce greatly increased.

Divisions, Towns, &c.—The divisions of Cambridgeshire have undergone little change since the Domesday Survey. We subjoin a list of the present hundreds, giving also their situation in the county, and their ancient names:—Wisbeach, Witchford, Ely, occupy the northern half of the county, and correspond to the two ancient hundreds of Ely, Staploe (E.)—Staplehou. Cheveley (E.)—Chavelai. Radfield (S.E.)—Radefelle. Chilford (S.E.)—Cildeford. Whittlesford (S.)—Witelasfeld. Triplow (S.)—Trepelau. Armingford (S.W.)—Ermingford. Stow, or Long Stow (S.W.)—Stou. Papworth (W.)—Papoword. North Stow (central)—Norestou. Chesterton (central)—Cestretone. Wetherly (central)—Wederlai. Flodish (central)—Flamindic, or Flamidino. Staine (central)—Stanes. The county itself is called in Domesday Survey *Grantebrigescire*. In that survey the town of Cambridge is taxed as a hundred.

Besides the county town, CAMBRIDGE, this county has one city, ELY; and seven market-towns WISBEACH, MARCH, THORNEY, LINTON,

and SOHAM; NEWMARKET, partly in Suffolk; and ROYSTON, partly in Hertfordshire. Several other places formerly had markets; that at WHITTLESEY has been disused for about fifty years; it seems to have been held by prescription. For notices of these towns we refer to their respective articles. We subjoin a brief notice of the decayed market-towns and some of the more considerable villages, with the population of their several parishes in 1851.

Abington Pigotts, or *Abington-in-the-Clay*, 12 miles S.W. from Cambridge, population 238, had formerly a market on Fridays. It is now a place of no importance. There are two other Abingtons in the county. *Abington, Great*, on the river Granta, 8 miles S.E. from Cambridge, population 331, has an ancient church and a Free school for girls supported by T. Mortlock, Esq. *Abington, Little*, the adjoining parish, population 307, has an ancient church, with some interesting features, of early English date. The King's Arms, Bourne Bridge, in this parish, was a celebrated posting house on the Newmarket road previous to the opening of the railways. *Bulsham*, 10 miles E.S.E. from Cambridge, population 1352, belongs to the governors of the Charterhouse, London. The church is modern; there is a Dissenting chapel; also an Infant school. *Barrington*, on the left bank of the Rhee, 7 miles S.S.W. from Cambridge, population 596, had anciently a market on Mondays. The church is partly of early English date. The Independents have a chapel here. There is a National school. *Bassingbourne*, 13 miles S.W. from Cambridge, population 2148, had formerly a market on Mondays, which was originally granted by Henry III.; also a fair at the festival of St. Peter and St. Paul which lasted for eight days; but these have been long discontinued. The church, which is ancient, contains several good monuments. Royston Union workhouse is in this parish. *Bourne*, about 12 miles W. from Cambridge, population 945, has a large church partly of early English date. The mansion of Earl Delawarr, a handsome modern structure in the Elizabethan style, is in this parish. *Burwell*, 11 miles N.E. from Cambridge, population 2187, is a very extensive parish. The village of Burwell with the connected hamlets of Hightown, Newidun, and North Street, extends for about two miles. The church is a very handsome building of the perpendicular date and style, with windows of large size, and containing very elegant tracery. In the church are some good monuments. There are some remains of an ancient castle. CANTON and CHESTERTON being seats of Poor-Law Unions will be noticed in separate articles. *Chatteris*, 24 miles N.N.W. from Cambridge, population 5138, is a very large and populous village, but has no feature of general interest. Besides the church there are Dissenting chapels; also a National and a British school. *Cottenham*, 7 miles N. from Cambridge, population 2314, has a fine church of ancient date, with a lofty tower surmounted with pinnacles. The Wesleyan Methodists, Independents, and Baptists have places of worship. There is an Endowed Free Grammar school. There are several parochial charities. *Doddington*, 30 miles N. by W. from Cambridge, may be noticed as the largest parish in the county, and the richest benefice in the kingdom. The parish contains 36,985 acres of rich and fertile land; the living, a rectory in the gift of the Peyton family, is returned at 7306*l.* a year: the population of the entire parish, which includes the chapelries of Benwick and March and the hamlet of Wimblington, was 9703 in 1851; that of Doddington itself was 1454. Here was formerly one of the palaces of the bishops of Ely. An Endowed Free school for 28 boys, founded in 1696, had an income from endowment in 1837 of 175*l.*; but no return has been obtained in reference to the present state of the school. *Downham*, or *Little Downham*, Isle of Ely, 17 miles N. from Cambridge and 3 miles from Ely, population 2299, has an ancient church; Wesleyan Methodist and Baptist chapels; and a Free school. The inhabitants are chiefly agricultural. In Downham Park are some remains of the palace of Bishop Cox; they are now used as barns. *Duxford*, 9 miles S. by E. from Cambridge, on the west side of the Eastern Counties railway, population 844, contains two churches, and has several parochial charities. In Duxford are the remains of a monastery, part of which is now used as an inn, part as a barn. *Fen Ditton*, on the Cam, 2½ miles N.E. from Cambridge, population 555, has an endowed Free school and a National school. The chancel of the church is an interesting example of the decorated style. *Fordham*, 16 miles N.E. from Cambridge, population 1584, is a large but quiet and uninteresting village. *Horton*, 7 miles S. by W. from Cambridge, population 459, had formerly a market and two fairs; one fair is now held at Easter. The church is of perpendicular date and style. *Fulbourne*, 5 miles E.S.E. from Cambridge, population 1452, includes the two parishes of All Saints and St. Vigors. The churches of both parishes stood in the same churchyard till 1776, when that of St. Vigors having become much dilapidated, it was taken down under the authority of a special Act of Parliament. St. Vigors' church is of the early English and perpendicular styles. It contains some interesting ancient monuments and brasses, and a wooden pulpit, believed to be of the 14th century, and one of the oldest in the kingdom. There is a Free school in the village. *Gamlingay*, on the border of Bedfordshire, about 14 miles W.S.W. from Cambridge, population 1886, was formerly a market-town, but is now an unimportant village. The parish is very large. The church is a handsome structure. *Grantchester*, 2 miles S.S.W. from Cambridge, population 685, is by some antiquaries supposed to be the *Camboritum* of Antoninus; others suppose that the Roman town stretched

from the present town of Cambridge to Grantchester. The village contains a National school. *Haddenham*, in the Isle of Ely, 13 miles N. by W. from Cambridge: population 2118. The church, a handsome building of the perpendicular style with a very lofty spire, stands on an eminence and is visible for a considerable distance. The Wesleyan Methodists and Baptists have places of worship. The Free school, founded in 1642, had an income from endowment of 76*l.* a year, and had 57 scholars in 1851. *Histon*, 4 miles N.N.W. from Cambridge: population 1011. The church, which is small, is of the early English style, with later insertions. There is a Wesleyan Methodist chapel. There is an endowed Free school, for which a new school-house has been erected within the last few years. *Isleham*, on the border of Suffolk, 20 miles N.E. from Cambridge, population 2236, has a neat gothic church, a Wesleyan Methodist, an Independent, and two Baptist chapels; also two Free schools. *Kingston*, 8 miles S.S.W. from Cambridge, population 315, had formerly a market and two annual fairs; it is now a poor village. *Leverington*, 44 miles N. from Cambridge, population 2143, is an agricultural village of no particular interest. In the church is an excellent latten lectern. *Littleport*, in the Isle of Ely, 14 miles N.N.E. from Cambridge: population, with the hamlets of Old Bank and Apshall, 3832. Littleport has a very handsome church with a lofty tower; a Wesleyan and a Primitive Methodist and two Baptist chapels; also a National school. The inhabitants are chiefly dependent on agriculture. *Long Stanton*, 7 miles N.W. from Cambridge, population 634, contains two churches: St. Michael's, a rude structure of early English date with a thatched roof, and All Saints, a rather handsome gothic building with a lofty tower and spire. In the village is a National school. Long Stanton was the seat of the Hatton family from a very early period until recently. The noble Elizabethan manor-house has been most part pulled down to make way for a new and smaller mansion. The Bishop of Ely had a palace here in which Queen Elizabeth was entertained. *Melbourne*, 10 miles N. by W. from Cambridge: population 1931. The church is a handsome edifice of the decorated style, and contains some good monuments. The Independents and Baptists have places of worship; there is a National school. *Oakington*, 5 miles N.W. from Cambridge, population 694, has a very excellent gothic church; a Baptist chapel; and a National school. *Sawston*, 6 miles S. by W. from Cambridge and 1 mile from the Whittlesford station of the Eastern Counties railway, population 1121, was formerly a market-town, and the vestiges of the market-cross are still standing in the centre of the village. The church, which is very spacious, is partly of the Norman date, with windows of the decorated period, which with various details, and the monuments in the interior, are of much interest to the archaeologist. There are places of worship for Roman Catholics and Independents; also almshouses and other parochial charities. *Sawston manor house*, a picturesque old mansion, was erected in 1557 by Sir John Huddleston, with the materials of Cambridge castle, given to him by Queen Mary. *Shelford, Great*, 4½ miles S. from Cambridge: population 1038, including numerous labourers employed on railway works in progress. The church is of the perpendicular period, and contains some good brasses. There are a place of worship for Baptists, and National and British schools. Extensive flour-mills are in the parish. At Great Shelford is a station of the Eastern Counties railway which is largely used for the conveyance of agricultural produce. *Shelford, Little*, adjoining Great Shelford: population 580. The inhabitants of both parishes are dependent on agriculture. *Stretham*, Isle of Ely, 11 miles N. from Cambridge: population, with Thetford hamlet, 1597. The church is ancient; near it stands a stone pillar. The houses in Stretham are mostly new, a fire having destroyed the greater part of the village in May 1844. *Sutton*, Isle of Ely, 18 miles N. from Cambridge: population 1814. The village consists of one long street; the inhabitants are wholly agricultural. The church, a spacious edifice partly Norman, has two towers with pinnacles, and a spire. The Wesleyan Methodists, Baptists, and Quakers have places of worship. The village stands on an eminence, and commands extensive views. *Swavesey*, 9 miles N.W. from Cambridge, population 1385, formerly possessed a market and a fair. The church originally belonged to a monastery founded here before the conquest; it is chiefly of the decorated style, of which it is a good example. There are chapels for Baptists and Unitarians; National and British schools; and some parochial charities. *Triplow*, or *Thriplow*, 10 miles S. from Cambridge, population 521, has an ancient church; a Dissenting meeting-house; and a British school. Triplow hench was for awhile the head-quarters of the parliamentary army commanded by Fairfax and Cromwell. *Trumpington*, 2 miles S. from Cambridge, population 771, is a sort of suburb to Cambridge. The church is an excellent specimen of the decorated style. Many portions of it are very beautiful; and there are several monuments of much interest—among others a brass of Sir Roger Trumpington, a crusader, who died in 1288, the oldest incised slab known with the exception of one at Stoke D'Abernon in Surrey. In the village is a large mansion belonging to the Pemberton family. *Waterbeach*, an extensive village and parish, 5 miles N. by E. from Cambridge: population 1440. The church is partly of early English date. There are chapels belonging to the Wesleyan Methodists and Baptists; an Endowed Free school; almshouses, and other parochial charities. Since the opening of the Eastern Counties railway, which has a

station here, Waterbeach has considerably increased. *Willingham*, a large agricultural village and parish, about 10 miles N.W. from Cambridge: population 1604. The church is a very fine and spacious edifice partly of early English date, with a lofty tower, and a remarkably good wooden roof. A mortuary chapel has a stone roof of high pitch and of rather uncommon design. There are chapels for Wesleyan Methodists and Baptists; an Endowed Free school for 30 boys; almshouses and other parochial charities. *Wimpole*, 9 miles S.W. from Cambridge, population 452, is chiefly noteworthy as containing the seat of the Earl of Hardwicke. The mansion is a spacious brick building, the centre of which was erected in 1632 by Sir Thomas Chicheley; the wings were added by Lord Oxford; the chief apartments were fitted up by Lord Chancellor Hardwicke. In the picture gallery and principal rooms is contained a very valuable collection of paintings. The library is large and valuable; and there is an extensive and important collection of state papers, now well known by the publication of a portion of them a few years back. Wimpole church was built by Lord Chancellor Hardwicke in 1749; it contains several costly monuments to the Hardwicke family.

Divisions for Ecclesiastical and Legal Purposes.—The county is, for the most part, in the diocese of Ely. The parishes are mostly in the archdeaconry of Ely; a few are in the archdeaconry of Sudbury. There are 165 parishes. By the Poor-Law Commissioners the county is divided into 9 Unions:—Cambridge, Caxton and Arrington, Chesterton, Ely, Linton, Newmarket, North Witchford, Whittlesey, and Wisbeach. These Unions include 173 parishes and townships, with an area of 538,303 acres, and a population in 1851 of 191,514; but the boundaries of the Unions are not strictly co-equal with those of the county. Cambridgeshire is in the Norfolk circuit. The assizes and quarter-sessions are held at Cambridge. County courts are held at Bourne, Cambridge, Ely, March, Newmarket, Royston, Soham, and Wisbeach. The county returns three members to the Imperial Parliament; the borough of Cambridge two; and the University of Cambridge two. Cambridge is the chief place of county election. According to the 'Census of Religious Worship' taken in 1851 it appears that there were then 404 places of worship in the county, of which 176 belonged to the Church of England, 72 to Baptists, 57 to Wesleyan Methodists, 39 to Primitive Methodists, 5 to Wesleyan Reformers, 38 to Independents, and 17 to various smaller bodies. The total number of sittings provided was 104,546.

History and Antiquities.—In the most remote period of British history Cambridgeshire appears to have been inhabited by the Iceni, a powerful nation. In the Roman division of the island this county was included in Flavia Caesariensis. Several British and Roman roads crossed the county: the Ikenold and Ermine Streets are supposed to be British. Ikenold or Icknield Street crosses the county from the neighbourhood of Newmarket to the neighbourhood of Royston. For a considerable part of this distance it runs parallel to the road from Newmarket to London and a little to the left of it. Near the border of Essex it bends to the right and runs westward, just within the boundary of the county, to Royston; whence it gradually turns to the south-west, and runs towards Baldock, Hertfordshire. This ancient road has been in some parts so far obliterated by the plough as not to be easily traceable, in other parts the marks of its course are evident. Ermine Street entered the county at Royston, and ran to the left of the present turnpike-road to Caxton and Godmanchester near Huntingdon. A Roman road in the same direction kept nearly in the line of the present turnpike-road. The great Roman road (Via Devana) which connected the colonies of Camulodunum (Colchester or Maldon) and Deva (Chester) passed through Cambridgeshire, entering the county from Withersfield, near Haverhill in Suffolk, and proceeding with little deviation from a straight line to Cambridge, where it is supposed the Romans had a bridge, and from thence nearly in the line of the present turnpike-road to Godmanchester near Huntingdon. Other roads are still traceable or have been mentioned by antiquarian writers. Roman antiquities of various kinds have been dug up at Cambridge, Soham, Elme, near Wisbeach, and other places. The circular camp of Vandlebury on the Gogmagog hills; Arbury in the parish of Chesterton near Cambridge; Willingham on the edge of the fen; and the earth-works round the sites of Bourne and Camps Castles, are probably of British origin. Vandlebury, from Roman remains found there, appears to have been afterwards occupied by the Romans; and Willingham was occupied and strengthened with new works by William the Conqueror when he besieged the Isle of Ely. At Great Shelford near Cambridge are the remains of a Roman camp; and a Roman embankment, connected with the works for draining the fens, extends some miles from Elme to Tyd St. Giles near Wisbeach. There are some remarkable ancient ditches in this county, as the Devil's Ditch near Newmarket, running north-west and south-east for about 4 or 5 miles, and crossing the London road; Fleamdyke, running parallel to it, at a distance of 6 miles; a third near Bourne Bridge, not far from Linton; and, fourth, a slighter work, near Foulmire, nearly in the same direction as the first two. The Devil's Ditch, the largest probably, and the most perfect, consists of a deep ditch and an elevated vallum, having a slope of 52 feet on the south-west side, where the ditch is, and 26 feet on the north-east side; the whole of the works are about 100 feet in breadth.

In the wars between the Saxons and Danes this county suffered

severely. About the year 870 Cambridge was burnt by the Danish invaders; the monasteries of Ely, Soham, and Thorney were destroyed, and their inmates slaughtered. The first attack of the barbarians on the Isle of Ely was repulsed, but the second was successful; many of the Saxon nobles who had taken refuge there with their effects became the prey of the invaders. In 875, in the reign of Alfred, the larger portion of the Danish army was posted at Cambridge, which had been rebuilt. In 921 an army formed of the Danes settled in East Anglia by Alfred, surrendered at Cambridge to Edward the Elder. In 1010 Cambridge was again burnt by the Danes, who were ravaging the country under their king Svein. When William the Conqueror invaded England, the most obstinate resistance which he experienced was in the Isle of Ely. Hereward le Wake, son of Leofric, lord of Brunne (Bourne?) in Lincolnshire, had been banished in early life for his violent temper, and having signalled his valour in foreign parts, was in Flanders when the battle of Hastings was fought in 1066. Hearing that his paternal inheritance had been given to a Norman, and his mother ill-used, he returned to England and commenced hostilities against the usurpers of his patrimony. The Isle of Ely was his central station, and he built on it a wooden castle which long retained his name. William surrounded the island with his fleet and army, attempting to make a passage through the fens by solid roads in some parts and bridges in others; and either awed by the superstition of the tiffes, or wishing to make it subservient to his interests, he got a witch to march at the head of his army and try the effect of her incantations against Hereward. The Anglo-Saxon, no way daunted, set fire to the reeds and other vegetation of the fens, and the witch and the troops who followed her perished in the flames. The actions of Hereward became the theme of popular songs, and the Conqueror's own secretary, Ingulphus, has penned his eulogium. During his warfare against the Normans his camp was the refuge of the friends of Saxon independence: Morcar earl of Northumbria, Stigand archbishop of Canterbury, Ellgwin bishop of Durham, and others repaired to him. The defence of the Isle lasted till 1074, and the Conqueror penetrated at last only by virtue of a compact with the monks of Ely, whose lands beyond the island he had seized. Hereward, unsubdued, contrived to make his peace with the king, obtained the restoration of his inheritance, and died quietly in his bed.

In the civil wars of Stephen and the Empress Maud, the bishop of Ely, who supported the empress, built a wooden castle at Ely, and fortified the castle of Aldreth (in Haddenham parish), which appears to have commanded one of the approaches to the Isle. The Isle then and afterwards suffered much from the ravages of war, and from famine and pestilence. In the civil war between John and his barons the Isle was twice ravaged by the king's troops, first under Walter de Brunck, and afterwards about 1216 under Fulke de Brent and his confederates. The barons took Cambridge castle, and the king marching into Cambridgeshire did, as Holinshed expresses it, 'hurt enough'; but on the king's retreat the barons recovered the Isle of Ely except one castle, probably that at Ely. In the troubles which marked the close of the reign of Henry III. the Isle was again the scene of contest. It was taken and fortified by the barons, who ravaged the county and took and plundered Cambridge. The Isle was retaken by the king's son, afterwards Edward I., in 1266 and following years. In the civil war of Charles I., the county of Cambridge supported the cause of the Parliament. The University adhered to the royal cause, and the heads of the University voted their plate to be melted down for the king's use. In 1643 Cromwell took possession of Cambridge, and the Earl of Manchester being sent down, expelled the most eminent loyalists from the University; in 1645 Cromwell was again sent to secure the Isle of Ely. When the king was seized by Cornet Joyce in 1647 the parliamentary army was at Kennet, in this county, near Newmarket; but the king was conveyed by Cromwell's order to Childerley, near Cambridge, where Cromwell and Fairfax visited him. On the 9th of June in the same year the king was removed to Newmarket.

Of baronial castles this county has scarcely any remains: there are some remains of a castle in Cheveley Park and at Burwell, both near Newmarket; and earthworks, marking the site of castles, at Ely, Bourne (between Cambridge and Potton, in Bedfordshire), and Castle Camps, near Linton. Some old entrenchments at Swavesey near St. Ives, called the Castle, are probably the remains of a mansion-house. Of Wisbeach Castle and Bassingbourne Castle, near Royston, there are no remains. At Downham in the Isle of Ely are some remains of an ancient palace of the bishops of Ely, and there are some old manor-houses, or remains of manor-houses, in different places. The principal monastic establishments in the county besides those at and near Cambridge, Ely, and Thorney, were Anglesey Priory of Austin canons at Bottisham, between Cambridge and Newmarket; Denny Abbey on the edge of the fens for Nuns Minorites; and Shengay, a house of the Knights Hospitallers at Wendy, near Royston. Of these there are no remains that call for notice. Of ancient ecclesiastical edifices the most striking are at Cambridge and Ely, and Thorney and Whittlesey; but there are various others, parts of which will well repay the attention of the student of gothic architecture.

Cambridgeshire is almost entirely an agricultural county, ranking

the sixth in that respect in England. In 1851 there were three savings banks in Cambridgeshire: at Cambridge, Ely, and Wisbeach. The total amount owing to depositors on the 20th of November, 1851 was 180,986*l.* 18*s.*

CAMBUSNETHAN. [LANARKSHIRE.]

CAMDEN. [CAROLINA, SOUTH.]

CAMDEN. [WALES, NEW SOUTH.]

CAMELFORD, Cornwall, a market-town and the seat of a Poor-Law Union, in the parish of Lanteglos and hundred of Lesnewth, is situated in 50° 37' N. lat., 4° 40' W. long.; distant 12 miles N. by E. from Bodmin, and 228 miles W.S.W. from London. The population of the parish of Lanteglos in 1851 was 1740, of which about one-half belonged to the town of Camelford. The town is governed by a mayor and corporation. The living of Lanteglos is a rectory in the archdeaconry of Cornwall and diocese of Exeter. Camelford Poor-Law Union contains 12 parishes and townships, with an area of 36,012 acres, and a population in 1851 of 7309.

Camelford derives its name from the river Camel or Alan which rises about four miles to the north-north-east, and flows through the town. Camelford was made a free borough by Richard, earl of Cornwall, brother of Henry III., and afterwards king of the Romans. From the time of Edward VI. the borough sent two members to Parliament till it was disfranchised by the Reform Act. In Camelford are the ruins of an ancient chapel; the parish church is at Lanteglos, about a mile and a half from the town; the Wesleyan and Association Methodists and Independents have places of worship in the town. There is an Endowed Free school for 12 boys. The streets are broad and well paved. The town-hall was built about the commencement of the present century by the Duke of Bedford. A manufactory for serge employs some of the inhabitants. The market is on Friday for corn and provisions. A county court is held in Camelford. The neighbourhood of Camelford is supposed by some to have been the scene of the battle in which King Arthur fell, and of another battle fought in 823 between the Britons and the West Saxons, under Egbert. A considerable amount of rain falls at Camelford, from its proximity to high hills.

CAMEROON, or CAMAROENS, a river of Africa, which discharges itself into the Bight of Biafra and into the same estuary as the Malimba, about 45 miles E. from Fernando Po. It has a bar across its mouth, with an average depth of from 15 to 18 feet water over it. Of this river little is known beyond a few miles from the entrance. Like other rivers on this coast, it has been long known to be a great mart for slaves. Palm oil and ivory are obtained here; the latter is considered very fine. The system of traffic is by barter. This river is separated from those to the westward by high land called the Cameroon Mountains, the highest peak of which rises to 13,000 feet above the sea, and is generally capped with snow. The name is derived from the Portuguese word for shrimp, of which there is a great abundance. Each side of the river is governed by a separate chief, whose friendship must be purchased by presents before any traffic is commenced.

CAMPAGNA DI ROMA, the popular and historical name of the most southern part of the Papal States, corresponding in a great measure to the ancient Latium, is bounded N.W. by the Tiber, which divides it from the Patrimonio di San Pietro; N. by the Anio or Teverone; E. by an offset of the Apennines, which divides it from the valley of the Liris or Garigliano in the kingdom of Naples, and which terminates at the sea near Terracina; S. and W. by the Mediterranean. The length of the district thus designated from Ostia to Terracina is about 62 miles, and its greatest breadth from the Apennines to the sea is about 45 miles. It is divided into two regions, the lowlands and the highlands, including the valley of the upper Sacco and part of that of the Teverone. The highlands consist of ramifications of the Apennines; of the offset which divides the valley of the Teverone from that of the Sacco, the ancient Trerus, and on which are the towns of Anagni, Palestrina, &c.; of the Monti Lepini (Volsorum Montes), which divide the valley of Sacco from the Pomptine marshes; and lastly, of the Alban and Tusculan hills which rise in the middle of the plain, and separate the lowlands of the Tiber from the Pomptine marshes. Towards the north the highlands of Alba and Tusculum are connected by some high ground towards Zagarolo with the mountains of Palestrina, thus separating the waters which run eastward into the Sacco and the Liris from those that run westward into the Tiber. The Apennines and the Monti Lepini are mostly rugged and bare; the valley of the Teverone is healthy, and the population robust, though poor; the valley of the Sacco is wide, fertile, and well cultivated. The Alban and Tusculan mounts are covered with trees, vineyards, and gardens; the air is salubrious, and the soil in many places very fertile. Those who talk of the desolation of the Campagna seem to have visited only the lowlands to the right and left of the high road between Rome and Naples, and that only in the summer months; for "in the winter and early part of the spring you see fields and pastures decked in all the luxury of a spontaneous vegetation, numerous herds of cattle and flocks of sheep grazing on the rich grass; but as soon as the hot season comes, a sudden change takes place in the appearance of the country—vegetation ceases—first a yellow, then a gray tinge covers the ground—the dusty soil looks as

if it were calcined by fire—the cattle migrate to the mountains—and the inhabitants disperse.” (Tournon, ‘*Études Statistiques sur Rome*.’) The lowlands of the Tiber, which form the Agro Romano, or territory of the city of Rome, which extends on both banks of the Tiber, and which is often confounded with the Campagna, contain about 550,000 acres, of which about one-half is arable land, the rest pasture and forest, and only about 6000 acres are marsh. This territory is divided into farms of from 1200 to 3000 acres, some however are much larger, as the celebrated farm of Campomorto which probably contains not less than 20,000 acres. All the arable land of this large tract is rented by a small number of wealthy farmers who reside in palaces in Rome and manage the estates by means of *fattori*, or agents and clerks. It is evident that it is not the marshy grounds that cause the unwholesomeness of this part of the country. The surface of the soil is in fact undulating and dry, and slopes gently towards the coast; the malaria must be attributed to other natural causes. In Sir Wm. Gell’s ‘*Topography of Rome and its Environs*,’ which is accompanied with an excellent map, embracing almost the whole province of the Campagna, with the exception of the Pomptine marshes, we find the following statement:—“There are 242,000 rubbi of arable land, 82,000 of which are considered to be in healthy districts, and the rest, being unwholesome, are sown with grain only once in four or five years. Wheat returns about nine to one. The vineyards are 14,600 rubbi; pastures, 162,000 rubbi; orchards, 1400; woods and forests, 170,000: in all 590,000 rubbi, or 2,360,000 acres, besides rocks, sands, marshes, rivers, &c., which occupy about 145,000 rubbi more. There are 700,000 sheep, 100,000 horned cattle, 4000 buffaloes, and 35,000 horses, besides pigs and goats.” This statement however comprises also part of the adjoining province of the Patrimonio di San Pietro, on the right bank of the Tiber. The great plain between the south slope of the Lepini Mountains and the sea, which is known by the name of the Pomptine marshes, extends from Torro Tré Ponti to Terracina, a length of about 22 miles by 10 of breadth; of this extent only the lower tract, about 65,000 rubbi, is really marshy. Pius VI. drained 9000 rubbi which were constantly under water. Of the whole extent of the marshy ground, one-third is susceptible of cultivation; another third is in pasture, and the rest forest or marsh. The extent of the Campagna is about 2400 square miles, of which about one-half is unwholesome, and only inhabited by a permanent population of about 15,000. The total population of the Campagna is 276,325, exclusive of the city of Rome, which in 1852 had a population of 175,838.

The Campagna is divided into two administrative districts—the Comarca di Roma which is under the jurisdiction of the governor of the city of Rome; and the delegation of Frosinone. Such towns in the Campagna as are not noticed in separate articles in this work are given under the heads ROMA, COMARCA DI; and FROSINONE; and the ancient geography of the district is given under LATIUM.

The name of Campagna di Roma was adopted in the middle ages, to distinguish the country from the neighbouring Campania, or Campagna Felice, in the kingdom of Naples. The depopulation of the Campagna of Rome is often, though most erroneously, attributed to Papal misgovernment; it is an historical fact that it was nearly as desolate in the time of Cicero as it is now. The depopulation of the country dates from the early conquest by Rome of the various people who inhabited Latium: the long obstinate resistance of the latter, and especially of the Volsci, in consequence of which most of their towns were destroyed; the subsequent devastations by Sulla; and the custom of the Roman patricians to abandon their vast estates to the cultivation of slaves and the care of overseers. The lowlands near Rome are mentioned as unwholesome by Livy, Cicero, Strabo, Horace, &c. After the fall of the Western empire, the devastation of Latium became complete, and Rome, reduced to a population of less than 20,000 inhabitants, stood literally in the midst of a desert. After the return of the Popes from Avignon in 1377, the population both of Rome and its territory began gradually to increase again. Since the pontificate of Sixtus V., ‘the restorer of public peace and security’ (1585-90), it has been steadily though slowly increasing. It is probably owing to the Papal government that Rome and the Campagna are not reduced to the condition of Babylon or Palmyra. No administration could render the lowlands of the Campagna healthy, or fix a population in them. Those provinces of the Papal States which enjoy a more salubrious atmosphere, such as Umbria, Perugia, the valley of Rieti in Sabina, the Marche, are among the finest, most populous, and best cultivated in all Italy.

The cultivation of the plains of the Campagna is peculiar. The farms, as above stated, are very large. The farmer seldom or never resides upon the estate, the farmhouse being occupied by the *fattore*, or steward, and by herdsmen. In winter the farm is covered with cattle; the sheep then collected in the Campagna amount to about 600,000, and the large gray oxen fed for the Roman market amount to about half that number. The herdsmen ride over the plain dressed in sheep-skin cloaks and armed with long pikes; their horses, almost as wild-looking as themselves, are in the summer turned loose among the woods and morasses along the coast, where with herds of buffaloes and swine they feed till caught again for winter and spring service. When the summer comes, and with it the insalubrity of the soil returns, the sheep and oxen are driven to the Apennines. Some hun-

dreds of labourers are engaged every year from the highlands for the service of one farm, between the months of October and June, and double the number at harvest-time, after which they return to their hills, or come to the hospitals of Rome with the malaria fever. At harvest-time the heat in the Campagna is most intense and the malaria most fatal. The hardy peasants from the Volscian hills for the sake of earning a few crowns reap all day under a scorching sun, and sleep at night on the ground shrouded by the heavy pestilential vapour, which begins to rise after sunset, and which in a week after overcomes the healthiest and hardiest. During the summer months only a small number of permanent servants remains on the farms. This system of farming on a large scale is rendered necessary by the malaria, and the consequent depopulation of the plains. In the highlands and valleys of the Apennines property is much more subdivided, the farms are of moderate size, and most of the villagers have gardens and orchards or vineyards. The highest summits in the Campagna are—Monte Caciame, in the Lepini ridge, 3500 feet; Monte Cavo, in the Alban ridge, 3000 feet; Maschio d’Ariano (Mons Algidus), an eastern projection of the Alban, 2950 feet; Monte Tuscolo, 2000 feet.

(Tournon; Gell; Chateaurieux, *Lettres écrites d’Italie*; *Foreign Quarterly Review*; Murray, *Handbook for Central Italy*; Blewitt, *Handbook for South Italy*.)

CAMPAN. [PYRÉNÉES, HAUTES.]

CAMPANIA, the ancient name of that part of the present kingdom of Naples which is now called Terra di Lavoro. It was celebrated from the remotest times for its extraordinary fertility, and its soft and genial climate. The Osci, or Opici, and Ausones (probably all one people), are the first inhabitants of Campania recorded in history. Etruscan colonies afterwards spread to this country, and founded twelve cities, including Capua, which became the principal city of Campania. The Etruscans of Campania appear to have degenerated from their ancestors, and to have become licentious, indolent, and idle. The Etruscans were driven out or conquered by the Samnites, who finally yielded to the Romans. The cruel invention of the fights of gladiators, afterwards adopted by the Romans, and carried to a frightful extent, is attributed to the Campanians of Capua.

After being allies of Rome the Campanians of Capua took the part of Hannibal, and were severely treated by the Romans in consequence. [CAPUA.] Livy (xxiii.-xxv.) speaks at length of the Campanians, their manners, and the part they took in the second Punic war. The island of Caprea (Capri) was reckoned a part of Campania. The Volturnus was the principal river of Campania. (Strabo, p. 242, &c.) For a description of the country see TERRA DI LAVORO.

CAMPBELTOWN, Argyleshire, a royal burgh and sea-port in the parish of Campbeltown, near the southern extremity of the peninsula of Cantire, stands on a loch or indentation of the coast, which forms an excellent harbour, about two miles long and one mile broad, with from 6 to 13 fathoms’ depth of water. It is situated in 55° 24’ N. lat., 5° 42’ W. long., 65 miles W. by S. from Glasgow. The population of the burgh was 6880 in 1851. The burgh is governed by a provost and 17 councillors, and in conjunction with the burghs of Ayr, Irvine, Inverary, and Oban, returns one member to the Imperial Parliament.

Campbeltown was till 1700 a fishing village; but in that year it was created a royal burgh by William III. It then stood entirely on the property of the Duke of Argyle, and principally on the south-western side of the harbour; but it has since extended round the head of the loch towards the north-eastern side. There are good quays on both sides of the harbour. The intercourse with the mainland has been much increased by steam navigation. The vessels registered as belonging to the port on December 31st 1852 were 21 sailing vessels of 1252 tons, and 2 steam vessels of 259 tons. The vessels entered at the port during 1852 were—Coasting trade, inwards, 751 of 21,356 tons; outwards, 341 of 8645 tons: steam vessels, inwards, 342, tonnage 44,619; outwards, 339, tonnage 43,954. Foreign trade, one British vessel, inwards, tonnage 156.

There are many distilleries in Campbeltown and in the neighbourhood. The principal imports are barley from Ireland, and coals from Glasgow and Ayrshire. The principal exports are highland cattle and sheep, herrings, and whiskey. Fishing is a considerable branch of industry in Campbeltown and its neighbourhood. There is a weekly corn-market. In the parish, and about three miles from the town, coal of inferior quality has been found. There is a canal to facilitate its transport to Campbeltown. Besides the two parish churches, which are collegiate charges, and in one of which the service is in Gaelic, Campbeltown contains chapels for the Free Church and other Presbyterian Dissenters, an Episcopal chapel, and a chapel for Roman Catholics. The town-house is a spacious building with a spire. A weekly market is held on Thursday for the sale of grain and other agricultural produce. In the centre of the chief street of the burgh is an ancient granite cross, elaborately sculptured. It is said to have been brought from Iona. The parish contains the ruins of two chapels, around which are small burying grounds. On the coast are the remains of what have been considered Danish forts.

CAMPBELTOWN. [VAN DIEMEN’S LAND.]

CAMPDEN, CHIPPING. [GLOUCESTERSHIRE.]

CAMPEACHY, a town in Yucatan which forms part of the Mexican Republic, is situated in 20° 0’ N. lat., 90° 30’ W. long., on the west coast of the peninsula of Yucatan, on that portion of the Gulf of

Mexico which is sometimes called the Bay of Campeachy, but more appropriately the Bay of Vera Cruz. The smaller and open bay, about the centre of which the town is built, is properly the Bay of Campeachy. The town contains about 15,000 inhabitants, though some estimates make it 30,000, probably including the suburbs. The houses are constructed of stone, generally of one story only, and being whitewashed, though the windows are without glass, extending along the low flat shore, have a pleasing effect. The streets are rectangular throughout the city, and there are several good public buildings, including six churches, six convents, a handsome theatre used also occasionally for a ball-room, and a college. There is a museum containing a fine collection of shells, other objects of natural history, and numerous Yucatan antiquities, which was founded by two monks, the brothers Comacho. There is also an Alameda, or public walk, planted with double rows of orange-trees and furnished with seats. The town is fortified, but the fortifications were much damaged in 1841-2, when it was besieged unsuccessfully by the Mexicans on the revolt of Yucatan; they have however been completely repaired, and the bastions are mounted with heavy ordnance and mortars. There are some singular old caverns under the town. The harbour is formed by a jetty or mole. The exportations consist of logwood, or Campeachy-wood, cotton, and wax. The wood is cut in several places, especially on the banks of the Rio Champoton, south of the town; and the wax is got from the wild bees without stings, which are common in the country to the east. The country around is very picturesque, well wooded, and the climate is healthy and agreeable. There are many quintas or villas in the neighbourhood of the town, but the hovels of the poor native Indians are anything but agreeable objects.

CAMPLI. [ABRUZZO.]

CAMPO BASSO. (SANNIO.)

CAMPO FORMIO, a village 4 miles S.W. from Udine, in the Venetian province of Friuli, on the high road to Treviso and Venice. It is celebrated for the treaty of peace concluded here, 17th October 1797 between General Bonaparte, in the name of the French republic, and Count Cobentzel and General Moerfeld, the Austrian plenipotentiaries. By that treaty the emperor of Austria resigned Lombardy and Flanders, and received the Venetian States as a compensation. During the negotiations Bonaparte's head-quarters were at Passeriano, a few miles from Campo Formio, near the banks of the Tagliamento.

CAMPSIE. [STIRLINGSHIRE.]

CAMPSIE HILLS, in Scotland, extend between the lower courses of the rivers Forth and Clyde, in a general direction from E.N.E. to S.S.W. They occupy the middle portion of the county of Stirling and the south-east part of that of Dumbarton. More than one-third of Stirlingshire is covered with the Campsie Hills and the valleys belonging to them, but only a small part of Dumbartonshire. The Campsie Hills are not connected with any mountain range of Scotland. To the south of them extends the plain, through the north portion of which the Forth and Clyde Canal runs; and at their western extremity they are separated from the hills of Renfrewshire, which terminate east of Port Glasgow, by the wide and deep bed of the Clyde. They are separated from the mountains skirting the banks of Loch Lomond on the west by the valley of the Leven. The mountains south-east of Ben Lomond are also detached from them. From Buchanan, near Loch Lomond, a plain with an average width of four or five miles extends to the banks of the Forth at Kippen. This plain in its highest parts is hardly more than 200 feet above the sea. Farther east the valley of the Forth divides the Campsie Hills from the high summits in Perthshire and the southern extremity of the Ochill Hills. The rock on which the castle of Dumbarton stands, close to the Clyde, is the south-western extremity of the range; the rock of Stirling Castle is its north-eastern extremity. At nearly an equal distance from both these rocks are the Campsie Fells, the highest portion of the system, which rise to more than 1500 feet above the sea. In these hills the sources of the Carron, the Endrick, and the Glazert are interlocked. From this point the Campsie Fells branch off west and east, and continue about 12 miles in each direction, ending on the west near Killearn. On the east the range divides into two ridges, which inclose the valley of the Carron, till both terminate somewhat more than a mile above Denny. The southern ridge is the higher, and rises in some points to 1350 feet; the northern, which is much lower, separates the valley of the Carron from the hills about the sources of the Bannockburn. From the point where the sources of the Endrick and Carron are interlocked, a ridge branches off in a north-easterly direction, and continues to the banks of the Forth, at Touch, a distance of about 10 miles. At the source of the Glazert another ridge of high land called the Kirkpatrick Hills branches off from the Campsie Hills, which for four or five miles runs south-west, but then declines to the west, in which direction it continues for about 10 miles, till it terminates about a mile from the banks of the Leven, opposite Bonhill. These heights occupy a considerable space, sending off to the south and north offsets which advance southward to the road leading from Dumbarton to Glasgow, where Chapel Hill and Dulnotter Hill are situated. The descent of the Campsie Hills to the north is everywhere gentle, and often terminates in moors; on the south their declivity towards the plain is steep, and the streams are full of rapids and falls. Coal is found in some places.

CAMPUS MARTIUS. [ROME.]

CANAAN. [PALESTINE.]

CANADA, divided into Canada East, or Lower Canada, and Canada West, or Upper Canada, is the most important British settlement on the continent of America. Its southern extremity is Point Pelée, or South Foreland, which extends to the south of 42° N. lat. (near 2° 45' W. long.). No boundary having yet been fixed between Canada and the British possessions to the south and west of Hudson's Bay, it is impossible to assign its extent towards the north. It is however usual to consider all the countries north of the great lakes, which are drained by the rivers that fall into the St. Lawrence, as belonging to Canada; while those drained by the rivers falling into the Atlantic, or Hudson's Bay, are considered as portions of other divisions of the British possessions. Conformably to this notion, the most northern point of Canada lies between 52° and 53° N. lat., at some distance north of the Lake of Manicouagan, near 65° W. long. The most easterly point is Cape Gaspé south-west of the Island of Anticosti, 64° 15' W. long.; and the most western extremity may be considered to be Goose Lake, in 48° 5' N. lat., 90° 14' W. long.

Canada borders on the west, north, and for the most part also on the east, on other British territories, and in these directions its boundary-line is generally undetermined. The meridian of 67° 50' W. long. and the river Ristigouche divide it from the British colony of New Brunswick. On the south and partly on the east Canada is bounded by the United States of North America. The line of demarcation in this direction was ill-defined by the treaty of 1783, so that the frontiers respectively claimed by the British and the United States governments embraced between them a disputed territory of about 8000 square miles. By the treaty signed at Washington, August 9, 1842, the boundary between British North America and the United States was permanently defined on the east, and on the west as far as the Rocky Mountains. The eastern boundary commences at a point called the Monument, at the source of the river St. Croix, thence north following a line marked in 1816 and 1817 to its intersection with the river of St. John and to the middle of the channel of the river; thence to the mouth of the river St. Francis, along its channel and the lakes through which it flows, to the outlet of Lake Polenagamook; thence south-westerly in a straight line to a point on the north-west branch of the river St. John—which point is to be 10 miles distant from the main branch of the St. John, but if the said point is found to be less than 7 miles from the nearest crest of the highlands which divide the rivers flowing into the St. Lawrence and the St. John, then the said point is to recede down the said north-west branch of the St. John to a point 7 miles from the crest—thence in a straight line to where the parallel of 46° 25' N. lat. intersects the south-west branch of the St. John; thence southerly to its source at Metgarrette Portage and along the highlands which divide the rivers falling into the St. Lawrence from those falling into the Atlantic to Hall's stream, and down the middle of it, until the line intersects the old line of boundary surveyed previously to the year 1774 at the 45th degree of N. lat., and thence west along that parallel to the St. Lawrence, or as it is here called the Catarqui. From this point the line is drawn along the course of the river, and through the lakes Ontario, Erie, Huron, and Superior, and the passages which unite these lakes to one another. By the treaty of 1842 the western boundary is altered at the entrance to Lake Superior so as to transfer to the United States the Island of St. George, or Sugar Island. The line is then carried through Lake Superior north of Isle Royale, along Pigeon River and Lakes Saisaginega, Cypross, Bois Blanc, La Croix, Little Vermillion, Nanocan, and La Pluie to Chaudière Falls, thence to the north-western point of the Lake of the Woods (49° 22' 55" N. lat., and 95° 14' 38" W. long.), thence due south to its intersection with the 49th parallel of latitude and along the parallel to the Rocky Mountains. Previously to the treaty of 1783 the extent of Canada to the west was much more considerable than at present—extending as far south as the source of the Mississippi (47° 10' N. lat.), and from the source of this river west to the Rocky Mountains.

The average breadth of Canada from south to north is about 300 miles, and the length from Lake Superior to the Island of Anticosti about 1000 miles. This gives an area of about 300,000 square miles. Another statement gives Upper Canada about 90,000 square miles; Lower Canada, 205,863; and the St. Lawrence River with its estuary, 52,500—making the total surface 348,363 square miles. Nearly the whole of Canada is situated within the basin of the St. Lawrence River, both having one common boundary on the north; but on the south the basin of the St. Lawrence extends to a considerable distance into the United States of America, running from the western extremity of Lake Superior to the most southern point of Lake Michigan, by a line describing a curve towards the point where both lakes approach nearest each other. From the most southern point of Lake Michigan it runs east-south-east to the sources of the river Maumee, which empties itself into the western corner of Lake Erie: it then turns east-north-east towards Lake Erie, and runs parallel to it at an average distance of 15 to 25 miles. So far the elevated land forming the margin of the basin of the river seems to be from 1000 feet to 1200 feet above the level of the sea. At the eastern extremity of Lake Erie the range forming the boundary-line turns due east, and runs parallel to Lake Ontario: but here the distance from the lake

varies from 60 to 70 miles, and the average elevation of the country is estimated at rather more than 1400 feet above the sea. This range, which up to 75° W. long. continues in that direction, east of that meridian turns to the south and joins the Catskill Mountains on the banks of the Hudson (near 42° N. lat.). Between the north-eastern extremity of this ridge of high land and another ridge which begins near 74° W. long. and 43° 20' N. lat. on the southern shores of Lake St. George, the edge of the basin of the St. Lawrence is not formed by a ridge, but by nearly a flat country, which is not more than 500 feet above the level of the sea. Through this break the Great Erie Canal in the state of New York has been cut. From the south corner of Lake St. George the edge of the St. Lawrence basin runs first north by east, but having approached to the distance of 70 miles from the banks of the river, it turns north-east, and runs parallel to its course up to 70° 20' W. long., where it follows the mountain ridge which extends from the origin of St. John's River northward till it approaches within 20 miles of the St. Lawrence. This distance it maintains on an average up to Cape Rozier, at the mouth of the wide estuary of the river. The high land forming the edge of its basin east of Lake George is probably never less than 1500 feet above the level of tide-water.

The whole basin of the St. Lawrence is calculated by Darby to contain 537,000 square miles, of which ;

	Sq. miles.
The upper basin, or that of Lake Superior, contains .	90,000
The middle basin, terminating at the great falls of the Niagara .	160,000
The lower basin, to the mouth of the St. Lawrence .	287,000
	537,000

Of this area Lake Superior covers 43,000 square miles, Lake Huron 16,500, Lake Michigan 13,500, Lake Erie 10,900, Lake Ontario 12,600, and the river St. Lawrence with its wide estuary 52,500 square miles, making in all 149,000 square miles.

According to this calculation the country drained by the efflux of the basin comprises 388,000 square miles, of which about 290,000 belong to Canada and 98,000 to the United States of America. The five great lakes extend from west to east over nearly 15½ degrees of longitude, with a difference of latitude of about 8½ degrees. Their contents amount to more than half of all the fresh water on the face of the globe.

Lake Superior, the true source of the St. Lawrence, is the greatest of all known fresh-water lakes. It is crescent-shaped, convex to the north, and terminating to the south-east and south-west in narrow points. It measures on a curved line drawn through the centre more than 400 miles in length; its extreme breadth is 175 miles, and its circumference, following the sinuosities of the coast, about 1740 miles. Its surface is 627 feet above the tide water in the Atlantic, and appears from various indications on the shores to have been 40 or 50 feet higher at some remote period. Its depth varies much, but is generally very great, and at its maximum is probably 1200 feet. When its surface is agitated by storms it resembles the ocean. It is subject to a considerable rise at the time of the spring-freshes, especially after a rigorous winter. The Thunder Mountain, one of that class of mountains which in some places approach near and form the margin of the lake, is a bleak rock about 1200 feet above the level of the lake, with a perpendicular face of its full height towards the west. It is, says Simpson, "one of the most appalling objects of the kind I have ever seen." The rivers which fall into Lake Superior are not long, but they amount to upwards of 50 of some size, and several are broad at their mouths. In general they are not navigable, or only for a short distance, as they descend in their short course from heights which are from 500 to 614 feet above the lake. The St. Louis, the most considerable of these tributaries, which enters at the extreme south-west angle, is the channel of communication with the Upper Mississippi; it rises 551 feet above the lake. Along the north shores of the lake the rocks are from 300 to 1500 feet high, and would render the navigation dangerous during a gale but for the numerous small islands near the entrance of inlets and bays, in which vessels find shelter. The country is dreary and almost without trees or vegetation; the climate is cold, and game and esculent plants exceedingly scarce. Along the south shore extends a low sandy beach, intersected with rocks of limestone rising 100 feet above the surface of the water. The navigation is dangerous in this part, owing to there being no bay on the whole extent of the coast. Islands only occur along the north shore and towards each extremity of the lake. The largest, called Isle Royale, is said to be 100 miles in length by 40 miles in breadth, but on most maps it has not half these dimensions. The waters accumulated in Lake Superior are carried off by a river issuing at its most eastern angle, called St. Mary's River or Strait. About 12 or 15 miles from the lake it forms the rapids of St. Mary, which are produced by a great mass of water forcing its way through a confined channel. The rapids are nearly 2 miles long, and have altogether a fall of 22½ feet perpendicular height. Canoes sometimes venture to descend the rapids, but generally avoid them by means of a portage about 2 miles long, which connects the navigable parts of the river. As far as the falls the river runs east, but below them it turns to the south-east, and dividing into several channels incloses

numerous islands, of which the most considerable are St. George or Sugar Island, St. Joseph, and Drummond; the island of St. Joseph belongs to Canada; the other two to the United States. This part of the river is navigable for boats and sailing vessels of 6 feet draught. Above the island of Drummond the river widens and soon enters Lake Huron after a course of above 40 miles, in which it falls 32 feet, the rapids included.

Lake Huron is only second to Lake Superior in extent, its greatest length in a curved line between St. Mary's Strait and its outlet being above 240 miles. From south to north it is 186 miles. Its extreme breadth, which lies nearly west-north-west and east-south-east, is about 220 miles; its circuit exceeds 1000 miles. The surface is 595 feet above high water in the Atlantic; the average depth is 1000 feet, but loads have been sunk 1800 feet off the inlet called Saginaw Bay without finding bottom. It is divided into two unequal portions by a series of islands called Manitoulin Islands, and by a peninsula called Cabot's Head. The Manitoulin Islands begin on the east of Drummond's Island in the very mouth of St. Mary's River, and extend east with an inclination to the south for 120 miles. They belong to Canada. One of them, Great Manitoulin, is upwards of 72 miles long, and varies in breadth from 3 to 23 miles, being singularly indented by inlets and coves, which give it a very irregular and broken outline. Its name is derived from the language of the Indians, who regard it as the dwelling of the Great Spirit, or 'Manitou.' It is settled exclusively by Indians. These islands are divided from Cape Hurd, the northern extremity of the peninsula of Cabot's Head, by a strait about 10 miles wide, which contains a few small rocky islands. Cabot's Head projects from the south shores of the lake, about 50 miles into the lake, with an average width of 12 miles. That portion of the lake which is thus separated from its main body is called Georgian Bay, and measures in length from the southern extremity of Natawasaga Bay to St. Mary's Strait about 225 miles. Its south portion east of Cabot's Head has an average width of 50 miles, and lies south-south-east and north-north-west; but between the Manitoulin Islands and the north shores of the lake it does not exceed 7 or 8 miles, and sometimes contracts to 3 miles. At Natawasaga Bay the shores are high, but the lake is free from rocks. Farther north the shores are much indented and fringed by a multitude of small islands and rocks. There is a small naval station at Penetanguishene, an excellent harbour near the head of the bay about 3 miles in length, narrow and landlocked by hills on both sides. The main body of Lake Huron contains very few islands, and is generally of great depth. The shores of Lake Huron opposite the Manitoulin Islands are elevated and broken, especially between 81° and 82° W. long., where there is a bold ridge of hills called Cloche Mountains extending about 40 miles along the coast, and exhibiting distinctly three or four elevated summits. From Cabot's Head to the outlet of the lake the shores are in general low, or of very moderate height. This is a dangerous part of the coast, having no shelter for large vessels from the violent westerly winds except the artificial harbour of Goderich. The western shores of the lake do not rise to a great height, and form nearly in the middle a deep and wide inlet—Saginaw Bay, which is 60 miles long by 20 miles wide. Among the rivers falling into Lake Huron three are remarkable—the Franquais, or French River, the outlet of Lake Nipissing; the Muskoka, the outlet of the lake of that name; and the Severn, which issues from Lake Simcoe. The Severn is not navigable. At its north-western extremity Lake Huron is united to Lake Michigan by the Strait of Machillimackinac, which is only 6 miles long and 8 miles wide. Lake Michigan is nearly 300 miles long, with an average width of 75 miles, and very deep. Its form is elliptical and regular, except a break in the west coast, which forms the Green Bay, and is said to extend 100 miles parallel to the lake, and another bay on the opposite side called Grand Traverse Bay. Its shores are everywhere of a moderate height. This lake is surrounded by the territories of the United States. Its level is lower than that of Lake Huron, and a current constantly sets into it from the latter.

The river St. Clair issues from the south point of Lake Huron, and runs 30 miles between moderately high banks till it expands into Lake St. Clair, which is about 30 miles in diameter and shallow, but has sufficient depth in its channel to admit steamboats and schooners; and the same is the case with the river St. Clair. The shores of the lake are low and level; and it receives from the east two considerable rivers, the Great Bear River or Crock and the Thames. Issuing from the south-west angle of Lake St. Clair the river is called Detroit. It first runs west, and then bends in a regular curve about due south to its influx into Lake Erie. Its length is 29 miles, and it is navigable for such vessels as are employed upon the lakes, being from 7 to 8 feet deep. At Amherstburg near its mouth is an excellent harbour. The banks of the river are moderately elevated. The fall between Lake Huron and Lake Erie is 30 feet.

Lake Erie is 265 miles long and 63½ miles broad at its centre; its circumference is computed at 658 miles; and its surface is 565 feet above the sea. It is the shallowest of all the great lakes, its average depth being 85 feet only, with a rocky bottom. The navigation on this lake has rapidly increased since the Great Erie Canal in the state of New York and the Welland Canal in Canada have been formed; but several circumstances combine to render it tedious and dangerous.

The chief of these is the very heavy ground swell which prevails in stormy weather in consequence of the shallowness of the waters. Several elongated points stretch from the north shore into the lake. The most conspicuous are Point Pelée or South Foreland, Point aux Pins or Landguard, Long Point or North Foreland, and Point Abino. The southern shores belonging to the United States are in general low, except between Cleveland and the mouth of the river Huron, where the cliffs rise almost perpendicularly nearly 60 feet above the water-level. This shore has some harbours for small vessels. There are several small islands scattered over the west end of the lake, only one of which, Point Pelée Island, is inhabited. These islands have also in some places good anchorage and shelter for small vessels; and on Cunningham's Island, which belongs to the United States, there is a fine harbour called Put-in Bay, which has 12 feet of water, and is well sheltered. The basin of this lake does not receive any great river except at its west and east extremities. At its west end it receives the Detroit and the Miamce, which flow in the territories of the United States; and at its east end the Ouse or Grand River, whose mouth makes the best harbour on the north shore.

The waters of Lake Erie descend to Ontario by the Niagara River, which commences at the extreme north-east point of Lake Erie, and runs 33½ miles, measured along its course, in a general direction from south to north. Its breadth varies from half a mile to one mile and more. It divides several times into two branches, including some islands; of which the largest, Grand Island, belonging to New York, contains 11,200 acres. A little to the north-west of Grand Island is Navy Island, noted for having been taken possession of by the Canadian rebels under Dr. Mackenzie in 1837. Below Grand Island the river is above one mile wide, and turns to the west, in which direction it flows to the Great Falls, 3½ miles distant, and 20 miles from the beginning of the river. In this distance its waters fall 66 feet, of which they descend 51 feet in the space of the half mile immediately above the falls, so that the river is navigable to the village of Chippewa. The Great Falls are formed where the river suddenly turns to the north-north-east. Above them the banks of the river are very little elevated above the water's edge; but below the falls the current flows rapidly in a bed several hundred feet deep, and walled in on both sides by perpendicular rocks. The cataract consists of two falls, divided from each other by a small island called Goat Island. The fall on the American side is 162 feet high and 375 yards wide; that on the Canadian side, called from its shape the Horseshoe Fall, is 700 yards wide and 149 feet high. The face of Goat Island measures 330 yards. The whole breadth of the river at this point is 1405 yards, and the mass of water projected each minute over the precipice is estimated at 710,000 tons. Four miles lower down is a very strong eddy, called the Whirlpool; and 4 miles below it the river emerges from the rock-bound chasm, and flows in a deep and gentle current between banks of moderate elevation. As more than one-third of the Niagara is not navigable, the navigation of Erie and Ontario has been united by the Welland Canal.

Lake Ontario extends nearly west and east in an elliptical shape, measuring in length 172 miles, and in extreme width nearly 60 miles; its circuit is stated to be 467 miles; the depth varies from 18 feet to 300 feet, except in the centre, where it averages 3000 feet, but is said to be in some places beyond the reach of soundings. Its surface is 234 feet above the tide-water in the Atlantic. Its shores round the west end are of moderate height, they rise higher east of Toronto where they assume a lofty character, but subside gradually as they approach the peninsula of Prince Edward. The remainder of the Canada side up to the beginning of the river Cataraqui is low, and in many places marshy. The southern shores are in general low or very little elevated; at the east end of the lake is a good harbour at Sackets. The Canadian shores have two excellent harbours for vessels of a middling size at Toronto and Kingston: the bays of Quinté and Burlington are also remarkable for extent and security. Two large rivers fall into the lake from the south, the Genessee and the Oswego or Onondaga; on the northern side the Trent falls into the Bay of Quinté. There are some small islands at the east extremity: the largest is Wolfe Island, opposite Kingston, at the efflux of the Cataraqui or St. Lawrence, by which two channels are formed leading to the river; the northern channel is called the Kingston Channel, and the south the Carleton Channel.

The St. Lawrence issues from Lake Ontario by the two channels which surround Wolfe Island, but in this part and generally above Montreal it is called Cataraqui. The part of the river immediately below Wolfe Island presents the appearance of a lake, and is studded with a multitude of small islands varying greatly in extent, shape, and appearance, whence it is called the Lake of the Thousand Islands. The number of these islands is 1692. About 40 miles from Lake Ontario the channel gradually becomes narrower and the current imperceptibly increases, but continues gentle 10 miles farther down to Prescott. Six miles below this place a series of rapids commences, which is almost uninterrupted to the head of Lake St. Francis, immediately below 45° N. lat. The greatest impediments to navigation occur between Johnston and Cornwall, where the river in 39 miles falls 75 feet, and very violent rapids are formed by the heavy volume

of the waters.

The lakes of St. Francis and St. Louis, which follow, are only

expansions of the river. St. Francis is 25 miles long by 5½ miles where widest; St. Louis, which is formed by the junction of the Ottawas or Ottawa River with the Cataraqui, is 12 miles long and 6 miles broad at its greatest width. Between the two lakes lie the rapids of the Coteau, the Cedara, and the Cascades, at the last of which a sudden declivity in the bed of the river, obstructed by rocks in some places, and scooped into cavities in others, produces a most singular commotion. The waters precipitated with great velocity down the declivity are thrown up in spherical figures, and driven with the utmost violence back again upon the current. At the junction of the Ottawa and Lake St. Louis there are four considerable islands formed by the different channels of the river—Montreal, Isle Jesus, Bizarre, and Perrot. Montreal, the largest of them, is a beautiful island of a triangular shape, and contains the city of the same name. The surface of the island is nearly level, with the exception of a mountain (Coteau St. Pierre) and one or two hills of slight elevation, from which flow numerous streams and rivulets. Isle Jesus, separated from the north-west of Montreal by the Rivière des Prairies, is 21 miles long by 6 miles broad, and is level and admirably cultivated. Off its south-west end is Isle Bizarre, about 4 miles in length and nearly oval, well cleared and tenanted. Isle Perrot, 7 miles long by 3 miles broad, lies off the south-west end of Montreal; it is level, sandy, and not well cleared. The small islets De la Paix are annexed to the seignior of Isle Perrot, and serve for pasturages. The principal channel runs between the island of Montreal and the south bank, first due east and afterwards nearly due north. Where it turns to the north there is a picturesque rapid called Sault St. Louis, which is very dangerous and almost impassable for boats and vessels, on account of the great rapidity of the current. A canal called Lachine has been cut through the south-east part of the island of Montreal, which is rather more than 8 miles long, extending from the village of Upper Lachine to Montreal. The Sault St. Louis is the last considerable impediment in the navigation of the St. Lawrence. Some magnificent works have been constructed within the last 12 years for the purpose of improving the navigation between Lake Ontario and Montreal. The series of shorter rapids occurring in the first 33 miles below Prescott has been overcome by means of six locks and four short lateral cuts, measuring collectively 9½ miles. The Cornwall Canal, terminating at the town of Cornwall, is 11½ miles long, with a fall of 48 feet distributed through seven locks, and avoids the most violent rapids on the St. Lawrence. The Beauharnois Canal is situated on the south side of the river; it is 11½ miles in length, has nine locks, and unites lakes St. Francis and St. Louis. These canals give 10 feet depth of water with a width of 80 feet at the bottom; the locks are 45 feet wide, 200 feet long, and give 9 feet depth of water. The Lachine Canal has been enlarged to the same dimensions. Through the new channels thus provided first class vessels run up from Montreal to Toronto and Hamilton, and through the Welland Canal to lakes Erie, St. Clair, and Huron.

Though Montreal is 580 miles from the Gulf of St. Lawrence, vessels of 600 tons get up to it with very little difficulty. Below Montreal the width of the river varies from 3 to 4 miles, till after receiving the river Richelieu at Sorel or William Henry it expands into Lake St. Peter, which is 25 miles long and above 9 miles wide. Groups of islands cover about 9 miles of its surface at its upper end; and farther down shoals stretch from both banks, which are low, far into the lake, so that only a narrow passage from 12 to 18 feet deep is left in the middle. About 10 miles from the lower end of this lake, the St. Lawrence is joined by the river St. Maurice, near the town of Three Rivers, where the tides are sometimes perceptible, though they are generally not much felt for several miles farther down. Three Rivers is 432 miles from the head of the island of Anticosti.

Richelieu Rapid, the last in the St. Lawrence, occurs 52 miles below Three Rivers. The bed of the river is here so much contracted and obstructed by rocks that it leaves only a very narrow channel, in which at ebb tide a rapid is formed that cannot be passed without great care. But when the ocean swell is at its height the rapid disappears, as the tides rise here from 15 to 20 feet. At Quebec, 180 miles below Montreal, the river is only 1314 yards wide, but the navigation is completely unobstructed; and just below the narrow channel lies a deep basin 4 miles wide, formed by the head of the island of Orleans, and serving as a harbour for the city. Below that island the St. Lawrence expands continually till it enters the Gulf. At the mouth of the river Saguenay it is 18 miles, and at Cape des Monts or Mont Pelée 25 miles across; but here the left bank trends suddenly almost north, so that at the Seven Islands the banks are 73 miles apart. The distance between Cape Roziere and Mingan settlement on the Labrador shore is very near 105 miles. This may be considered as the embouchure of the St. Lawrence. Its waters begin to be brackish 21 miles below Quebec and they are perfectly salt at Kamouraska, 75 miles lower down. Several islands occur in the lower and wider course of the river, of which the largest is the island of Orleans, about 10 miles below Quebec, which is about 18 miles long, 5 miles wide, and well cultivated. At the mouth of the river is the large island of Anticosti.

If we consider Lake Superior as the true source of the St. Lawrence, the course of the river is between 600 and 700 miles shorter than that of the Mississippi.

That part of Canada to the north of the great lakes and the river St. Lawrence may be divided into three sections. The most western comprehends the country of Lake Superior and the north shores of Lake Huron, and is divided from that farther east by the range of mountains called La Cloche, which commence opposite the eastern extremity of Grand Manitoulin Island, and extend farther north than they have been explored. This part of Canada is very little known, and contains no European settlement except a few establishments for the fur-trade. It seems to be a table-land of considerable elevation, the surface of which is often slightly broken and covered with small hills, but in other parts spreads out in extensive levels. It is full of small lakes, and is traversed by a great number of small rivers; in some places it is covered with extensive swamps. It is generally well wooded. The middle section extends from the La Cloche Mountains east to the Ottawa, and comprehends all the countries west of that river, and also the peninsula which lies between the lakes Huron, Ontario, and Erie, and terminates at the rivers St. Clair and Detroit. It embraces consequently the whole settled part of Upper Canada and a very small portion of Lower Canada. The surface of this section comprises a table-land of a somewhat uneven surface, two extensive terraces, and a level plain. The table-land comprehends the northern half of this section; its southern edge is marked on the west by the rise in the country between lakes Simcoe and Muskoka. This acclivity continues eastward at a distance of about 20 miles S. of 45° N. lat., and may be considered as terminating a little east of the meridian of 77°. From the shores of the Georgian Bay the country rises rapidly to a considerable height; that portion of the table-land east of Lake Huron is 750 feet above the lake, and 1344 feet above the sea. This height may be considered about the average elevation of the table-land. Its surface is probably not very irregular, except towards the banks of the Ottawa, where it is broken by extensive valleys running parallel to the river, and considerably depressed below the surface of the table-land. About the middle of this elevated country is a depression which contains numerous lakes, united by two rivers, of which one called Nesswabic runs north and afterwards east, and joins the Ottawa; and the other, called Muskoka, runs first south and then west, and after having traversed the Trading Lake and Lake Muskoka, and formed several rapids, empties itself into the Georgian Bay. Towards the north-western boundary is Lake Nipissing, which is above 50 miles in diameter, and is 750 feet above the sea. From its southern extremity issues a river called the Français, or French River, which forms several rapids before it enters Lake Huron. As far as this table-land has been explored it appears to be generally covered with forests of hard wood, and to have a fertile soil. It is still entirely in possession of the native tribes, among which the Mississauga are the most numerous.

The Ottawa, which bounds this country on the east, issues from Lake Temiscaming, but its remotest branches rise nearly 100 miles beyond that lake. Its upper course is only visited by traders in fur and timber. The first European settlement is at Lake Allumettes, not far from the place where the Nesswabic enters the lake. In this part the Ottawa divides into two channels, inclosing between them Black River Island, which is about 15 miles long, with an average breadth of 4 miles. The upper course of this river consists only of a series of lakes, connected by short channels, which always exhibit rapids or falls. Farther down is the Grand Calumet Island, which is about 20 miles long and 7 miles in its greatest width. Both the channels which inclose it are full of rapids. At the Lake Des Chats the Ottawa is joined by the Matawasen, which descends from the table-land by a course of about 100 miles. Lake Chaudière is 18 miles long, with an extreme breadth of 5 miles; at the lower end of this lake commence the falls called Chaudières, or Kettles, from their form, the principal of which is 60 feet high. Below these falls near Hull is the mouth of the Gatineau River, which flows from the north-north-west through an immense valley of rich soil, and is navigable by canoes for more than 300 miles. From this point the Ottawa is navigable for steam-boats to Grenville, a distance of 60 miles: and in this part of its course the banks of the river, which so far are generally high, subside so much that the adjacent country is inundated in spring and autumn for more than a mile. At Grenville is the rapid called Long Sault. At Point Fortune the Ottawa gradually begins to expand into the Lake Two Mountains, which discharges itself by the rapid of St. Anne's into the St. Lawrence where it forms the Lake St. Louis above Montreal. To avoid the rapids the Grenville Canal has been constructed on the north bank between the town of Grenville and the Lake of the Two Mountains. Thus the Ottawa is navigable up to Bytown and the Chaudière Falls, a distance of above 100 miles. The course of the Ottawa from Lake Temiscaming to Lake Two Mountains is about 350 miles. The country bounded by the lower course of the Ottawa and the Catarqui rises with gentle acclivities in the form of terraces from the banks of both rivers. In the eastern districts the highest land extends at no great distance from the Catarqui; but north of the Lake of the Thousand Islands it turns to the west, and continues in that direction till it joins the table-land near 77° W. long. This ridge is probably not more than 700 feet above the sea: it is lowest at its western extremity, where it occupies a greater space and incloses a number of lakes, the greatest of which are the Rideau and Mississippi lakes. Some portions of this

country are marshy, but in general the soil is fertile, and agriculture is rapidly advancing. The comparatively small elevation of the western districts has suggested the formation of a canal between Lake Ontario and the Ottawa. This grand work is called the Rideau Canal from the lake of that name, which it enters at the south and quits at the northern extremity. The canal is 135 miles long, beginning at Kingston on the shores of Lake Ontario, and terminating at the foot of the Chaudière Falls. Lake Rideau, which is about 24 miles long and 6 miles wide on an average, is the summit-level of the canal, from which it descends 283 feet to the Ottawa River, and 154 feet to Lake Ontario. On the north side of Rideau Lake are 30 locks, and on the south side 17 locks. The locks are 142 feet in length, 33 feet in width, the depth of water being 5 feet, so that vessels under 125 tons can navigate the canal.

The country between the table-land and Lake Ontario forms two distinct terraces, which extend from east to west. They are divided from each other by a ridge of hills, which begin between 77° and 78° W. long., near the west end of the Bay of Quinté, about 8 or 9 miles from the shores of Lake Ontario, and run west nearly in a straight line, under the parallel of 44° N. As they proceed farther west they are farther from the lake, so that opposite the town of Toronto the plain along the shores of the lake is 24 miles wide, and where the ridge terminates, near 80° W. long., it is still wider. Between this ridge and the south edge of the table-land is the upper terrace, which is much larger. At the eastern extremity it extends to the shores of the Bay of Quinté, and farther west the southern range remains always about 50 miles distant from the south edge of the table-land; its length is about 150 miles. Both terraces are divided from the low plain, which extends farther west between the lakes of Huron and Erie by a ridge of hills which begins on the north on the shores of Natasawaga Bay, and runs south to the west end of Lake Ontario, where it forms the Burlington Heights, and continues along the shores of Burlington Bay and the south side of Lake Ontario, at a distance not exceeding from 4 to 8 miles. Near Queenstown it reaches the Niagara River, where it forms the Great Falls. It continues in an easterly direction through the state of New York to Lockport, where it is about 12 miles from Lake Erie. It afterwards crosses the Great Erie Canal, runs parallel to it, and subsides at Rochester, on the Genesee River.

The northern and larger of the terraces seems to rise gradually from east to west. In its western district is Lake Simcoe, whose surface covers 300 square miles, and is at least 100 feet above Lake Huron and 468 feet above Lake Ontario. From its north shore issues a considerable river called the Severn, which empties itself into an inlet of Lake Huron, called Gloucester Bay. Barrie, the thriving chief town of the Simcoe district, stands at the head of Kempenfeldt Bay, a large inlet of Lake Simcoe, on its north-west side. Balsam Lake, farther to the east, may be considered as the source of the river Trent, which running east unites the lakes Sturgeon, Pigeon, Shemong, Shibauticon, and Trout, all of which lie on the northern border of the terrace, and extend several miles from south to north. Issuing from Trout Lake the river runs with many windings south, and reaches Rice Lake by a bold bend to the east. This lake, which is 25 miles long, and from 4 to 5 miles wide, lies south-west and north-east, and only 15 miles from Lake Ontario. The Trent leaves the lake at its north-eastern extremity and continues in that direction for about 30 miles, when it turns east, soon afterwards south-west, then east, and afterwards south, till it falls into the Bay of Quinté. The Bay of Quinté is only a long, irregular, and winding lake, divided from Ontario by the peninsula of Prince Edward. Its length measured along its windings is near 50 miles, and its breadth varies from 6 to 12 miles. The isthmus which connects the peninsula of Prince Edward with the continent is, at its western extremity, only three furlongs wide. The peninsula is indented on every side by small bays and coves, offering anchorage and shelter for such vessels as navigate the lakes.

Of the upper terrace the soil, so far as it is known, is fertile, and it contains few sterile tracts except swamps. It is covered with valuable timber. Iron ore is abundant. European settlements are fast increasing. The southern terrace, which terminates in rather a high shore on Lake Ontario, and extends between the peninsula of Prince Edward and Darlington, is generally level and very fertile, with the exception of a sandy plain between Ontario and Rice Lake; west of Darlington the soil along the lake is of an inferior quality.

The plain of Upper Canada comprehends the peninsula which extends between the lakes Erie and Huron, nearly in the form of an equilateral triangle, whose base is formed by a line drawn from Fort Erie, on the inlet of the river Niagara, to Capo Hurl, the north extremity of Cabot's Head, a distance of 216 miles. Another line, cutting it at a right angle and striking Detroit River at Amherstburg, is about 195 miles long. All this tract, which contains about 20,000 square miles, is level, or slightly undulating, except on its east side, where it borders on the hills which separate it from the terraces. About the sources of the Thames indeed it appears to contain some rising ground, the upper plain of which is a kind of swamp or moor. The whole tract is an alluvial soil of great fertility, containing neither stones nor gravel. Most of it is covered with large forests of maple, beech, oak, basswood, ash, elm, hickory, walnut, butternut, chestnut, cherry, birch, cedar, and pine. In the midst of these woods, and some-

times on the banks of the rivers, there are prairies or natural meadows of no great extent, generally covering only a few thousand acres, and containing on their small clumps of lofty pines, white oak and poplar, scattered here and there. The largest of these prairies are in the neighbourhood of Long Point and the rivers Thames and Ouse. The largest river of this plain is the *Thames*, whose sources are in the great swamp which occupies the centre of the country. Its upper course is north and south as far as London, whence its general direction is south-west. It discharges itself into Lake St. Clair, after a winding course of nearly 150 miles. It is navigable for vessels as far as Chatham, 15 miles from its mouth, and for boats nearly to its source; but it has a bar at its entrance. The *Ouse*, or *Grand River*, rises in the hills south of Natawasaga Bay, about 30 miles from it, and runs with a very winding course, first about 75 or 80 miles south, and then nearly the same distance south-east, till it falls into Lake Erie at Sherbrooke. It has more water than the Thames, and is 900 yards wide at its mouth, but the bar across its entrance has only eight feet of water on it. Nevertheless it forms one of the best harbours on the north shore of Lake Erie. The river is navigable about 25 miles from its mouth for schooners, and considerably farther up for large boats. The *Welland*, or *Chippeway*, which rises between the west end of Lake Ontario and the banks of the Ouse, runs east and falls into the river Niagara nearly three miles above the Great Falls. For more than 25 miles from its mouth its depth varies between 9 and 15 feet. It has given its name to the canal which unites the lakes Erie and Ontario. The Welland Canal was formerly navigable only by vessels not exceeding 125 tons. It has of late years been reconstructed so as to give passage to vessels 140 feet long by 26 feet 4 inches beam, and of about 450 tons burden. The aqueduct which carries the canal over the river Welland is an extensive stone structure.

We have now to describe the third great section of Canada north of the St. Lawrence, or that which extends from the Ottawa to the Atlantic, and comprehends the greater part of Lower Canada. About 30 miles below Quebec is Cape Torment, in the neighbourhood of which a mountain rises to the height of 1890 feet above the sea. A line drawn from this point at right angles to the river divides the northern countries into two portions, which are different in features and character. Between the mouth of the Ottawa and Cape Torment the banks of the St. Lawrence are low, or of very moderate elevation, as far as Richelieu Rapid, 52 miles below Three Rivers; but from this point they begin to rise and assume a bold character, which continues increasing to Cape Diamond, on which Quebec stands, and still more towards Cape Torment. Where the banks are low the adjacent country from 5 to 15 miles inland is level, or rises gradually to slightly elevated terraces. Beyond this level the country rises in moderate hills with gentle slopes. The range of hills in the background begins on the banks of the Ottawa near Grenville, and runs nearly parallel to the St. Lawrence in a north-east direction. In the parallel of Quebec it turns east, and covers the country about that town with numerous hills which are divided from one another by fine valleys. The country has thus a different aspect in those districts where the banks of the river begin to be high and bold. The soil of this tract along the river is generally good. The country behind the range of mountains has only been explored along the course of a few rivers. It appears to contain very few tracts fit for agriculture in the narrow river valleys. The intervening spaces are occupied by ranges of high and bare rocks which contain numerous small lakes and swamps. The larger rivers have their origin to the west of the mountain range, break through it, and fall into the St. Lawrence. Those which join it to the south of the Richelieu Rapid are navigable for 20 miles and upwards from their mouth, but are obstructed by rapids and cataracts higher up. The rivers which discharge themselves into the St. Lawrence north of Richelieu Rapid are for the most part too rapid to be navigated; they are used in the spring to float down the timber to the mills situated near their mouth. The largest of these rivers is the St. Maurice, whose upper branches rise far in the interior behind the mountain range. They are three in number, and each of them passes through a considerable number of large lakes. They unite near 48° N. lat., from which point the river runs in a south-east direction with numerous bends to its mouth near Three Rivers, a course of above 150 miles. It is navigable for boats to La Tuque, about 100 miles from its mouth, but there are some rapids which must be avoided by short portages. The country extending north-east from Cape Torment is almost entirely unknown, except the valley of the river Saguenay. The coast has a forbidding appearance. From Cape Torment the ridge continues unbroken, except by the beds of rivers and rivulets, until it lowers 15 or 18 miles below the mouth of the Saguenay. It rises from the water-edge with a steep ascent to an average height of 300 or 400 feet, but in some places of 2000 feet. Farther down it subsides in approaching the Bergeronnes, and sinks to a moderate elevation at Pontneuf, about 40 miles below the mouth of the Saguenay. But towards Pointe des Monts the banks rise again, and continue at a great elevation to the boundary of Labrador. The interior is described by the natives as consisting of rocky cliffs and rugged hills of inconsiderable elevation dispersed over barren plains, and with thick forests studded with crooked and stunted pines, birch, fir, and cedar. Small lakes and swamps abound over the whole tract. The

Saguenay issues from Lake St. John, which covers about 540 square miles and receives several large rivers, of which the Wiatsuan and the Assuapmoussouin are the most considerable; but their course is very imperfectly known. Around Lake St. John are some tracts of cultivable land. Two rivers issue from the east part of the lake, called the Grande and Petite Discharge, and unite after a course of about 40 or 50 miles, forming an island 38 miles long with an average breadth of 17 miles. After their junction the river is called Saguenay, and runs nearly 100 miles to its mouth near Tadoussac. For about half the distance the banks are rich and fertile, but in the lower half they are formed of rocks rising from 200 to 1000 feet in height. The current of the Saguenay is very quick, though its depth is great; it is navigable for vessels of any size for about 70 miles to Ha-Ha Bay, which is a good harbour. The tide ascends to the union of the two Discharges, and rises about 15 feet. A mass of turbid water brought down by this river darkens the stream of the St. Lawrence for many miles.

In the south section of Lower Canada there is a mountain range at the sources of the Connecticut River, on the boundary-line between Canada and the United States, which runs east-north-east to the origin of the St. John River, and thence nearly due north till it approaches within about 20 miles of the St. Lawrence River. It then turns north-east, and continues in that direction parallel to the river, its rocky heights often advancing to the very edge of the water. By this mountain range, which terminates in capes Roziere and Gaspé, the country is divided into three regions, one lying to the west of the mountain range which runs north, the second forming the narrow tract along the St. Lawrence, and the third comprehending a small part of the basin of the St. John River. The western districts of the first region form an almost level plain, on which, at considerable distances, a few isolated mountains rise abruptly above the surface. The summit of Rouville Hill is 1100 feet above the level of the St. Lawrence. This flat country extends almost to the river St. Francis; but towards the south the surface becomes progressively hilly, till it assumes a mountainous character towards the lakes of Memphramagog and St. Francis. The banks of the St. Lawrence are low, and partly marshy, especially on the shores of Lake St. Peter; but lower down they gradually begin to rise, and at the mouth of the Chaudière they are high and bold, and continue so to Point Levy, opposite Quebec. The western level districts have the best soil in Lower Canada, from which wheat is exported to Great Britain. This is probably the most populous and best cultivated part of Canada. Between the St. Francis and the Chaudière the soil varies very much in fertility, and large portions of it are still covered with forests.

The *Chambly*, also called *Richelieu*, *St. John*, *St. Louis*, and *Sorel*, the largest of the rivers of Lower Canada which fall into the St. Lawrence from the south, rises in Lake George, in New York state, which lake is united by a short passage to Lake Champlain. Issuing from Lake Champlain, the Chambly is a wide river, but it grows gradually narrower as it proceeds north, so that at its mouth it is only 250 yards broad, while near Lake Champlain its width exceeds 1000 yards. The upper course is rather violent, and at some places broken by rapids; lower down its current is regular and gentle. It is navigable for decked vessels 12 or 14 miles from its mouth, and to Lake Champlain for boats and canoes. From St. John there is a ship navigation to the towns on Lake Champlain. By this river the produce of part of the state of New York contiguous to Lake Champlain is brought to Montreal. At the mouth is the town of William Henry, or Sorel. The course of the Chambly in Canada is above 70 miles. The *St. Francis* rises in the lake of St. Francis, which is about 18 or 20 miles long, and very irregular in breadth. The river issues from its west side, and runs about 30 miles south-west, where it turns to the north-west, and soon afterwards uniting with the river Magog, flowing from Lake Memphramagog, it continues its course north-west to its junction with the St. Lawrence, a distance of about 70 miles. The numerous rapids and falls render the navigation of this river difficult and laborious; yet the trade upon it is considerable. The *Chaudière* rises in the lake of Megantic, north-east of the sources of the Connecticut, and flows about half of its course north and the other half north-north-west. It is not navigable, owing to the rapids and falls following one another in quick succession. About four miles from its mouth are the Chaudière Falls, which are 130 feet high, the breadth of the river not being more than as many yards. Few falls can be compared with these for picturesque beauty. The course of the river is more than 100 miles. The country along the St. Lawrence, below the mouth of the Chaudière, rises from the banks of the river in irregular ridges, with generally a steep ascent, and attains a considerable elevation at the distance of 10, 15, and 20 miles from the river. It then forms a sort of table-land, which descends gently towards the river St. John. East of Point Levy the banks soon begin to lower, and for some extent are of moderate elevation. At St. Anne they rise into isolated cliffs of considerable height, and continue so to Kamouraska and St. Andrew's. Farther down there is, close to the river, a steep ascent, varying between 150 and 200 feet; and this elevation is still considerably increased opposite Bic Island. From this part to Cape Roziere it maintains nearly the same height and character, except at a few places where the rivers descend from the mountains. A very small part of this country is fit for cultivation, and the population is

inconsiderable. The peninsula of Gaspé, extending between the mouth of the St. Lawrence and the Bay of Chaleurs, contains an elevated valley, skirted by two ranges of high hills, which extend at a short distance from the St. Lawrence and the Ristigouche rivers and the Bay of Chaleurs. In the valley is a series of lakes, which send out rivers that cut the ranges and fall into the St. Lawrence or the Bay of Chaleurs. The settlements are few, and situated along the Bay of Chaleurs, the banks of the St. Lawrence being nearly uninhabited.

That portion of Lower Canada which is drained by the St. John and its tributaries, is in its lowest parts probably several hundred feet above the level of the sea. The *St. John* River has three upper branches, which lie between 46° and 47° N. lat., and west of 70° W. long., and all unite near that meridian. The *St. John*, or, as it is here called, the *Wallooscock*, runs for a great distance north-east through the state of Maine, parallel to the St. Lawrence, and between 30 and 40 miles from it. By degrees it declines to the east, and is here joined by three large rivers, the *Allagash* running from the south, and the *St. Francis* and the *Madawaska* both descending from the north. After its confluence with the *Madawaska* it turns to the south-east, and forms part of the boundary of the province until it enters the British colony of New Brunswick, through which it runs in a southern direction for more than 80 miles. Having passed to the south of 46°, it again turns to the east, and flows 80 miles in that direction, when it again turns south, and after a course of about 60 miles falls into Fundy Bay with a wide estuary. Its course within New Brunswick is above 230 miles; from the frontier of that province to its junction with the *St. Francis* is about 70 miles, and thence to its source about 100 miles. Though descending from an elevated country, this river is more navigable than the others which drain Canada, the lower course of the *St. Lawrence* excepted. The upper part of its course, though not very deep, and in many parts rapid, is not broken by falls or rapids. Near the mouth of the *Madawaska* are the *Little Falls*, and at its entrance into New Brunswick the *Great Falls*, which are 75 feet in perpendicular height. Between these the navigation is practicable for steam-boats. Below the *Great Falls* some rapids occur, but they do not appear to be so strong as to interrupt navigation. Vessels of from 50 to 100 tons ascend to Fredericton, about 100 miles from the mouth.

Geology.—The geological character of Canada, so far as it has been ascertained, is in general granitic, with sandstone and calcareous rocks, the latter of a soft texture, disposed in horizontal strata. The banks of the *St. Lawrence* are in many places formed of a schistous substance in a decaying state; but still granite is everywhere found and always in strata more or less inclined. Cape Torment, 30 miles below Quebec, is a round, massive, granite mountain, about 1000 feet high, and the north shore of the river eastward of that point is generally of the primitive formations. Except in the marshes and swamps, rocks obtrude over all parts of the surface. In many places there occur deep fissures from six inches to two feet wide; the Indians describe some of these rents as several miles long, and 40 or 50 feet deep; when covered with the thick underwood they are at times very dangerous to the traveller. Intense frost may have occasioned these chasms; but the more received opinion attributes them to some great subterranean action, such as the tremendous earthquake recorded in a manuscript in the Jesuits' College at Quebec. The first shock occurred on the 5th of February 1663, and raged with great violence for fifteen minutes, extending simultaneously over 180,000 square miles of country. It continued afterwards to be felt for nearly six months almost without intermission. In the neighbourhood of Quebec a reddish or dark gray slate generally appears, and it forms the bed of the *St. Lawrence* and of *Lake Ontario* as far as *Niagara*. Boulders of granite, limestone, sandstone, syenite trap, and marble occur throughout the same extensive region. The strata laid bare in the chasm at the falls of *Niagara* are limestone, next slate, and lowest sandstone. The upper and lowermost of these strata compose the secondary formations of a large portion of Canada, and of nearly all the vast territory in the United States which is drained by the *Mississippi*. Slate is often interposed between them as at *Niagara*. It is there nearly 40 feet thick, fragile like shale, and crumbling away from beneath the limestone, so as to afford strong ground for the opinion that there has been for many ages a continual retrocession of the *Great Falls*. The islands and the level shores of *Lake Huron* are a calcareous region abounding in organic remains. Part of the northern and eastern shores of *Lake Superior* present old formations—syenite, stratified greenstone, alternating five times with vast beds of granite. Great quantities of the older shell-limestone are strewn in rolled masses on the beach. *Amygdaloid* occupies also a very large tract to the north, mingled with porphyries, conglomerates, and other substances. From *Thunder Mountain* westward trappose-greenstone is the prevailing rock; it forms some strange pilastered precipices near *Fort William*.

Minerals.—The mineral resources of Canada are immense, but till very recently they have been almost wholly neglected. Marbles and serpentine are quite common. Plumbago, ores of antimony, lead, iron, and copper are frequently met with. The mountains north of the *Saguenay* abound in iron to such an extent as to influence the mariner's compass. The iron mines of *St. Maurice* have long been

celebrated for the excellence of their yield, and metal not at all inferior is cheaply produced at *Charlotteville* near *Lake Erie*, and at the *Marmora* works about 32 miles north of the *Bay of Quinté*. The dreary wastes northward of *Lake Superior* contain stores of copper, perhaps unsurpassed anywhere in the world. At the *Coppermine River*, 300 miles from the *Sault de St. Marie* the metal occurs in great masses in a pure state. Gold, silver, and tin have also been discovered in the same region. The northern and western shores of *Ontario* abound in salt springs, some of which (*Stony Creek* and *St. Catherine's*) are very productive. The north shore of *Lake Erie* exhibits immense beds of gypsum which are quarried for agricultural purposes.

Soil, Agriculture, &c.—The soil of Canada is generally good, as that made by the decay of forests for thousands of years upon substrata chiefly formed of the deposit from waters, must necessarily be. It is extremely fertile; in some districts wheat has been raised for 20 years successively on the same ground without manure. The grains cultivated in Canada are wheat, barley, rye, oats, buckwheat, and maize. Wheat is the staple of western Canada, and it bears a higher price than any other in the markets of *Montreal* and *Quebec*. The potato crops are superior, and all the vegetables of the temperate regions of the Old World grew with great luxuriance. All the European fruits, and some even of the tropical, are produced abundantly in this province, owing to the richness of its soil and the great heat of the summer. Tobacco grows well in the western regions. Hemp and flax are both indigenous. The variety of trees found in the vast Canadian forests is astonishing, and it is supposed that many kinds still remain unknown. Of all these none is more beautiful and useful than the maple, the adopted emblem of Canadian nationality. Its timber is valuable for many purposes, and large quantities of excellent sugar are made from its sap. The other forest trees most prevalent are beech, birch, elm, bass, ash, oak, pine, hickory, butternut, balsam, hazel, hemlock, cherry, cedar, cypress, fir, poplar, sycamore, white-wood, willow, and spruce. Timber and ashes, the raw produce of the forests, constitute the chief exports of the province. An immense quantity of oak and pine is annually sent down to *Montreal* and *Quebec*. The American ashes contain a larger proportion of pure potash than those of *Dantzic* or *Russia*.

Zoology.—The wild animals of Canada are deer, moose-deer, bears, wolves, wolverines, four species of the cat kind—namely, the cougar, the *loupcervier*, the catamount, and the *maugay* or *lynx*—foxes, hares, squirrels, &c. The larger beasts of the forest are fast disappearing before the progress of civilisation; of the smaller ones many kinds still remain in diminished numbers. The beaver is now seldom found within reach of the white settlements.

The birds of Canada differ little from those of the same name in Europe. The only noxious reptiles are the rattlesnake, and two species of rattlesnakes; and these are rarely seen in the older settlements. The Canadian waters abound in fish of almost every variety known in England, and others peculiar to the country. Sturgeon of 100 lbs. weight are frequently taken, and a giant species of pike, called the *maskenongi*, of more than 60 lbs. The trout of the upper lakes attain the weight of 80 lbs. or 90 lbs. A fresh-water herring is found in great shoals in the lower lakes, but is inferior in delicacy to the corresponding species of the salt sea. Salmon are numerous in *Ontario*, but are never seen above the *Falls of Niagara*.

Climate.—The extreme range of temperature throughout all Canada is from 36° below to 120° above zero of Fahrenheit's scale; that is to say, from a point two degrees above that at which mercury freezes to a tropical summer heat. The more inhabited parts of the province lie between 42° and 48° N. lat., and their lowest temperature is scarcely under 25°. But healthful and even agreeable as it is on the whole, the Canadian climate everywhere exhibits extremes of heat and cold far exceeding those incident to European countries under the same parallels. Its hygrometric condition is much more constant. Fogs are almost unknown except in the peninsula of *Gaspé*, and such is the dryness of the air that metals exposed to it are seldom rusted. This remarkable peculiarity of a region so abounding in water, greatly mitigates the effects of both extremes of temperature on the human frame; and the cold of winter is moreover tempered in its action thereon by the usual absence of wind during the greatest intensity of the frost. The prevailing winds are from south-west, north-east, and north-west. The south-west is the most frequent; it is generally moderate and accompanied by clear skies. Thunder storms are frequent, and often cause great damage. The *aurora borealis* is often seen and has a much greater brilliancy than in Europe. Water-spouts are sometimes formed on the great lakes.

Circumstances of position and local configuration occasion corresponding varieties of climate in Canada. In the eastern division of the province the fall of snow begins in November and is completed by the end of December, when there ensues perfectly calm frosty weather, with a beautiful clear blue sky. By the first or second week of May the snow has all disappeared, summer is fully established, and the vegetation which had been in active progress for a month or more under the snow breaks forth in profuse luxuriance. The climate of Canada West is milder and more equable than that of the eastern division, which along with the humidity of the atmosphere arising from the extensive surface of water presented by the great lakes, makes the climate particularly favourable for the cultivation of

wheat and other cereals. In Canada West out-doors work may be prosecuted at all seasons, but in Canada East this is occasionally rendered impracticable by the severity of the cold. The duration of winter is less by six or eight weeks in some parts westward than in Montreal. The earth in Canada West is seldom frozen more than 12 or 18 inches deep, and the covering of snow is generally not more than a foot and a half or two feet thick. The maximum heat of summer seldom exceeds 85°, and it is generally tempered by pleasant breezes from the lakes. From observations made in her Majesty's observatory at Toronto, it appeared that the highest mean maximum was in the month of July, when it reached 88·11°, and the lowest mean minimum was in the month of December, when it stood at 3·52°. The annual mean was 44·39°. The observations extended over eleven years, 1840-50.

The great lakes are never icebound in their centres. The St. Lawrence is frozen over every winter from Montreal to the Richolien Rapids, but from thence to Quebec only once in about five years. The steamboats on the St. Lawrence and Lake Ontario seldom cease running till near Christmas, and from Toronto to Niagara they generally continue to run through the whole winter. The navigation is entirely re-opened by the first or second week in May.

Canada West is settled for the most part by emigrants and the descendants of emigrants from Great Britain and Ireland, the Irish having rather a majority. In some localities there are large settlements of Pennsylvanian Germans. Canada East is inhabited principally by the descendants of the old French settlers, with the exception of Quebec and Montreal, where there are large trading populations of British origin, and the eastern townships which the British American Land Company have for some time been engaged in settling with British emigrants. The Indians in Canada belong to two nations, the Chippeways or Ojibbeways, and the Mohawks or Iroquois. The former are dispersed over the countries bordering on lakes Superior and Huron, the latter along those bordering the St. Lawrence and between lakes Ontario, Erie, and Huron. A few of them have settled in villages and embraced Christianity; the rest are hunters without fixed abode. Their numbers hardly amount at the largest estimate to 16,000, and are continually decreasing especially in the neighbourhood of the white settlements. The Canadians of French origin have preserved their native language, but they generally speak it incorrectly, and with some intermixture of English words. They are Roman Catholics; they have their own peculiar code of laws—that, namely, which was in use in the times of the ancient French monarchy, and is called 'Contumes de Paris;' and lastly, they hold their lands by an antiquated feudal tenure that acts as an effectual bar to all improvement. The nature of this tenure will be explained hereafter. The Ottawa River to about 20 miles from its confluence with the St. Lawrence, forms the boundary between the two main divisions of the province.

LOWER CANADA, or CANADA EAST, is divided into 36 counties, the names of which we give here with the population of each in 1851:—Beauharnois, 40,213; Bellechasse, 17,982; Berthier, 34,608; Bonaventure, 10,844; Chambly, 20,576; Champlain, 13,896; Dorchester, 43,105; Drummond, 16,562; Gaspé, 10,904; Huntingdon, 40,646; Kamouraska, 20,396; Leinster, 29,690; L'Islet, 19,641; Lotbinière, 16,567; Mégantic, 13,835; Mississquoi, 13,484; Montmorency, 9598; Montreal, 77,381; Nicolet, 19,657; Ottawa, 22,993; Portneuf, 19,366; Quebec, 61,526; Richelieu, 25,686; Rouville, 27,031; Rimonski, 26,882; Saguenay, 20,788; St. Maurice, 27,562; St. Hyacinthe, 30,623; Sherbrooke, 20,614; Shefford, 16,482; Stanstead, 13,898; Terrebonne, 26,791; Two Mountains, 30,470; Vaudreuil, 21,429; Verchères, 14,393; Yamaska, 14,748;—total population of Canada East, 890,261.

In Canada East are Montreal, which was selected at first as the capital of the united province, and Quebec. [MONTREAL; QUEBEC.] The other towns are Three Rivers, St. Hyacinthe, Sherbrooke, and Sorel. *Three Rivers* is prettily situated at the confluence of the St. Maurice with the St. Lawrence, and has a population of 4936. There are iron mines near the town. There is a considerable trade in pot- and pearl-ashes. *Three Rivers* is one of the depôts of the north-west traders, and is on the whole a place of some importance in a commercial point of view. *St. Hyacinthe*, population 3313, in St. Hyacinthe county, is situated on the left bank of the Yamaska River, about 30 miles E. by N. from Montreal. It is the seat of a college. *Sherbrooke*, population 2998, the district town of the eastern townships, is situated at the junction of the Magog with the St. Francis River. Its extensive command of water-power gives it great facilities for manufactures. The chief public building here is the court-house and jail. *Sorel*, or *William Henry*, population 3424, at the confluence of the Richelieu and the St. Lawrence, is likely from its advantageous situation to be of much greater importance than it has yet attained. By the Chambly Canal there is communication between Lake Champlain and the St. Lawrence at Sorel. There is also a railway on the same line of route.

The following villages in Canada East may be named with the population of each in 1851:—Aylmer, in Ottawa county, near the borders of Canada East, population 1169; Batiagar, in Champlain county, population about 750; Beauharnois, in Beauharnois county, population 874; Berthier-en-haut, population about 1600; Chambly,

population, 884; Cote St. Louis, in Montreal county, 995; Fraserville,

1757; L'Assomption, 1084; Longueuil, 1496; Montmagny, in L'Islet county, 1221; St. Eustache, 784; St. John's, Chambly county, 3215; St. Ours, Richelieu county, 542; St. Thérèse, Terribonne county, 1129.

UPPER CANADA, or CANADA WEST, is divided into 42 counties, as follows:—Addington, population 15,165; Brant, 25,426; Bruce, 2837; Carleton, 31,397; Dundas, 13,811; Durham, 30,732; Elgin, 25,418; Essex, 16,817; Frontenac, 30,735; Grey, 13,217; Haldimand, 18,788; Halton, 18,322; Hastings, 31,977; Huron, 19,198; Kent, 17,469; Lambton, 10,815; Lanark, 27,317; Leeds, 30,280; Lenox, 7955; Lincoln, 23,868; Middlesex, 39,899; Northumberland, 31,229; Norfolk, 21,281; Ontario, 30,576; Oxford, 32,638; Peel, 24,816; Perth, 15,545; Peterboro', 15,237; Prescott, 10,487; Prince Edward, 18,887; Renfrew, 9415; Russell, 2870; Simcoe, 27,165; Stormont, 14,643; Victoria, 11,657; Waterloo, 26,537; Wellington, 26,796; Welland, 20,141; Wentworth, 42,619; York, 79,719;—population of Canada West, 952,004. Total population of Canada, 1,842,265.

Canada West contains the cities of Toronto, Hamilton, and Kingston. *Hamilton* is beautifully situated at the western extremity of Burlington Bay, near the shore of Lake Ontario. It was founded in 1813, and became an incorporated town in 1833: the population in 1851 was 14,112. The construction of the Burlington Canal, a short cutting which opens a clear navigation into Lake Ontario, and the improvements of the Desjardins Canal, 5 miles long, which connects Hamilton with the manufacturing town of Dundas, have much promoted the prosperity of the place. It is the district town of Gore district, and as such contains the court-house for the district and other public buildings. The streets are well laid out, and many of the houses are built of stone. There are two market-houses, one of them including an upper story used as the town-hall, a custom-house, a post-office, and a theatre. There are places of worship for Episcopalians, Presbyterians, Wesleyan Methodists, Independents, Baptists, Roman Catholics, and others; news-rooms; and a mechanics institute. Good roads extend in all directions from the city, and numerous stage-coaches keep up communication with the surrounding districts. Steam-vessels ply regularly during the season to Toronto and to Queenstown and Niagara. Hamilton has much increased in commercial importance of late years. The Great Western railway, uniting Hamilton with Windsor on the Canadian side of the Detroit River, will when completed open up a direct communication with the eastern states of the American Union. The line, which is in all about 225 miles in length, has been finished to London, or about half the entire distance. *Kingston*, population 11,585, situated on Lake Ontario, distant 199 miles S.W. from Montreal, and 177 miles E.N.E. from Toronto, was incorporated in 1838. It is advantageously situated at the beginning of the Rideau Canal and the Cataraqui River, and is important in a military as well as a commercial point of view, being the key of the central St. Lawrence, as Quebec is of the river's ward extremity. In its neighbourhood is Navy Bay, a narrow and deep inlet of Lake Ontario, which is the chief naval station on the lakes. The market-house, which contains also the post-office, the town-hall, and several public offices, is a handsome stone building of considerable dimensions. There are places of worship for Episcopalians, Presbyterians, Wesleyan Methodists, Baptists, Roman Catholics, and others. There are here a Presbyterian college, an hospital, a mechanics institute, and news-rooms. Ship-building is carried on. A bridge nearly 600 yards long crosses the river Cataraqui at Kingston. There are several mineral springs in the vicinity.

Of the towns of Canada West the following may be noticed:—*Amherstburg*, a garrison town on the Detroit River, population 1880, is finely situated, the banks of the river in the vicinity of the town being very beautiful. The town received in 1845 a charter to hold a fair twice a year. There are Episcopal, Presbyterian, Methodist, Baptist, and Roman Catholic places of worship, a court-house, news and reading-rooms, and a market-place. British and American steamers frequently call. Several handsome dwelling-houses are in the neighbourhood of the town. *Barrie*, population 1007, commenced in 1832, is now the district town of Simcoe district. One of the railway projects of Canada is a line from Toronto to Barrie. There are in the town a court-house, several places of worship, a mechanics institute, and a jail. Steam-vessels ply on Lake Simcoe, which by the river Severn communicates with Georgian Bay and Lake Huron. *Belville*, population 4569, situated about 60 miles W. from Kingston on the Bay of Quinté, is a place of considerable trade. There are here a court-house for the district of Victoria, several places of worship, and some other public buildings. Steam-vessels call regularly at Belville. *Brantford*, population 3877, on the left bank of the Grand River, about 74 miles W. by S. from Hamilton, was commenced in 1830. A canal about 2½ miles long with three locks enables vessels of moderate draught to reach the town, thus avoiding the falls of the Grand River. There are chapels for Episcopalians, Presbyterians, Independents, Baptists, and Roman Catholics. Grist-mills, fulling-mills, soap-factories, and other establishments give considerable employment. *Brockville*, population 3246, situated on the river

St. Lawrence, about 56 miles N.E. from Kingston, was founded in 1802; it is now an incorporated town. Most of the houses are built of stone, and the town has a handsome appearance. The court-house and jail, and the churches, of which there are several, are stone-buildings. Tanneries, saw-mills, a brewery, and other works employ some of the inhabitants. Steam-vessels call at Brockville on their passage. *Chatham*, population 2070, on the left bank of the river Thames, 66 miles S.W. from London, and 50 miles E. from Detroit, is a thriving town, with an increasing trade. A steam-vessel belonging to the place maintains a regular communication with Detroit and Amherstburg. There are here saw-mills, tanneries, pottery works, &c. Several places of worship are in the town. *Cobourg*, population 3871, is situated on gently rising ground, on the bank of Lake Ontario, 103 miles W. by S. from Kingston, 72 miles E. by N. from Toronto. The town is well built, and has a good appearance. The harbour and lighthouse are of recent construction. There are churches for the leading denominations of Christians, a court-house, a mechanics institute, &c. Victoria College, founded by the Wesleyan Methodists, but not exclusive in its management, is supported partly by a legislative grant. It has the power to grant degrees. There are here a large cloth-factory, mills, and other works. *Cornwall*, population 1646, situated at the termination of the Cornwall Canal in the St. Lawrence, was incorporated in 1834. There are many good stone dwelling-houses, several churches, and a court-house and jail. Some tanneries, a foundry, and other establishments give employment. *Dundas*, population 3517, a manufacturing town, about 5 miles N.W. from Hamilton, possesses extensive water-power, which has contributed much to its prosperity. The town is surrounded on three sides by high table-land, usually termed 'the mountain;' from this high land freestone and limestone are procured and exported. There are several chapels in the town. There is a mechanics institute. *Coderich*, population 1329, on Lake Huron, at the entrance of the Maitland River, was laid out in 1827 by Mr. Galt, who was at that time Secretary of the Canada Company. The town is finely situated on rising ground, more than 100 feet above the level of the lake. It is about 60 miles N. by W. from London. An expensive harbour was constructed, and a lighthouse was placed at the port, but the town has not been very successful. There are several churches, a court-house, breweries, tan-yards, &c. *Guelph*, population 1860, the district-town of Wellington district, about 42 miles N.W. from Hamilton, was laid out by Mr. Galt in 1828. It is pleasantly situated on elevated ground. The Episcopalians, Presbyterians, Wesleyan Methodists, Independents, and Roman Catholics have places of worship. *London*, population 7035, is finely situated at the junction of two branches of the river Thames, 85 miles W. by S. from Hamilton. It was laid out in 1826 by the crown, and was incorporated in 1840. London suffered severely from fire in 1844 and 1845, but the appearance of the town was much improved by the handsome streets of fine buildings which were subsequently erected. St. Paul's Episcopal church, erected by subscription to replace the edifice burnt down in 1844, is a beautiful gothic structure with a square tower surmounted with pinnacles. The court-house and jail, built of brick in the form of a castle; commodious barracks; two market-buildings; a theatre, and a handsome station of the Great Western railway are among the public buildings of the town. There are good roads in the vicinity. Machine-making, tanning, brewing, &c. are carried on. The central section (Hamilton to London) of the Great Western railway was opened on December 15th, 1853. *Niagara*, population 3340, the district-town of Niagara district, 48 miles E. from Hamilton, was for a few years, under the name of Newark, the capital of the country. It was incorporated in 1845. There are here several churches, a town-hall, and a court-house. The Niagara Harbour and Dock Company, incorporated in 1830, have constructed in their ship-yards numerous barges, schooners, and steam-vessels. Considerable quantities of apples, peaches, and cider are shipped annually from the port of Niagara. *Perth*, population 1916, the chief town of Bathurst district, distant about 40 miles N.W. from Brockville, was laid out by the government in 1816. It stands on the river Tay, which is made navigable to the Rideau Canal by a branch canal about 11 miles in length. The town contains seven places of worship, a court-house and jail, and many good dwelling-houses built of stone. White marble is found a few miles from the town. *Peterborough*, population 2191, occupies a beautiful situation on the Otumbee or Trent River, about 34 miles N.N.W. from Cobourg. It was commenced in 1826, is well laid out, and has a handsome appearance. Part of the town on the east or left bank of the river is called Peterborough East. Most of the places of worship are built of stone. On an elevated site behind the town is the court-house and jail, a handsome stone edifice. There are here woollen manufactories, fulling-mills, saw-mills, chair-factories, breweries, &c. *Picton*, population 1569, chief town of Prince Edward district, is finely situated on the Bay of Quinté. It is an old town, and contains many good stone houses. Steamers call here on their passages between Kingston and Trent. There are several places of worship, a court-house and jail, and a library. A good deal of trade is carried on. Wheat, flour, butter, leather, &c. are exported. *Port Hope*, population 2476, on Lake Ontario, about 8 miles W. from Cobourg, between Toronto and Kingston, is built on the side of a hill commanding interesting views of lake and inland scenery. It

contains some handsome buildings, including four places of worship. Wheat, flour, and timber are the chief exports. *Prescott*, population 2156, on the St. Lawrence, about 12 miles N.E. from Brockville, possessed considerable trade previous to the opening of the Rideau Canal, but since then it has not made rapid progress. Among the buildings are four places of worship, and a custom-house. At this place the river is about a mile and a quarter broad. A good deal of pot- and pearl-ashes is exported. *Sandwich*, population not given separately, on the Detroit River, is finely situated and well laid out. It is one of the oldest towns in Canada, and has assumed very much the appearance of an English country town. Many flower-gardens and orchards are kept by the inhabitants. The Episcopalians and Methodists have places of worship in the town. *Simcoe*, population 1452, the chief town of Talbot district, is situated near the shore of Lake Erie, about 24 miles S. by W. from Brantford. Grist- and saw-mills, a carding-machine and fulling-mill, with other establishments, furnish employment. *St. Catherine's*, population 1368, on the Welland Canal, about 12 miles W. from Niagara, occupies a beautiful situation, and possesses a good trade. Ship-building is carried on. Great quantities of flour are annually exported. There are six places of worship. *Woodstock*, population 2112, chief town of Oxford county in the Brock district, about 32 miles E.N.E. from London, is pleasantly situated. It is composed of East and West Woodstock, forming one street of about a mile long. There are six places of worship, a court-house, and a mechanics institute. Considerable trade is carried on.

A few of the villages may be named:—*Bath*, in Addington county, population about 700. *Chippawa*, population 1193, laid out in 1816, on the Welland River, has a good ship-building trade. The Niagara Harbour and Dock Company have a ship-yard at this place. There are several chapels. Tanning, iron- and brass-founding, wagon-making, &c. are carried on. *Galt*, population 2248, on the Grand River, is situated in a low valley about 25 miles W.N.W. from Hamilton. It possesses good water-privileges, which have favoured the growth of manufactures. The streets are well laid out, and the houses are generally of stone. A considerable quantity of flour is exported. *Ingersoll*, population 1190, on the east branch of the river Thames, about 22 miles E. from London, was commenced in 1831. It possesses three places of worship, several mills and foundries, and a good trade. It has increased considerably of late years. *Oshawa*, population 1142, about 33 miles N.E. from Toronto, in the midst of a farming district, possesses a considerable trade. Several branches of manufacture are carried on. The principal articles of export are wheat, flour, and lumber. There are three places of worship in the village. *Paris*, population 1890, on the Grand River, about 22 miles W. from Dundas, was named Paris from the large quantities of gypsum, or plaster-of-Paris found in the vicinity. The village is finely situated, and is increasing in importance. There are five places of worship. Large quantities of wheat, lumber, and plaster are exported. *Preston*, population 1180, about 3 miles N.W. from Galt, chiefly inhabited by Germans. The village was commenced in 1834. There are chapels for Lutherans and Roman Catholics. *Richmond*, population 434, on the Goodwood River, about 20 miles S. by W. from Bytown, was laid out in 1818 by the Duke of Richmond. There are three churches. A small trade is carried on. *St. Thomas*, population 1274, about 17 miles S. from London, is agreeably situated, and possesses a good trade. There are six places of worship. *Thorold*, population 1091, situated on a hill about 4 miles S. from St. Catherine's, is on the line of the Welland Canal. It contains three places of worship, several mills, a brewery, and other establishments.

History, Government, &c.—Canada was first discovered by John and Sebastian Cabot in 1497. In 1525 it was visited by Verazani, a Florentine, who took possession of the country for the king of France. In 1535 Jacques Cartier, bearing a commission from the French king, explored the river St. Lawrence, which he so called from his having first entered it on St. Lawrence's day; but it was not until 1608 that the first permanent settlement, of which there is any record as having been made by Europeans on the continent of North America, was formed by the French under Champlain, on the spot now occupied by the city of Quebec. Settlements had been made about 1604, or the year following, under grants of Henry IV. of France, near the river St. Croix, and at Port Royal; but these settlements were broken up in 1614, owing to a successful attack upon them by Sir Samuel Argal. Quebec surrendered to the English under Kirk, in 1629, but was immediately restored to France, peace having been established with that country in April of that year. In 1663 the colony was constituted a royal government, and the governors were thenceforth appointed by the king. Canada continued a possession of France until 1759, in which year Quebec was taken by General Wolfe, and the province was ceded in full sovereignty to Great Britain by the treaty of Paris in 1763. The affairs of Canada were regulated by the ordinances of the governor alone till 1774, when under an Act of Parliament called the Quebec Act, a legislative council of 23 members was appointed by the king. The form of government was subsequently altered by an Act styled the Constitution of 1791; under the provisions of which Canada was divided into an upper and a lower province. To each province was assigned a constitution consisting of a governor, an executive council appointed by the crown (similar

to the privy council in England), a legislative council, the members of which were appointed for life by the king, and formed the second estate, and a representative assembly, or third estate, elected for four years. A long course of violent dissensions between the provincial Houses of Assembly and the respective executive governments reached their climax in 1837, when ill-concerted and futile attempts at insurrection were made in both provinces. In the following year the Earl of Durham, who had been appointed governor of Canada and high commissioner for the adjustment of Canadian affairs, made a report, in accordance with which the Act 3 and 4 Vict. c. 35, for the re-union of the provinces was passed on the 23rd of July, 1840. This Act authorises the appointment of a legislative council by the crown of not fewer than 20 members; and enacts, that the two provinces shall return an equal number of representatives to the House of Assembly (at present 42 each); that the city of Toronto shall return two members, and the towns of Kingston, Brockville, Hamilton, Cornwall, Niagara, London, and Bytown, in West Canada, one each; that the cities of Quebec and Montreal shall return each two members, and the towns of Three Rivers and Sherbrooke one each; that the members of the House of Assembly shall be elected for four years; that all writs, proclamations, journals, &c. of the council and assembly shall be in the English language only; that the entire duties and revenues of the province shall form one consolidated fund, and the sum of 75,000*l.* is specifically appropriated for the civil government of the province. The Act was brought into operation during the administration of Mr. Ponlett Thomson, who was created Lord Sydenham. The House of Assembly also passed, with his assent, the 'responsible government' resolutions, for the permanent establishment of this system, whereby the government of the province for the time being is identified in policy with the majority of the representative body.

The tenure of land in the Seigniorial district of Lower Canada, that is, with two exceptions, of lands granted by the crown of France, is as follows:—A tract of land, varying in extent—but sometimes large, as in the case of the seignory of Beauharnois, which is six square leagues—was granted to a seignor, or lord of a manor, to re-grant to others at a certain fixed rent (*cens*). The seignor held of the crown upon the accustomed rents and dues, according to the custom of Paris: he had a local legal jurisdiction, which is now abolished; he performed homage on a mutation of possession; he was to reside by the express condition of some grants (*tenir feu et lieu*); certain timber was to be reserved for public purposes; he was to make roads; he had the privilege of trading with the Indians; with certain other privileges and obligations. Any settler, not already possessed of land, was entitled to demand of right, from the seignor, a grant of waste land, usually of about 90 acres, at the accustomed rent, commonly a 'sol' or penny an acre—a rent of the nature of our chief rent in free and common socage manors; the grantee was personally to occupy his land under the penalty of its re-union to the domain; he was to clear the land; to make and repair roads; with some other provisions of a similar kind. The system had many advantages. The settler had no more land than his means enabled him to cultivate; what he received he was to cultivate; he was to reside; he was not required to apply any part of his previously-accumulated gains in the purchase of his land, and the whole of his capital was free to be employed in agriculture. As his family increased, his children were enabled to apply for new grants, and to extend the settlement of the country.

Upon the establishment of the English authority in Canada, the enforcement of the law against the tenants continued, but was neglected by the crown against the seignors. The mill-service has been abused by conditions of grants that no mill of any kind shall be erected by the tenant. The accustomed rent has been increased, as though it was a farm rent, and this has also been done to evade the penalty of forfeiture imposed on the seignor in case he sold the land for a fixed sum. The abuses of the system occasioned many complaints in the province, connected also with a strong feeling in favour of the commutation of the fines payable on alienation. But instead of submitting the subject to the Provincial Legislature, which was perfectly competent to deal with it, the government passed the Imperial Act of the 6 Geo. IV. c. 59, called 'the Canada Tenures Act,' which placed matters in a worse state than before. Instead of enforcing on the seignors the duty to make grants, which many refused to do; placing the rent in a uniform state, and checking the abuses of the seignors; this Act enabled the seignors by paying the fifth (*quint*) to the crown on the alienation of land, to have the tenure of the land commuted into free and common socage; the waste lands, which they only held on trust for public purposes, became private property; and the tenants, whose grievances were alleged to justify this measure, were left more completely at the mercy of the seignors than before.

There are 223 seignories in Lower Canada. They are almost inclosed by the townships, or lands held in free and common socage. In Upper Canada the land is held upon the tenure of free and common socage. The system of land-holding is defective in not being connected with a general land-tax on all waste lands not in the possession of the crown.

By the establishment of the Canada Company, which was incorporated by Act of Parliament and by Royal Charter in 1826, a considerable impulse was given to emigration from the mother country to

Canada, and to the settlement of many parts of the province. Many public works, and improvements, such as roads, bridges, &c., have been executed by this company, and by the British American Land Company, which was incorporated by Royal Charter and Act of Parliament in 1831. The following table shows the amount of emigration from the United Kingdom to all parts of the world, and the proportion of emigrants who went to British America in the four years 1849-52.

	1849.	1850.	1851.	1852.
Total Emigration from the United Kingdom	299,498	280,819	335,966	367,675
To British North America from the United Kingdom	41,367	32,061	42,605	32,876
Of which, from Ireland	26,568	19,791	23,930	17,693
from England	9,352	10,152	11,675	9,538
from Scotland	5,447	3,025	7,000	5,645

Of the population of Canada East, 890,261, as many as 669,528 are natives of Canada of French origin, and 125,580 are Canadians of other than French origin; 51,499 are of Irish origin; 14,565 of Scotch; 12,482 are from the United States of North America; and 11,230 from England and Wales. The remainder is composed of natives of the European continent, and of our own colonies. In Canada West, the population of which is 952,004, the Canadians of French origin number 26,117, and the Canadians not French, 526,093: the Irish, 176,267; English and Welsh, 82,699; the Scotch, 75,811; natives of the United States, 43,732; natives of Germany and Holland, 9957. With respect to the whole of Canada, of which the total population is 1,842,265, the seven principal items stand as follows:—Canadians of French origin, 695,945; Canadians, not French, 651,673; Irish, 227,766; English and Welsh, 93,929; Scotch, 90,376; natives of the United States, 56,214; of Germany and Holland, 10,116. At the time of the surrender of Canada to Great Britain, the population was chiefly French, and located in the lower province. Although this class has not been much increased by immigration, its numbers have in the course of 90 years increased about 1000 per cent. The progress of Canada West has been still more remarkable. In 1791, the date of the Constitutional Act, the population was 50,000; in 1811 it was 77,000; in 1824 it was 151,097; in 1832 it was 261,060; in 1842 it was 486,055; in 1851 it amounted to 952,004.

The agricultural census in 1852 shows the following results:—Canada East:—Occupiers of land, 94,419; of whom 13,261 held 10 arpents and under; and 4585 held above 200 arpents. The number of arpents held amounted to 8,113,915; of which 3,605,517 arpents were under cultivation; 2,072,953 under crops; 1,502,355 under pasture; and 30,109 in gardens. There were 4,508,598 arpents in wood or wild land. The arpent, which contains about six-sevenths of an acre, is the common measure of land in Lower Canada. Of the land under crops 427,111 arpents produced 3,075,868 bushels of wheat; 42,927 produced 668,616 bushels of barley; 46,007 produced 311,113 bushels of rye; 165,192 arpents produced 1,182,190 bushels of peas; 590,422 yielded 8,967,594 bushels of oats; 51,781 produced 530,417 bushels of buckwheat; and 22,669 arpents produced 400,287 bushels of Indian corn. Of potatoes 4,456,111 bushels were yielded by 73,214 arpents; of turnips 369,909 bushels by 3897 arpents; of clover and other grass-seeds there were raised 18,921 bushels; of carrots 82,344 bushels; of mangel-wurzel, 103,999 bushels; of beans 23,692 bushels; of hops, 111,158 lbs.; of hay, 965,653 tons; of flax and hemp, 1,867,016 lbs. The amount of tobacco obtained was 488,652 lbs.; of wool, 1,430,976 lbs.; of maple sugar, 6,190,694 lbs.; of cider, 53,327 gallons; of full-d cloth, 780,891 yards; of linen 889,523 yards; of flannel, 860,850 yards. The live stock included 111,819 oxen, 294,514 milch cows, 180,317 calves or heifers, 236,077 horses of all ages, 629,827 sheep, and 256,219 pigs. The dairy produce amounted to 9,637,152 lbs. butter, and 511,014 lbs. cheese. Of provisions there were prepared 68,717 barrels of beef, and 223,870 barrels of pork. The fish cured amounted to 48,363 barrels.

Canada West. Occupiers of land, 99,860; of whom 9976 had 10 acres and under, and 3080 had above 200 acres each. The total number of acres held was 9,823,233; of which 3,697,724 acres were under cultivation, 2,274,586 were under crops, 1,367,644 were under pasture, and 55,489 were in gardens. Of wood or wild land there was an extent of 6,125,509 acres in 1852. Of the land under crops, the proportions devoted to the different productions stood thus:—Wheat, 782,115 acres, produce 12,692,852 bushels; barley, 29,916 acres, produce 625,875 bushels; rye, 38,968 acres, produce 479,651 bushels; peas, 192,109 acres, produce 2,873,394 bushels; oats, 421,384 acres, produce 11,193,844 bushels; buckwheat, 44,265 acres, produce 639,384 bushels; Indian corn, 70,571 acres, produce 1,696,513 bushels; potatoes, 77,672 acres, produce 4,987,475 bushels; turnips, 17,135 acres, produce 3,644,942 bushels; clover and other grass-seeds, 42,160 bushels; carrots, 174,895 bushels; mangel-wurzel, 54,226 bushels; beans, 18,109 bushels; hops, 113,064 lbs.; hay, 681,782 tons; flax and hemp, 50,650 lbs. Of tobacco, the production amounted to 764,476 lbs.; of wool, 2,699,764 lbs.; of maple sugar, 3,581,505 lbs.; of cider, 701,612 gallons; of full-d cloth, 527,466 yards; linen, 14,955 yards; and flannel, 1,169,301 yards. The live stock included

193,982 oxen; 296,924 milch cows; 254,988 calves and heifers; 203,300 horses of all ages; 968,022 sheep; 569,257 pigs. The dairy produce consisted of 15,976,315 lbs. of butter, and 2,226,776 lbs. of cheese. Of provisions there were provided 817,746 barrels of beef, and 528,129 barrels of pork. The fish cured amounted to 47,589 barrels. Canada receives from the United Kingdom coals, metal, cordage, East India produce, and the various kinds of British manufactures; from the British West Indies, sugar, molasses, coffee, rum, and hard woods; from the United States, beef and pork, biscuit, rice, and tobacco. The exports of Canada are:—To the United Kingdom, pot- and pearl-ashes, wheat and flour, and timber; to the West Indies, beef and pork, beer, grain, and flour; to the United States, forest produce, wheat, flour, butter, wool, live stock, &c. The imports and exports for four years (1848-51) were as follows:—

Imports.			Exports.		
£	s.	d.	£	s.	d.
1848	2,629,581	17 11	2,302,830	17 6	
1849	2,468,130	6 9	2,193,078	0 3	
1850	3,189,166	3 5	2,457,886	1 2	
1851	4,104,409	0 2	2,663,983	11 4	

The exports in 1851 consisted principally of the following divisions:—Products of the forest, value stated, 1,245,927*l.* 18*s.* 5*d.*; animals and their products, 182,366*l.* 10*s.* 5*d.*; vegetable food, 773,916*l.* 2*s.* 2*d.*; other agricultural products, 7814*l.* 1*s.* 7*d.*; products of the seas, 51,225*l.* 5*s.* 6*d.*; products of the mines, 17,826*l.* 7*s.* 5*d.*; manufactures, 11,327*l.* 10*s.* 3*d.*

The progress of wealth in Canada West may be seen by comparing the amount of assessable property, returned at various periods, as follows:—In 1825 the amount of assessable property in Upper Canada was returned at 1,854,965*l.*; in 1830 it was 2,407,618*l.*; in 1840 it was 4,608,843*l.*; in 1845 it was 6,393,630*l.*; in 1852 the total value of assessable property in Upper Canada, as valued under an Act passed in 1850, which included some kinds of personal property previously exempt, amounted to 37,695,931*l.*; and even this appears to be considered short of the real amount by at least 20 per cent.

Since 1819 the policy of the government has been to alienate roads, bridges, harbours, and some other public works, and to dispose of them to private companies, with certain stipulations as to the continued efficiency of the respective works. Besides these however there are several works of provincial importance which are in the hands of government, such as the St. Lawrence and Welland canals, the Erie Canal, &c. The total cost of these works to 1st January, 1852, was 2,834,231*l.* The net revenue in 1851 was 48,278*l.*, or less than 2 per cent. on the outlay. The revenue is increasing. With respect to railways, the Provincial Act, 12 Vict., cap. 29, passed in 1849, provided that in no case should government advance more than half the amount expended on the works, and that the whole resources and property of the companies should be pledged for the redemption of the advances with interest. On this principle public aid has been extended to the following railways, undertaken since the passing of the Act of 1849:—St. Lawrence and Atlantic railway, from the St. Lawrence opposite Montreal, to the frontier line, length 126 miles; the Ontario, Simcoe, and Huron railway, from Toronto to Lake Huron, 90 miles; Great Western, from Hamilton to Windsor, 228 miles; Quebec and Richmond, 100 miles; Main Trunk, Toronto to Montreal, 380 miles; and the Quebec and Trois Pistoles line, on the route to the lower provinces, 160 miles. Acts have been recently passed by the local legislature to encourage steam communication between Liverpool and Quebec, and to connect Quebec and Montreal by railway with sea-ports open during the winter. A contract has been completed (subject to approval by Parliament) with an eminent firm in Liverpool, by which a line of powerful screw steamers, of not less than 1500 tons burden, are to run between Liverpool and Quebec and Montreal every fortnight during the season of navigation, and to Portland, in the state of Maine, during the winter months. The contract is to extend for 7 years, at a cost to the province of 19,000*l.* sterling per annum; or 11,000*l.* should it be determined to run the steamers monthly during the summer instead of fortnightly.

In April 1851 the management of the post-office was transferred to the control of the provincial authorities. A uniform rate of 3*d.* currency (about 2½*d.*) per half ounce was adopted at the same time, and the result has been satisfactory. The number of miles travelled by the mail during the year ending April 5th, 1852, was 2,931,375; an increase of 444,360 miles over the previous year; 213 new post-offices were opened; the gross revenue during the first year of the reduced system was 59,904*l.*, being only about 18,000*l.* less than the revenue of the last year of the former system.

Special grants of public money are annually made for the support of the common schools. The sum of 41,095*l.* 17*s.* 10*d.* is divided between Upper and Lower Canada for this purpose, in proportion to their respective population. Each school municipality, before receiving any share of this public grant, must raise at least an equal sum by local taxation. In Upper Canada the local contributions greatly exceed the required proportion. In 1851 Upper Canada possessed 3001 common schools, attended by 168,169 scholars; the total sum available for teachers' salaries, and for the erection and repair of school-houses, being 98,226*l.* 15*s.* 7*d.*, of which 20,547*l.* 18*s.* 11*d.* was received out of the parliamentary grant. In Lower Canada, the

principle of local assessment was not so favourably received at first, but the school system is now making more satisfactory progress. In both sections of the province there are also several endowments and special grants for collegiate institutions, normal schools, and other objects of a similar character. In Lower Canada the revenues of the estates of the Jesuits are devoted to education. They amounted in 1841 to 4566*l.*; and a sum of 29,592*l.* on the same account was, in 1844, in the provincial chest without interest. In Upper Canada the University of Toronto was founded by royal charter in 1827, and endowed with property now realising about 11,000*l.* per annum. It was formerly connected with the Church of England; but by an act of the Colonial Legislature which came into force on the 1st of January 1850, it was made a purely secular institution, and its government was placed exclusively in the hands of laymen.

The Roman Catholic creed is professed by seven-eighths of the inhabitants of Lower Canada. Their clergy have for their support 1-26th of all the grain raised on the lands of Catholics, and an annual stipend of 1000*l.* is paid by the government to the Roman Catholic bishop of Quebec and his coadjutor. The numbers of the population attached to the leading religious denominations in Canada in 1851 were as follows:—Church of Rome, 911,561; Church of England, 268,592; Presbyterians, 237,653; Methodists, 228,839; Baptists, 19,846; Lutherans, 12,107; and Congregationalists, 11,674.

Of one-seventh of all the lands in Upper Canada, and of those in the townships of Lower Canada, set apart under the name of clergy reserves, and sold, the proceeds were applied to the maintenance of a 'Protestant Clergy.' By the Act 16 Vict., cap. 21, passed May 9, 1853, the provincial government and legislature have the power of dealing with the question of the clergy reserves without referring to the home government, the present recipients retaining their interest during their lifetime. The Church of England in Canada is presided over by the bishops of Quebec, Montreal, and Toronto, who have each an annual allowance of 1000*l.* The Church of England, which has 242 clergy, obtained 10,391*l.* 5*s.* 11*d.* of the public money in 1851 for Upper Canada, and 1786*l.* 15*s.* for Lower Canada; the Church of Rome, which has 7 dioceses and 543 clergy, had in 1851 for the upper province 1369*l.* 17*s.* 3*d.*; the Church of Scotland had 5847*l.* 16*s.* 7*d.* for the upper, and 893*l.* 7*s.* 5*d.* for the lower province; the Wesleyan Methodist body had 639*l.* 5*s.*; and the United Synod of the Presbyterian Church 464*l.* 18*s.* 4*d.* The number of places of worship in Canada included in the Census returns of 1851 is 1559, including 471 Methodist, 257 Presbyterian (of which about 80 are in connection with the Established Church of Scotland, 100 with the Free Church, and 60 with the United Presbyterian Church), 226 Church of England, 135 Roman Catholic, 116 Baptist, 81 Congregational and Independent, 46 Bible Christian, 22 Lutheran, and 18 Quaker places of worship, besides others not classified.

In both sections of the Canadian territory small bodies of Indians remain, and of them some have been brought considerably under the influence of civilisation. They have made greatest progress in the upper province, where more care has been taken to respect their rights, and to provide for them some stated means of support. In Upper Canada the Indians inhabiting the settled districts are reckoned at about 7500; those in the unsettled districts may be about 3000. In Lower Canada these classes number respectively about 3500 and 2000. Efforts have been made to introduce industrial schools among the Indians in the settled districts, and hopes are entertained that the attempt will be to some extent successful. An interesting community of coloured people, fugitives from slavery in the United States, has been formed at Dawn, in the Western district of Canada, on the Bear Creek, a feeder of the river St. Clair.

Before the union the province of Lower Canada had only a small debt of about 30,000*l.* In Upper Canada in 1839 Sir G. Arthur stated the debt to be 1,162,187*l.*; the interest 65,000*l.*; the permanent expenses of the government 55,000*l.*; and the revenue 78,000*l.*—leaving a deficiency of 42,000*l.* The public debt of the province at the close of 1851 was 3,659,146*l.* 15*s.* 1*d.*, besides the liabilities connected with the various lines of railway recently undertaken. The expenditure for 1851 amounted to 521,643*l.* 11*s.* 2*d.*, inclusive of 183,749*l.* 7*s.* interest on the public debt; the revenue was 692,206*l.* 4*s.* 9*d.*—showing an excess of revenue over expenditure of 170,562*l.* 13*s.* 7*d.*

CANADIAN SEAS, a term that has sometimes not inaptly been used to designate the large fresh-water lakes Superior, Huron, &c., which lie within the basin of the St. Lawrence. The description of the Canadian Seas and the St. Lawrence basin is given under CANADA.

CANALE. [ALBA.]

CANARA, a province on the west coast of Hindustan, between 12° and 15° N. lat., and between 74° and 76° E. long. It is bounded N. by Bejapore and the Portuguese territory; E. by Mysore and the Balaghaut ceded districts; S. by Malabar; and W. by the Indian Ocean. The length of the province along the coast from north to south is 180 miles, and its mean breadth is about 40 miles; the total area has been computed at 7380 square miles; of this area 4622 square miles are contained below and 2758 square miles above the Ghauts.

The province is divided into two districts, North and South Canara; the line of division is about 13° 40' N. lat. The surface of Canara is rocky and uneven. On the high grounds red gravel prevails

near the coast the soil is sandy, but the valleys are well adapted for rice cultivation. There are several small mountain streams.

The entire population of Canara has been estimated at about 760,000, of which number it was computed that more than one-sixth were Brahmans. About 50,000 were said to be Roman Catholics. The inhabitants of the sea-coast are principally Mohammedans, and those of the interior Hindoos.

The chief production of the province is rice, for cultivating which the climate is peculiarly favourable, owing to the prevalence of rains. Cocoa-nuts, betel, and pepper are also cultivated.

The chief towns are in the north division Batticollah, and in the south division Mangalore and Barcelore. *Batticollah* stands on the sea-coast in 13° 55' N. lat., and 74° 37' E. long.; on the north bank of the Scandaholy, a small stream which waters a beautiful valley surrounded by hills. *Mangalore* is built on the margin of a salt lake, which is separated from the sea by a sandy beach in 12° 53' N. lat., and 74° 57' E. long. It is a place of considerable trade; the exports consist principally of rice, betel-nut, pepper, sandal-wood, and turmeric to Muscat, Goa, Bombay, and the coast of Malabar. The imports consist of raw sugar and silk from Bengal and China, and of oil and ghee from Surat. The Portuguese had a factory here, which was destroyed in 1596 by the Arabs from Muscat. In 1768 the town was taken by the English, but retaken by Hyder. In 1783 it again surrendered to the English, but was immediately besieged by Tippoo, and when at the conclusion of the war it was given up to him was little more than a heap of ruins. The fortifications have since been dismantled. The population is estimated at 30,000. *Barcelore*, supposed to be the Barace of the ancients, is situated on the sea-coast 55 miles N. from Mangalore, in 13° 37' N. lat., 74° 47' E. long.

The province of Canara, which till then had been subject to Hindoo sway, was subdued by Hyder Ali, ruler of Mysore, in 1763. On the death of his son Tippoo, in 1799, the whole province was placed under British authority. Canara is now included in the territories of the Bombay presidency.

(Buchanan, *Journey through Mysore, Canara, and Malabar*; Mill, *History of British India*.)

CANARIES, a group of islands in the Atlantic, lying off the coast of Africa, between 27° 40' and 29° 30' N. lat., 13° 30' and 18° 20' W. long. They are supposed to be the Fortunate Islands of the ancients. Pliny in his account of them (vi. 32), which is taken from Juba, the learned Mauritania prince, calls one island Nivaria, or Snow Island, which is probably Tenerife; another island he calls Canaria, from the number of dogs of a large size that were found there; Juba had two of these dogs. The first meridian of Ptolemaeus is drawn through the group.

The first account we have of these islands in modern times is about the year 1330, by a French ship which was driven among them by stress of weather. Upon this discovery a Spanish nobleman, Don Luis, count of Claramonte, obtained a grant of the islands from Pope Clement VI., with the title of king. Nothing was however done towards making a settlement till 1385, when a fleet under Ferdinando Perera sailed from Cadiz and touched at Lanzarote, but was driven away by the natives. The next expedition was from Seville in 1393, but no possession was taken of any of the islands. In 1400 another fleet sailed from Rochelle, under John de Bethencourt, and anchored at Lanzarote, where they built a fort at Point Rubicon. The adventurers then passed over to Fuerteventura; but being opposed by the natives they were obliged to re-embark. De Bethencourt returned to Spain, and having obtained from Enrique III. of Castille and Leon a grant of the islands, with the title of king, again sailed to Lanzarote, and in June 1405, took possession of Fuerteventura, Gomera, and Hierro; but failed in his attempts upon Gran-Canaria or Canaria and Palma.

De Bethencourt died in 1408 and was succeeded by a nephew, who in 1418 sold his right to the islands to Enrique de Guzman. This nobleman expended large sums in endeavouring to subdue the other islands, but without success. In 1461 the Spaniards went through the form of taking possession of Canaria and Tenerife for the crown.

Some difference having arisen between Spain and Portugal with regard to these islands, in consequence of a second sale of them by the nephew of De Bethencourt to the latter power, the Portuguese arrived in force at Lanzarote to take possession; but the dispute was settled by treaty, in which the islands were ceded to Spain. A treaty of commerce was entered into with the chiefs of Canaria in 1476, but in the same year the court of Castille purchased the right to the three unconquered islands of Canaria, Tenerife, and Palma, and in the following year sent out a fleet to undertake the conquest of Canaria, which however was not finally accomplished till April 1483. Palma and Tenerife were subjugated respectively in 1491 and 1493. Since this time the Canaries have always belonged to the Spanish crown. The original inhabitants were called Guanches, of whom little is now known except their bravery and their custom of embalming the dead. Owing to intermarriage with their conquerors, the Guanches have ceased to exist as a separate people, and the population may now be considered entirely Spanish.

The group consists of seven islands: Hierro or Ferro, Palma, Gomera, Tenerife, Gran-Canaria, Fuerteventura, and Lanzarote; and of several small rocky islets, the largest of which are Graciosa and Alegranza. The whole group stands on a bank; but the depth of

water between the islands is very great, and the passages are good. They are all of volcanic origin, and present a surface diversified by rocks, gorges, mountains, and valleys. The coasts are high and precipitous; there are no close harbours, the anchorage being generally open roadsteads. The mountains which are barren, rocky, and peaked, rise to the greatest height about the centres of the islands, and some of them have their summits covered with snow during the winter. The valleys, wherever there is water or any humidity in the soil, are exceedingly fertile, producing grain, vegetables, and fruits, both tropical and European. The vine is extensively cultivated, and much wine is made. The sugar-cane grows, but its cultivation is neglected. All kinds of domestic cattle abound in some of the islands. Camels are reared and used as beasts of burden. Fowls, ducks, geese, pigeons, and turkeys are very numerous. The number of wild birds, both native and migratory, is also very great; among the former are wild pigeons, quails, larks, and canaries.

Each of the islands has its governor, and the whole group is under a Captain-General. The whole area of the islands is 3340 square miles; and the population in 1849 was 257,719. The entire annual produce is estimated as follows: wheat, maize, barley, millet, and rye, 170,000 quarters; wine, 54,000 pipes; barilla, 300,000 quintals; and potatoes, 500,000 barrels. The chief foreign trade is with England, the United States, and Hamburg; there is also an active trade between the islands. The principal ports are Santa-Cruz and Orotava in Tenerife, and Palmas in Gran-Canaria. The exports consist of wine, fruits, corn, barilla, honey, orchilla, moss, fish, cochineal, raw silk, &c.; the imports are woollen and cotton cloths, linen, silks, colonial produce, brandy, paper, oil, glass, hardware, &c. There are important fisheries along the coast of Africa.

The temperature is very equable and the climate excellent. There are two seasons, the rainy and the dry. The dry season lasts from April to October; during its continuance the weather is constantly fine, and the north-east trade-wind blows without intermission, being strongest from the middle of May to the middle of August. The mountains of the several islands, by obstructing the course of the north-east trade-wind, cause calms to prevail for several miles to leeward to the point where the divided currents again unite. These winds render communication between the islands tedious. A vessel can sail from Tenerife to Hierro in a day; but the return voyage takes 10 or 12 days, sometimes three or four weeks. Since 1849 however the communication between the islands has been much facilitated by the use of steam-packets. A mail steamer plies regularly every week between the islands and Cadiz. From October to April the south-west winds prevail, attended with rain; and at times with thunder-storms. The genial nature of the climate is disagreeably affected, at the beginning and end of the rainy season, by the south-east wind called *El Levante*, which blowing across the Sahara is dry, hot, and sultry, and produces great thirst. It sometimes carries clouds of locusts, which commit great ravages on the corn-fields and plantations. The islands are ill-supplied with spring-water. Rain-water is preserved in tanks.

Hierro or *Ferro*, the most south-western of the Canaries, contains about 80 square miles, and has a population of 5000. The promontory on the west coast, now called *Debesa*, was formerly famous as the point through which the universal first meridian was drawn; it is about 18° 10' W. of Greenwich. The island suffers more than any of the others from droughts, and but for the frequent fogs vegetables could not live. *Vulverde*, a small place on the north-eastern coast, is the chief place in the island.

Palma lies N. by E. of Hierro; it is about 30 miles long from north to south, and its greatest breadth is about 20 miles. The area is 510 square miles, and the population about 34,000. The mountain ridge runs from north to south, and contains many extinct craters of great height. The central crater called *Caldera* is surrounded by many lofty peaks, of which the *Pico-de-los-Muelachos* and the *Pi. de-la-Cruz* rise to the respective heights of 7631 and 7469 feet above the sea. The coasts and valleys are extremely fertile, producing much wine, fruits, and silk. There are forests in the island in which good timber is grown; the palm, sweet-bay, and myrtle abound; and in many places the *Euphorbia balsamifera* or *Canariensis* grows. *Santa-Cruz-de-las-Palmas*, the capital, is on the east coast; it and *Tazacorte* on the west coast are the chief ports. Some taffetas, stuffs, and ribands are the only manufactures of any importance.

Gomera, which lies S.E. of Palma, is nearly circular, and contains 164 square miles. The mountains consist of granite and micaceous slate. The valleys are well watered, but badly cultivated. Corn, wine, oil, cotton, fruits, moss, and honey are produced. Cattle, sheep, mules, poultry, and game are abundant. *San-Sebastian* is the chief town and port. The island has a population of about 12,000.

Tenerife (sometimes incorrectly written *Teneriffe*) is the largest and most important of the islands. It is about 60 miles long from north-east to south-west; its greatest breadth is 30 miles, but it grows gradually narrower towards the north-east, and at that extremity the breadth is not more than 6 miles. The area is about 1225 square miles, and the population 86,000. About one-seventh of the surface is fit for cultivation; the remainder is covered with lava and other volcanic matter, and a great part of it is entirely destitute of vegetation. The coasts present some remarkable promontories—*Del-*

Hidalgo on the north-west, Amagada on the north-east, Rasca on the south, and Teno and Buenavista on the west. The highest point on the island is the Peak of Teyde, or Peak of Tenerife, a dormant volcano, rising to the height of 11,946 feet above the sea. The crater measures 300 feet by 200 feet; it is surrounded by a circular wall 40 feet high, which from a distance has the appearance of a cylinder placed on a truncated cone. The peak rises above the current of the trade-winds, and is always exposed to a violent continuous gale from the west. The view of this mountain from Orotava on the west coast is magnificent, from the contrast of the rich cultivated plain and the leafy forests on its lower slopes with the barren, wild, and stern aspect of the peak. Teyde is connected by a mountain ridge with another crater called Chahorra, which is 9888 feet high. Sulphurous vapours are constantly issuing from the crevices in these craters. To the west of Chahorra there are four volcanic cones, which were in a state of eruption in 1798. The Peak of Teyde is surrounded on the south and east by a continuous chain of mountains, inclosing a semicircular plain of about 3 miles' radius, which is called Llanos-de-las-Retamas, from the broom (*retama*), almost the only vegetable that grows on it. The whole plain is nearly covered with pumice-stone. The country west and north of the peak descends with rapid broken slopes towards the sea. The outer edge of the semicircular mountains is surrounded by high table-lands, which together with the region of the peak cover nearly half the island, and contain some pine forests. Towards the north-east these table lands, which have a very broken surface, extend for about 20 miles, and terminate in the plain of Laguna. This plain, which is nearly in the middle of the island, is of considerable extent; it is shut in by hills, and is nearly a dead level. After the rains it is partially covered with water, from which circumstance it takes its name. It produces abundance of grain, but no trees. The eastern part of the island consists of numerous fertile valleys separated by basaltic hills, the highest of which, the Bufadero, is 3069 feet above the sea. This part produces the finest fruits in the island. The valley of Taoro, in the northern part of the island, is of great extent and of extraordinary fertility.

In Tenerife all European domestic animals, and also white camels are reared. Cattle are kept for slaughter and the plough; cows are never milked. Goats, sheep, asses, and mules are numerous. The silkworm is extensively reared. Bees also are numerous, and a great deal of excellent honey is collected. Rabbits, wild fowl, turkeys, and all kinds of poultry are very plentiful. The agricultural produce is similar to that of the other islands. The quantity of wine annually made amounts to 3,000,000 gallons; the best sort, called Vidonia, which resembles Madeira, is exported to England. Coffee has been cultivated with success; iron ore is found, and sulphur abounds on the Peak of Teyde. Linen and woollen stuffs are manufactured by each family generally for its own use. Some silk stuffs, earthenware, soap, vermicelli, leather, brandy, ropes from the agave, hats, baskets, and mats of palm-leaves are the other chief articles of manufacture. The imports consist of iron utensils, hardware, bar-iron, flax, glass, pottery, leather, candles, cotton goods, salt provisions, cod, &c.; the exports are wine, brandy, barilla, almonds, dried fruits, raw silk, and orchilla.

The island is divided into three districts—Laguna, Orotava, and Garachico. *Santa-Cruz-de-Santiago*, the chief town and port of the island, stands on the north-east coast. It has a small harbour, well sheltered, except from the south-east winds. The town is the residence of the Captain-General of the Canaries, and has a population of 9000. *San-Christoval*, in the centre of the plain of Laguna, is a pleasant well built town, with 10,000 inhabitants. *Orotava*, on the north-east coast, stands on the slope of a hill nearly 1200 feet above the sea; it is a well-built thriving place, with 8000 inhabitants, who carry on a considerable commerce by means of a harbour, two miles distant, at *Puerto-de-la-Orotava*, a town of 4600 inhabitants. *Guimar*, S.W. of Santa-Cruz, stands in a fertile well-watered valley, and has a population of 3500; near it are several mummy tombs of the Guanches. *Taraonte* and *Icod-de-las-Vinas* are on the north coast, and have each about 5000 inhabitants. *Garachico* is a port to the west of the peak, on the low coast north of Buenavista.

Gran-Canaria, or *Canaria*, which gives name to the group, lies E. of Tenerife. It is nearly circular, and about 75 miles round: the population is about 69,000. The highest point, El Cumbre or Picod-el-Pozo-de-las-Nieves, is 6648 feet above the sea. The mountain Sancillo, near the centre of the island, is 6070 feet high, and is surmounted with a large wooden cross. *Port-la-Luz*, which affords good anchorage and is well sheltered from the north-east winds, is formed by Isleta, a rocky promontory joined to the island by a low isthmus. *Las-Palmas*, the capital of the island, is on a bay on the east coast; it is the largest and best built town in the Canaries; it is the seat of a bishop and of the Audiencia Real, or supreme court of justice for all the islands. The city is well supplied with water by numerous fountains, and has 17,382 inhabitants. It contains a cathedral, hospital, college, several monasteries, and has a well-supplied market. The harbour is formed by a mole. The following are the other chief places:—*Aguimes*, situated on the eastern coast, has 2300 inhabitants. *Atalaya*, population 2000, is composed of dwellings consisting of apartments cut in the sides of the Mount St.-Antoine. *Teror*, population 4600, situated in the interior in the northern part of the island, is frequented by pilgrims as a sacred spot. The bishop has a residence

here. *Tiraxana* is a village composed of a collection of grottoes inhabited by a colony of free blacks, who do not cultivate intercourse with Europeans.

Fuerteventura, which is N.E. of Gran-Canaria, is about 60 miles long; its breadth is very irregular, varying from 20 miles to 5 miles. The area is about 720 square miles, and the population 18,000. It is less mountainous than the other islands. Though generally barren, it contains many spots of great fertility. The interior formation of the island is singular. A group of extinct volcanoes, 2160 feet high, to the south of Puerto-Cabras, branch off eastward and westward to within a short distance of the sea, follow the direction of the coast for about 30 miles, and then again unite, inclosing an extensive arid plain, on which several villages are built. From the southern junction of the mountains an isthmus, 5 miles long and 2½ miles wide, unites the mountainous peninsula of Jandia to the main part of the island. This mountain mass is about 28 miles long; it presents a precipitous face towards the north-west, rising directly to the height of 2820 feet above the sea, but sends out spurs in other directions, which inclose slopes of easy ascent. It is uninhabited, though it is said to contain some good springs. The pasturage on it is so fine that the flocks and herds are driven here from other parts of the island to graze. Orchilla also is produced in large quantities in the peninsula. The capital of the island is *Santa-Maria-de-Betancuria*, also called La Villa. The only road in the island leads from La Villa to Cabras on the east coast, which is the chief port. The anchorage at Cabras is indifferent, and the landing-place a beach of shingles. *Oliva*, in the fertile valley of Oliva, in the north of the island, is the largest town in the island, and has only 2000 inhabitants.

Lanzarote, the most eastward of the Canaries, lies N.E. of Fuerteventura, from which it is separated by a strait called La Bocayna. The island is 31 miles long, and its breadth varies from 5 to 10 miles. The area is about 240 square miles, and the population is about 18,000. From the northern extremity of the island precipitous cliffs 1500 feet high run south-west for 7 miles, and terminate in a sandy plain, where in 1825 an eruption took place, and two considerable hills were thrown up, which are still burning. Beyond this plain the shore is again precipitous as far as the promontory of Pechiguera, with the exception of the little bay of Janubio, in which there was formerly a harbour for small vessels. This harbour was converted into a salt lake by the eruption of 1765. The eastern shores are neither so steep nor so high, and there are many fertile tracts of ground. The highest land, called Montaña Blanca, is nearly in the centre of the island; it is 2000 feet high, and cultivated to its summit. This island is subject to long droughts, and to gales of excessive violence. The wine and grapes are of superior quality. *Teguise*, a small place in the interior, is the chief town. *Naos*, on the eastern shore, has a small secure harbour formed by rocky islets, and with two entrances, of which the northern one has a depth of 12 feet, the eastern of 17½ feet at low water, and 9 feet rise of tide. *Arecife*, a more frequented port, situated south of Naos, has 2500 inhabitants, most of whom are engaged in the fishery on the African coast.

In accordance with a decree of the Queen of Spain the seven principal ports of the islands—namely, Santa-Cruz-de-Santiago, Orotava, Las-Palmas, Santa-Cruz-de-las-Palmas, Arecife, Cabras, and San-Sebastian—have been constituted free ports since October 10, 1852.

The Little Canaries lie N. of Lanzarote, and are connected with it by a bank on which there are 40 fathoms' water. *Graciosa* is separated from Lanzarote by the Strait del Rio, which is about a mile wide, and is the safest and most commodious port for large ships in the Canaries. The great difficulty of communicating with Lanzarote, on account of the high precipitous coasts of that island, presents an insuperable obstacle to this strait being resorted to as a harbour for trade. *Graciosa* and *Alegranza*, a little farther north, are both the product of extinct volcanoes; they contain craters, and are covered with naked basaltic rocks, lava-streams, and other volcanic matter. They are inhabited by 40 or 50 persons each, who cultivate barilla in the bottom of the craters. *Santa Clara*, *Roquete*, *Lobos*, and the others, are mere rocky islets, and uninhabited.

CANCALE. [ILLE-ET-VILAINE.]

CANDAHAR. [AFGHANISTAN; KANDAHAR.]

CANDEISH, or KHANDEISH, a province of Hindustan, extending along the southern bank of the Nerbudda, between 20° and 22° N. lat., 73° and 77° E. long. It is bounded N. by Malwa, E. by Berar and Gundwana, S. by Aurangabad and Berar, and W. by Gujerat. Its length from east to west is about 210 miles, and its average breadth about 80 miles. The area is estimated at about 12,500 square miles, and the population at nearly half a million.

Candeish is generally a level country, but is nearly surrounded by mountains. The plain of Candeish is very fertile, although its whole surface is studded with isolated hills with perpendicular sides of rock and flat summits. Each of these hills forms a natural fortress. In addition to the Tuptee and the Nerbudda the province is watered by several copious streams which flow from the table-land and fall into the Tuptee.

This country was rendered a scene of desolation before it fell into the hands of the British. The ravages committed by Jeswant Rao Holkar in 1802 caused a famine in the following year, which carried off a large proportion of the inhabitants. After this the Bheel tribes, whose chiefs command most of the passes in the mountain range to the north, and the Pindarries, were accustomed to make periodical incursions into the plains for plunder. In 1818 Canloishi, then among the possessions of Holkar, was ceded to the British; but the Arabs, who had previously obtained a footing in the country, opposed the British authority. In 1819 the British obtained possession of the province. At that time nearly one-half of the villages had been abandoned to the tigers, which swarmed throughout the land. The mischief was repaired under the administration of General Briggs, who succeeded in restoring the province to prosperity.

The principal towns in the province are—Boorhanpore, Ascerghur, Hindia, Nundoorbar, and Gaulna. [BOORHANPORE; ASERGHUR.] Hindia is situated on the south bank of the Nerbudda, where its channel is 3000 feet wide, in 22° 26' N. lat., 77° 5' E. long. This place is chiefly important from its position, as commanding some of the best fords across the Nerbudda. Nundoorbar contains about 500 houses, and was formerly a place of much greater extent. The wall by which it was surrounded is now for the most part in ruins. This town is in 21° 25' N. lat., 74° 15' E. long. Gaulna was once a large town, but has fallen greatly to decay. The fort stands on a high rocky mountain, and is surrounded by a wall of stone and brick 20 feet high and a mile in circumference. The town, which is at the foot of the mountain, on its north side, is surrounded by a mud wall and towers.

(Mill, *History of British India; Institutes of Akbar; Reports of Committees of House of Commons on the Affairs of India.*)

CANDIA, the ancient *Kritē* or *Ceta*, and the modern Greek *Kēti*, one of the largest islands in the Mediterranean Sea, is situated to the south of the Archipelago, between the Morea, Africa, and Asia Minor. It extends from 31° 54' to 35° 42' N. lat., and from 23° 28' to 26° 19' E. long. Its length from east to west is about 160 miles from Cape Salmone to Cape Crio; its breadth is very unequal. In some places towards the middle of its length it is about 35 miles broad, in others about 20 miles; between Retimo and Sphakia 10 miles, and in one place in the east part of the island, between the Gulf of Mirabel and the coast of Hierapetra, only 6 miles. It has three principal capes—Simonium, now Salmone, at the east extremity towards Rhodes; Corycum, now Cape Bnso, looking towards the Morea; and Crio, looking towards the Cyrenia. Its coast, especially towards the north, is indented by deep gulfs, of which those of Kisamos, Khania, Suda, Arnyro, and Mirabel, or Spinalonga, are the deepest, and the three principal towns of the island, Canea or Khania, Retimo, and Candia, are on that side. The south coast is rugged and iron-bound. A continuous mass of high land runs through the whole length of the island, about the middle of which Mount Ida, now called Psilorati, rises far above the rest to the height of 7674 feet. The mountains in the west part of the island are called by Strabo Leuka Orē, or White Mountains; he says they are about as high as Taygetus (probably about 5000 feet). In the south-west part of the island the mountains run close to the coast. This is the district of the Sphakiotes, a race of mountaineers, occasionally robbers and pirates, who have never been totally conquered by the Turks. The ridge eastward from Mount Ida is the ancient Diete, now called Mount Siti. The main chain sends out offshoots to the north and south. Those on the north side slope down gradually towards the sea, inclosing plains and valleys of great fertility, and forming by their projections the numerous bays and gulfs with which the northern coast is indented. The southern offshoots descend abruptly, present a steep, rocky, and arid surface, and terminate in a precipitous coast provided with no good harbour. Mount Ida itself sinks down rapidly on its south-eastern side into an extensive plain watered by the Hieropotamo, the ancient Lethæus, which rising in the mountainous district of Arkadioti flows westward into the sea a few miles south of Mount Ida. The southern boundary of this plain is a secondary range, which springing from the main chain near the source of the Hieropotamo runs south-west and terminates in Cape Matala. The rivers of Candia are only a kind of torrents very shallow in the dry season.

To the north of the principal range of mountains the island contains extensive forests, pastures, and meadows; and produces corn, wine, oil, opium, liquorice, flax, cotton, silk, carobs, oranges, lemons, dates, and other southern produce. Besides the common domestic animals, game, wild sheep, chamois goats, bees, and fish are very numerous. About 60,000 sheep and goats are fed on the mountains; their wool is coarse; their milk is made into cheese. There are in the island about 50,000 horned cattle, which are used chiefly for draught and for ploughing; the milk of cows is not used, there being a prejudice against it.

The valleys that have rivulets running through them are from June to the end of September very unhealthy, so that although they are very productive, and offer facilities for the conveyance of produce to market, the peasantry generally reside on the hills, where the land is less fertile, but where they are sure of enjoying uninterrupted health. The habitations of the peasantry are rude in the extreme, and their clothing consists of coarse cottons, linens, or woollens, manufactured

by each household. The chief manufacture is soap, which is highly esteemed all through the Levant. The principal exports are oil and soap; the imports are some British and Austrian manufactured goods and metals, colonial produce, and corn. Ploughing the land between the olive-trees is all the culture they receive. The fruit is generally allowed to drop from the trees, and it is gathered by women and children into heaps; these are then taken to the mill and the fruit is bruised, after which process it is put into a wooden press worked by two or four men. In the district of Apokorona the fruit is beaten from the trees, which are thereby injured. Although many of the olive-trees were cut down during the numerous insurrections of the peasantry, the population is still insufficient to attend to them all, and in good years a fourth of the fruit is lost for want of hands to gather it. Every article produced on the island pays one-seventh to the government, and besides this extraordinary taxes are often arbitrarily imposed. In lieu of a tax on silk the mulberry-trees are rated. There are several small islands round the coast, of which the principal are Standia, on the north, and Gozzi, on the south. The climate is warm, and in the low valleys unhealthy in the autumn. The sirocco, the common scourge of the Mediterranean, is often severely felt.

Candia is divided into eight Greek bishoprics, including the see of the metropolitan archbishop of Gortyna; into three sanjaks—Canea, which is governed by a pasha of three tails, Canea, and Retimo, each governed by a pasha of two tails; and into twenty mukattas, or districts, each governed by an 'aga,' who receives the taxes and the tithes of the mosques. In ancient times the island seems to have been very thickly peopled. Under the Venetians the population is said to have been about 1,000,000; in 1821 it amounted to 260,000, and in 1840 but little over 159,000, four-fifths of whom were Greeks.

The principal towns and ports are on the northern coast of the island. Canea, or Khania, on the Gulf of Khania, is the capital of the western sanjak; it has a population of 8000, and a good harbour formed by a mole 1237 feet long, with a lighthouse at its extremity; vessels of 300 tons can enter the harbour, which is defended by a fort. The fortifications were constructed by the Venetians. The town is surrounded by old walls and deep ditches, and contains several mosques and Greek churches. It is the seat of a Greek bishop, and has an arsenal, docks, lazaretto, and some soap factories. Several European consuls reside at Khania.

Suda, distant from Canea about 3 miles by land, on the Bay of Suda, has a harbour perfectly safe in all weathers.

Retimo, the capital of the central sanjak and the seat of a Greek bishop, has 4000 inhabitants, and a small harbour formed by a mole.

Candia, or Khandia, about 40 miles E. from Retimo, is the capital of the island. The name is the Venetian form of Khandax (Great Fortress), the designation given to the city by its Saracen founders. From the city the name has been commonly applied in Europe to the island itself, which however is never called Candia by the natives. Candia is much decayed since the time of the Venetians. The fortifications are still in tolerable repair, but the houses of the town are falling to ruin, and the harbour, which is formed by two moles, is blocked up with sand to such a degree that only vessels drawing less than 8 feet of water can enter. Ships loading from Candia anchor in one of the three ports of Standia, an island about 7 miles north-north-east of the town. Candia has 12,000 inhabitants; it is the residence of the Greek archbishop of Gortyna, and of the chief pasha of the island. The streets are wide and rudely paved, and many of the houses are fronted by gardens adorned with fountains. The pasha's palace, the bazaar, mosques, public baths, large cathedral built by the Venetians, and the fortifications, are the principal structures. Soap is the chief industrial product of the town. There are a few Jews in Candia, but in Canea, which is the principal port of the island, they amount to about 200, and have a synagogue. Not far from it are the ruins of the ancient Cnosus, famous in fable for its labyrinth.

Spinalonga, on the Gulf of Mirabel, has a good harbour, but the entrance is subject to sudden squalls. A few miles south of this is the harbour of Ayio-Nicola, the best harbour in the island next to Suda, but it is not frequented. The most noted town on the south coast is Sphakia, the chief town of the Sphakiotes. At Hagio-deka, a village near the Hieropotamo, are the ruins of Gortyna, and a cavern of great extent in a part of Mount Ida. This cavern has been sometimes taken for the labyrinth of Cnosus, of which no trace remains.

The ancient history of Crete begins with the heroic or fabulous times. The early inhabitants are supposed to have been descended from Phœnician, Pelasgian, and Dorian colonists. The Dorian immigration must have taken place long before the time of Homer, who speaks of the different races in the island (*Odys.* xix. 171, &c.). Historians and poets tell us of a king called Minos who lived before the Trojan war and resided at Cnosus, the site of which is not far from the present town of Candia, and ruled over the greater part of the island. He was the legislator of the country and his laws became celebrated among the Greeks, who borrowed from them (*Strabo*, x. 323). He employed, say the legends, Dædalus, an Athenian artist, on his return from Egypt to build a labyrinth in imitation of that of Mœris in Egypt, and he afterwards confined in it Dædalus himself. Minos according to tradition was also the first who had a navy; he cleared the Grecian seas of pirates, expelled the Carians from the Cyclades, and settled his sons in them (*Thucyd.* i. 4). Then comes the well-known story

of the Minotaurus, Theseus and Ariadne. Idomenus, a grandson of Minos, one of the Cretan chiefs who went to the siege of Troy, on his return was driven away by his subjects and went to found the colony of Salentum on the coast of Iapygia. After the expulsion of the dynasty of Minos, Gortys, a town built in the centre of the island near the foot of Mount Ida, became a principal city. Candia, the capital of Crete, had once many flourishing cities, some say a hundred; the principal, besides Chossus and Gortys or Gortyna, were Gismnus, Cydonia now Canes, Amphimalla, Rithymna, now Retimo, Hieracleum the port of Chossus, and Miletus, all on the north coast, Phalasarna on the west coast, Lyctus, Phoenixportus, and Hierapetra on the south coast, and Ampelos on the east coast. Strabo, whose maternal ancestors were from Chossus, although he himself was born in Pontus, gives a pretty full account of the Cretans, their laws, their towns, and the wars between them; and Aristotle in his 'Politic' (book ii.) has described the peculiar institutions of the ancient Cretans. The east part of the island had been colonised by the Dorians, the west part was inhabited by the Cydonians, and the south by the Eteoeretes. It was two days' sail from the south coast of Crete to Cyrenæa and four to Egypt.

The Cretans were often at war among themselves or with their neighbours the Cilicians, and with the kings of Syria and of Egypt. They materially assisted Demetrius II. Nicator to recover the throne of Syria, over the usurper Alexander Balas, B.C. 148 (Justin xxxv. 2). The Cretans were celebrated for their archery, and in the later period of their political history were often employed as mercenary troops by other nations.

Crete was conquered by the Romans, B.C. 67, under the proconsul Quintus Metellus, after an obstinate defence. It became a Roman province and a colony was sent to Chossus. The Cretans seem to have been notorious for dishonesty and lying. 'Cretizans eum Cretensibus' was a common proverb, meaning 'to deceive the deceiver.' St. Paul in his epistle to Titus, whom he had appointed to preach the gospel to the Cretans, alludes to the bad reputation of the people.

Crete remained subject to the Roman emperors and afterward to the Byzantines till A.D. 823, when it was conquered by the Saracens, who built the town of Candia, which has ever since been considered the capital of the island. Nicephorus Phocas retook it in 961. After the taking of Constantinople by the Franks Baldwin I. gave the island of Candia to Boniface, marquis of Montferrat, who sold it to the Venetians in 1204. The Venetians kept possession of Candia more than four centuries; it was one of their chief possessions in the east, and the first of the three subject kingdoms (the other two were Cyprus and the Morea) whose flags waved over the square of St. Mark. The island was governed by a provveditore-general from Venice, who had under him the four provveditori of Canes, Candia, Retimo, and Sittia. For judicial matters there were *tribuni*, or judges, sent also from Venice, each of whom was assisted by two councillors who were natives of the island. The municipal administration was in the hands of the *Candiotes*. The taxes were very moderate. The native nobility enjoyed feudal privileges, and they were bound to have a certain number of militia from among their vassals and tenants ready when called. The whole of this militia was reckoned at 60,000 men. Although most of the natives were of the Greek Church and had their own clergy, there was an archbishop of the Latin or Western Church who was sent from Venice. In 1615 the Turks landed 50,000 men, besieged and took Canes; in the following year they took Retimo, and in 1648 laid siege to Candia the capital of the island. This siege, the longest in modern history, lasted 20 years. The Venetians strained every nerve for the defence of the place. The order of Malta, the Pope, the Duke of Savoy, Louis XIV., all sent auxiliaries to the relief of Candia. The vizier Achmet Coprongli was at last sent in 1667 by the sultan with great reinforcements to carry the place. Francesco Morosini conducted the defence. In September 1669 the Venetians, having exhausted every means, surrendered Candia to the vizier by a convention in which they retained the forts of Suda, Spinalonga, and Carabusa, on the coast of the island. The wars of Candia cost the senate 25 millions of ducats. In the last three years of the siege 29,000 Christians and 70,000 Turks were killed. The Turks made 69 assaults and the Venetians made 80 sorties; the number of mines exploded on both sides was 1364. Since the capture of Candia, Crete has remained in the hands of the Turks, under whom it has been perhaps the worst governed country in the world, all its former prosperity has vanished, and its population dwindled to a fourth of what it was under the Venetians. In 1821 and for several subsequent years the native Greek population maintained a sanguinary warfare with their Turkish masters in the hope of shaking off their oppressive yoke. In this struggle they failed. According to a decision of the allied powers the island was made over to Mehmet Ali of Egypt in 1830, to indemnify him for his losses in the revolutionary war in the Morea. He made some improvement in the trading regulations of the island, but the oppressed raya obtained little relief by a change of masters. Mehmet Ali held it till 1840, when by a convention of the great European powers (except France) it was restored to Turkey, from which another insurrection in 1841 and 1842 failed to set it free. In ancient times the forests upon Mount Ida supplied wood for smelting and forging iron, though no

trace of ancient mining operations has been discovered on the island. Among the forest-trees in ancient times flourished the fruit-bearing poplar, the evergreen plane, the cypress, and the cedar. The wines of Crete, and especially its raisin wine, were celebrated in ancient times. Among its simples grew the dictamnus or dittany, famous among physicians and poets. The island was free from all wild beasts and noxious animals; its dogs were a match for those of Sparta, and its wild goat is the supposed origin of a few domestic varieties.

CANDY. [KANDY.]

CANE. [CANDIA.]

CANFRANC. [ARAGON.]

CANNES. [VAR.]

CANNSTADT, properly KANNSTADT, a town in the Neckar-Kreis in the kingdom of Württemberg, is famous for its mineral springs, its healthy climate, and its beautiful situation on the right bank of the Neckar, nearly in the centre of the kingdom, and in the heart of a fertile country. It is a station on the railroad from Stuttgart to Esslingen and within 4 or 5 miles of the former city, and contains about 5350 inhabitants. Independently of its trade, for it is the staple town for the traffic in the Neckar, and has manufactures of woollens, cottons, tobacco, &c., there are 37 mineral springs in the neighbourhood and a regular establishment of baths, with grounds laid out for visitors. The Kur-saal is decorated with fresco paintings and is otherwise an elegant building. It is erected a quarter of a mile from the town, at the foot of a hill from which the springs arise. Kannstadt is frequented in the season by large numbers of people from Stuttgart. There are horse-races in summer. The Seelberg, an adjoining hill, 610 feet in height, contains many curious fossil remains. Vases, coins, and other Roman antiquities have of late years been found near Kannstadt. The two royal seats, Bellevue and Rosenstein, are in its vicinity.

CANOPUS or CANO'BUS (*Kānezōs*), a city of Egypt, on the coast near the outlet of the western or Canopic branch of the Nile. It was 120 stadia from Alexandria by land, with which it was connected by a canal. In the time of Strabo (p. 801) it contained a great temple of Serapis.

CANOSA. [BARI, TERRA DI.]

CANTABRI, a people of ancient Spain, who lived east of the Asturians in the region now called Las Montañas de Santander. To the east they bordered on the Antrigones and the Varduli, or Biscayans. To the south the Cantabri seem to have extended beyond the mountains into the north part of the present province of Palencia, where they bordered on the Vaccaei (Maurer, *Geographie der Griechen und Römer*). They were a brave, secluded, half wild race, who long resisted the Romans, and were only finally subdued together with the Asturians by Augustus, B.C. 25. They revolted again after some years but were defeated and nearly exterminated by Agricola, B.C. 19. In the division of Spain made by that emperor the Cantabri were included in the Tarraconensis province. They gave their name to the Sinus Cantabricus, now Gulf of Biscay.

CANTAL, a department in France, lies between 44° 37' and 45° 25' N. lat., 2° 2' and 3° 20' E. long., and is bounded N. by the departments of Corrèze and Puy-de-Dôme, E. by those of Haute-Loire and Lozère, S. by Aveyron, and W. by Lot and Corrèze. It is formed out of Upper Aveyron, and is named from the highest of its mountains, the Plomb-du-Cantal, which stands nearly in the centre of the department. The department measures 68 miles from north-east to south-west, and 57 miles from south-east to north-west. The area is about 2000 square miles; and the population in 1851 was 253,329, which gives 126.66 to the square mile, being 48.05 below the average per square mile for the whole of France.

The department is almost entirely covered with the mountains of AUVERGNE, the principal chain of which crosses it from north-north-east to south-west. In this chain, and within a range of 7 miles diameter, are the volcanic summits of Plomb-du-Cantal, Col-de-Cabre, Puy-Mary, and Puy-Violent, which rise to the respective heights of 6095, 5511, 5143, and 5229 feet above the sea. These peaks are of conical shape, bare, rugged, and from their steepness almost inaccessible. The whole range is of volcanic origin and contains many craters distinguished by the local name Puy. In the neighbourhood of this central region are many ancient valleys filled up with lava, which has flowed at several unknown and long distant epochs. The mountains are covered with snow during several months of the year. In the spring the lower heights abound with verdant pastures, intermixed with numerous wild flowers, especially violets, hyacinths, lily-of-the-valley, pinks, daisies, &c.; they also produce medicinal plants and orchil abundantly. The only human habitations met with in this wild region are the barons, or little huts, which serve as temporary dwellings for the cow-herds, who drive their cattle hither in the fine season, and manufacture large quantities of butter and cheese.

At the lower extremities of the high plains and in the abysses which separate them are found the towns, villages, and cultivated lands of the department. Here also the flocks and herds come to pass the winter in vast buildings, the upper story of which is used as

a store for corn and other farm produce. The valleys, which radiate in all directions from the mountain-knot of the Plomb-du-Cantal, are picturesque and beautiful in the extreme, abounding in woods, meadows, waters, and bold cascades, and strewed with neat villages, which are clustered round the parish church, or sheltered by a lofty precipice or some ancient castle. The mountains of Cantal form part of the watershed between the Allier and the Loire on the north-east, and of the Dordogne on the west, and the Lot on the south. The Rue, which receives the Sautoire, rises on the northern side of Plomb-du-Cantal, and flows north-west into the Dordogne. The Cère rises in its south-western slopes, and receiving the Jordanne a little below Aurillac flows west on its way to join the Dordogne, which forms for several miles the boundary of the department on the north-west. The streams springing from the south and south-east of the central group flow into the Truyère, which rising in the mountains of Lozère, and flowing first eastward, then towards the north, enters the department of Cantal, crosses it to westward, then turns south-west, and falls into the Lot near Entraignes in the department of Aveyron. The Alagnon rises on the eastern side, receives several small streams, and flowing north-north-east falls into the Allier. In the south-west of the department rises the Celle, a feeder of the Lot, which river flows for a short distance along the extreme south of the department. Several of these rivers flow through very deep ravines, the precipitous sides of which show the different layers of lava and other strata through which the waters have worn their way. All of them abound in cascades, have great rapidity of descent, and are consequently not navigable.

To the south and west of the great mountain range the department has a tolerably mild climate; to the north and east the climate is less genial; all the central and higher portion of the department has a rude climate and a long dreary winter. The department is subject to terrible hurricanes; those that occur in the winter, called 'ceirs,' are especially fearful, as they sweep the snow before them, fill up the narrow valleys, and bury the houses beneath the drift.

The department contains 1,279,481 acres. Of this surface 547,789 acres are mountain pasture, 157,765 forest and woodland, and 255,834 acres heaths and moors. The arable portion, which hardly exceeds 400,000 acres, consists generally of a very light and stony soil, and does not produce bread-stuffs sufficient for the consumption. Very little wheat is grown or used; the chief crops are rye, buckwheat, barley, hemp, flax, and oleaginous plants. Chestnuts are abundant, and in some districts form the principal part of the food of the people; in other districts peas and lentils are used as food. The excellent mountain pastures form the main source of the wealth of the department. The number of horned cattle reared for exportation and for the purpose of making butter and cheese is very great. As much as 50,000 quintals of cheese are annually made. Horses are numerous; they are small in size, but hardy: mules are much used as beasts of burden. Sheep are very numerous, and in high repute for the goodness of their wool. In mineral wealth the department is rich; copper, iron, lead, sulphur, alum, antimony, coal, limestone, slate, granite, &c., are found, but the only mine worked is one of coal. The number of mineral and hot springs is very great. The manufacturing industry of the department is of little importance; it is confined to the making of lace, copper vessels, coarse stuffs, glue, and leather. At the end of autumn many of the population emigrate to Paris and other parts of France, where they find employment as porters, water-carriers, tinkers, and handicraftsmen, returning home in the spring of the following year, or in some instances after an interval of several years, for the inhabitants are strongly attached to their poor, wild, but highly picturesque country. The mountainous nature of its surface, and the want of roads, canals, and navigable rivers present great obstacles to the development of the trade of the department, which consists in the exportation of its cattle and agricultural products, and in the importation of corn, wine, oil, salt, metals, and cloth.

The department is divided into four arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Aurillac	8	93	96,433
2. Mauriac	6	57	63,346
3. Murat	3	34	35,309
4. St.-Flour	6	74	58,241
Total	23	258	253,329

Of the first arrondissement, and of the whole department, the chief town is AURILLAC. *St.-Cernin*, a few miles N. from Aurillac, has a population of 3046. *St.-Mamet*, 11 miles from Aurillac, has a fine old castle, an ancient church, and a population of 2000. *Mauriac*, 25 miles S.S.W. from Aurillac, stands in the beautiful valley of Arcambio, which is watered by the Rance, a feeder of the Celle: population 3000. *Vic-sur-Cère* stands near the head of the fine valley of the Cère, which extends far up the south flank of the Plomb-du-Cantal: the population is 2000, but this number is doubled from June to October by the numbers who resort to the mineral waters.

In the second arrondissement the chief town is *Mauriac*, which has

a college, a tribunal of first instance, and a population of 3400. The most remarkable building is the ancient church of *Notre-Dame-des-Miracles*, which is adorned with some very curious bas-reliefs. The town is the chief entrepôt for the colonial produce, provisions, and merchandise required for the mountain districts, and has a considerable trade. *Pléaur* stands in a fertile plain, 10 miles from Mauriac, and has 3012 inhabitants. *Riom-ès-Montagnes*, in which several Roman remains have been found, is 19 miles from Mauriac, and has 2400 inhabitants.

In the third arrondissement the chief town is *Murat*, which is an ill-built place on the right bank of the Alagnon, with 2700 inhabitants. It has a college and tribunal of first instance. The neighbourhood of this town is most interesting to the geologist for the many evidences it presents of violent volcanic action. *Allanche*, a small well-built town, 9 miles N.E. from Murat, has a handsome church, an old castle, and 2605 inhabitants. *Marcenat*, 10 miles N. from Murat, has a ferruginous spring and a population of 2664, including the whole commune.

Of the fourth arrondissement the chief town is *St.-Flour*, formerly the capital of Haute-Auvergne, which stands on a high plateau formed by a mass of basaltic rock, presenting on three sides steep precipices, and joined to the neighbouring high land of Plauvère by a narrow isthmus which is handsomely laid out as a promenade. A part of the town stands at the foot of this rock, and communicates with the upper town by a winding road cut in the rock. Through this part of the town the road from Paris to Perpignan runs. The streets of *St.-Flour* are narrow; the houses are built of basalt and lava and covered with tiles. The chief building is the cathedral. The town is the seat of a bishop, has an ecclesiastical seminary, a college, tribunals of first instance and of commerce, and a population of 5254. The assize court of the department is held here. *Claudes-Aigues*, 15 miles S. by W. from *St.-Flour*, is famous for its hot mineral springs, from which it derives its name. It is situated in a gorge of the mountains, and has a population of 2476. The waters vary in heat at the different springs from 135° to 177° Fahrenheit; in the winter they are conveyed by pipes through the houses of the town for the purpose of heating. The road from *St.-Flour* to *Claudes-Aigues* traverses the plateau of Plauvère, and affords a fine view of the volcanic group of Cantal: on approaching *Claudes-Aigues* it is terraced through the granitic rock along frightful ravines, at the bottom of which the Truyère flows. *Massiac*, 15 miles N. by E. from *St.-Flour*, on the high road to Clermont, is situated in a narrow valley, and not far from the right bank of the Alagnon: population 2200.

The department forms the diocese of the bishop of *St.-Flour*. It is comprehended in the jurisdiction of the High Court of Riom, and belongs to the 20th Military Division, of which Clermont-Ferrand is head-quarters.

(*Dictionnaire de la France; Annuaire pour 1853.*)

CANTERBURY, Kent, a municipal and parliamentary borough, a cathedral city, the seat of the metropolitan see of all England, and forming of itself a county and a Poor-Law Union. The city of Canterbury is situated on the river Stour, on the high road from London to Dover, in 51° 17' N. lat., 1° 4' E. long., and is distant 55 miles E.S.E. from London by road, and 81 miles by the Ramsgate branch of the South-Eastern railway. The population of the city of Canterbury, which includes 14 parishes, 2 precincts, and 4 extra-parochial districts, was 18,398 in 1851. The borough is governed by 6 aldermen, one of whom is mayor, and 18 councillors; and returns two members to the Imperial Parliament. The livings are in the archdeaconry and diocese of Canterbury. Canterbury Poor-Law Union contains an area of 3830 acres, with a population in 1851 of 14,097.

All traces of the origin of Canterbury are lost in the obscurity of early history. At the time of the Roman occupation it was of considerable importance, as is evident from its position at the point of junction of the Roman military roads to Dover and Lympne, their two principal havens. The ancient British name seems to have been *Durwiler*, which in Latin was changed into *Durovernum*. By the Saxons it was called *Cær Cant*, or the City of Kent; whence we have *Cantuaria* and *Canterbury*. At the beginning of the Saxon Heptarchy it was considered the chief city of the kingdom of Kent, and was the king's residence. Canterbury is pleasantly situated between hills of a moderate height, the air is salubrious, and the neighbouring country fertile. The city extends about half a mile from east to west, and somewhat more from north to south: there are four suburbs at the four cardinal points. Many Roman coins and Roman and British remains have been discovered in the city and neighbourhood.

Canterbury in early times suffered repeated ravages, particularly from the Danes. In 1011 a great part of the city was reduced to ashes. It has frequently suffered by fire, the most calamitous instances of which were in the reigns of Henry II. and Henry VIII.; but it always recovered from these disasters, owing to its rank as the metropolitan city; and the constant resort of pilgrims tended in no small degree to enrich it. At Canterbury was founded the first regular Christian establishment of Augustine, who in the year 597 baptised Ethelbert, king of Kent, and 10,000 Saxons in the river Swale. Augustine was the first archbishop, and died here in the year 604. His body was first buried in the monastery of St. Augustine, and afterwards, in 1091, was removed into the cathedral. Among the

most celebrated of the archbishops are Thomas à Becket, who was murdered before the altar by four of the attendants of King Henry II. in 1171; and Thomas Cranmer, who was burnt at Oxford in the reign of Queen Mary. The cathedral, one of the most noble buildings in England, is of very ancient date. Augustine is said (Bede, 'Hist. Ecc.' lib. i. c. 33) to have commenced his cathedral on the site of a church which was built during the Roman dominion in Britain for the use of the Christian soldiers. The present cathedral dates from 1130, when the building which had been founded by Archbishop Lanfranc, and enlarged by Anselm, was solemnly consecrated by Archbishop Corbel, in presence of Henry I. of England, David, king of Scotland, and all the English bishops. Forty-five years later however, in consequence of having been nearly destroyed by fire, the cathedral was almost entirely rebuilt, and at subsequent periods it was frequently added to, or repaired, or in parts rebuilt. Hence it exhibits the utmost diversity of architectural style, ranging from early Norman to the latest perpendicular; but notwithstanding this all the parts are so disposed as to produce a pleasing effect. The cathedral is a double cross, with a noble tower 235 feet high rising from the intersection of the nave and western transepts, and two towers 130 feet high at the western end. The eastern end, called Becket's Crown, from having been finished during his tenure of the archbishopric, is circular. The south porch is a handsome embattled structure, with a roof of stone. The great tower, called Bell Harry Tower, is one of the most beautiful specimens of the pointed style of architecture in England. There are many windows of painted glass, of which the great western is the most remarkable. A new stone chair or throne for the archbishop has recently replaced the former throne, which was made of wood. The choir is one of the most spacious in the kingdom, being nearly 200 feet in length and 38 feet in breadth. The extreme length of the whole building from east to west is 514 feet, and the extreme breadth 71 feet. The cathedral has lately undergone extensive repairs and judicious restoration at the expense of the dean and chapter. The crypts underneath the cathedral are the finest in the kingdom. They have numerous chapels, in one of which are some perfect remains of ancient paintings on the walls. The crypt was long occupied by a Walloon congregation as a place of worship, Queen Elizabeth having granted it for that purpose in 1568. The cathedral contains numerous splendid monuments: among others are those of Henry IV., Edward the Black Prince, Archbishop Langton, and many other personages famous in English history. Of the magnificent shrine of Thomas à Becket not a vestige remains.

Of the numerous old churches in Canterbury by far the most interesting is that of St. Martin. A church occupied the site of the present edifice at least as early as the time of St. Augustine; who, according to Bede, on his arrival in Britain, found a church existing there. It does not appear very certain when the oldest part of the present church was erected; the body of it was rebuilt in the 12th or 13th century, apparently out of the materials of the older church, as Roman bricks and some Norman sculpture are worked up in the walls. It is a small plain building, consisting only of a nave and chancel without pillars. A few years back the whole was carefully and thoroughly restored. The church of St. Mary Magdalene is in part of Norman date. The church of St. John the Baptist has also some Norman features. St. Dunstan's church and the church of the Holy Cross are both very ancient. The chancel of St. Mildred's church may be noticed as an example of the late perpendicular style. In several of the churches are monuments of interest. In St. Dunstan's is the vault of the Roper family, in which is still contained the head of Sir Thomas More, which was buried there 'with great devotion' by his favourite daughter Mary Roper. When the chancel was repaired in 1835 the Roper vault was opened, and in a niche in the wall was found a leaden box, open in front, and with an iron grating before it, in which was contained a head that was afterwards proved to be that of Sir Thomas More. ('Gentleman's Mag.,' May, 1837.)

The Grammar school, which is within the precincts of the cathedral, and is supported by the chapter, is called the King's school, having been remodelled by Henry VIII. This school was originally founded by Theodora, archbishop of Canterbury, who died about 690. The King's scholars, of whom there are 50, have their classical education free of charge, and receive 17. 16s. 8d. a year in money. There are 30 exhibitions and scholarships attached to this school. Besides the King's scholars there were 45 commoners at the school in 1851.

St. Augustine's Monastery stood in the eastern suburbs: this abbey and its precincts occupied 16 acres of ground, which were inclosed by a wall. The fine gateway of St. Augustine, which formed the chief entrance, was in a dilapidated state, but was repaired a few years back by public subscription. The revenues and privileges of this monastery increased rapidly. Ample contributions from kings, nobles, and others supplied funds for adding to the extent and magnificence of the buildings. In 1168 the greater part of the church of the monastery was burnt, and numerous ancient charters and codicils were consumed. At the dissolution, Henry VIII. appropriated the monastery as a royal palace. Queen Elizabeth kept a court here in 1573, when she was on a royal progress. From Lady Wotton, who dwelt here during the rebellion, the buildings were called Lady Wotton's Palace, and the green in front of the great gate is still called Lady Wotton's Green. The property continued in the possession of Lady

Wotton's descendants till 1844, when the remains of the abbey were sold by public auction. The purchaser was Mr. A. J. Beresford Hope, M.P., the cost being 2100*l*. The building had been employed for some years for purposes very different from its original object. "The chapel was in ruins; the Guests' Hall was used as a brewery and public-house of low character; the space under the gateway was a dray-house, and the room over it (the state bed-chamber of the abbey and palace) contained the large vat for cooling the liquor, and had before this been used as a cock-pit." Mr. Hope presented the site and the remains of the buildings to the Archbishop of Canterbury in trust for the erection of a missionary college in connection with the Established Church. In the erection of the required buildings as much as possible of the ancient structure has been preserved. The entire expense of the chapel, which has been built on the foundation of the former chapel, including the altar plate, amounting in all to about 4500*l*., was defrayed by Mr. Hope, who also contributed largely to the institution in other ways. The windows of the chapel are filled with stained glass. The chapel and cloister are paved with encaustic tiles. On the south of the chapel are the warden's lodge and rooms for the fellows of the college. On the north side of the quadrangle are the rooms and dormitories, which are calculated to accommodate about 45 students. The library, a spacious room, 80 feet by 40 feet, is built on the foundations of the ancient refectory of the abbey. The library contains about 8000 volumes. Beneath the library is a fine crypt, used as a workshop in which the students are taught carpentering, carving, and other branches of manual industry. The college was incorporated by royal charter, June 28, 1848. The course of study extends over three years. The annual collegiate charge for the education and maintenance of each student is 35*l*. Twenty exhibitions have been founded by private individuals and by committees of public societies in order to promote the objects of the college. The Archbishop of Canterbury is visitor, and one of the patrons. The Archbishop of York and the Bishop of London are also patrons. The number of students in 1852 was 20.

Among the ruins of ancient buildings in Canterbury may be noticed the walls of a castle, said to have been built by William the Conqueror, which is on the south-west side of the city, near the entrance from Ashford. These remains appear to have been the keep, or donjon, of a fortress, within which it stood, and of which the bounds may still be traced. The ruins of the palace, which was originally built by Archbishop Lanfranc, are adjoining the borough of Staplegate, a suburb of the city. The Pilgrims' Passage, by Mercery Lane, on the north side of the High Street, is towards the cathedral. Canterbury contains 14 parish churches and places of worship for Independents, Baptists, Wesleyan Methodists, Quakers, Roman Catholics, Unitarians, Jews, and others. The charitable institutions for education, for the maintenance and relief of the aged and infirm, and other purposes, are numerous; those which have endowments attached are administered by trustees appointed by the Lord Chancellor. There are several National, British, and Infant schools, a Blue-Coat school, and a Gray-Coat school. The city and county hospital, a valuable and well-conducted establishment, was completed in the year 1798: it is supported by voluntary contributions.

The city of Canterbury was in ancient times part of the royal demesnes, and was under the government of an officer appointed by the crown, styled the prefect, portreeve, or provost, who had all the civil authority, and accounted yearly to the king for the several profits arising from the city. In the 18th of Henry III., the citizens were empowered to choose bailiffs for themselves. In the 26th of Henry VI., a charter of further liberties and privileges was granted, and that form of municipal government established which existed until the operation of the Municipal Reform Act. Edward IV. granted a charter which settled the boundaries of the jurisdiction, and formed the city into a county by the name of the county of the city of Canterbury. There were subsequent charters by Henry VII., Henry VIII., James I., Charles II., and George III. A county court is held at Canterbury. Quarter sessions are held by the recorder; capital offences are removed to the assizes at Maidstone. The city has sent two members to Parliament since the 23rd of Edward I.

Canterbury is neither a manufacturing nor a commercial city. Silk weaving, which was introduced by French refugees, was at one time prosecuted to a considerable extent in the city, but has been long extinct. The trade in wool is large, but the chief trade is in corn and hops, for the cultivation of which the soil of the neighbouring country is particularly favourable. There are numerous mills on the banks of the river Stour. Canterbury has long been noted for its brawn, which is sent to all parts of the kingdom. A railway from Canterbury to Whitstable, the port of Canterbury, has been of considerable benefit to the trade of the town. Of the public buildings the guildhall, the fruit and vegetable market, the new corn and hop exchange, the butter and fish markets, the philosophical museum, the barracks, the military infirmary, the jail, the houses of correction, and the assembly rooms, are the chief. There is a savings bank in Canterbury. The city is lighted with gas. At the south-east corner of a field, close to the city wall, is a large artificial mound, or circular hill, which in 1790 was converted by Alderman James Simmonds, to whom the city is much indebted for many improvements, into a city mall: the sides of the hill were also cut into serpentine walks, so as to admit an easy

ascent to its summit, and were connected with a terrace formed up the rampart within the wall, extending in length upwards of 600 yards; additional walks were also made in the field in which it is situated, called the Dane John or Donjon field, and a double row of limes was planted on the sides of the principal walk. The public spirited conduct of the alderman is commemorated by a pillar placed on the summit of the mound. Some springs of mineral waters discovered in 1693 on premises now used as a nursery-ground, have been highly esteemed for their medicinal properties. One is purely chalybeate, and the other contains a portion of sulphur in combination with the iron. During the severest seasons these waters never freeze. In the vicinity of Canterbury are many gentlemen's seats.

The markets are held daily for provisions of all kinds; but the principal market, which is for cattle, corn, hops, and seeds, is on Saturday, and is toll free for corn. A market for fat stock is held every alternate Tuesday with Ashford. The annual fair, which commences on the 11th of October, and lasts from eight to ten days, is very numerously attended; it is chiefly for pottery and toys.

The Archbishop of Canterbury is primate of all England and metropolitan. His ecclesiastical province includes the following dioceses: St. Asaph's, Bangor, Bath and Wells, Canterbury, Chichester, St. David's, Ely, Exeter, Gloucester and Bristol, Hereford, Lichfield, Lincoln, Llandaff, London, Norwich, Oxford, Peterborough, Rochester, Salisbury, Winchester, and Worcester. The diocese of Canterbury comprises 352 benefices, including the county of Kent, except the city and deanery of Rochester, and some parishes in the London diocese. The chapter consists of a dean, 12 canons, 2 archdeacons, 6 preachers, and 5 minor canons. By a late statute the canonries are reduced to six; accordingly six are now suspended. The income of the Archbishop of Canterbury is 15,000*l.* a year.

(Somner; Batteloy; Lambard; Hasted; Gosling; Camden *Canterbury Guides*; *Communication from Canterbury*.)

CANTERBURY. [ZEALAND, NEW.]

CANTIRE. [ARGYLESIRE.]

CANTON, a city of China, the capital of the province called Kiang-tong, a corruption of which has been applied by Europeans to the town itself; the real name is Kuang-chow-foo. It lies in 23° 7' 10" N. lat., and 113° 14' 30" E. long., distant about 1200 miles S. by W. from Peking, and 60 miles N.N.W. from the Chinese Sea. The city is built on the north bank of the Choo-keang, or Pearl River, and on the eastern bank of its affluent, the Pi-keang, a river which flows from the mountains north and west of the city. From the entrance of the river Bocca Tigris (so called after the Portuguese) to Canton the distance is 32 miles; a ship sails a few points west of north until she arrives near the 'first bar,' and thence her course is nearly due west to the anchorage at Whampoa, which is 10 miles below the foreign factories, the intercourse with which is entirely conducted in boats. On reaching the city the country to the north and east appears hilly and mountainous. The rivers and creeks, which are very numerous, abound with fish, and are covered with a great variety of boats, which are continually passing between the neighboring towns and villages. The tide flows about 40 miles above Canton. The country lying southward of the city consists of an alluvial flat, being the delta formed by the depositions from the waters of the main river, with here and there a solitary hill of granite or red-sandstone rising up like an island. Rice-fields and gardens, in a high state of cultivation, occupy the lowlands, and trees, principally firs, cover the elevated points. That part of the city situated within the wall is built in the form of an irregular square, and divided by another wall, which runs from east to west into two parts. The north and largest portion is called the old or inner city; it is inhabited chiefly by Mantchoo or Tartar families; the south part is called the new or outer city: it is the abode of Chinese. Across the old city, about the centre of it, a wide street runs east and west, called by the Chinese the Straight Street of Benevolence and Love. Outside the city walls, close to the foreign factories, is the Street of Perpetual Joy. To the south the wall runs parallel to the river at the distance of about 100 yards; on the north, where the city is built partly up the acclivity of the hills in the rear, the wall takes an irregular course, and in some places is about 300 feet above the surface of the river. The whole circuit of the walls may be about 7 miles. The walls are of brick, on a foundation of red-sandstone: they are about 20 feet thick, and vary in height from 25 to 40 feet. The gates of the city are 16 in all, but 4 of them lead through the wall which separates the old from the new city; so that there are only 12 outer gates, each distinguished by a name descriptive of its position. Most of the streets are short, and irregularly laid out, varying in width from 6 to 16 feet; but in general they are about 8 feet wide, just allowing the passage of two sedan chairs, for no wheel carriages are used at Canton. They are everywhere flagged, more or less regularly, with large flat stones. The crowd that throngs them is exceedingly great. Bricks are generally used for the walls of houses, though a few of the poorer sort are constructed of mud. Stone and wood are sparingly used in building; stone is employed about gateways, and wood for columns, beams, and rafters. The roofing consists invariably of thin tiles, which are laid on the rafters in rows alternately concave and convex, the latter overlapping the joined edges of the former and cemented over them with mortar. Windows are small and rarely supplied with

glass. Paper, mica, and other transparent substances are used in its place. The materials for building are procurable at moderate prices and in abundance. The wood, a variety of fir, is floated down the river in huge rafts, and bricks are made in the neighbourhood of Canton. There are 120 temples in and near Canton. The principal Buddhist temple stands on the island of Homan, which is situated in the river, opposite Canton. This temple covers, with its buildings, courts, and gardens, an area of about 7 acres, and is surrounded by a lofty wall. In the old city is a Mohammedan mosque, with dome and minaret 160 feet high. At the north side of the city is a pagoda five stories in height.

The habitations in which about one-half of the population of Canton have their abodes, stand close on the street, and have usually only a single entrance, which is closed by a bamboo screen suspended from the top of the door; within these houses there are no superfluous apartments; a single room allotted to each branch of the family serves as a dormitory, while a third, which completes the number into which the whole inclosure is divided, is used by all the household as a common eating-room. Chinese houses of consequence open towards the south, but in the poorer sort this point of course is often disregarded. The dwellings inhabited by the more wealthy part of the community are surrounded by a wall 12 or 14 feet high, that fronts the street, and completely screens the buildings within. The poorest persons live in the extreme parts of the suburbs, along the banks of the river and its creeks, and in the northern part of the old city; their houses are mere hovels, low, narrow, dark, and without any division of apartments. Several canals traverse the city and suburbs, and are used for conveying goods and passengers. Two of the largest of these canals run parallel to, and outside of the east and west walls, and communicate with each other by a third, which crosses through the outer city. The foreign factories are walled in, and form a promenade, called Respondentia Walk.

The shops are commonly quite open towards the street, that is, those appropriated to Chinese customers: for the few streets devoted to European trade are rather on a different plan, the shops being of a closer structure and less exposed to external observation. The several streets are commonly devoted to distinct trades. There is 'Carpenter' Street, or rather Square, as it is carried round a parallelogram; 'Curiosity' Street (as the English call it) is devoted to the sale of antiques, real and fictitious; and 'Apothecary' Street is full of druggists' shops, the drawers in which are neatly arranged and lettered, but filled principally with simples. By the side of each shop is suspended from on high a huge ornamental tablet of wood, varnished and gilded, on which are inscribed the particular calling of the tenant and the goods in which he deals. Some of the shops, which are pretty richly supplied, appear to be much exposed towards the street; but the inhabitants of each division generally combine into a system of watch and ward for common protection, and during the night the streets are closed at each end by doors, which are guarded by the regular police. The greatest risk to which the houses and shops of Canton are exposed is that of fires, which are frequent, the notion of fatalism which prevails among the natives rendering them singularly careless. The Chinese have very generally adopted the use of our fire-engines, which they themselves manufacture sufficiently well to answer the purpose. The amount of the native population of Canton has been often estimated, but so little authentic information has ever been obtained on the subject, that it still remains undecided. The usual estimate of a million appears to be much too high. No inconsiderable part of the population live upon the river, in the junks, barges, and small boats, causing the space opposite Canton and its suburbs to assume the appearance of a floating city. By far the largest part of the small boats are called 'egg-house' boats, from their shape resembling the longitudinal section of an egg. They are generally not more than 10 or 12 feet long, about 6 feet broad, and so low that a person can scarcely stand up in them. Their covering consists of a bamboo or mat tilt, shaped like that of a waggon, which is very light, and serves tolerably as a defence against the weather. Whole families live in these boats, and are considered as a distinct part of the population, being under a separate regulation and not allowed to intermarry with those on shore. These boats are registered, and the whole number has been reported at 84,000. Some of these floating houses present a handsome appearance. Vagabonds and beggars are very numerous in Canton.

A foundling hospital, instituted in 1693, affords accommodation for upwards of 200 children. There is also a general hospital, commenced in 1835 by an American missionary society. Canton possesses 14 high schools and 30 colleges, three of the colleges have about 200 students each. In the new city is the residence of the provincial governor or viceroy, and that of the Hoppo, or commissioners of the customs on foreign trade. The barracks are also in the new city.

The portion of Canton in which the European factories are situated, being a mere suburb, does not contain many of the larger or public buildings; but the arrangement and architecture of the streets and shops are precisely the same as within the walls of the city. The whole frontage of the buildings in which foreigners of all nations are shut up together for the prosecution of their trading business at Canton, does not exceed between 700 and 800 feet. Each front, of

which there are about thirteen, extends backwards 130 yards, into a long narrow lane, on each side of which, as well as over arches that cross it, are the confined abodes of the English, French, Dutch, Americans, Parsees, and others.

The European factories are called by the Chinese 'Hongs,' the word hong being always used by them to denote a commercial establishment or warehouse. To the east of all there is a narrow inlet from the river—a sort of ditch, which serves to surround a portion of the city wall, as well as to drain that portion of the town. This is crossed with a single arch by a narrow street at the back of the factories, that leads to the warehouses of the several Hong merchants, all of them communicating with the river by wooden stairs, from which the tea and other goods are shipped. The space occupied by the foreign factories is crossed by two well-known thoroughfares, one of them named China Street, and the other Hog Lane; to which a third, called New China Street, has been added. The first is rather broader than the generality of Chinese streets, and contains the shops of the small dealers in carved and lacquered ware, silks, and other articles in common demand by strangers. The shops, instead of being set out with the showy and sometimes expensive front of an English or French shop, are closed in by gloomy black shutters, and very ill-lit by a small sky-light, or rather a hole in the roof. The alley called Hog Lane is narrower and more filthy than anything of the kind in a European town. The hovels by which it is lined are occupied by abandoned Chinese, who supply the poor ignorant sailors with spirits, medicated to their taste with stimulating or stupefying drugs.

The climate at Canton is generally remarkably healthy, though extremely hot during the summer, and at all times subject to great and sudden vicissitudes. In July and August the thermometer sometimes reaches 100° Fahr. in the shade, and during winter it occasionally falls below the freezing point at night: the average of the year is about 72°.

Canton derives its chief interest and importance from having been formerly the sole, and still being the principal, emporium of the British trade with China. Canton city is nearly at the farthest possible distance from the capital. The policy of the Tartar dynasty in confining the European trade with such obstinacy to a point so unsuited to its extension may have been prompted by the desire to remove the danger of external involvements from the vicinity of the capital, and to derive the largest possible revenue from internal duties on transit, which in this instance are known to be large. The emperor derives a very large revenue, direct and indirect, from Canton, and the Chinese officials practise extortion to a very great degree for their own private advantage. The restriction on foreign trade which confined commercial transactions to the Hong merchants has been removed, and foreigners may now trade with any parties they choose to employ.

The annual amount of foreign business transacted at Canton was estimated a few years ago at 80 millions of dollars; the larger part of the trade being carried on by Englishmen and Americans. All the legitimate trade of China with European nations, with the exception of Russia, was formerly conducted at Canton. The Russian depôt is at Kiachta, on the border of the empire, in Mongolia. The British possessions in India have extensive commercial dealings with China, exceeding even the amount of the trade between England and China. From India the principal article received was formerly raw cotton; but opium, clandestinely introduced, was more recently the largest in amount. The Chinese authorities, having been roused to activity on the subject, in 1839 confiscated and destroyed a very large quantity of opium belonging to British subjects. Redress was demanded, and a war ensued, which ended in the adoption of a treaty in 1842, by which a complete change was effected in the commercial policy of China. The Chinese government agreed by the terms of this treaty to pay 21 millions of dollars as an indemnity; to open the ports of Amoy, Foo-cho-foo, Ningpo, and Shanghai, in addition to Canton, for the admission of the ships and goods of Britain; to cede to the British government the island of Hong Kong, situated in the estuary of the Canton River; and to establish a just tariff of duties on exports and imports. The average arrivals of ships under the British flag at Canton are about 230, of 120,000 tons burden; of which about one-half clear out for the United Kingdom, exclusive of those which clear for British ports after touching at Hong Kong. The average annual value of the imports, exclusive of opium, amounts to 16,000,000 dollars, the exports to from 18,000,000 to 20,000,000 dollars. The principal articles of export are tea, raw silk, and silk piece-goods. Of tea the quantity exported in 1844 was 72,566,311 lbs., of which 15,825,800 lbs. went to the United States and 52,179,533 lbs. to Great Britain. The total value of the tea exported in 1844 was 19,307,759 dollars. The quantity of tea brought into Great Britain during the year ending 5th January 1853 was 66,361,020 lbs., and that to America had increased in a somewhat larger proportion. On the 5th January 1853 the emperor of China legalised the importation of opium into his dominions.

Tea.—The bulk of the Company's exportations down to the end of 1833, when the trade was thrown open, comprised under the head of black teas—bohea, congou, with souchong and campoi, under which may be ranged souchi and pekoe. The green teas consisted of the

three principal distinctions of twankay, hyson skin, and hyson. The two great varieties of the tea plant are the *Thea viridis*, which is most extensively cultivated in the northern part of the empire, and the *Thea Bohea*, which is the Canton variety. From the *Thea viridis* are made all the fine green teas in the great Hwuy-chow country and the adjoining provinces. From the *Thea Bohea* are produced at the pleasure of the manufacturer, and according to the demand, the inferior green and black teas which are made about Canton.

Occupations of the Inhabitants.—It has been estimated that about 50,000 persons are engaged in Canton in the manufacture of various kinds of cloth; about 17,000 in the weaving of silk; and upwards of 4000 in shoemaking. A large number of persons find employment as workers in wood, brass, iron, stone, &c. The book trade affords considerable employment. Particular trades are associated in distinct communities, guided by laws of their own in reference to the management of their business. A large proportion of the articles required for use in Canton and for export is manufactured at Fuh-shan, a place of considerable size a few miles west from Canton.

Money and Weights.—A paper currency was adopted by the Mongol conquerors of the empire, but was subsequently abandoned in consequence of the depreciation and discredit which ensued from over issues and the bad faith of the government. At Canton silver and a base alloy of copper are the two metals in circulation. The native copper coin is from its low value used only in bazaar payments, the exchange varying between 700 and 800 for a Spanish dollar. The Chinese seem to find it impossible to have a silver coin, from the propensity of the people to play tricks with anything more valuable than their base copper coin, the cash. The Spanish dollars imported into Canton are very soon punched into such a state as to be exchangeable only by weight. None but freshly imported dollars are received without a very strict scrutiny called shroffing. The charge attendant on this operation causes a premium in favour of new dollars.

The broken Spanish dollars circulate by weight, and their proportion to the tale or tael varies in different transactions, being estimated in the accounts among foreigners and native merchants at the rate of 720 taels per 1000 dollars; but in the weighing of money, at 717 taels per 1000 dollars; and to 'outside dealers,' shopkeepers, and compradors, at 715 taels per 1000 dollars.

The Chinese money-weights are as follows:—

Tale.	Mace.	Candareen.	Cash.	Oz. Troy.	Grs. Troy.
1	10	100	1000	1.208	579.81
	1	10	100		57.98
		1	10		5.79

In the sycee, or fine silver prescribed for the payment of government dues, 98 parts in 100 must be pure. This is cast in oblong ingots, of 1 and 10 taels in weight, with a stamp impressed. Gold is not used either for exchange or as an article of remittance.

The commercial weights are calculated in peenul, catties, and taels, and their proportions are according to this table:—

Pecul.	Catties.	Tales.	lbs. avoirdupois.	Cwts.
1	100	1600	1334	1.19047
	1	16	14	

(A Description of the City of Canton; The Chinese, a General Description of the Empire of China and its Inhabitants; Fortune, Two Journeys into the Tea Districts of China, 1853; Parliamentary Returns.)

CANVEY ISLAND. [Essex.]

CAPE, literally Head (*Cap*, French; *Capo*, Italian; *Cabo*, Spanish and Portuguese; all from the Latin *Caput*), is a term used to indicate the extremity of a portion of the coast which projects beyond the general line of the shore. On rocky and much-indentured coasts, as on that of northern Scotland, capes are of course very frequent, while low and sandy coasts sometimes offer no cape for 50 or even 100 miles. On shores of the latter description they are commonly formed by the change in the trending of the land, and form obtuse angles, while on rocky coasts they terminate in acute angles, on which account they sometimes are called Points.

CAPE BRETON, an island of British North America, situated to the E. of Nova Scotia, and forming the S.E. limit of the Gulf of St. Lawrence, lies between 45° 27' and 47° 4' N. lat., and between 59° 45' and 61° 38' W. long. Its greatest length from north to south is about 100 miles, and its greatest breadth 85 miles. Its area, exclusive of the great salt waters, is about 2,000,000 acres, more than one-half of which is supposed to be fit for cultivation. The extent of improved land in 1851 was 63,227 acres. The island is divided from the mainland of Nova Scotia by the Gut of Canso and St. George's Bay. The Gut of Canso is a channel 21 miles long, varying from one mile to one mile and a half in width. St. George's Bay is at the northern extremity of this channel. North Point is about 73 miles from Cape Anguille, the south-western extremity of Newfoundland. The population of the island in 1851 was 27,550.

The Island of Breton contains much high land, particularly in the north part, and on the east and north-west districts near the coast. Cape Ensmic, on the north-east coast, in lat. 46° 40', is 1800 feet above the level of the sea. The east and south coasts are well provided with harbours. St. Ann's Bay, on the east, leads through a narrow pass to a safe and capacious harbour of the same name, in which ships of considerable burden may anchor. Sydney Harbour,

to the south-east of St. Ann's Bay, is an inlet two miles wide and four miles long; which then separates into two narrow arms, one of which runs to the south-west, the other to the south: at the bottom of the south arm, seven miles from the sea, is the town of Sydney, the capital of the island. Sydney Harbour is safe and spacious. It has a bar at its mouth, but with sufficient depth of water for large ships to enter. South of Sydney Harbour are Lingen, Windham, Murgain, and Miré bays. Miré Bay is the outlet of Miré River, which flows into it from the west. On the south-east coast are Louisbourg Harbour, Gabarus Bay, Portland Cove, Forked Harbour, and St. Esprit Harbour. St. Peter's Bay is on the south coast, and in Lenox Channel leading to the Gut of Canso. In the southern entrance of the Gut is situated the island of Arichat, with the port of the same name. The only harbour on the west coast which will admit trading vessels is Port Hood, situated at the north-east point of St. George's Bay: this harbour is capacious, and completely sheltered. The most remarkable physical feature of the island is the Bras d'Or, an inland sea, which occupies a large portion of its surface, and nearly divides it into two islands. The entrance to this basin is by two channels formed by the island of Boulardrie, which lies between St. Ann's and Sydney harbours on the east coast. The north channel is called the Great Entrance, and the channel on the south side of the island the Little Entrance: the last has a sunken bar at the mouth, and is seldom used even by boats. Boulardrie Island is 20 miles long, and its greatest breadth is two miles. Within this island is the Little Bras d'Or, a passage to the west of which leads to Bedeque Bay and Whyecocomagh Basin, which are together 15 miles long. Another narrow passage at the south extreme of the Little Bras d'Or conducts to the large basin, which contains numerous small islands, and branches out into several arms or inlets. The most southern of these arms terminates at the Isthmus of St. Peter, a neck of land only 900 yards across, which separates the water of Bras d'Or from the Atlantic, at the Bay of St. Peter in Lenox Channel.

The Bras d'Or receives the waters of several rivers, the principal of which are the Bedeque and the Wagamatcook on the north, and the Dennys on the west. From the mouth of the Great Entrance to the south-west extremity of St. Peter's Isthmus this inland basin is 55 miles long; its width from east to west at the broadest part is 20 miles. The depth of water varies from 70 to 360 feet, and in every part it is safely navigable, offering great commercial advantages to the island by affording water-communication to the farmers of every district.

The island contains several fresh-water lakes. In the north-west division is Lake Marguerite, 40 miles in circumference, the outlet of which is by a river of the same name 15 miles long, which falls into the sea opposite East Cape, on Prince Edward's Island. Grand Lake and Miré River or Lake are in the south division; the latter receives the waters of Salmon River, which flows from the west. There are likewise on different parts of the coast many small streams which are not navigable.

The climate of Cape Breton is not so regular, but neither is it so rigorous as that of the neighbouring continent. The frost does not usually set in long before Christmas; and there are frequent intervals of warm weather, sometimes for a fortnight together, in the course of the winter season. Very intense cold is occasionally experienced. The summer months are dry and warm on the eastern coast, but on the western coast there is more moisture. The mean summer heat is 80° Fahrenheit in the shade. The spring is short, and vegetation is exceedingly rapid. Planting and sowing are done in May, fruits ripen in July, and in August and September the harvest is got in.

Mica-slate, clay-slate, syenite, and primitive trap are found in all parts of the island. Transition limestone, granwacke, gypsum, and coal are very generally distributed. The coal-fields are of great extent in the south-east division. Coal exists in the west part of the island; and it has been calculated that the available seams of coal in different parts occupy an area of 120 square miles. Extensive works are carried on at Sydney and at Lingen, where the seams vary in thickness from 3 to 11 feet. The quantity of coal raised in the island in 1851 was 53,000 chaldrons. Granite prevails among the primitive rocks south-east of the Bras d'Or. Gypsum is found in great abundance in many parts, and particularly on the shores of the Bras d'Or. There are salt springs at Bedeque, at Whyecocomagh, at Wagamatcook, and in some other parts on the Bras d'Or: the brine produces from 10 to 12 per cent. of salt. Iron-ore is found abundantly associated with the coal about Sydney, Lingen, and in other places. Some of the ore will, it is said, yield 60 per cent. of the metal.

The principal vegetable productions of Cape Breton are timber, and the common cereal grains, including maize and potatoes. Of the timber, which includes the pine, birch, oak, spruce, hemlock, beech, ash, maple, and elm, considerable shipments are made yearly to the United Kingdom. The produce in 1851 included:—Wheat, 16,600 bushels; barley, 24,776 bushels; oats 188,188 bushels; maize, 124 bushels; buckwheat, 75 bushels; rye, 33 bushels; potatoes, 114,654 bushels; turnips, 21,718 bushels; hay, 16,251 tons; butter, 329,086 lbs.; cheese, 16,300 lbs.

The coast and harbours swarm with fish. Those most commonly

taken are salmon, cod, herrings, mackerel, shad, halibut, sturgeon, alewives, soles, plaice, haddocks, and smelts. In the lakes and rivers perch, trout, bream, and eels are abundant. The statistics of the fishery for 1851 show the following results:—Vessels employed 21, of 463 tons, with 83 men; boats employed 654, with 1298 men. Quantities cured: dry fish, 21,458; salmon, 344 barrels; shad, 28 barrels; mackerel, 9428 barrels; herring, 6113 barrels; alewives, 53 barrels. A considerable quantity of fish-oil was also obtained, amounting to nearly a fourth of the quantity furnished by all the other parts of Nova Scotia.

The first settlement was made on this island in 1712 by the French, who gave it the name of *Ile Royale*. In 1720 they constructed the fortifications of Louisbourg, on the south-eastern coast. In 1745 the island was taken by the British. The town of Sydney, now the capital of the island, was founded in 1823. It is laid out with regularity, and the houses are neatly built, each having a garden attached to it. The courts of law are held in Sydney, where also the different government officers have their residences. The other settlements are situated either on the sea-coast or on the margin of the Bras d'Or. Most of the smaller settlements on the coast have been made by fishermen, many of whom are the descendants of the Acadians, or original French settlers from Nova Scotia. The European inhabitants who occupy themselves in agriculture and in the timber trade, are principally emigrants from Scotland and Ireland; some few inhabitants are the descendants of American loyalists. According to the Census returns of 1851 there were then on the island 18 clergymen, 7 lawyers, 7 doctors, 119 merchants and traders, 94 employed in manufactures, 502 mechanics, 3276 farmers, 1124 persons engaged in the fisheries, 35 registered seamen, 273 persons employed at sea, and 66 employed in the lumber trade.

The island is included within the government of NOVA SCOTIA, and is politically divided into two districts or counties, those of Cape Breton and Victoria. The island sends two representatives to the Nova Scotia House of Assembly. The greater number of the inhabitants, including most of the Scotch who came from the Highlands, are of the Roman Catholic religion. There are a few Presbyterians, and some members of the Church of England, who are under the spiritual care of the bishop of Nova Scotia. The respective numbers of the various religious bodies in 1851 were as follows:—Church of England, 2156; Roman Catholics, 11,493; Kirk of Scotland, 3152; Presbyterian Church of Nova Scotia, 103; Free Church, 8968; Baptists, 531; Methodists, 685; Independents, 73; other denominations, 318. The number of churches in all was 47; of schools, 70; of scholars, 2179. A few Indians still remain in the island. Their principal employments are hunting and fishing, but tracts of land have been reserved for them, upon which they grow maize and potatoes. They are quiet and inoffensive, generally remain stationary at their settlements during the winter, but wander along the shores at the return of warmer weather.

The following figures relative to the trade and manufactures of Cape Breton are obtained from the Census returns of 1851:—Saw-mills 14; grist-mills, 34; steam-mills, 2; tanneries, 7; value of leather manufactured, 2854*l.*; value of boots and shoes manufactured, 6978*l.*; one foundry, employing 5 hands, and producing castings of the value of 1200*l.*; 3 weaving and carding establishments; 1194 hand-loom; filled-cloth manufactured, 24,850 yards; cloth (not filled) manufactured, 43,504 yards; flannel manufactured, 16,084 yards; soap manufactured, value, 1074*l.*; candles, 512*l.*; quantity of maple sugar, 2132 lbs. The number of vessels built during the year was 24 of 2593 tons: the number of boats built was 469. The imports and exports stood as follows:—*Sydney*, estimated value of imports, 12,954*l.*, of which 6413*l.* was from Great Britain; 1332*l.* from British North America; and 4849*l.* from the United States. Exports, 30,234*l.*, of which 18,906*l.* went to British North America, and 8805*l.* to the United States. Shipping, inwards 293, of 28,633 tons, with 1620 men; of these ships 193 were from the British colonies: outwards, 300 ships (of which 192 sailed to British colonies), tonnage 30,127, with 1721 men. *Arichat*, value of imports, 16,256*l.*; exports, 21,850*l.*, of which about one half went to foreign states. Shipping, inwards, 183 of 15,215 tons, with 801 men: outwards, 77 of 5443 tons, with 357 men.

(Macgregor, *British America*; Bouchette, *British Dominions in North America*; *Parliamentary Papers*.)

CAPE COAST CASTLE. [GOLD COAST.]

CAPE COD. [MASSACHUSETTS.]

CAPE FEAR. [CAROLINA, NORTH.]

CAPE OF GOOD HOPE, one of the most southern points of Africa, was discovered by Bartholomew Diaz, the Portuguese navigator, in 1493. Diaz, after exploring the Atlantic coast of Africa as far as Cape das Voltas, 29° S. lat., was driven out to sea by a storm, and the next land he saw was Algoa Bay. He had thus doubled the southern extremity of Africa without knowing it. On his way back he saw the cape to which he gave the name of Cabo Tormentoso, or Cape of Storms. On his return home the King of Portugal gave it the name of Cape of Good Hope, as an omen that the Portuguese had now a fair prospect of reaching India, the great object of their maritime expeditions. Vasco de Gama doubled it in November 1497, on his way to the Indian seas, and from that time the Portuguese consi-

dered it as the southern extremity of Africa. But Africa does not terminate in a point: it presents to the Southern Ocean a broad line of coast running east and west, from $18^{\circ} 23'$ E., the longitude of the Cape of Good Hope, to about 26° , which is the longitude of Algoa Bay. This coast is indented by several bays and forms several promontories, of which the Cape of Good Hope is the most westward, but Cape Agulhas, $20^{\circ} 10'$ E. long. advances furthest to the south, being in $34^{\circ} 45'$ S. lat. The Cape of Good Hope is in $34^{\circ} 22'$ S. lat. It forms the southern extremity of a narrow peninsula about 30 miles long, formed by False Bay on the east, Table Bay on the north, and the Atlantic on the west. Cape Town is on Table Bay on the north coast of this peninsula, and Simon's Town is on False Bay. This peninsula was the original boundary of the settlement which the Dutch made here about the middle of the 17th century, but they soon extended themselves beyond the isthmus which joins it to the African continent. The Hottentots, the natives of this part of Africa, a mild and inoffensive race, were easily though gradually subdued by the Dutch, who encroached step by step upon their country, reducing them to the condition of serfs, or driving away before them the more stubborn tribes. This process continued for more than a century, until at last the Dutch occupied the whole country as far as the great ridge called Nieuwveld Bergen and Sneeuw Bergen, about 32° S. lat., which runs east and west nearly parallel to the south coast, and divides the waters that run to the south, from those which flow north into the Orange River. Down to the close of the last century this ridge formed the natural boundary of the Cape colony, although the political boundary stretched considerably farther, the back settlers having extended beyond it on several points through the districts called by the Dutch Onder Roggeveld, Agter Roggeveld, and Middle Roggeveld. The colonial territory has since been considerably augmented.

The present boundaries of Cape Colony proper, as fixed by proclamation of July 5th, 1848, are—on the W. and S. the Atlantic Ocean; on the N. the Orange River, or Gariop, to where the Welge Spruit falls into it in $30^{\circ} 25'$ S. lat., $27^{\circ} 20'$ E. long.; on the E. the Welge Spruit to where the Wittebergen approach it; the ridges of the latter and the Stormbergen to the sources of the White Kei River; along its eastern branch to where it joins the Zwart (Black) Kei; up the latter to the junction of the Klaas Smits River, ascending it to its sources near Gaika's Kop; thence across the mountains to the sources of the Clunnie, and down the latter and the Keiskamma to the sea. The length of the territory thus comprised, from west to east, is nearly 600 miles; its greatest breadth from north to south is about 450 miles; and its probable area is 203,000 square miles. It consists of several well-marked mountain chains and terraces rising one above another from the coast.

At the south-western extremity of the colony is a completely insulated mountain mass, forming the peninsula above mentioned, and of which the celebrated Table Mountain at the back of Cape Town is the highest summit (elevation 3582 feet). A broad expanse of level sands (the Cape Flats) divides it from the Hottentot Holland Mountains, which terminate in Cape Hangklip on the east of False Bay, opposite to the Cape of Good Hope. From the neighbourhood of Worcester, between 60 and 70 miles north-east of Cape Town, several chains of mountains strike off in different directions: the western or Tulbagh chain, which runs northward to near the mouth of Olifant's River; the Drakenstein or Hottentot Holland chain before mentioned, which runs southward, in which and its offshoots are several important mountain passes; a range which bears in its course from west to east, successively, the names of the Zwellendam, Outeniqua, and Zitzikamma mountains, and which divides the southern sea-coast of the colony from the elevated longitudinal valleys called Kammland and the Long Kloof; and the great Zwartberg chain, which bears generally from west to east, and nearly parallel in the greater part of its extent to the last-mentioned chain, being separated from it by the Long Kloof and the valley of the Kromme River.

North of the Zwartberg lies the vast elevated plain called the Great Karroo, which extends for nearly 300 miles east and west, and about 80 miles north and south. It is a bleak wide desert, utterly bare and barren, except after heavy rains. On the west it communicates with the Roggeveld Karroo, and on the north it is bounded by a great chain of mountains, which in its western part bears the name of the Nieuwveld Bergen, and farther eastward that of the Sneeuw Bergen. These last are the highest mountains in the colony; yet, notwithstanding their name, they are not covered with perpetual snow, and therefore do not give rise to unfailing streams. Their highest summit, the Spitzkop or Kompas Berg, north of the village of Great Reynott, has been variously estimated at 7000 and 10,000 feet of elevation above the level of the sea.

The land between these several mountain chains rises in successive stages like terraces from south to north; so that the Long Kloof is higher by some hundreds of feet than the country along the southern coast; the Great Karroo is much higher than the Long Kloof (having, it is said, a medium elevation of 3000 feet above the sea); and the country to the north of the Sneeuw Bergen is more elevated still.

The easternmost district of the colony, that of Albany, is for the most part a region of undulating hills, without any very conspicuous eminences; but to the north and north-east of it is another system

of high mountains, in which the Kunap, the Kat River, and most of the other tributaries of the Great Fish River, as well as the Keiskamma and its feeders, take their rise. These are the mountains of Somerset, the Tarka, and the Ceded Territory. The Winterberg, their highest point, is supposed to have an elevation of 7000 feet. This chain extends in somewhat of an irregular crescent shape from between the Great and Little Fish rivers above the village of Somerset, to the upper valley of the Keiskamma, and links itself to the Amatola Mountains in Kaffraria.

The rivers of the Cape Colony are numerous, but have little permanent depth of water. A very few can be entered by small craft; the remainder, including the Orange River, are not navigable. The principal streams which discharge themselves into the sea on the southern coast are (in succession from west to east) the Breede, the Gauritz, the Gantoois, the Sunday, the Bushman's River, the Great Fish River, and the Keiskamma. Those of secondary importance likewise flowing directly into the sea are the Dnyvenboks, the Knyana, the Kearsbooms, the Kromme, the Zwartkops, and the Kowie. Of those which flow to the western coast the chief are the Berg River, Olifant's River, and the Gariop or Great Orange River. Nearly all but the latter are torrents shrunk almost to dryness except after heavy rains, when they rise suddenly and become extremely impetuous and formidable. Many of them flow in deep channels cut down fifty feet or more below the general surface of the country, between steep banks choked with thick vegetation. These ravines are great hindrances to travellers, and render it very difficult to use the waters of the streams for irrigation.

The general character of the country is sterile and uninviting. The environs of Cape Town indeed are picturesque, and so also is the country eastward of the Fish River; some of the south-western districts have a considerable degree of fertility, and produce corn and wine in abundance, whilst all the rest of the colony may be considered at present as nearly a grazing country. The quantity of corn raised is more than sufficient for the wants of the colony. Considerable attention is paid to the cultivation of the vine. White wine is produced in the interior. The small vineyard of Constantia, situated about eight miles west from Cape Town, has acquired celebrity from the luscious and high-flavoured wine which it produces, and which is known as Constantia wine. The produce of the Constantia vineyard, including both red and white wines, varies from 8000 to 12,000 gallons annually, according to the season. The chief occupation of the rural districts is the rearing of cattle. Merino sheep have been introduced into the colony, and have been successfully reared. In various parts of the country there are extensive varieties of beautiful flowers, including several hundred species. The alooe yields produce amounting in some years to about 3000*l.* in value, which is chiefly exported. From the covering of the wax-berry, candles are manufactured. The southern faces of the Outeniqua and Zitzikamma mountains are clothed with forests of large trees, as are also the Zuurberg and some other tracts near the eastern frontier; but the general characteristics of the scenery are rocky and arid mountains, naked uncultivated plains, stony valleys without a tree, a prevailing monotony, and absence of shade, of verdure, and of water. A few of the larger species of wild animals still exist in the remote parts of the colony, but their number diminishes as the civilised man encroaches on the territory hitherto occupied by the wild beast and the undisciplined savage. The climate is on the whole dry, but mild and favourable to health. Rain falls plentifully on the coast, but in the interior of the country it occurs rarely. The mean temperature for the year at Cape Town is $67^{\circ}3'$, the range being from $58^{\circ}3'$ to $76^{\circ}6'$. The coldest months are June and July; the warmest are December and January.

The territory of Cape Colony is divided into 10 western and 10 eastern districts, very unequal in size. The western districts are Cape, Stellenbosch, Zwellendam, Caledon, Worcester, Clanwilliam, Paarl, Malmesbury, George, and Beaufort. The eastern districts are: Uitenhage, Port Elizabeth, Graaf Reynet, Cradock, Colesberg, Somerset, Albany, Fort Beaufort, Victoria, and Albert. The principal towns are—Cape Town, the capital [CAPE TOWN], Grahamstown, Port Elizabeth, Graaf Reynet, Simon's Town, Uitenhage, Zwellendam, Stellenbosch, Beaufort, &c.

Grahamstown, the principal town of the eastern districts and capital of the Albany district, is situated near the sources of the Kowie River, on a plateau about 700 feet above the level of the sea. It contains 800 houses and about 6000 inhabitants; returns two members to the House of Assembly; is governed by a municipality and has lately been very much improved. Port Elizabeth, on the north-west corner of Algoa Bay in the district of Uitenhage, is a mean-looking but thriving town of 5000 inhabitants, and is the principal port of the eastern province. In the year ending 5th January 1849 there entered the port 138 vessels of 24,900 tons aggregate tonnage. The customs dues were 25,266*l.*; the total value of imports was 326,293*l.*; of exports 132,461*l.* The anchorage of Algoa Bay though open to the south-east winds is not unsafe for well provided vessels if proper care be taken. Landing however is often impracticable on account of the heavy surf. A lighthouse has been recently placed upon Cape Recife, the south-western extremity of the bay. Graaf Ryp, the chief town of the district of that name, distant 500 miles E. from Cape Town and 142 miles N.W. from Grahamstown, stands on the Sandry River, near

the foot of the Great Sneeuw Bergen. It is a pretty Dutch looking town and inhabited almost exclusively by Dutch: population about 8000. *Uitenhage* has more the appearance of a rural village than a town. It is one of the most agreeable places in the colony, and stands on the beautiful little Zwartkops River, in a fertile valley surrounded by wooded hills. It was proposed by the late Sir Benjamin d'Urban to remove the seat of government to this place, a measure which promised many advantages, but which was defeated by the opposition it excited at Cape Town. *Simon's Town*, 24 miles from Cape Town, is a small place consisting of little more than a single row of houses, stretching along the shore of the bay and backed by steep barren stony hills. *Simon's Bay*, the station for ships of war, is a cove on the west side of False Bay: it is not capable of containing any great number of vessels; but being sheltered from the westerly winds and in part from the swell caused by the south-easterly winds, it is a safer anchorage than False Bay. *Zwillingdam*, *Stellenbosch*, and *Beaufort*, the chief places of the districts so called, are large villages.

The population of the Cape Colony according to the Census of 1848 was 200,546. Of this total 76,827 were whites, namely, 39,896 males and 36,931 females; 101,176 belonged to the coloured races, namely, 52,197 males, 48,979 females; the remaining 22,543 belonged to Cape Town, namely, 11,074 males, 11,469 females. The genuine Hottentots now in the colony are few in comparison with the mixed breeds, or Bastards as they are called, in whom the blood of the aboriginal race is crossed with that of the Dutch, the Negro, or the Malay. The Baroa or Bosjesmen too have declined in numbers, but some of this singular race still roam the deserts lying along the northern boundary of *Clanwilliam* and *Beaufort* districts.

The constitution of the colony as finally adopted in 1853 after much agitation, consists of a Governor, a Legislative Council, and a House of Assembly. The Governor is appointed by the crown. The Legislative Council is formed of fifteen elective members and the chief justice of the colony, who holds his seat in right of his office and is president whenever present: five members form a quorum; all questions are decided by a majority not including the president, but when the votes are equal the president has the casting vote; the members are elected for ten years, but eight and seven retire alternately every five years. The House of Assembly consists of forty six members elected for five years, and twelve form a quorum. The electors are every male person not subject to legal incapacity who has occupied for twelve months previous to the day of election premises or land of the annual value of 25*l.*, or has been in the receipt of a salary of not less than 50*l.* per annum, or of 25*l.* together with board and lodging. Registration claims, objections, publication of lists of voters, revision, &c., are after the model of the mother country. Each of the ten western and ten eastern divisions returns two members each; *Grahamstown* returns two members and Cape Town (including the municipality of *Green Point*) returns four members. A property qualification is required for members of both houses of 2000*l.* in real property, or 4000*l.* in personal property clear of all mortgages or debts. The colonial secretary, the treasurer, the attorney-general, and the auditor are empowered, ex officio, to act and speak in both houses but not to vote. A session is to be held once at least in every year. The governor has power to give or refuse his assent to bills passed, or to reserve them for the royal pleasure, but the Queen in council may disallow of acts assented to by the governor. The civil list, as it may be called, amounts to 106,090*l.*, of which the governor and his secretary receive 5300*l.*; the colonial secretary and his department 5500*l.*; the treasurer-general and his department 1890*l.*; the registrar of deeds 1000*l.*; the post-office 2330*l.*; the supreme court of law 7935*l.*; the divisional courts 16,335*l.*; education establishments 4100*l.*; police, prisons, and jails 1540*l.*; public worship 16,060*l.*; pension 15,000*l.*; border department (aborigines) 14,000*l.*; the rest to various offices.

The Established Church has a bishop of Cape Town with a dean, four canons, and two archdeacons. The bishop of Cape Town is metropolitan, and has under him the bishop of *Grahamstown* created in 1853, and the bishop of *Natal* created in the same year, and the diocese includes the island of *St. Helena*. A considerable part of the community belong to the Dutch Reformed Church, and there are also members of Dissenters, all of whom have their various places of worship, schools, &c. The public provision for education in the colony is made on a comprehensive and liberal scale. Besides the *South African College* in Cape Town and the *Diocesan Collegiate School* in the Cape division, there are 179 public and private schools, some wholly some partially supported and directed by the government. In each district town there is a government free school, which is kept independent of all sectarian influence.

The gross revenue of the Cape of Good Hope in the year 1849 was 223,554*l.*, the cost of collection being 19,030*l.*. The principal items were: Customs, 83,788*l.*; land revenue, 14,500*l.*; land sales, 8687*l.*; transfer duties, 20,387*l.*; auction duties, 17,257*l.*; stamps and licences, 20,607*l.*, and postage, 957*l.*. The total expense of the civil establishment in the same year was 259,207*l.*, including 10,813*l.* for immigration. The total military expenditure for the year ending March 31, 1850, was 158,201*l.*; the number of men, including the artillery, was 4790. In 1849 the total amount of exports was 547,647*l.*; the imports amounted to 829,382*l.*

The Cape Colony is pre-eminent among new countries for the number and excellence of its roads. They are managed by a board sitting at Cape Town, and the expense is defrayed by a local rate. [NATAL; KAFFRARIA; TRANSGARIEPINE SOVEREIGNTY.]

(*Parliamentary Papers; Cape of Good Hope Almanack; Communication from the Cape of Good Hope.*)

CAPE HORN, which is considered the southern extremity of America, is not a part of that continent, but is the most southern point of a small island which belongs to the extensive group of *Tierra del Fuego*. It is situated in about 56° S. lat., 67° 10' W. long., and consists of a high precipitous black rock, which is conspicuous above all the neighbouring land, utterly destitute of vegetation, and running far out into the sea. The strong westerly gales which blow in the neighbourhood of this cape render it difficult to be doubled from the east. These gales however blow during the summer (October to April) only near the cape; in 60° S. lat. they are more variable, and vessels now double the cape, as it is called, without danger, simply by sailing on a higher latitude. During the winter east winds are more frequent; but at that season the navigation is rendered dangerous by the floating islands which approach the cape, and are found even further to the north. There is a current towards the east near the cape which is attributed to the effect of the west gales. (Capt. Basil Hall.)

CAPE TOWN, the capital of the British possessions in South Africa, is in 33° 55' S. lat., and 18° 21' E. long., at the foot of *Table Mountain*, on the shore of *Table Bay*, from which the ground rises with a gentle slope towards the mountain. Cape Town was founded by the Dutch in 1650, and together with the colony, continued in their possession until 1795, when it was taken by the English. At the peace of *Amiens* it was restored to the Dutch, but was again taken by the English in 1806, and has since remained in their possession. The town is well and regularly built. The houses, which are flat roofed and for the most part of a good size, are nearly all of red brick or stone, and furnished with a verandah in front. The principal streets are wide and clean, and regularly laid out, intersecting each other at right angles, and shaded with oaks and elms; but they are unpaved, and therefore excessively dusty in dry weather. The town is exposed to great heat in consequence of its situation, facing the noonday sun and immediately backed by naked mountains. The castle is on the right side of the town looking towards *Table Bay*, the anchorage in which it commands. This fortress is of considerable strength. Its form is pentagonal, and it has a broad fosse and regular out-works. Many of the public offices of the colony are within its walls, which likewise contain barracks capable of holding 1000 men. Connected with the castle on the east by a rampart called the *Sea-line* is *Fort Knokke*, and still farther east is *Craig's Tower* and battery. On the west, surrounding the hill called the *Lion's Rump*, are *Chavonne*, *Amsterdam*, and *Rogge* batteries; and the entrance to the bay is commanded by a battery called the *Mouille*.

Table Bay is sufficiently capacious to contain a great number of ships, but it is exposed to a heavy swell during the prevalence of the westerly winds in June, July, and August. At other times the anchorage is tolerably safe. When discharging or taking in goods ships are moored very near the landing-place, which is built of wood, and is at the east side of the town. The south-east wind, as it blows from off the shore, is not dangerous to ships in the bay; but it often cuts off the communication between them and the land for several days together. It is usually accompanied by that peculiar cloud called the *Table Cloth*, which lies along the top of *Table Mountain* like a wreath of snow, while the rest of the sky is perfectly clear.

There are eleven churches and chapels in the town. Three of these are of the Established Church, four English Dissenting, one Scotch, one Dutch, one Lutheran, and one Roman Catholic. The ministers of all these places of public worship are supported by the colonial government. The supreme court of justice for Cape Colony is held within the town under the presidency of a chief justice and two puisne judges; there are besides a magistrates' court and a police office, having a judge and superintendent and a deputy. An observatory has been established about 2 miles north from Cape Town under the control of the Lords of the Admiralty. An iron building has lately been erected to serve as a depot for coals, to supply the steam-vessels which touch at the cape on their route to Australia.

The plain which surrounds *Table Mountain* is composed of blue schist, interrupted by masses of blue flinty rock, and resting upon a tenacious clay impregnated with iron. After ascending 900 feet the mountain appears to be nearly a solid mass of granite, characterised by large crystals of felspar, and containing, besides quartz and mica, occasional masses of hornblende. After ascending 900 feet higher the granite is surmounted by thin horizontal strata of red sandstone for near 200 feet; then succeeds a more indurated sandstone, quite white, and containing imbedded in it pieces of quartz from the size of a pea to that of an apple; this formation continues to the summit of the mountain, which is 3567 feet above the sea.

CAPE VERD ISLANDS (*Ilhas Verdes*), were so called by the Portuguese because the sea to the west of them is covered with Gulf-weed, so as to present some resemblance to extensive meadows. This group of islands is about 300 miles from the western shore of Africa, between 14° 17' and 17° 19' N. lat., and between 22° 10' and 25° 10'

W. long. Their shores are commonly low, or of moderate elevation, but in the interior the islands often rise to a considerable height. They are doubtless of volcanic origin, and a volcano still exists in the island of Fogo, the summit of which is above 9000 feet high. The soil is very dry, but by no means sterile. The rainy season lasts from July to November, and is attended with thunder-storms and thick fogs. Sometimes no rain falls for three or four years together, and the consequence is a famine. During the rainy season the climate is unhealthy. Maize and rice are the principal objects of agriculture; but all the fruits of the south of Europe and of Western Africa grow abundantly, especially oranges, melons, pomegranates, bananas, lemons, figs, guavas, grapes, cocoa-nuts, and pine-apples. Coffee grows well, as also indigo and tobacco. Sugar and cotton are grown, but very little is exported; and though the vine flourishes, the wine made is of inferior quality. The palm, tamarind, and adansonia are the principal trees. The number of trees on the island however is but small. Among the domestic animals the most numerous are cattle, goats, asses, and fowls; goat-skins are the principal article of export, upwards of 6000 being annually shipped. Asses are exported to the West Indies. The most remarkable of the wild animals are monkeys and bisam-cats; turtles abound in the neighbouring seas. Salt is made by evaporation from sea-water in most of these islands on the low shores, and forms an important article of export to America and the coast of Africa. A good deal of orchilla is gathered. The inhabitants, who are all Catholics and speak Portuguese, are mostly negroes, mixed with some mulattoes, the descendants of the Portuguese who have settled here. There are very few whites. Vessels bound for the East Indies sometimes stop here for fresh provisions.

The group consists of 8 larger islands and several barren islets. The following table shows their area and comparative populations: -

	Area in sq. miles.	Free inhab.	Slaves.
Santiago	360	19,932	1714
Fogo	144	4,706	909
Brava	36	3,820	170
Maio	50	1,512	363
Bonavista	140	2,818	513
San Nicolao	115	5,293	125
San Antonio	210	15,407	180
San Vicente	70	336	5
Total	1155	51,851	3979

It must be mentioned however that the total population of the islands in 1850 amounted to 86,738. The population in the table is taken from the Census of 1834. The total area of all the islands and islets belonging to the group is 1642 square miles.

Branca, Chao, Carnera, and Ghucy are bare rocks, and Ilha do Sal has a sterile soil, but is important for the great quantity of salt collected in the numerous lagoons with which its beach is covered, and which is formed by solar evaporation.

The capital of the islands is *Ribeira Grande*, which is situated on the island of Santiago. It is the seat of a bishop, the residence of the Portuguese governor of the Cape Verde, and contains 500 houses: it is situated at the mouth of a river which forms a small harbour, but it is not much visited. *Porto Praya* is a good harbour, and is visited by vessels bound for India: it contains 1200 inhabitants.

These islands were discovered in 1449 by the Portuguese, and some years afterwards they were settled. They are still in the possession of the Portuguese, and under a separate governor. Besides the few articles (goat-skins, salt, turtles, fruits, saltpetre, cattle, and asses) which are exported, the inhabitants have some commerce with the continent of Africa, where they sell cotton cloths. Whales abound round the islands, and amber is found on all the coasts. Linen, earthenware, pottery, and soap are made on some of the islands.

In the sea which divides this group from Africa, the atmosphere for the greater part of the year is hazy and foggy, especially near the continent, so that the vessels sailing south prefer to keep to the west of the islands. The same phenomenon of a foggy atmosphere is observed farther north, between the Canaries and the coast north of Cape Bojador.

(Macgregor, *Commercial Statistics*.)

CAPE WALKER. [NORTH POLAR COUNTRIES.]

CAPELLE, LA. [AISNE.]

CAPERNAUM, an ancient city of Galilee in Palestine, about 70 miles N. by E. from Jerusalem, was situated on the north-western shore of the Sea of Tiberias, and about 2 miles W. from the mouth of the Jordan. It was a place of considerable importance in the time of Christ. It was there that our Saviour commenced his public ministry; and in its neighbourhood he delivered the Sermon on the Mount. Its continued impenitency and unbelief, notwithstanding the peculiar opportunities with which it was favoured, led to the denunciations pronounced against it. The name (Kaphr-nahum) meant 'village of consolation.' The ruins are now called Tell-Hum, 'the ruined heap of a herd of camels.' The remains of Roman baths, porticoes, and buildings attest its ancient importance.

CAPITANA'TA, a province of the kingdom of Naples corresponding to the ancient Daunia, extends along the Adriatic from the mouth

of the Saccione to the mouth of the Ofanto. The Ofanto divides the province on the south-east from Basilicata and Bari; on the south and south-west lies the province of Principato Ultra, separated from Capitanata by the main ridge of the Apennines. The north-western boundary towards Sannio or Molise is formed by the upper course of the Fortore to the point where this river crosses the high road from Lucera to Ururi: it then runs along this road for five miles in a north-west direction, and thence down to the Saccione, along the left bank of which it runs to its mouth. The length of the province along the coast in a straight line is 70 miles; but reckoning the winding or the sea round the great projection of Monte Gargano, the coast-line measures at least 100 miles. The average width of the province is about 45 miles; but between the crest of the Apennines and the extremity of Monte Gargano it is not less than 75 miles. The area is about 2359 square miles, and the population in 1851 was 318,415. The governor of this territory and the adjoining parts of Italy subject to the Eastern emperors, was styled Katapan; and Capitanata is supposed to be a corruption of Katapanata or Catapanata, the name by which his province would most probably be designated. The province is also vulgarly called *Puglia Piana* (or level Puglia) to distinguish it from *Puglia Pietrosa* (the rocky), now Terra di Bari and Otranto.

The greater part of Capitanata consists of a wide plain sloping gently from the foot of the Apennines to the Adriatic. In the northern part of the province the mountainous region of Monte Gargano projects eastward into the sea, forming a promontory which from its shape and position has been called the 'Spur of Italy.' To the north-west the districts of Torre Maggiore, Lucera, and Vulturara lie among offsets of the Apennine ridge. To the west the towns of Troja and Bovino, and to the south that of Ascoli rise at the foot of the ridge itself. All the rest is a vast monotonous plain, without trees, with hardly any villages or houses, and with only the city of Foggia in the middle of it, and the town of Cerignola near the Ofanto. This plain is known by the name of Tavoliere di Puglia. The Fortore flows north-north-east into the sea to the north of Lake Lesina, opposite the Tremiti Isles. The Candellaro rises to the north of Torre Maggiore, not far from the right bank of the Fortore, from which it is divided by a low offshoot of the Apennines; it thence flows south-east along the western base of the Monte Gargano, receiving on the right bank from the Apennines the Triolo, the Volgano, and the Celone (which cross the northern part of the Tavoliere), and on the left bank a few small streams from Monte Gargano, and falls into the shore-lake of Pantano Salso, a few miles south of Manfredonia. The Cervara and Campella flow in a north-east direction from the Apennines, and at a distance of only a few miles apart across the Tavoliere, the former enters the Pantano Salso; the latter discharges part of its waters into the shore-lake of Salpi, and the rest, by a canal cut in 1830, into the Adriatic. The Candellaro, Celone, and some of the other rivers are embanked to prevent inundations. The Ofanto (ancient Aufidus) is noticed under BASILICATA.

About one-sixth of the surface among the hilly regions of Gargano and the Apennines is covered with forests and plantations of trees. *Monte Gargano*, the ancient *Garganus*, is the only great promontory on the Italian shore of the Adriatic between Ancona and Otranto. The region is a compact mass of limestone mountains geologically connected with the Apennines, but separated from them by a portion of the great plain of Apulia. It extends not less than 35 miles from east to west, above 20 miles from north to south, and attains in its highest point an elevation of 5120 feet above the sea. In ancient times Garganus was celebrated for its dense forests of oak, but these have now almost entirely disappeared. The southern slopes of Monte Gargano are covered with aromatic herbs, from which the bees of the region make most excellent honey. The offshoot between Monte San Angelo and the sea was celebrated for its honey by Horace, whose name for the rugie (Matinus) is perpetuated in that of Mattinata, a village with a tower and small port. The ridges of Monte Gargano that extend down to the sea screen several coves well adapted for sheltering small craft. The Monte Gargano, with its well-wooded ravines interspersed with villages, presents much beautiful and interesting scenery. The region contains extensive quarries of alabaster.

The great plain of the *Tavoliere* is about 60 miles long and 30 miles broad in its widest part; it occupies 1,120,000 moggia, or nearly one-half of the surface of the province. It belongs to the crown, with the exception of a few small portions. Two-thirds of the plain are left for pasture, and have no resident population; and the other third is cultivated, excepting 58,000 moggia of it, which are covered with marshes. The history of the Tavoliere is interesting. Daunia, previous to the Roman invasion, was well inhabited, and had many towns. In the second Punic war the devastation of the country was commenced. The wars of Sulla and the servile war of Spartacus completed the desolation. The towns and villages of the plain being destroyed, the inhabitants became wanderers and shepherds. The course of the rivers and drains being neglected, pestilential marshes were formed near the sea-coast; while the inland plain, deprived of irrigation, was burnt up by the summer heats. In winter however it afforded a natural and abundant pasture. The mountaineers of Sannium and Abruzzo began to lead their flocks in winter into the plains of Apulia, which were abandoned, and returned to the mountains for the summer. This was the origin of the system of migratory

pasturing, which has continued ever since. The Romans imposed a tribute upon the right to pasture in the plain, and intrusted its management to Publicani, called 'Alabarchi,' who numbered the heads of cattle or sheep, and collected the tax. (Ducange, 'Glossarium,' art. 'Alabarchi.') Under the emperors the complaints of the extortions of the Publicani became so loud that Nero proposed to the senate the abolition of the tax, which however was not effected. Under the Normans the Tavoliere was made a royal property, and parts of it were let to 'locati,' or tenants. Charles of Durazzo drove away the tenants. By letters-patent of Alfonso of Aragon, dated from Tibur 1st of August 1447, the proprietors of flocks in the mountains of Samnium and Abruzzo were obliged to take them into the plain of Puglia for the winter, and to pay a tax at so much per head. In mitigation of this compulsory system the proprietors obtained several privileges and immunities, which gave it a marked resemblance to the Spanish Mesta, on which no doubt it was modelled.

In 1661 this obligatory migration was commuted into a voluntary one, by which every proprietor of flocks obtained the quantity of ground that he wanted for pasture by paying to the treasury 132 ducats a year for every 1000 sheep. Other parts of the plain were let for cultivation. Under Joseph Bonaparte, in 1806, all the temporary tenants of the Tavoliere were obliged to become perpetual tenants, and to purchase their lease, under which regulation 1,800,000 ducats were paid at once into the treasury. In 1817, after the restoration, a second fee to the same amount was exacted, and the annual charge was also raised; at the same time the price lowered the price of agricultural produce, and much distress among the tenants was the consequence. An insurrection followed in 1820. Austria intervened and abolished the compulsory system which was the cause of the outbreak. The farmers and breeders of the neighbouring provinces however still voluntarily bring their flocks; and the administration of the pasturage instead of being as formerly in the hands of a jobbing board at Foggia is entirely confided to the Intendente of the province. The tolls and rents now paid to the crown from this system are said to amount to 400,000 ducats a year. Each flock is under the care of a chief shepherd, an under shepherd, and head dairyman; it is subdivided into 'morre' of 350 sheep each, under the care of a shepherd, dairyman, and cheese-maker. To each morra two dogs of the large white Abruzzo breed are attached, and a mule for carrying the baggage and utensils for making cheese. All the attendants on the flocks are dressed in sheep-skin coats, coarse cloth breeches, and sandals; and whilst in the pastures they sleep on the ground under tents of skins.

The breed of sheep has been improved by the cross of merinoes, and the wool is doubled in value. The breed of horses has also been improved; and winnowing and threshing machines have been introduced. Notwithstanding the dryness of the soil and the little manure used by the cultivators, wheat thrives very well on it, and large quantities are exported. From the Gargano, which is the best cultivated district in the province, oil, lemons, oranges, carobs, capers, and terebinth gum are exported. Large eels from the lakes of Varano and Lesina, in the same district, are exported, chiefly to Naples. Cheese, cattle, and ponies form the other articles of exportation. The manufactures are very few, consisting of some linens made at Cerignola, coarse hats, leather, common soap, &c. Manfredonia, on the Gulf of Manfredonia, which is sheltered on the north-west by Monte Gargano, is the only harbour in the province, but it has not depth of water for large vessels. Near Manfredonia are salt-works of marine salt. The marsh called *Lago Salso*, between the Candelaro and the Cervaro, is about 4 miles in length and 2 miles in breadth. Further east along the coast, and between the mouth of the Carapelle and that of the Ofanto, is the great marsh called *Lago Salpi*, 20 square miles in extent and only 2 feet in its greatest depth; it is nearly dry in summer, and poisons the air all around. Two small towns, Salpi (on the ruins of the ancient Salapia, celebrated for its siege by Hannibal) and Casal-Trinità (population 3800) are near its borders. The royal salterns near Casal-Trinità are the most important salt-works in the kingdom.

Towns.—*Foggia*, the capital of Capitanata, is a well-built modern town of 21,000 inhabitants, the seat of the provincial courts of justice, of a commercial court, and the centre of all the trade of the province. Around it are plantations of olives, vines, and other fruit-trees, which form an oasis in the midst of a desert. Many of the provincial nobility and gentry reside at Foggia. The great road from Naples to Barletta, Bari, &c., passes through Foggia, whence other roads branch off to Manfredonia and Monte Gargano, to San Severo, and to Lucera. Foggia is 78 miles E.N.E. from Naples, and 20 miles S.W. from Manfredonia. The city is supposed to have been built from the ruins of Arpi, 4 miles distant, which was taken by Hannibal after the battle of Cannæ. The principal streets are wide, and contain good houses and handsome shops. The cathedral, originally a gothic structure, was destroyed by an earthquake in 1731; the upper part has been since rebuilt in a different style. The town has a good theatre; and a new *campo-santo*, or cemetery, and promenade have been recently formed. Foggia was one of the favourite places of residence of the emperor Frederick II., whose third wife, Isabella of England, and daughter of King John, died here. The gateway of the emperor's palace and a well sunk by him still remain. Manfred, Frederick's natural son, defeated the legate of Pope Alexander IV. under the walls of Foggia, and was crowned in the cathedral. Charles I. of Anjou

and his son Philippe died in the fortified palace of Foggia. After the occupation of Otranto by the Turks Ferdinand I. of Aragon assembled here a parliament of barons and prelates to arrange a crusade against the Infidels. In 1779 Francis I., then duke of Calabria, was married to the Grand Duchess Maria Clementina of Austria, in the cathedral; and at this time Ferdinand I. and his court resided at Foggia, which ranked as the second city in the kingdom.

Cerignola, 24 miles S.E. from Foggia, and about 6 miles N.W. from the bridge of Canosa over the Ofanto, is a well-built episcopal town with about 10,000 inhabitants. It consists of an old and a new town; the former still retains portions of its ancient walls. The town is built on a hill, which commands an extensive view over a monotonous plain of corn-land without a single tree. The decisive battle of Cerignola, in which the Spaniards under Gonsalvo di Cordoba (April 28, 1503) defeated the French under the Duke de Nemours, reduced the kingdom of Naples to a Spanish province. An ancient military stone still standing in one of the streets records that Trajan had made the road from Beneventum to Brundisium at his own cost.

Bovino, 18 miles S.W. from Foggia, is an episcopal town situated on a hill at the foot of the Apennines, and has a population of 5700. It occupies the site of the ancient Vibinum. The Val di Bovino, or Pass of Bovino, is a narrow defile traversed by the Cervaro, inaccessible except at its two extremities; it is diversified by corn-fields, hop-grounds, and forests abounding with white acacia and arbor-vitæ. This defile was formerly the haunt of the brigands of Capitanata; indeed Bovino still enjoys the reputation of being the nursery of the most famous brigands in all Italy. The road from Ariano to Foggia runs through the Val di Bovino, along the left bank of the Cervaro; at Ponte di Bovino, the eastern end of the defile, a branch crosses the Cervaro, and traverses the Tavoliere to Cerignola.

Ascoli, a poor place of 5000 inhabitants, on the road from Bovino to Melfi, occupies the site of the ancient Asculum Apulum, the scene of the drawn battle between Pyrrhus and the Romans under the consul Curius. [ASCOLI DI SATRIANO.]

Manfredonia, a city founded by Manfred in 1256, and named from him, is 23 miles E.N.E. from Foggia, at the head of the Gulf of Manfredonia, and has 5000 inhabitants. It was built from the ruins of Sipontum, an ancient Greek city, which was desolated in the invasion of the Goths. The town is well built, with wide streets of symmetrical houses. Manfredonia gives title to an archbishop, and for cleanliness and regularity of plan is surpassed by few cities in Europe. It is surrounded by walls and defended by a strong castle, which also commands the port. The population, formerly much greater, has dwindled to its present amount in consequence of malaria from the Sipontine marshes; these however have been recently drained, and the town is said now to be more healthy. The church of Madonna di Xiponto, among the ruins of Sipontum, is still the archiepiscopal cathedral, and is built in the Saracenic style. The city contains many beautiful buildings, and its harbour is the chief port of the province.

Monte Sant' Angelo, about 6 miles N. from Manfredonia, situated on one of the mountains of Garganus, is a well-built town with about 12,000 inhabitants. The town, which has a fine castle, took its name and its origin from the archangel St. Michael, the patron saint of the Norman conquerors of south Italy and Sicily, who is said to have appeared here in a cave in the year 491 to San Lorenzo, archbishop of Sipontum. On the 8th of May, the festival of the saint, the town and mountain are crowded with pilgrims to the holy cave, not only from the region of Monte Gargano but even from remote provinces of the kingdom; they come in an endless variety of costume, many of them armed cap-à-pie and all ascend the mountain on foot, bareheaded, and singing the hymn to the archangel. The cave is lighted with lamps and terminates in three chapels, one dedicated to St. Michael and another to the Madonna; in the third is a small cistern of cool and limpid water, which is distributed to visitors, and is said to have wonderful healing powers. Through a narrow fissure in the roof of the cave a most imposing view of the monastery of Sant' Angelo is obtained rearing its pinnacles from the impending rock at an immense height above. The road from Manfredonia to Monte Sant' Angelo passes through a succession of gardens filled with orange trees for three or four miles. The mountain is then ascended by steep and tiresome zigzag paths practicable only for pedestrians. The town of Monte Sant' Angelo, like most places of pilgrimage, is beset with beggars.

Lucera, about 10 miles N.W. from Foggia, is situated on a steep and commanding eminence above the Tavoliere, and has a population of about 10,000. It occupies the site of the ancient *Luceria*, the capital of Daunia. The ancient city was destroyed in the wars of the 7th century, and lay in ruins till 1239, when the emperor Frederick II. restored it as a residence for his Sicilian Saracens, to whom he guaranteed the free exercise of their religion. Christians were excluded from the city and compelled to reside beyond the walls, where their church, called Madonna della Spica, is still standing. The town is girt with old walls pierced by five gateways. The castle is about a quarter of a mile from the town and separated from it by a ditch crossed by a drawbridge. The old streets are narrow, but the modern parts of the town are well built and handsome. The bishop's palace is the finest building in the province. The cathedral, which the Saracens converted into a mosque, has a gothic interior, but still

bears external traces of Moorish architecture; it contains 13 pillars of verde antique, supposed to have belonged to an ancient temple, and the pulpit is adorned with Greek mosaics. The castle occupies the site of the ancient Roman citadel, under the walls of which the Romans wiped out the disgrace of their ignominious defeat at Furculæ Caudinæ. A large square tower in the centre of the castle is supposed to be of Roman erection; the rest of the building is attributed to Frederick II. Though now in ruins this castle is one of the most imposing buildings of the kind in Italy. Its walls inclose space enough to contain a small city; two round towers are still standing, one of which is now a telegraph station. The emperor erected apartments for himself in the area, which were connected with the town by a subterranean passage. Frederick's son, Manfred, took refuge with the Saracen garrison of Lucera in 1254, and his widow and children after the fatal battle of Benevento resided in the castle for a short time. Charles of Anjou expelled the Saracens in 1269. Near Lucera are the ruins of Castel Fiorentino, in which the emperor Frederick II. died Dec. 13, 1250. Lucera is the seat of judicial courts for the province of Capitanata and has a small college. The territory of Lucera is now as in ancient times famous for the fine quality of the wool which is furnished by its flocks.

San Severo, one of the most flourishing towns in the province, is situated near the northern edge of the Tavoliere, 20 miles N. by W. from Foggia, and has a population of 19,000. In 1799 it was almost destroyed by the French in revenge for the gallant resistance made by its inhabitants, 3000 of whom were slain; the rest were saved by the intrepid conduct of the women, who rushed between the combatants. The town was afterwards walled, but a new quarter and large suburbs have recently sprung up beyond the walls, which contain many handsome residences of the rich proprietors of the province.

Serra Capriola, in the north of the province between the Fortore and the Saccione, is a small town of 5600 inhabitants. At the village of Chienti, a little north of it, are ancient ruins supposed to be those of the Apulian Teate.

Troja, a small episcopal city of 5300 inhabitants, built on a conical hill, 15 miles S.W. from Foggia, was founded by one of the Greek Kutapans in the 11th century. This city has given name to three remarkable battles: one fought in 1254, in which Manfred defeated the army of Pope Innocent IV.; a second in 1441 in the plain between Troja and Bovino, in which Alfonso I. of Aragon in person defeated the army of René of Anjou; and the third in 1462, when the Angevines were again totally defeated by the Spaniards commanded by Ferdinand I. of Aragon.

Vesoli, a small sea-port town of about 5000 inhabitants, is situated on the Adriatic shore at the north-eastern base of Monte Gargano.

Off the northern coast of Capitanata are the Tremiti Islands, about 10 miles distant from the Punta di Miletto between the shore lakes of Varano and Lesina. These islands are the ancient *Diomedæ Insulæ*. There are four of them: San Domenico the most southern and the largest; San Nicola or Tremiti; Caprara; and about 10 miles north-eastward Pianosa. There is a monastery and castle on Tremiti; in this island a volcano burst forth May 15, 1816, and threw up stones and lava for several hours. On San Domenico also there is a large monastery. This island was the place of exile of Augustus's infamous granddaughter Julia, who died here.

CAPO D'ISTRIA. [ISTRIA.]

CAPPADOCIA, a country of Asia Minor, usually spoken of in two divisions—1, Cappadocia the Great, or Cappadocia bordering on the Taurus (Strabo), also called Cappadocia simply; and 2, Cappadocia bordering on the Pontus, often called Pontus only. Cappadocia on the Pontus includes the country north of the range of mountains anciently called the Paryadres. Taken in its comprehensive sense the term Cappadocia included nearly the whole of the Turkish province of Roum, and a great part of Kuramania. It was bounded N. by the Pontus Euxinus (Black Sea), S. by Taurus, which divided it from Cilicia, W. by Paphlagonia, Phrygia, and Galatia, and E. by the Euphrates. Both the Cappadocians on the Pontus and those bordering on the Taurus were called Syrians by the Greeks, and White Syrians (*Λευκοὶ Σύροι*), to distinguish them from the Black Syrians beyond the Taurus. (Herod. i. 72, v. 49; Strabo, xvi. p. 737, α, Casaub.) Cappadocians was the name given them by the Persians. (Herod. vii. 72.) There is a river Cappadox, mentioned by Pliny, rising in some of the mountain-ridges, and flowing along the boundary of Galatia and Cappadocia into the Halys; the name is not mentioned by Strabo; and it is probably of comparatively late origin. Some writers however have derived the name of the country from the river. Ainsworth in the 'London Geographical Journal,' vol. x. 290, supposes the Cappadox to be the Kalichî, which joins the Halys on the right bank a little north of 39° N. lat.

Cappadocia is one of the richest parts of Asia Minor; it is characterised by extensive plains of great fertility. It was generally deficient in wood, but well adapted for grain, particularly wheat. Some parts of it produced excellent wine. Of the mountains the principal is the Taurus, which forms in fact the southern boundary. Two other important chains, the Anti-Taurus and the Paryadres (Keldir), run nearly parallel from Armenia into the centre of Cappadocia. From the summit of Mount Argæus Strabo says (xii. p. 538), that the few who had ever gone so high had been able to see the Black Sea and the

Gulf of Scanderoon, an assertion which is confuted by the bare inspection of a map. [ANATOLIA.] Cappadocia the Great generally has little wood; almost the only timber district is in the neighbourhood of Mount Argæus, which supplies the rest of the country with fuel. Beyond this woody region which surrounds the mountain is a sandy plain with a substratum of rock, quite barren and uncultivated. The part between Mount Argæus and Mazaca (Kesarieh), and indeed most of this district, appears to have been the seat of volcanic action (Strab. xii. p. 538); it abounds in water, chiefly marshes caused by the overflow of the river Melas. On the banks of the Melas were some large stone quarries, which supplied the people of Mazaca with building materials. Mazaca was the favourite abode of the kings of Cappadocia, who appear to have selected it for its central position, and because it abounded in timber and in stone as well as in fodder, which was a great object where so much attention was paid to cattle. (Xen. 'Cyrop.' ii. 1, 5.) The tribute which they paid to the Persian monarch consisted chiefly in horses, mules, and sheep. The high table-lands of this country are admirable pasture-land; and it is probable that in very early, as well as in later times, the Cappadocians carried on an extensive trade in supplying the neighbouring nations with horses and mules. (Ezekiel, xxvii. 4.)

The principal towns of Pontic Cappadocia were on the coast. A little east of the mouth of the Halys was Amisus (Samsun); farther east on the river Thermodon stood Thomiscyræ, whose plains were the fabled abode of the Amazons; proceeding along the coast we come to Cerasus, which some suppose to be represented by the modern Keresun, where cherry-trees grow wild in great abundance on the hills; it was from this place that Lucullus (B.C. 74) first brought cherries into Italy, on his return from the Mithridatic war. The word 'cherry' (*cerasus*) took its name from the place. Just upon the eastern boundary of Cappadocia on the Pontus stands Trapezus, the modern Trebizond, originally a colony from Sinope (Xen. 'Anab.' iv. 8, 22), where the Greeks met with a hospitable reception on their retreat after the battle of Cunaxa. Trapezus and Cerasus paid tribute to Sinope. (Xen. 'Anab.' v. 5, 10.)

The chief towns inland were Amasia, Mazaca, Comana (in Pontus), the great emporium for the Armenian merchants (Strab. xii. p. 559), and Comana in Cappadocia the Great, the modern Bostan, which contained a great temple of Bellona. To the west of Comana, near the boundary of Lycæonia, was Tyana, or as Xenophon ('Anab.' i. 2, 20.) calls it, Dana, the limit of Cyrus's march in Cappadocia. The principal rivers of Cappadocia are the Halys (Kizil) and the Iris (Yeshil), both of which flow into the Euxine; and the Melas, which flows into the Euphrates. The Kizil flows through a country abounding in salt-hills, and hence Strabo supposes the ancient name to have been derived (xii. p. 546, d). Indeed in many parts of Cappadocia salt tracts are found of great extent. [ANATOLIA.] The Iris flows through Amasia.

Cappadocia abounded also in mines of iron and silver: Horace alludes to this fact. ('Epist.' i. 6, 39.) The iron mines in the north-east of Pontus were worked by the Chalybes (Strab. xii. 549, d; Xen. 'Anab.' v. 5, 1), the greater part of whom appear to have gained a livelihood by working in iron. On the same coast east of Samsun (Amisus) at a place called Unich, rock alum still forms a considerable article of trade. There is said to be a silver mine at a place near Amasia, called now Hadji Kioi. Crystal, jasper, and onyx are said also to enrich this country. (Strab. p. 540, α.) Strabo speaks of a beautiful stone which was produced in Cappadocia, white like ivory; the handles of swords were made of it.

The Cappadocians were very generally known during the Roman occupation of their country for their unprincipled and vicious character; so much so that the word 'Cappadocian' was only another name for a villain.

The condition of Cappadocia before the period of the Persian rule is uncertain; possibly it belonged to the extensive kingdom of Lydia. At any rate both Cappadocia on the Pontus and Cappadocia on the Taurus appear to have formed one state. Darius Hystaspis is said to have first divided it into two satrapies. (Strab. xii. 534, c.) The satraps appear to have been kings of the countries tributary to the Persian monarch, and hence an hereditary succession is observed. The circumstance that Darius and his successors in this, as in most other cases, left the government of the district with the native princes, is probably to be attributed more to their inability to prevent it than to any other reason.

The first king of Cappadocia, according to Strabo (xii. p. 534, α), was Ariarathes. But Aribæus, mentioned by Xenophon ('Cyrop.' ii. 1, 5), would appear to have preceded him. The following list has been drawn up in the 'Universal History' (vol. x. p. 8):—Pharnaces, Smerdis, Atamnus, Anaphas I., Anaphas II., Datames, Ariaramnes I., Ariarathes I., Olophernes, Ariarathes II., Ariarathes III., Ariaramnes II., Ariarathes IV., Ariarathes V., Ariarathes VI., Ariarathes VII., Ariarathes VIII., Ariarathes IX. (the family of Pharnaces now extinct). Ariobarzanes I., Ariobarzanes II., Ariobarzanes III., Archelaus. On the death of Archelaus Cappadocia was reduced to a Roman province (Strabo, xii. p. 534), which it continued to be till it was invaded by the Turks.

On the division of Cappadocia by the Persians Pontus was given over to one of the ancestors of Mithridates, according to Justin and

other writers. The following is a list of the kings as they have been mentioned in history:—Artabazes (an interval of perhaps 80 years then occurs), Rhodabates, Mithridates I., Ariobarzanes I., Mithridates II., Mithridates III., Ariobarzanes II., Mithridates IV., Mithridates V., Pharnaces I., Mithridates VI., Mithridates VII., surnamed the Great, with whom the Romans long waged war (he died B.C. 64); Pharnaces II., Darius, Polemon I., Polemon II. Pontus was then reduced entirely to a Roman province. (Tacit. 'Hist.' iii. 47.)

Coin of Ariarathes.

British Museum. Actual size. Silver. 61 grains.

CAPPOQUIN. [WATERFORD.]

CAPRI, the Roman *Caprea*, a rocky but beautiful island in the Mediterranean, stands at the southern entrance of the Bay of Naples. It is 3 miles from Cape Campanella, which terminates the promontory of Sorrento; about 10 miles from Cape Miseno, on the other side of the bay, and 22 miles from the mole of Naples. It is composed of limestone rocks, which are disposed in two masses with a considerable hollow between them. The highest of these two masses, which is to the west, rises 1900 feet above the sea. It is called Monte Solaro, and a pretty little town named Anacapri (Upper Capri), is situated upon the table-land of the mountain. The inhabitants of Anacapri communicate with the other town called Capri, and all the east of the island by means of a steep flight of 535 steps, which is carried down the face of a precipice in a very curious manner. The eastern division of the island is only 860 feet above the sea in its highest part. The circumference of the island is about 11 miles. There are only two safe landing places on it.

Capri stands on a shelving rock towards the eastern extremity of the island: it contains from 200 to 300 small but neat houses, five or six churches and chapels, and a confined piazza or square in the middle. The population of the island is about 6000, of whom about 4000 are settled in the district of Capri, and 2000 in the western district. The inhabitants are almost all small farmers and fishermen. By great industry the islanders have retained and secured patches of good soil on steep hill sides and in the midst of rocks and cliffs: the cultivable parts produce most kinds of vegetables and fruits, a small quantity of excellent oil, and a considerable quantity of excellent wine. This wine, which is much used at Naples, is of two sorts, red and white. The red wine is called 'vino Tiberiano' from the emperor Tiberius. Another important item of exports consists of quails, which are annually captured at their seasons of passage in vast numbers.

The narrow area of this island is wonderfully crowded with a variety of scenic beauty, remains of antiquity, and historical recollections. Extensive ruins of the villas of Tiberius, who resided a long time at Caprea, still exist. He erected not less than twelve villas on different parts of the island. The ruins of the most considerable of them are seen on a bold perpendicular cliff at the eastern end of the island, opposite the Surrentine Promontory. Near it also are the remains of a pharos, or lighthouse, which served to guide ships through the strait between the island and the Surrentine Promontory. One of the greatest attractions of Capri is the Grotto Azzurra, or Blue Grotto, on the north-eastern coast.

CAPUA, a city in the kingdom of Naples, is finely situated in one of the richest parts of the Terra di Lavoro, in a plain on the left bank of the Volturno, 15 miles N.W. from Naples, on the high road to Rome, and has a population of 8700. The Volturno enters the sea about 12 miles below Capua; at the town itself it is a deep and rapid river, and makes such a bend as to sweep round at least two-thirds of the inclosure of the city. Capua occupies the site of the ancient *Casilinum*, celebrated for its noble stand against Hannibal. It was built in the 9th century, and first fortified in 1231. In the 18th century the fortifications were enlarged and reconstructed on the principles of Vauban; but in the French invasion of Italy it was unable to make a long resistance to its assailants. The most noteworthy objects in the town are the gothic cathedral, in which are some granite columns from ancient Casilinum; and the church of the Annunziata, which is built on the site of an ancient temple, and has some bas-reliefs in its walls. Under the arch of the Piazza dei Giudici numerous ancient inscriptions are preserved. Capua gives title to an archbishop. It is a pretty well-built town. There is a railroad from Capua to Naples, which was completed about nine years since.

The site of ancient Capua is occupied by the large village or 'casale' of Santa Maria di Capua, which, although it does not rank as a town, contains nearly 10,000 inhabitants. Santa Maria is about 2 miles from the Volturno, and about the same distance east of the modern Capua. The railroad above mentioned passes through it. It is a very interesting place on account of the ancient remains strewed about it. Considerable portions of the ancient walls and encircling ditch are visible, so that the circuit of the city may be traced with

tolerable certainty. The ruins of the amphitheatre are extensive, and show that when perfect it must have been one of the most magnificent structures of the kind in Italy. There are remains of a triumphal arch near the amphitheatre; and some traces are found of the theatre, the existence of which is recorded by an inscription.

Capua was one of the Etruscan cities founded in Campania. The date of this Etruscan foundation is much disputed, some referring it with Cato to B.C. 471, and others assigning it to B.C. 800. There seems little doubt that before the Etruscan occupation there was an Oscan town named Capua on the site. The Etruscan name, according to Livy (iv. 37), was Volturnum. When it fell into the hands of the Samnites, B.C. 423, the original Oscan name seems to have been restored. The name Capua is supposed to mean 'a plain,' and the adjective Campanus (Ager) is evidently formed from Capua. Capua after this event became an essentially Oscan city, and soon rose to great prosperity. Livy writing of it about B.C. 343, styles it the greatest and most opulent city in Italy (vii. 31). Its wealth rendered its inhabitants proverbial for luxury and effeminacy.

Hannibal spent a winter in this town during his campaign in Italy. In the course of this war the Romans formed the siege of Capua, which adhered to the side of Hannibal (Livy, xxv. 20); when the place was taken by the consuls Fulvius and Appius Claudius, the senators were put to death, about 300 nobles were shut up in prison, and the bulk of the citizens sold for slaves. Capua at this time was probably a larger and wealthier city than Rome. The Romans spared the city, which they peopled with strangers, in order that the most fertile lands in Italy might not be left without cultivators; but its political importance was annihilated. It soon however became again a flourishing town, and distinguished for its attachment to Rome. Though deprived of all political privileges and of its fertile territory, which the Romans retained as the property of the state, the city is characterised by Cicero as distinguished for its extent and embellishments. In B.C. 59 Capua became a Roman colony, and 20,000 Roman citizens were settled in its territory under the Agrarian law passed by Cæsar in his consulship. From this time the city enjoyed a dignity corresponding to its importance, and under the empire, although little is said of it, it continued to be a flourishing, large, and populous city. On the fall of the empire its prosperity attracted the barbarians who desolated Italy. The Vandals under Genseric took it, A.D. 456, and utterly destroyed it. In the wars of Belisarius it figures again, but in a very reduced condition. In the 8th century it seems to have recovered considerable prosperity, for it is termed by P. Diaconus one of the three most populous cities in Campania. At last the Saracens A.D. 840 took it and reduced it to ashes. Its surviving inhabitants abandoned its defenceless position and took refuge in the mountains, but were soon after (A.D. 856) prevailed upon by their bishop Landulfus to return and establish themselves on the site of Casilinum, which they fortified and named from their ancient city.

In the outskirts of Santa Maria, and on the roads that branch off from that town to Capua, Caserta, Naples, and Nola, there are many ancient tombs, and the whole district, taking a diameter of 10 miles, abounds more than any part of Italy with those ancient vases so vaguely called 'Etruscan,' but which ought to be called Capuan, or Campanian. The coins of Capua are almost all of copper, and bear the name of the city with Oscan legends.

Coin of Capua.

British Museum. Actual size. Bronze. 225 grains.

CARACAS, the capital of the republic of Venezuela, and of the department of Caracas, in South America, is situated in 10° 30' 15" N. lat., 67° 4' 45" W. long., and about 20 miles by the road from its port, La Guayra, and has a population of about 50,000. It is situated at the west end of the plain of Chacao, which extends about 8 miles towards the east, and is about 5 or 6 miles wide. The ground on which the town is situated is very uneven, and has a steep slope from north-north-west to south-south-east. The Plaza Mayor is 2880 feet above the level of the sea. On the south side of the town is the small river Guayra; and from the heights on which the town stands the Anaeco, the Caronta, and the Catucho flow into the Guayra near the town. There are several bridges over the three last-mentioned rivers. The Catucho supplies many public and private fountains with water. The streets, which are straight and generally paved, intersect each other at right angles. The private houses are good and well-built; some are of brick, but the greater part of masonry, in framework. They are arranged in the manner of the houses in Spain, presenting towards the street bare walls with one or two windows, but containing in the middle large court-yards, into which the apartments open.

The largest of the eight squares is the Plaza Mayor, which is the market for vegetables, fruit, meat, salted provisions, fish, poultry, game, bread, parrots, monkeys, birds, &c. Within the square is the cathedral, an extensive and solid edifice. The east and south sides of the square are occupied by well-built barracks, erected by the Spaniards. The city is the seat of a university; it contains several convents, three hospitals, and a theatre. The mean temperature of the year is about 72° Fahr.; that of the hot season is about 75° and that of the cold season 66°; but the thermometer sometimes reaches 84° or 85°, and at others descends to 51° or 52°. Rain is extremely abundant during April, May, and June, but not so incessant as in other tropical countries: the other parts of the year are rather dry.

By the earthquake of 1812 about 12,000 persons are said to have perished. The war with the Spaniards reduced the population still further. The earthquake of 1826 also contributed to its diminution: at this last period the population did not exceed 30,000. As Caracas is united by roads with the well-cultivated valley of Aragua, and with the Llanos, which extend south to the banks of the Orinoco, it is the place from which all these countries receive European manufactures, and to which they send their produce. The exports from La Guayra consist principally of cacao, cotton, indigo, coffee, tobacco, hides, and live cattle.

CARAMANIA, or KARAMANIA, a large and important part of Turkey, comprising nearly the whole of the south coast of Asia Minor, which is described under the general head of ANATOLIA. This extensive sea-board, which, measuring from the Gulf of Iskenderoon, or Scanderoon, to the Gulf of Makri is upwards of 400 miles long, is divided into pashalics or governments bearing different names; and it seems that the appellation 'Caramania' is neither used by the present inhabitants nor recognised at the seat of government. The name is not classical, for in ancient times the provinces called Lycia, Pamphylia, the two Cilicias, with parts of Caria and Phrygia, occupied the country which we call Caramania. In the middle ages however, a kingdom or state called Karamanly, from the name of Karaman, the founder of it, did exist here, and comprised all the ancient provinces which we have mentioned; but after a struggle of two centuries it was conquered by the Osmanli Turks under Bajazet II., about 1485.

The fertile and beautiful district of Adana (the Cilicia Campestris of the ancients) is the best cultivated part of Caramania. Solitude, desertion, and wretchedness reign over nearly all the rest of the long line of coast, where the frequent and splendid ruins of Grecian and Roman cities indicate a prosperity and wealth that have long been past.

CARCASSONE, or CARCASONE. [AUDE.]

CARDIFF, the county town of Glamorganshire, a municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated in 51° 28' N. lat., 3° 10' W. long.; 166 miles W. from London by road, and 170 miles by the South Wales railway. The population of the borough in 1851 was 18,351. The borough is governed by 6 aldermen, one of whom is mayor, and 18 councillors; but by an Act passed in 1837 the management of local affairs is vested in a body of commissioners consisting of the resident justices of the peace, the constable of the castle, the mayor, aldermen, and town clerk, together with 50 other persons. There is also a Local Board of Health. Cardiff, with Cowbridge and Llantrissant, returns one member to the Imperial Parliament. The livings of the two parishes are vicarages in the archdeaconry and diocese of Llandaff. Cardiff Poor-Law Union contains 44 parishes and townships, with an area of 127,941 acres, and a population in 1851 of 46,443.

The town is built on the left bank of the river Taff, Taff, or Taf, about a mile above the fall of the river into Penarth Harbour. Cardiff seems to be a corruption of Caer Taf, the 'fortress on the Taf;' but some Welsh antiquaries derive the Welsh name of the town (Caerdydd) from Caer Didi, the 'fortress of Didius,' from a post which it is assumed the Roman general Aulus Didius erected here. Cardiff is a corporate town of ancient date, its earliest charter being dated 12 Edward III. (A.D. 1338). The town with its contributory boroughs sent one member to Parliament by the statute 27 Henry VIII. The town consists of the principal street on the road from London to Pembroke, running east and west, a second main street at right angles to this, three other large streets, and several smaller ones. Cardiff has risen to the rank of an important commercial town and port from the circumstance of its being the natural outlet of the large mineral district of the Taff valley, and of the productions of the works at Merthyr Tydvil and other places. During the last few years a marked increase has taken place in the town in consequence of the opening of several collieries in the Aberdare valley. A kind of coal peculiarly adapted for the production of steam is raised in the Aberdare collieries and brought to Cardiff for shipment to all parts of the world. The town is built upon a low flat site, very little above the ordinary high-water level. The town-hall, which is the highest point, is only 10 feet above that level. The town is almost surrounded by water: the estuaries of the Taff and the Ely form Cardiff harbour, a shallow tract, a large portion of which is left uncovered as the tide recedes. The Cardiff Flats are a level mud waste. The town is lighted with gas by a company formed in 1837.

Among the buildings of Cardiff is the castle, now in possession of

the Marquis of Bute, and converted into a modern mansion. This castle was erected by Robert Fitzhamon, the Anglo-Norman conqueror of Glamorganshire, in the room of a smaller one which stood on the same site, built by the Welsh princes of Morganwg. Robert, duke of Normandy, brother of William Rufus and Henry I., died in the castle, having been a prisoner for 28 years. The west front of the castle is modern, and being flanked by a massive octagonal tower, appears to great advantage on entering the town from the west. The ruins of the ancient keep, still standing on a circular mound within the castle inclosure, command an extensive prospect over the level amid which Cardiff is situated. In the interior of the castle are some family portraits and other paintings by Vandyke, Kneller, Romney, and other artists.

The town is comprised within the parishes of St. John the Baptist and St. Mary. St. John's includes the older part of the town; St. Mary's the modern part, in the neighbourhood of the Bute Docks. St. John's church is spacious and handsome, in the early English style, with a lofty square embattled tower in the perpendicular style. St. Mary's was built in 1845. There are chapels for Baptists, Independents, Methodists, and Roman Catholics; five public schools, at which about a thousand children are educated; an infirmary, built at the charge of Daniel Jones, Esq., of Beaupré; and the Union workhouse, which stands on the western outskirts of the town. The county jail comprehends the house of correction for the eastern parts of the county. The guildhall stands in the midst of one of the principal streets. The market-house was built by the corporation in 1835.

The population has risen from 2000 to upwards of 18,000 between 1801 and 1851. The Glamorganshire Canal was finished in 1798; the Taff railway was opened in 1840. The river, the canal, and the railway run nearly side by side, and terminate at Cardiff. The late Marquis of Bute, the owner of a large amount of property in this neighbourhood, projected the formation of a large harbour or dock between the town and the Bristol Channel on a piece of waste ground belonging to himself. The dock, called the Bute Dock, and a ship canal leading thence to the sea, were opened about the same time as the railway. On these works about 300,000*l.* has been expended. The entrance into the floating harbour from the sea is through sea-gates 45 feet in width; the harbour or basin has an area of an acre and a half, and is fitted for the reception of large vessels. The main entrance lock is 152 feet long by 36 feet wide. The ship canal extends to Cardiff, 1400 yards in length and 200 feet in width, comprising a mile of fine wharfage, and varying in depth from 13 to 19 feet. These improvements by affording facilities to the shipping trade have tended to promote the growing prosperity of the port. The number and tonnage of vessels registered as belonging to the port of Cardiff on the 31st of December 1852 were:—Under 50 tons 22 vessels, 581 tons; above 50 tons, 40 vessels, 6233 tons: steam-vessels, under 50 tons, 7, tonnage 179; above 50 tons, 2, tonnage 187. The number and tonnage of vessels that entered and cleared at the port of Cardiff during 1852 were as follows:—Constwise, inwards 1394 sailing vessels, 66,209 tons; outwards 5791, tonnage 392,734: steam-vessels, inwards 422, tonnage 39,048; outwards 421, tonnage 38,962. Colonial: inwards 97 vessels, tonnage 15,455; outwards 247, tonnage 57,379. Foreign, inwards 378 vessels, 65,820 tons; outwards 1464 vessels, tonnage 286,846; and one steam-vessel of 86 tons.

(Cliffe, *Book of South Wales; Communication from Cardiff.*)

CARDIGAN, the chief town of Cardiganshire, a sea-port, municipal, and parliamentary borough, and the seat of a Poor-Law Union, mostly in the parish of St. Mary and partly in Pembrokeshire, is chiefly situated on the right bank of the river Teify, about three miles from its mouth, in 52° 5' N. lat., 4° 40' W. long.; distant 239 miles W. by N. from London. The population of the borough in 1851 was 3876. The borough is governed by 4 aldermen, one of whom is mayor, and 12 councillors; and in conjunction with Aberystwith, Lampeter, and Adpar returns one member to the Imperial Parliament. The living is a vicarage in the archdeaconry of Cardigan and diocese of St. David's. Cardigan Poor-Law Union contains 26 parishes and townships, with a population in 1851 of 20,144.

Cardigan is called in Welsh Aberteify, from its position on the river Teify. The corporation claim to be a corporation by prescription. Cardigan first rose into a town about the time of the Norman conquest. The foundation of its castle is ascribed to Gilbert de Clare, about 1160. In the struggles between the Welsh and their Norman invaders for the possession of this post, which the mouth of the river rendered important, the castle was frequently damaged or destroyed. The two towers and the wall now standing are probably the remains of the fortifications erected by Gilbert Marshall, about the year 1210. Edward I. resided here for a month while settling the affairs of South Wales. The castle stands in a commanding position above the river, which is here crossed by an ancient bridge. Giraldus Cambrensis states the Teify to have been the last British river in which beavers were to be found. There was a priory here, which Leland says contained 11 black monks, and was a cell to Chertsey. A small but strong camp called Hên Castell, is situated on the banks of the Teify, a little below the town. All the streets are narrow except the principal one, at the end of which stands the

county jail, erected by Mr. Nash in 1793. A handsome county hall was built here in 1764. A county court is held at Cardigan. A literary and scientific institute is supported in the town.

The church, dedicated to St. Mary, is an ancient and substantial structure, having at the west end a noble tower; the interior has a spacious nave, and a chancel of more ancient date than the body of the church. A neat gallery at the west end was erected at the cost of the late Pryse Pryse, Esq., M.P. The National school-room has been licensed for divine service. The Calvinistic and Wesleyan Methodists, Independents, and Baptists have places of worship. The National school, erected in 1848, at a cost of about 1500*l.* in addition to the site, is in the early English style. A Free Grammar school endowed in 1653 is free to six poor boys of the borough. A Girls' Charity school, supported by voluntary contributions, is well attended. There are also Commercial schools.

The port of Cardigan extends from four to five miles beyond Fishguard on the south, and about 24 miles to the north, so as to include Aberayron. The harbour is greatly obstructed by a bar, and is dangerous in winter. Ships of 400 tons can come up to the bridge in spring tides; but the general trade is confined to vessels of from 20 to 100 tons. The number and tonnage of vessels registered as belonging to the port of Cardigan on 31st December 1852 were as follows:—Under 50 tons, 132 vessels, 3941 tons; above 50 tons, 94 vessels, 8871 tons. The number and tonnage of vessels entered and cleared at the port during 1852 stood thus:—Coastwise, inwards 587 vessels, 13,783 tons; outwards 50 vessels, 1519 tons. Colonial and foreign, inwards 6 vessels, 997 tons; outwards 1 vessel, 109 tons.

The imports are chiefly coal, culm, limestone, and deals; the exports oats, butter, and slates. Salmon-fishing is productive, and the herring-fishery is of some importance.

(Cliffe, *Book of South Wales*; *Communication from Cardigan*.)

CARDIGANSHIRE, a maritime county of South Wales, lying between 52° 2' and 52° 33' N. lat., 3° 38' and 4° 42' W. long., is bounded N. by the counties of Merioneth and Montgomery, E. by Radnorshire and Brecknockshire, which are for the most part separated from it by the rivers Claerwen and Towy, S. by Pembrokeshire and Caermarthenshire, from which in three-fourths of its length it is divided by the river Teify, and in part by a stream called the Dothie. The Irish sea forms its boundary on the W. The area is 443,387 acres. In 1851 its population was 70,796.

Surface, Hydrography, Communications.—The south-west district of the county and several tracts near the coast are level; in general however the surface is mountainous, especially in the northern and eastern parts. The highest lands are rugged, bleak, and barren; covered with ling, rushes, and heather: those that are somewhat lower afford pasture for the little hardy sheep of the country, the property of the small farmers, whose dwellings are for the sake of shelter placed in the narrow valleys beneath. A part of Plinlimmon is situated in the north-east part of the county; this mountain and Tregaron Down, Tulsarn, and Capel Cynon are the most elevated summits in Cardiganshire. Their heights are—Plinlimmon, 2463 feet; Tregaron Down, 1747 feet; Tulsarn, 1143 feet; Capel Cynon, 1016 feet.

The sea-coast, in its north and south extremities, is flat and sandy; towards the centre of its line the hills terminate abruptly, and the beach, from which on account of its shelving rapidly, the sea retreats but little at low tide, is chiefly formed of shingle. The principal rivers are—the Teify, which rises in Llyn Teify, a small lake on the eastern border, and abounds with salmon, of which a large quantity is carried to distant markets; the Towy, the Claerwen, the Ystwith, and the Rhydol, which rises in Plinlimmon. The Ystwith and the Rhydol fall into the sea at Aberystwith. The Arth, the Ayron, the Wirral, and the Lery are also considerable streams. There are upwards of 20 lakes, or llyns, in the county. Most of them are small, but they are abundantly stored with fish. The chief are Llyn Teify, Llyn Gynon, Llyn Egnant, and Llyn-ruddon-vawr; these have much wild beauty, which is however far exceeded by the celebrated water-falls of the Mynach at the Devil's Bridge, the falls of the Rhydol at Hafod, and the rapids higher up that stream, in the neighbourhood of Pont Erwydd.

The roads (which carry the whole traffic of the county, for there is neither canal nor railroad in this district) have of late years been much improved. An entirely new line of communication with Radnorshire, which in part of its length is used by travellers to Llanidloes and Newtown, has been of great benefit to Aberystwith. The other principal roads lead from Aberystwith to Machynlleth, from the same place to Cardigan and Lampeter, and from Tregaron through Lampeter and Newcastle-Emlyn to Cardigan.

Geology and Mineralogy.—The county of Cardigan chiefly consists of hard slaty strata, belonging to the transition series of the Lower Silurian and Upper Cambrian systems; they are destitute of organic remains. Veins of copper-ore, lead, and sulphate of zinc occur. The mines were in the 16th and 17th centuries worked extensively and profitably. They afterwards were almost wholly neglected. But of late years the spirit of mining enterprise has led to the re-opening some of the old mines and to the commencing of new ones. The lead-mines are said to be most successful. The lead contains silver, varying from 14 to 80 ozs. to the ton; at Llanvair mine some specimens

have occurred which yielded 100 ozs. to the ton. Slate of inferior quality is quarried in the neighbourhood of Aberystwith.

Climate, Soil, Agriculture.—The climate of this county is in winter very rough, the winds are violent, and the snow frequently remains on the mountains till late in the spring; in summer however and in autumn there is a light dry wholesome air, which is extremely pleasant. The soil in the mountainous districts is thin and cold, and yields a small produce of oats, barley, and potatoes; rye is also sown in small quantities. Near the sea-coast, especially on the flat loamy tract between Aberayron and Llanrysted, wheat is cultivated successfully; large crops of barley are raised on lands manured with sea-weed; and potatoes are grown in abundance.

The prevailing breed of cattle is small and hardy, in colour generally black or brindled; dairy-farming is not uncommon, and butter is made in considerable quantities. The horses are small but compact, and are capable of drawing considerable weights in one-horse carts, which throughout the county are in general use. The sheep are neither well-formed nor fine in the fleece; but their endurance and constitution adapt them admirably to the exposed hills on which they pasture, and from which they are seldom driven down, the ewes in the yearning season excepted. They are so small as frequently not to weigh more than 10 lbs. a quarter: the mutton is excellent both in grain and flavour. A considerable quantity of pigs and poultry is reared, and eggs in great numbers are collected from the cottages and farm-houses by persons who convey them weekly to distant markets. With nearly all farms is lot a right of pasturage on the hills for a given number of sheep, which often forms the principal source of profit. The size of the farms varies from 40 to 150 acres; in the best districts some are larger. The fences are frequently made with alternate layers of turf and stones, built up as walls, without bushes growing upon them. The farms and cottages have a rude and almost primitive appearance. As there is no coal in the county, peat, being abundant, is the fuel chiefly consumed.

Divisions, Towns, &c.—Cardiganshire is divided into five hundreds—Gnewr Glynn, Iar, Moyddyn, Penarth, and Troedyrour. Cardigan Island, an extra-parochial tract of pasturage of about 40 acres extent situated at a short distance from the mainland, at the mouth of the Teify, forms a part of Troedyrour hundred. These hundreds are divided into 68 parishes, which contain five market-towns—ABERYSTWITH, ABERAYRON, LAMPETER, CARDIGAN, and TREGARON. Cardigan is on the river Teify, and Tregaron and Lampeter are within a short distance of its banks. Cardigan, Lampeter, Aberystwith, and Adpar are corporate towns. Adpar is united with Newcastle-Emlyn, in Caermarthenshire, by a bridge which crosses the Teify. They form together a contributory parliamentary borough, and being in fact one town will be most appropriately noticed together under NEWCASTLE-EMLYN.

We add a brief account of the villages which, from their size or importance, seem to call for notice, with the population of their several parishes in 1851:—

Aberporth, 8 miles N.E. from Cardigan, population 514, is pleasantly situated at the mouth of the Howny on the shore of Cardigan Bay. There is some trade in coals, culm, and limestone. Herring fishing is carried on. In summer the village is resorted to for sea-bathing. The church is of great antiquity. The Cribach Road affords good shelter for shipping. *Hafod*, 14 miles S.E. from Aberystwith, is much visited by tourists on account of the celebrated water-falls and rock scenery of the Devil's Bridge. Hafod House and grounds, which when the property of Colonel Johnes were the subject of so much admiration from literary tourists, still form a principal attraction. The house has been rebuilt, and the grounds are much altered. *Llanarth*, 18 miles N.E. from Cardigan: population, 2337. The village is of some size: fairs are held in January, March, June, September, and October for cattle, horses, and pedlery. The church is spacious and of considerable antiquity. The Wesleyan and Calvinistic Methodists and Independents have places of worship. In the parish are a British encampment and some tumuli. *Llanbadarn-vawr*, about 24 miles N.N.E. from Cardigan, is a very extensive parish, containing besides several hamlets, the market-town of Aberystwith: population of the entire parish 12,776. Llanbadarn-vawr church is one of the oldest in Wales; and contains portions of the two still older edifices which successively occupied the site previous to its erection. Llanbadarn-vawr is said to have been the seat of a bishopric, over which St. Padarn, the British saint to whom the church is dedicated, presided. There are some British encampments in the parish. *New Quay*, 20 miles N.N.E. from Cardigan, is in the parish of Llanllwchaearn, the population of which in 1851 was 1738. New Quay is a thriving little port. It is situated a few miles S. from Aberayron, with which flourishing town it is pretty closely connected. There is an extensive fishery. Ship-building is carried on; and there are stone-quarries. In summer it is resorted to as a bathing place. The church is of the early English date and style. *Pontrhydfendigaed*, a small village 4 miles N.E. from Tregaron, contains the remains of the Abbey of Strata Florida, so celebrated in the literary history of South Wales. Of the abbey buildings an arch of considerable beauty is still standing. At *Yspilly Ystradmeirich*, a little village about 3 miles from Pontrhydfendigaed, population 138, was a cell to the abbey of Strata Florida, of which some part yet remains. *Ystradmeirich*

possesses a Free Grammar school, founded in 1757 by Edward Richards. There are some remains of a British or Roman encampment, and of a Norman castle which figures somewhat conspicuously in early Welsh history.

Divisions for Ecclesiastical and Legal Purposes.—Cardiganshire is wholly in the province of Canterbury, diocese of St. David's, and archdeaconry of Cardigan. The several parishes are divided among the deaneries of Emlyn, Kemnes, Sub Ayron, and Upper Ayron. According to the 'Census of Religious Worship' taken in 1851, it appears that in the Registration county (which includes, in addition to the county proper, parts of Caermarthenshire and Pembrokeshire, with an additional population of about 27,000), there were then 349 places of worship, described as follows:—Church of England, 110; Calvinistic Methodists, 82; Independents, 71; Baptists, 48; Wesleyan Methodists, 20; Unitarians, 14; Latter-Day Saints, 2; Primitive Methodists, 1; Wesleyan Association, 1. The number of sittings provided was 82,335.

The county is divided by the Poor-Law Commissioners into five Unions: Aberayron, Aberystwith, Cardigan, Lampeter, and Tregaron. These Unions include 106 parishes and townships, with a population in 1851 of 77,319; but the boundaries of the Unions are not strictly co-extensive with those of the county. Cardigan is in the South Wales and Chester circuit. The assizes are held at Cardigan. The Easter quarter sessions are held at Lampeter, at other times at Cardigan or Aberayron. County courts are held at Aberayron, Aberystwith, Cardigan, Lampeter, Llandeilo-vawr, and Newcastle in Emlyn. One member is returned to the Imperial Parliament for the county; another for the contributory boroughs.

Civil History and Antiquities.—The name Cardigan is derived from 'Caredigion,' which signifies the territory of Caredig, the first king of this district. One of his successors, Rodri Mawr, or Roderick the Great, in the year 843 became by inheritance and marriage the king of all Wales. Roderick divided his dominions into three parts, in each of which he had built a palace, and, bequeathing to each of his sons a share, appointed the third prince umpire over the quarrels of any other two. Cardiganshire became the property of Cadell, who shortly after his father's death seized upon his brother Merfyn's portion, which caused the eldest brother Anarawd to lay waste the county of Cardigan. Cadell died in 900. After this time Cardigan became a lordship under the princes of South Wales. In 952 Cardiganshire was again laid waste by two North Welsh princes, who claimed it as their possession. In 1038 Gryffydd, prince of North Wales, came into Cardiganshire, burnt Llanbadarn-vawr, and afterwards compelled all South Wales to swear allegiance to him. About 1092 the Normans landed here, and Roger Montgomery, earl of Arundel, did homage to William Rufus for the lordships of Cardigan and Powis; but when King William returned to Normandy the Welsh, commanded by the princes both of North and South Wales, entered Cardiganshire, and destroyed the Normans, their castles and fortifications. In 1097 Cadwgan, who had been deprived of his possessions in South Wales, regained Cardiganshire with part of Powis. Upon a dispute with Cadwgan, Henry I. gave permission to Gilbert Strongbow, earl of Striggill, to seize his territories. Gilbert raised a strong force, soon reduced Cardiganshire, and built the castles of Aberystwith and Cilgerran. In 1135 Cadwalader and Owen Gwynedd, the sons of the prince of North Wales, with 6000 foot and 2000 horse, overran the country as far as Cardigan, and were victorious in an engagement with Stephen, the governor of the place. About the year 1137 Owen Gwynedd a second time invaded Cardiganshire, which it seems then belonged to his brother Cadwalader. He entered it a third time and burnt Aberystwith Castle in 1142. The disturbances among the Welsh continued with little intermission until 1171, when King Henry II. gave Cardiganshire with other territories to Prince Rhys, the last prince of this district. In 1176 Rhys gave a great entertainment at Christmas in his castle of Cardigan; several hundreds of English, Normans, and others were there. All the bards of Wales were present, answering each other in rhyme. Maelgwyn, one of the Welsh princes, having a contest with his nephews, whose authority he had usurped, swore allegiance to the English, and procuring a large army of English and Normans gave battle to his nephews, but was conquered and slain. King John having already subdued the rest of Wales, compelled Rhys and Owen, the nephews of Maelgwyn, to give up their lands and do homage to him. In 1238 Llewellyn summoned all the Welsh lords and barons to Ystradflur, where each swore fealty to him, and did homage to his son David, whom he named his successor. But Gilbert Marshal, earl of Pembroke, besieged, took, and garrisoned the castle of Cardigan. In 127 Madoe did homage to Llewellyn ap Gruffydd as lord of Cardigan, agreeably to the charter granted by the king of England, which confirmed to Llewellyn the title of Prince of Wales. King Edward I. in 1277 obtained great advantages over Llewellyn, and dictated hard conditions of peace, to enforce which he built and garrisoned a castle at Aberystwith. Edward now divided Wales into counties, and annexed it to England in 1284; and the better to settle his affairs, soon afterwards made a progress through Cardiganshire. In 1404 Owen Glyndwr took Aberystwith Castle, which was recovered by Prince Henry in 1407.

Cardiganshire abounds with antiquities. The remains of British

and Roman encampments are exceedingly numerous and widely spread. There are also many Celtic remains of the kind commonly attributed to the Druids. Of two stone circles near Nant-y-nod, the larger, consisting of 76 upright stones, is 228 feet, the smaller 98 feet in circumference. The cairns are numerous. That popularly known as Beid Taliesin, or the Grave of Taliesin (the famous Welsh bard), is 130 feet in circumference. Besides the Roman station at Ilanio, a Roman road known as Sarn Helen traverses the county in a north and south direction from that place. Remains of castles are either standing or it is evident that such fortifications have existed at Cardigan, Aberystwith, Lampeter, Ystradmeiric, Cilcennin, Llaurysted, Dinerth, Moyddyn, Abercinon, Penwalle, Castell Gwalter, Castell Cadwgan, Hên Castell, Castell Flenis, &c. There were also religious houses at Cardigan, Lampeter, Llaurysted, Llandewi-Brevi, and Strata Florida. The abbey of Strata Florida was the depository of part of the records of the principality, and the burial-place of many Welsh princes and celebrated bards. Rhys Gruffydd founded the first abbey in 1164; this building however was destroyed, and a new one erected two miles distant from the original site.

Cardigan is chiefly an agricultural county. The manufactures are confined to the weaving of a small quantity of flannel and coarse woollen stuffs. Gloves are made in the neighbourhood of Aberystwith and Tregaron. Oats, butter, and slates are exported. The vessels engaged during the summer in the coasting trade are used in autumn as fishing-boats. The principal imports are coal from Liverpool, culm from South Wales, Pembroke limestone, and Menai and American deals. The harbours are extremely exposed, and the bars at Cardigan and Aberystwith are great impediments to navigation. In 1851 the only savings bank in Cardiganshire was at Aberystwith: the amount owing to depositors on the 20th of November 1851 was 32,017. 6s. 9d.

CARDINGTON. [BEDFORDSHIRE.]

CAREW. [PEMBROKESHIRE.]

CARIA. [KARIA.]

CARIBBEE ISLANDS, The, have received their name from the Caribs. By this denomination are understood the whole series of islands which on the north begin with the Virgin Islands and on the south terminate with Trinidad. [ANTILLES.]

CARIBS, or CARIBBEES, is the name given by the first European navigators to one of the aboriginal tribes of South America, and which has been adopted by all European nations, though they call themselves Carina, Calina, and Callinago. At the time of the arrival of the Europeans in America the Caribs were in possession of the smaller islands of the West Indies which lie between Puerto Rico and the Gulf of Paria. The Caribs made stout resistance against the European intruders, but at last they were compelled to yield and to abandon the islands after the greater part of them had fallen in continually repeated conflicts. A small number is said to exist still on the islands of Trinidad, St. Vincent, and Dominica.

Though the Caribs have been nearly extirpated from the islands, there still exists a considerable number on the continent of South America. They are principally found on the banks of the Lower Orinoco and of the Caroni, one of its principal tributaries, where they are partly settled in the missions along the Caroni and Orinoco, but a considerable number are still independent under their own caciques, to whom they pay great respect.

The Caribs are distinguished from the other native tribes of America by their athletic stature and their great courage and firmness of purpose. They speak of other savages with contempt and disdain, and think themselves a privileged race. The Caribs have been accused of cannibalism. [AMERICA, *Man of*, vol. i. 294.]

CARIESFORT. [WICKLOW.]

CARIGALLIN. [CORK.]

CARINTHIA (*Kärnten*), a Crownland of the Austrian empire, constituting the northern part of the former kingdom of Illyria, is bounded N. and E. by Styria, W. by Salzburg and the Tyrol, and S. by Carniola. It is situated between 46° and 47° N. lat., 13° and 15° E. long., and occupies an area of 3978 square miles, with a population of 319,220 in 1850. Its northern and southern districts, between which the Drave runs from west to east, are covered with the Noric and Carnic Alps respectively, and with their offshoots; the land inclosed between these enormous masses does not enjoy the heat which is indispensable to successful cultivation, and the produce of the soil is insufficient for the population. The valleys between the mountains contain however a deep soil of sand and clay intermixed, and are very productive. Of the two mountain chains which encompass Carniola, the formation is wholly dissimilar. The Noric Alps are composed of granite, gneiss, and other primitive rocks, which are not unfrequently traversed by beds and strata of quartz, sulphate of barytes, and various species of ores. This chain also contains the most elevated summits in Carinthia; the 'Glockner,' which is on the north-western border, has an elevation of 12,980 feet, and is the highest of the Carinthian Mountains. Many parts of the Noric Alps are densely covered with forests. The Carnic Alps are composed of limestone. The eastern districts are bounded by the Carniolan Alps, which are much inferior in height to the two other ranges. The most remarkable feature in these Carniolan Alps is that portion called the Dobratsch, or Villach Alps, the elevation of which averages about 7500

feet, and along the side of which runs a fine plateau. The highest points in this chain produce only stunted grass, Iceland moss, and other plants resembling the vegetation of the most northerly parts of Europe.

Carinthia is richly supplied with streams. The Drave, which receives most of the rivers, enters the crownland from the Tyrol, and flows for about 140 miles from west to east through Carinthia. [DRAVE.] The other large rivers which water it are the Guil, Möll, Liser, Gurk, Glan, and Lavant. The crownland also abounds in mountain streams and small lakes. Only a small ratio of the surface is adapted for tillage, but there is a good breadth of meadow and pasture land. The stock of domestic animals includes horses, oxen, cows, and sheep. Horned cattle and shoop are the most numerous. The breed of horses is much finer in Upper than in Lower Carinthia, but in the latter the breed of horned cattle is superior. The wool is of an ordinary description. Swine and goats are reared in most parts. A very small portion of the soil is laid out in garden-ground and vineyards. The woods and forests cover about 570,000 acres.

The mines of Carinthia constitute its chief wealth. The mountain chains are rich in copper, iron, lead, and zinc. The mines of Fragent in Upper Carinthia contain inexhaustible supplies of copper. This metal is also raised at Kerschdorf in the circle of Villach, and on Mount Lumbrecht in that of Klagenfurt. Iron ore occurs through the whole length of the alpine chain, from the confines of the Tyrol in the west to those of Styria in the east. The principal mines at work are at Döllach, Gmünd, Freisach, Hüttenberg (where there are eighteen high-blast furnaces), Waldenstein, and St. Gertraud. In all the Austrian dominions there are no lead-works so extensive and productive as those of the Ore-Mountain (Erzberg), close to the Lead-Mountain (Bleyberg), at no great distance from Villach in Upper Carinthia. The largest zinc and calamine works are situated on the Raibl in the southern part of Upper Carinthia. On the Raibl, and in the iron strata at Hüttenberg, antimony is found. Immense beds of coal exist in Carinthia, and mines are worked at a few places. Large quantities of turf are dug at Feldkirchen and at Loretto on the Worthece. Carinthia contains quartz, jasper, semi-opal, garnet, beryl, and other valuable stones, as well as various kinds of clay, talc, limestone, &c. There are marble quarries at Velden, Upper Villach, and Wasserleomburg in Upper, and at Sittersdorf, &c., in Lower Carinthia.

Both Carinthia and Carniola are named from the *Carni*, an ancient Celtic tribe which occupied the Carnic and Julian Alps, and is supposed to have been so called from the Celtic word (*Carn*) for 'mountain peak.' The territory of the Carni however was not co-extensive with that of the two Crownlands named, but seems to have included the highlands between the Drave and the head of the Adriatic, from the Piave to the source of the Savo. Tergeste, now Trieste, was originally a Carnic village.

The industrial products are principally iron, iron-ware, and steel. The other manufactures consist of woollens, silk stuffs, cotton prints, ribands, and white-lead; the greater part at Klagenfurt, the capital of Carinthia. Independently of what has been enumerated, Carniola has few products to export beyond horned cattle. Its internal communications are much facilitated by good roads, among which there is a skilfully-constructed one across the steep and rocky Loibl into Carniola. A branch railroad is in course of construction southward from Klagenfurt to join the Vienna-Triest line at Laybach.

The western part of the crownland is commonly called Upper Carinthia, the eastern part Lower Carinthia. In the former, which is a truly alpine country, cattle-breeding, mining, and wood-cutting are the chief occupations; in Lower Carinthia, on the contrary, there are many fertile valleys well adapted for cultivation. The inhabitants are partly of German partly of Slavonic origin, the latter considerably preponderating. They are all Catholics, except a small number who are Lutherans and under the jurisdiction of the consistory of Vienna. Carinthia is in the jurisdiction of the supreme tribunal of Grätz. The governor of the crownland resides in Klagenfurt. The chief towns, KLAGENFURT and VILLACH, are noticed in separate articles. The Crownland of Carinthia is included in the so-called Germanic empire.

CARLINGFORD. [LOUTH.]

CARLISLE, Cumberland, the capital of the county, an episcopal city, a parliamentary and municipal borough and port, and the seat of a Poor-Law Union, stands on an eminence nearly encompassed by three streams, the largest of which, the Eden, passing the city on the north side receives the other two—the Caldew on the west and the Peteril on the east of the city. Carlisle is situated in 54° 53' N. lat., 2° 55' W. long., distant 301 miles N.W. by N. from London by road, and 300 miles by the North-Western and the Lancaster and Carlisle railways. The borough is governed by 10 aldermen, one of whom is mayor, and 30 councillors; and returns two members to the Imperial Parliament. The population of the city of Carlisle in 1851 was 26,310. The livings of the parishes of St. Mary and St. Cuthbert are perpetual curacies in the archdeaconry and diocese of Carlisle. Carlisle Poor-Law Union contains 19 parishes and townships, with an area of 62,981 acres, and a population in 1851 of 41,566.

Carlisle is supposed to be of British origin, and there is reason to conclude that it was a Roman station, the *Luguvalium* of the 'Itinerary' of Antoninus. It was probably first fortified about the time of Agricola. The Danes destroyed it about the end of the 9th century;

and it remained desolate for two centuries afterwards. Its restoration and the erection of the castle are attributed to William Rufus. The subsequent history of Carlisle, down to the union of the two kingdoms, is intimately connected with the wars between England and Scotland, and the history of the border feuds and forays. Carlisle was taken by David I., king of Scotland, and was besieged afterwards without success by William the Lion. It suffered by fire during subsequent sieges. It was occupied on different occasions by Edward I., who in 1306-7 held a Parliament here. Mary Queen of Scotland stopped in her flight after the battle of Langside at Carlisle, where commenced her long imprisonment in England. The inhabitants declared for Charles I.; in the civil wars they suffered severe privations. In 1745 the garrison surrendered to the Pretender, Charles Stuart, the mayor and corporation presenting him with the keys of the city on their knees, and afterwards proclaiming him King of Great Britain. On the city being re-taken by the Duke of Cumberland some of the principal actors on this occasion suffered death; on others severities little short of death were inflicted.

To its position as a fortified border-town Carlisle owes much of its importance and the possession of many immunities and privileges which at various periods in its early history were conferred upon it.

Till about a century ago no trade or manufacture of any importance appears to have been carried on within the city. The comparative strength of its position in a district frequently exposed to border conflicts, attracted to it the surrounding inhabitants, so that at certain periods in its history it was a populous place; but after the union of the crowns of England and Scotland in the person of James I. of England, Carlisle sunk into decay; a condition from which during the last 60 or 70 years it has been gradually but steadily recovering. In 1763 the population was about 4000; in 1780 it was 6299; in 1801, 10,221; in 1831 the total population amounted to 19,069; in 1851 it was, as mentioned above, 26,310.

The principal trade of Carlisle arises from its manufactures of cotton goods and gingham. There are also hat-factories, dye-works, and several extensive foundries. The distance of the city from Port Carlisle, at the mouth of the river Eden on the Solway Firth, is about nine miles; a ship canal, 11 miles in length, which was completed in 1823, connects Carlisle with Bowness on the Solway Firth. By this canal vessels of 100 tons can ascend to the town. A steamer plies twice a week between Liverpool and Port Carlisle. Besides being a principal station on one of the railway routes to Scotland, Carlisle possesses railway communication with Newcastle-on-Tyne and South Shields on the eastern coast and with Maryport on the western.

The following statement gives a view of the shipping business of Carlisle:—The number and tonnage of vessels registered as belonging to Carlisle on the 31st of December 1852, were—Sailing-vessels under 50 tons, 12, tonnage, 399; above 50 tons, 23, tonnage, 1624; steam-vessels, one of 10 tons, and one of 231 tons. The vessels which entered and cleared at the port during 1852 were as follows:—Coasting trade, inwards 139, tonnage, 5908; outwards 343, tonnage, 14,836; steam-vessels, inwards 104, tonnage, 26,646; outwards 99, tonnage, 26,319. In the colonial and foreign trade there entered 12 vessels of 2286 tons, and cleared 4 of 860 tons.

Before the Reformation there were several ecclesiastical establishments in the city. Dr. Paley was archdeacon of Carlisle, and published some of his most popular works while residing in the city. He is buried in the cathedral, where a monument has been erected to his memory. The cathedral is an ancient building of red freestone, displaying specimens of different styles of architecture from the Norman downwards. It is a comparatively small building, and inferior to most other English cathedrals. The chief architectural feature is the great east window, which is a splendid and elaborate example of the decorated stylo. The principal dimensions of the cathedral of Carlisle are as follows:—Extreme length, 242 feet; breadth, 130 feet; length of nave, 110 feet; breadth of nave, 34 feet; height, 73 feet; height of tower, 123 feet. In addition to the cathedral and St. Mary's there are three other churches—St. Cuthbert's, Trinity, and Christ church, and places of worship for Independents, Wesleyan and Primitive Methodists, Presbyterians, Baptists, Quakers, and Roman Catholics. Carlisle possesses an Endowed Grammar school, founded by Henry VIII. It is free to the choristers of the cathedral. The school possesses an income from endowment of 108*l.* a year. It is under the care of a head and second master, and three other masters: the number of scholars in 1852 was 75. There are National, British, and Infant schools, a School of Industry, and St. Patrick's school, instituted in 1825 for the education of 400 children. The Fawcett schools were recently erected as a testimonial of respect to the venerable incumbent of St. Cuthbert's church. There are in Carlisle two literary institutions, a mechanics institute, a public library, two public news-rooms, and a savings bank.

The castle of Carlisle, erected in 1092, lies between the city and the Eden, on a slight eminence overlooking the river. Some parts of the original castle remain in an unusually perfect state. This is especially the case with the barbican, which is a very interesting example of that portion of a Norman castle. Carlisle castle is still maintained as a garrison-fortress. Scarcely any portion of the old walls and bulwarks now remains. The county jail and house of correction, erected in 1827, are within the city. A county court is held in Carlisle.

Considerable improvement has taken place in Carlisle of late years. Many new buildings have been erected; handsome streets have been formed; the roads in the vicinity have been much improved. Among the more recent buildings may be mentioned the custom-house, a neat and convenient structure, situated at the canal basin; the news-room, in English Street, built of white freestone, in the decorated style, and erected in 1831; the fish-market, a plain Grecian building, erected by the corporation; and the large railway station of the Lancaster and Carlisle Railway Company. A handsome elliptical stone bridge of five arches was erected over the Eden in 1812, at a cost of 70,000*l*. There are also bridges over the Caldew and the Petheril. The city contains a number of benevolent institutions, among which are the infirmary, a fever hospital, a dispensary, and a humane society.

The market-days are Wednesday and Saturday. Fairs are held in August and September. A series of fairs or 'great marts' for horses and cattle, commences on the Saturday after the 10th of October, and continues every Saturday till Christmas.

An earldom of Carlisle was created shortly after the Norman conquest. It has become three times extinct, by surrender, attainder, and death without issue. The present earldom was revived in 1661, and is held by a branch of the Howard family. Carlisle was erected into a bishop's see by Henry I. in 1133; the bishop having jurisdiction over a large portion of Cumberland and Westmorland. The diocese at present extends over a considerable part of these two counties, and comprises 137 benefices: there is only one archdeaconry—that of Carlisle. The chapter consists of the dean, four canons, the archdeacon, chancellor, three minor canons, registrar, deputy-registrar, and secretaries. The income of the bishop is fixed at 3000*l*. a year.

(Nicholson and Burn, *History of Cumberland*; Lysons, *Magna Britannia*; *Communication from Carlisle*.)

CARLOVITZ, a well-built town in the Slavonian military frontier, is situated on the right bank of the Danube, about 8 miles S.E. from Peterwardein, and has about 5600 inhabitants. It is the seat of the archbishop or metropolitan of the Greek Church in the Austrian dominions. The finest buildings are the cathedral and the archiepiscopal palace. The only quarter of Carlovitz which has the appearance of a town is that part which adjoins the archiepiscopal palace; the larger portion of it stretches like a village along the Danube. It contains three other churches, a Greek theological seminary, a lyceum, a Roman Catholic academy, and an hospital. The church of Mariafried on an adjacent eminence is built upon the spot on which the treaty of 1699 between Leopold II. and his Polish and Venetian allies and Mustapha II. of Turkey was concluded. By this treaty Austria gained Hungary, Transylvania, and Slavonia. The traffic of Carlovitz is derived from its fisheries and transit-trade, as well as the export of the wines, which the environs produce in considerable quantity; this has in some years amounted to 1,800,000 gallons. Carlovitz is a station for the Danube steamers. Although situated within the military frontier, it is a free town, governed by civil magistrates, and its inhabitants are exempted from military duty in order that they may apply themselves to trade and manufactures.

CARLOW, an inland county of the province of Leinster in Ireland, is bounded E. and S.E. by the counties of Wicklow and Wexford, which separate it from the Irish Channel, S.W. and W. by the county of Kilkenny, and N.W. and N. by the Queen's county and the county of Kildare. It lies between 52° 28' and 52° 53' N. lat., 6° 32' and 7° 7' W. long. It has an area of 221,342 acres, of which 184,059 acres are arable, 31,249 uncultivated, 4927 in plantations, 602 comprised in towns, and 505 acres under water: the population in 1851 was 68,075.

The county, which is in form nearly triangular, comprises a plain of considerable extent and fertility, lying between the Wicklow and Wexford ranges on the east, and the high lands which bound the valley of the Barrow on the west. The Slaney River descending along the western declivities of the Wicklow range, and thence passing by the northern extremity of the Wexford group waters the central and north-eastern divisions of the county, passing in its course the towns of Rathvilly, Tullow, and Clonegall. The Barrow forms the boundary of the county on the west, except through a portion of its course where it cuts off the barony of Idrone West. The county town of Carlow, and the towns of Leighlin Bridge, Bagenalstown, and Borris are situated on the Barrow in this part of its course: the adjoining districts display excellent agriculture and great fertility. The southern extremity of the county, included between the Barrow and the mountain range of Blackstairs (2401 feet) and Mount Leinster (2604 feet), is hilly and ill cultivated. Through a distance of about 15 miles these mountains form a barrier between the south of Carlow and the adjoining county of Wexford, crossed only by one leading road through the pass of Scullough Gap.

The principal geological constituent is granite, which extends from the mountainous district of Wicklow through the entire central tract of the county. Through the central and more productive part of the field the granite is covered by tertiary beds of limestone gravel. In the southern division the granite rises into the elevations of Mount Leinster and Blackstairs. North of the ridge of Mount Leinster a tract of the silurian slate of Wexford, skirted by greenstone protrusions, crosses the valley of the Slaney from the neighbourhood of Clonegall to Myshall. In the valley of the Barrow the upper limestone, calp, and lower limestone present their respective edges in

parallel fields corresponding pretty nearly to the course of the river which flows chiefly through the field of calp. A small projection of the old red-sandstone formation of the Slievenamon group occurs at Goresbridge. In the limestone district the soil is gravelly but warm; it is lighter and more peaty in the granite district. From the facility of splitting with the wedge the granite which is found here, lintels of granite are commonly employed in cases where bars of wood are used elsewhere, and a common fence in the county of Carlow is a granite paling, the square lintels resting on their angles in notches on the tops of granite uprights; the weight of the stone keeps it in its place without any further fastening. A branch of the Great Southern and Western railway has been open since August 1846, connecting Dublin with Carlow town; and an extension of the line from Carlow to Lavietstown, within two miles of Kilkenny, was opened in November 1850. The great southern road from Dublin to Kilkenny passes through the county in a direction nearly parallel to the Barrow, which it crosses at Leighlin Bridge. The roads are numerous and mostly in good repair. Carlow also derives considerable facilities of transport from the Barrow navigation, which affords a water-carriage south to Waterford, and north by the Grand Canal, a branch of which meets it at Athy, to Dublin and the Shannon.

With a good soil and a resident proprietary Carlow has long held no mean position as an agricultural and productive county. The crops generally raised are potatoes, wheat, barley, and oats. The number of acres under crop in 1851 was 87,615: namely, wheat, 10,191; oats, 28,415; barley, bere, and rye, 5709; beans and peas, 136; potatoes, 11,154; turnips, 6047; mangel-wurzel, carrots, parsnips, and cabbage, 1157; vetches and other green crops, 352; flax, 117; and meadow and clover, 24,319 acres. Of plantations, including oak, ash, elm, beech, and fir trees, mixed timber, and fruit, there were 8428 acres. In 1851 the number of holdings in the county was 5942, of which number 529 did not exceed one acre. In the same year on 6403 holdings (of which 5413 were under one acre) there were 7039 horses, 2309 mules and asses, 33,989 cattle, 32,268 sheep, 24,642 pigs, 2743 goats, and 105,635 poultry. On the whole the county is a rich one, and the farmers have hitherto, for their stations, been generally comfortable.

The manufacture of coarse woollens was at one time carried on to some extent in Carlow, but the trade is now altogether gone. The county is essentially agricultural, and its staple is the raising and preparation of provisions—especially corn, butter, flour, and oatmeal. On the Barrow navigation there is a fall of rather more than one foot per mile, which gives a great water-power available for mill sites at almost every weir; the number of corn-mills along the line is accordingly very great, and with one or two exceptions these establishments lie within the limits of this county. The provision trade consists chiefly in bacon for the home market. Large quantities of barley are malted by the resident maltsters and distillers.

The only towns of any importance in this county are CARLOW, TULLOW, and BAGENALSTOWN. Carlow will be found described under its title: Tullow and Bagenalstown, with one or two villages, we notice here. Tullow is situated on the Slaney, on the road from Dublin to Wexford, in a well-cultivated and agreeable country: the population in 1851 was 2963. The parish church is adorned with a tower, and the Roman Catholic chapel with a spire, which form striking features in the landscape. There are here a small monastery and convent, the members of which occupy themselves in education. Quarter sessions are held here in rotation. The town is improving.

Bagenalstown, on the Barrow, is a small but neat and thriving place: in 1851 it had a population of 2256, and 36 inmates of the fever hospital. The sessions house, occupying an elevated site, has a handsome Ionic portico. A considerable number of respectable families reside here and in the vicinity; and an extensive trade is carried on in milling, for which the Barrow affords abundant water-power. The quarrying and dressing of granite also affords a good deal of employment. Quarter sessions are held here.

Borris is a small town, population 720 in 1851, which has grown up as an appendage to the neighbouring manor-house of Borris, the residence of the Kavanagh family. The Roman Catholic chapel is in the village; the private chapel attached to Borris House serves as the ordinary place of worship for the Protestant inhabitants of Borris town. Borris House is an imposing building in the Elizabethan style, and stands in a park of great extent and beauty on the left bank of the Barrow. Clonegall, population 334, on the eastern border of the county, is picturesquely situated on the river Derry, about 7 miles S.S.E. from Tullow. The village contains some good buildings. Ten fairs are held in the course of the year; two in May and December for frieze; the rest for cattle. Hacketstown, population 790, on the Derreen rivulet, about 35 miles S. by W. from Dublin, is a place of some importance in the district in which it is situated. Fourteen fairs are held in the course of the year. The town possesses a respectable amount of trade. Besides the parochial chapel, there are two chapels for Roman Catholics, and National and Charity schools. Leighlin Bridge, population 1292 in 1851, so called from a bridge built here in 1320 by a canon of the cathedral of Kildare, to facilitate the access to the cathedral church of Old Leighlin which stands two miles west, is a small straggling town on both sides of the Barrow. The parish church and Roman Catholic chapel stand on the right bank; the ruins

of an early Anglo-Norman fortress called the Black Castle, built to defend the ford before the erection of the bridge, occupy a considerable area on the left. *Old Leighlin* is a poor village, and the cathedral, a building of the 12th century, restored in the 16th, has been used since the union of the see with that of Ferns, in A.D. 1600, as the parish church. *Old Leighlin* was at an early period a parliamentary borough, and a place of some consequence, but suffered from fire, and the ravages of war. The borough returned two members to the Irish Parliament, but was disfranchised by the Act of Union. *Rathvilly*, population 466, situated on the left bank of the river Slaney, at the intersection of several roads; eight fairs are held during the year. Besides the parish church there are a Roman Catholic chapel and two National schools. *Tinnahinch*, on the left bank of the river Barrow, has increased in population from 221 in 1841 to 401 in 1851. It forms a suburb of the town of Graigneamanagh on the opposite bank of the river, in Kilkenny county. Near the village are the ruins of *Tinnahinch Castle*, and of *St. Michael's church*, burying-ground, and wall. Fairs are held in May, September, and December.

In the year 630 a synod was held at *Old Leighlin* to adjust the dispute between the Irish ecclesiastics and the See of Rome regarding the fit time of celebrating Easter. When the English invaders came this part of the country was known as comprehending the territories of Hy-Drone and Hy-Cavanagh, being the northern portion of the territory of Hy-Kinsellagh, the patrimony of Dermot Mac Murrough, king of Leinster, the inviter of Strongbow. Isabel, daughter of Strongbow by Eva, daughter of Dermot, married (1189) William Earl Marshal, one of the invading nobles, who in her right succeeded to the principality of Leinster. This William, who was Lord Justice of Ireland, granted the first charter to the inhabitants of Catherlagh, as the present county town was then called, about 1208; and King John coming to Ireland in 1216 made the county shire ground. William Earl Marshal and Pembroke dying in 1219 left five sons and five daughters, and on failure of the male line the Carlow division of his immense estates fell to his daughter Maud, who married Roger Bigod, earl of Norfolk. From Roger, earl of Norfolk, the lordship of Carlow passed to the crown, and from Maud his wife the barony of Idrone passed by grant in fee to the family of Carew. The lordship of the county was next granted by Edward I. to Thomas de Brotherton, and from him descended through the family of Howard, earls of Norfolk and lords of Carlow, till forfeited by the statute of absentees in the reign of Henry VIII. These lords palatine exercised a kind of sovereign sway in their territories, but the circumstance of their residing at a distance gradually slackened the exercise of their privileges, and the descendants of the dispossessed Irish taking advantage of the lax administration of their deputies, and headed by one of the Kavanaghs, a descendant of Dermot Mac Murrough, began forcibly to repossess themselves of their ancient patrimony, in which attempt they were ultimately so successful that in the 37th Edward III. an order issued *pro barrio amovendo a Catherlagh usque ad Dublin*—for withdrawing the boundary of the pale from Carlow to Dublin—the country south of Nus having fallen completely into the hands of the Irish. Richard II., A.D. 1394, and again in 1399, undertook expeditions for the recovery of the revolted counties, but although he forced some of the Irish chieftains to a temporary show of obedience, he was finally obliged to return to England without accomplishing his object. In 1494 the Fitzgeralds seized the castle, which they held till after the unsuccessful rebellion of Lord Thomas Fitzgerald in 1537. In this year the resumption of the lordship of Carlow, alluded to above, took place; by which means the crown was afterwards enabled to grant large estates to the family of Butler in this county. In 1567 Sir Peter Carew, descendant of the last proprietor of Idrone, into which the Kavanaghs had forcibly intruded in the reign of Edward III., exhibited his claim to this barony, and having established it to the satisfaction of the council, entered on possession, and "dealt in such good order with the Kavanaghs, and so honourably used himself, that they all voluntarily yielded up their lands, and submitted themselves to his devotion." (Hooker.) Sir Peter Carew died in 1570, and his son Sir Peter Carew was killed at Glendalough in a battle with the O'Byrnes of Wicklow in 1580, after which the Kavanaghs once more made head in Carlow, and with the O'Byrnes, commenced a predatory warfare, which lasted from 1590 till 1601, when Sir Oliver Lambert at length reduced both to submission.

During the reign of Elizabeth large tracts of the county of Carlow had been granted to the Butlers and Fitzgeralds, and in the succeeding reign their estates were confirmed, as well as considerable possessions to the Earl of Thomond, to the submitted Kavanaghs; and among other grants was that of the entire barony of Idrone, to the family of Bagnall. In the rebellion of 1798 Carlow was the scene of several engagements. On the 25th of May the rebels attacked the town of Carlow, and were repulsed with the loss of 600 men; on the same day a battle was fought at Hacketstown, in which the insurgents, said to have been 13,000 strong, were defeated with considerable loss; and on the night preceding, Borris House, the residence of Mr. Cavanagh, was attacked by 5000 of the peasantry, who were repulsed both on this occasion and on the 24th of June when they assailed the town of Borris. Leighlin Bridge and Bagenalstown were also attacked with a like result.

The chief antiquities of the county are military; cromlechs, near

the towns of Carlow and Hacketstown, and the cathedral church at Old Leighlin, being the only pagan and ecclesiastical monuments of interest. Of the cromlechs, that near Carlow is the most remarkable; the covering-stone weighs nearly 90 tons. Of the castles those at Carlow, Tullow, and Leighlin Bridge are the most ancient: the building of all is attributed to De Lacey. At Clonmullin, in the barony of Forth, are some traces of the castle of Donnell Spauling Kavanagh; Cloghigrenan, a castle of the Butlers on the right bank of the Barrow, is still standing; Clonmore, another stronghold of the same family, situated near Hacketstown, remains in a state of good preservation; it is a noble pile of 170 feet square, flanked with square towers at the angles.

Carlow county is divided into seven baronies: Rathvilly and Carlow on the north; Forth, Idrone East, and Idrone West in the centre; and St. Mullin's (Upper and Lower) on the south. The county court-house and prison, county infirmary, and district lunatic asylum are at Carlow town. Quarter sessions are held at Carlow, Tullow, and Bagenalstown. Fever hospitals are at Bagenalstown, Borris, Carlow, and Tullow. In December 1851 there were in the county 59 National schools, attended by 3133 male and 3815 female scholars. Carlow returns three members to the Imperial Parliament, two for the county and one for the borough of Carlow. The assizes are held at Carlow. The county is within the military district of Kilkenny; a barrack-station for cavalry and infantry is at Carlow. The county constabulary, of which the head-quarters are at Carlow, consist of 159 men, including officers; they are divided into four districts, of which the head-quarters are Carlow, Bagenalstown, Tullow, and Borris. There was no savings bank in the county in 1851.

(*Ordnance Survey Geological Map*; Ryan, *History and Antiquities of Carlow*; *Statistical Survey of Carlow*; Fraser, *Handbook for Ireland*; *Original Communications*.)

CARLOW, county of Carlow, Ireland, in the barony and county of the same name, with the suburb of Graigue in the barony of Slieve-mariquo, Queen's County, an assize, market, and post-town, a parliamentary borough, and the seat of a Poor-Law Union, is situated in 52° 47' N. lat., 6° 56' W. long.; distant from Dublin by the high road 49½ miles, by the Carlow branch of the Great Southern and Western railway 55½ miles. The population of the borough in 1851 was 9121, besides 2461 inmates of the Union workhouse and other public institutions. The borough returns one member to the Imperial Parliament. Carlow Poor-Law Union comprises 45 electoral divisions, and an area of 185,857 acres, with a population in 1851 of 63,598.

Carlow is situated on the left bank of the Barrow where the Burrin, a small river flowing westward from the barony of Forth, enters that river. The town consists chiefly of two main streets, one running nearly parallel with the Barrow, and crossing the Burrin by a neat metal bridge; the other leading to the suburb of Graigue, in Queen's County, by a handsome balustraded stone bridge over the Barrow. On the north side of the latter street opposite the site of the ruined castle stands the parish church, a respectable edifice ornamented with a spire of very elegant proportions. The court-house is an octagonal building of cut stone, with a handsome portico of Ionic columns, approached by a fine flight of steps, and elevated on a massive balustraded basement. There are places of worship for Presbyterians, Methodists, and Quakers. The Roman Catholic church and college are both fine buildings; the church, which serves as a cathedral for the united dioceses of Leighlin and Kildare, is a spacious and handsome cruciform edifice, with an octagonal tower surmounted by a lantern 150 feet high. The college, a plain edifice, was originally founded in 1789 for the education of Roman Catholics. A new wing was added in 1828, and the house is now calculated for 200 students. There is a Roman Catholic convent here, founded in 1811, with a school attached. There is also a nunnery. Carlow has a diocesan school and several other schools connected with the Established Church. The county jail is a well-regulated establishment; employment is provided for prisoners of both sexes. The Union workhouse is constructed for the accommodation of 3278 inmates. Adjoining is a barrack for two companies of infantry and a troop of horse. Coal is brought from the neighbouring coal district in the Queen's County, and by the Barrow from Ross and Waterford; but the principal fuel used by the lower classes is turf. The chief manufacture carried on here is that of flour and oatmeal, large grinding-mills being driven both by the Burrin and the Barrow; there are a brewery and a distillery, several flour-mills and malt-houses. The butter trade is carried on extensively.

The town of Carlow grew up round the castle which was founded here by the early English conquerors about the end of the 12th century. It was erected into a borough by William Earl Marshal, about 1208, and was surrounded with walls in 1362 by Lionel, duke of Clarence, who removed the king's exchequer hither from Dublin. It is said that the castle was seized in 1297 by Donnell Mac Art Kavanagh; and it appears to have been occasionally in the hands of the Irish till about 1494, when it was seized by a brother of the Earl of Kildare, and after a siege of ten days was taken from him by the lord deputy, Sir Edward Poyning. The castle was occupied by the Royalists under Captain Bellew, and on the 24th of July, 1650, after a short siege was surrendered to Sir Hardress Waller, commanding a division of Ireton's parliamentary forces. In July, 1604, the manor of Carlow was

granted to Domogh O'Brien, earl of Thomond, and the office of constable of the castle was bestowed on him and his son Brien in consideration of his surrender of certain castles in Tipperary and Limerick. In 1613 James I. granted a charter to the inhabitants of Carlow, constituting the town a borough. This charter was superseded by the Reform Act. The dilapidation of the castle has been comparatively recent. The whole structure, a square of 105 feet, with massive round towers at the angles, was standing in 1814, when an injudicious attempt was made to modernise it by piercing new windows and diminishing the thickness of the walls, in consequence of which more than one-half of the building fell to the ground. Its ruins, consisting of one curtain wall with its flanking towers, about 65 feet in height, stand over the left bank of the Barrow, and still form a prominent and picturesque object.

The Lunatic Asylum for the counties of Carlow, Kildare, Wexford, Kilkenny, and Kilkenny city, is half a mile north of the town. A fever hospital and military barracks are at Carlow. Carlow is a neat and thriving town, situated in a rich country, and is the residence of many respectable families. Fairs are held in May, June, August, and November. Markets are held on Monday and Thursday. Grain and butter are exported to Dublin and Waterford to a considerable amount. Several flour-mills and malt-houses are in the vicinity.

(Ryan, *History of the County of Carlow*; Thom, *Irish Almanac*; *Parliamentary Reports and Papers*; *Original Communications*.)

CARLSBAD, a royal town, celebrated for its mineral waters, is situated on the Tepl, in the circle of Ellbogen in Bohemia, in 50° 13' N. lat., 12° 52' E. long., and has a permanent population of about 3000. The warm spring called the Sprudel, to which it is indebted for its celebrity, was first brought into notice in 1370, when Charles IV., as the tradition says, while following the chase in its vicinity was attracted to the spot by the cries of a hound that had fallen into the hot spring in pursuit of a stag. Charles's physician, Beier, was one of the party, and formed so high an opinion of the virtues of the water, that he recommended his royal master to use it for the cure of wounds he had received at the battle of Crecy. The result having established its efficacy, Charles founded a free town on the spot, settled the inhabitants of a neighbouring village upon it, ordered baths to be opened, and gave it his own name. In the market-place is a statue of Charles IV.

Carlsbad is built in a deep narrow valley, traversed by the Tepl, which falls into the Eger just below the town, and is bounded on every side by lofty heights of granite. The houses branch out into three distinct ravines or lesser valleys. A more delightful scene cannot be conceived than the prospects from the summit of the heights that screen these dells. They are traversed in all directions by shady walks provided with seats and summer-houses. The hot springs are close to the banks of the Tepl. They emit a delicate vapour, which constantly hangs over the town, and has a peculiar odour. The Sprudel has a temperature of 165° Fahr.; its water boils eggs hard, and is used by the townspeople to scald poultry and pigs. Its principal chemical ingredients, which exist also in the same proportions in the other springs, are sulphate of soda, carbonate of soda, common salt, bromine, and potash. About 2,000,000 gallons of water flow from the springs in a day, two-thirds of which are furnished by the Sprudel and Hygieia. The Muhlbrunnen has a temperature of 138°, the Neubrunnen 147°, the Theresienbrunnen 132°. There are several other springs; most of them are shaded by a covered colonnade, under which the drinkers take the waters in the morning to the 'sound of soft music.' The waters are used also for warm, mud, vapour, and douche baths. In 1838 a new fountain burst forth in the market-place with a temperature of 135½°. All the springs rise out of granitic breccia; and all of them have petrifying qualities. The Sprudel bursts out of the breccia through a crust of its own formation.

Carlsbad is the most aristocratic watering-place in Europe. The most fashionable season is from June 15th to August 15th, but some visitors remain to the end of September. The number of visitors varies between 5000 and 6000. There are reading-rooms, restaurants, several good shops, a theatre, and coffee-houses; gaming is strictly prohibited. Bohemian glass, china, earthen and powder cups are sold in large quantities. Every visitor who remains 5 days pays a tax of 4 florins, which is laid out in keeping up and improving the walks, baths, temples, colonnades, and other buildings connected with the springs. The arrival of distinguished strangers is announced by trumpeters stationed on a tall tower near the market-place; the nature and extent of the flourish depend on the character of the equipage.

CARLSKRONA, a fortified sea-port town, the capital of the province (Län) of Carlskrona in Sweden, is situated in 56° 10' N. lat., 15° 35' E. long., and has a population of about 12,000. It was founded in 1680 by Charles XI., who made it the station of the royal fleet and the naval arsenal of Sweden. It is built chiefly on the island of Trotsö; the rest of the town stands on smaller adjoining islands, the whole being connected by bridges and by an embankment with the mainland. Its streets are wide and straight, but the ground on which the town stands is uneven. The houses are commonly good, though small; many of them are built of stone and the rest of wood.

The harbour, formed by a series of islands lying about three miles distant from the continent, is spacious, safe, and convenient, and has depth enough for the largest men-of-war. There are three entrances:

the only one practicable for large vessels is on the south side of the town, between the islands Aspö and Tjurkö, and is defended by two strong forts. The entrance to the west of it is called Aspösund, which may be entered by frigates, and still smaller vessels find admission into the harbour by the east entrance, called Skällesund.

The dry docks of this harbour have always attracted the attention of foreigners. The old dock, built in the time of Charles XII., was blasted out of the granite rock, and is 200 feet long by 80 feet wide; it is deep enough for the largest vessels. The new dock, constructed under Gustav III., is much more extensive, and consists of several divisions for the building of different kinds of vessels; it is likewise cut in the granite. The other buildings are the arsenal, the artillery-yard, and the admiralty. The buildings and constructions connected with the naval arsenal and dockyard are separated from the town by a wall. The greatest inconvenience to which the inhabitants are exposed is the want of good water. The manufactures, which, excepting the naval equipments made in the royal arsenal, are unimportant, comprise linen, tobacco, and refined sugar; metals, potash, &c., are exported. Steamboats between Stockholm and Carlskrona (a small sea-port, 26 miles W. from Carlskrona, with a population of 4200) call at Carlskrona.

The province of Carlskrona has an area of 1130 square miles, and had in 1845 a population of 102,342.

CARLSRUHE (Karlsruhe), the capital of the grand duchy of Baden, stands in the circle of Mittel-Rhein, about 4 miles east of the Rhine, on the railway between Mannheim and Bâle, being 34 miles S. from the former and 123 miles N.N.E. from the latter town: population, 24,000. It stands at an elevation of 372 feet above the level of the sea and 50 feet above that of the Rhine, in 48° 56' N. lat., 8° 22' E. long. Its origin was a hunting-seat built on the spot by Charles William, margrave of Baden, in 1715. It is constructed in the form of an extended fan, the grand ducal palace constituting the central point, from which the streets and avenues diverge. The streets commence from a semicircular row of handsome houses which fronts the palace, and is called the Great Circle. The style of the houses is various; some are in the Dutch, some in the French, and many in a mixed Greek and Roman style. The palace is remarkable only for its tower called Bleythurm, which stands in its centre; the right wing of the edifice contains the public library of 90,000 volumes, a collection of antiquities, coins, &c.; and the left wing, the church of the court. The view from the Bleythurm is splendid, comprehending the whole city and the Hardt Forest, which nearly surrounds the town, and is pierced by roads corresponding with the several streets; beyond this to the west are seen the Vosges Mountains and the windings of the Rhine, the Black Forest Mountains on the south, and the Bergstrasse on the north. The Great Circle contains the government offices, and the palace of the Margrave Maximilian. Karlsruhe has nine public squares, the finest of which is the market-place. The stone-pyramid, with an inscription in memory of Charles William the founder of the place, whose remains are inclosed in it, stands in the centre of the square. The new Protestant, the new Catholic, and the garrison churches are handsome buildings. The building for the Legislative Assembly is three stories high, and contains two fine halls for the sittings of the two chambers, besides residences for the president, officers, &c., and depositories for the archives and papers. Among the important institutions of Karlsruhe, to all which are attached handsome buildings, are—the museum, the mint and offices of works, the academy of the arts and sciences, with a picture gallery attached to it, the arsenal, polytechnic school, post-office, and barracks. The town also possesses a botanical garden, a veterinary school, four hospitals, a deaf and dumb asylum, and other useful and benevolent institutions. There is a theatre attached to the palace. The inhabitants derive their livelihood principally from trade, mechanical employments, and manufactures. The chief manufactures are silks, cottons, carpets, woollens, jewellery, tobacco, snuff, leather, carriages, and articles of luxury. The Palace Gardens and those called Amaliensruhe are always open to the public, and afford pleasant promenades. There are also many attractive spots in the neighbourhood. The town is supplied with water by an aqueduct from the Durlach. [BADEN.]

CARLSSTADT. [CROATIA.]

CARLTON, West Riding of Yorkshire, a township and the seat of a Gilbert Poor-Law Incorporation, in the parish of Guiseley and upper division of the wapentake of Skyrack. Carlton is situated in 53° 53' N. lat., 1° 40' W. long.; distant 2 miles S.E. from Otley, and 28 miles W. by S. from York. The population of the township in 1851 was 185, including 79 inmates of the workhouse. Carlton Gilbert Incorporation contains 40 parishes and townships, with an area of 86,034 acres, and a population in 1851 of 68,610.

CARLUKE. [LANARKSHIRE.]

CARMEL, a range of hills connected by a chain of lower hills with the central mountains of Palestine, runs in a north-west direction and terminates abruptly in the sea in a bold promontory, which is called Mount Carmel, and forms the southern extremity of the Bay of Acre. The range rises rapidly from the coast to the height of about 1500 feet, and its whole length is about 18 miles. It separates the great plain of Philistia from the plain of Esdraelon and the coast of Phœnicia. It is composed of limestone, and was formerly noted for

its fertility. On the summits of the range, oaks, pines, and other trees grow; and the vines and olive-trees which are still seen among the brambles indicate that its surface was once under cultivation. The sides are still covered with rich pasture, where shepherds feed their flocks as they did when the Hebrew prophets described it as the 'habitation of shepherds.' The Kishon runs along the eastern base of Carmel into the Bay of Khaifa.

Mount Carmel is celebrated in the Old Testament for the sacrifice of Elijah (2 Kings, xxiii.), and the fame of this miracle made it be regarded even by pagans as a place of peculiar sanctity. The site of Elijah's altar is still pointed out. Carmel contains numerous caves, particularly on the western side. At the north-western extremity of Mount Carmel is a monastery belonging to the Carmelite monks, who took their denomination from this mountain: the monastery is believed to be built over the spot where Elijah and Elisha had their abode.

The little town of *Caifa*, or *Khaifa* (the ancient Porphyrium), at the northern base of Mount Carmel, is of some importance on account of its roadstead. Corn, cotton, sesamum, and Galilean and Samarian oils are exported from Caifa.

CARNAK. [MORBIHAN.]

CARNAK. [THEBES.]

CARNATIC, a province in the south of Hindustan, extending between 8° and 16° N. lat., and between 77° and 81° E. long. This province comprehends the former dominions of the Nabob of Arcot, stretching from Cape Comorin on the S. to the small river Gundigama, by which it is separated from the Circars on the N. On the E. it is bounded by the Bay of Bengal, having a line of coast 560 miles long; and on the W. are Coimbatore, the Barramahall districts, and the territory ceded by the Nizam. The breadth of the province, no where greater than 110 miles, averages about 75 miles, and is narrowest towards the north. The chain of hills known as the Eastern Ghauts commences in the south, about 11° 20' N. lat., and extends northward in a direct line to 16° N. lat., separating the Carnatic throughout its extent into two divisions, one called Carnatic Balaghauts, or above the Ghauts [BALAGHAUTS]; the other the Carnatic Payceughaut, or below the Ghauts. The province is farther divided in length into three parts, severally called the Southern, the Central, and the Northern Carnatic. The first of these divisions is south of the river Coleroon, the northern branch of the Cavery, which runs from Trichinopoly to the Bay of Bengal. This part of the Carnatic did not form an integral part of the dominions of the Nabob of Arcot, but was tributary to that chief. The principal towns which it contains are Carrical, Cuddalore, Madurai, Nagore, Negapatam, Tanjore, Tinnevely, Tranquebar, and Trichinopoly. The Central Carnatic has the Coleroon for its southern and the Pannair for its northern boundary. Its chief towns are MADRAS, ARCOT, Chandergeri, Chingleput, Conjeveram, Gingee, Nellore, Pondicherry, Pulicat, Vellore, and Wallajabad. The Northern Carnatic comprehends the remainder of the province, and is included between the Pannair on the south and the Gundigama on the north; of its towns, which are few in number, we may name Saumgaum.

Carrical, at one of the outlets of the Cavery River, is a French settlement. The river is here navigable for small boats. The population is about 15,000. There is here a good harbour. The town possesses considerable trade. *Madurai*, situated near the Vaygaru River, is a fortified city, about 270 miles S.W. from Madras. The population formerly amounted to 40,000, but is now probably not half that number. The walls of its ancient fortifications remain, and a large palace, a great temple with pyramidal towers, with numerous Hindoo edifices, attest the former extent and magnificence of the place. The streets are wide, and regularly built, but the dwellings of the inhabitants are of an inferior description. *Nagore*, on the Nagore River, a branch of the Cavery, at its embouchure in the Indian Ocean, is a populous city, with a considerable trade. The houses are well built. The city possesses several mosques, a square tower 150 feet high, and other public buildings. *Negapatam*, on the Coromandel coast, about 50 miles E. from Tanjore, was formerly a Portuguese and afterwards a Dutch settlement of importance, but has lost its trade since it was united to the British dominions in 1783. *Tanjore*, the capital of the Raja of Tanjore, is situated near the right bank of the Cavery, in 10° 47' N. lat., 79° 13' E. long., distant 40 miles E. from Trichinopoly: the population has been variously estimated at from 35,000 to 80,000. The circumference of the city and the suburbs is about six miles. It is a place of great strength, being defended by two forts, which are connected with each other; both are surrounded by walls built of large stones, and by broad and deep wet ditches. The city is regularly built, and is said to contain a larger proportion of good houses than any other town in Southern Hindustan. The palace of the raja is in the larger fort. An extensive Hindoo temple is situated in the smaller fort. There is here an English church. *Tinnevely*, 60 miles N. by E. from Cape Comorin, is situated in a very well cultivated country not far from the mountains. *Tranquebar*, formerly a Danish settlement, is a fortified sea-port town. It was purchased by England in 1846. The town possesses a good harbour, and some commerce. The population may be about 20,000. Tranquebar is a principal station of the Protestant missionaries in Hindustan. *Trichinopoly* is situated on a rocky eminence on the right bank of the river

Cavery; it is fortified, and is said to contain, including the suburbs, upwards of 80,000 inhabitants. The houses are generally inferior to those of Tanjore. There is a considerable trade in cotton-cloth, jewellery, and horse equipments. The head-quarters of the south division of the Madras army is at Trichinopoly. The chief public buildings are a palace, a mosque, and two Hindoo temples. *Chandergeri*, is a fortified town, situated in 13° 43' N. lat., 79° 17' E. long., about 85 miles N.W. from Madras. *Chingleput* is situated in 12° 46' N. lat., 80° 2' E. long., on a feeder of the Palair, distant about 38 miles S.S.W. from Madras. The town is irregularly built, and the houses are of mean appearance. The fort has been allowed to fall into decay. In 1751 it was taken by the French and retained by them till 1752 when Captain, afterwards Lord Clive retook the place. *Conjeveram*, called by the natives Kunji, is situated in a fertile valley watered by the small river Wegawutty, in 12° 49' N. lat., 79° 48' E. long. The town is built in a straggling manner, and resembles a series of villages interspersed with extensive gardens and plantations. The streets, which are wide and regularly laid out, are planted on each side with cocoa-nut trees and bastard cedars. The houses are only one story high; they have mud walls and are roofed with tiles. Each house is built in the form of a square, with a small court in the centre. A considerable part of the inhabitants are weavers, and employ themselves in making red handkerchiefs, turbans, and cloths adapted for the dresses of the natives. Conjeveram is also the residence of numerous Brahmins belonging to temples dedicated to Siva and Vishnu, which are much frequented. The pagoda of Siva is a large building said to contain 1000 pillars, many of them elaborately sculptured. The pagoda dedicated to Vishnu Conjee is not so large, but is more highly venerated. It was from this building that the town obtained its name of Conjeveram. There are numerous pagodas, near which are placed large tanks; in one of these, situated on the west side of the great pagoda, every Brahmin who visits the place for the first time must perform his ablutions, and he must spend money in charity; the sums thus raised being in fact applied to the support of the Brahmins belonging to the temple. *Gingee* is situated in 12° 12' N. lat., 79° 28' E. long., distant 35 miles N.W. from Pondicherry. It was formerly considered by the natives as the strongest fort in the Carnatic. The works cover the summits and great part of the sides of three detached rocky mountains, upwards of 500 feet high, and difficult of access: the whole are connected by lines which inclose the plain between the mountains, and contain within them a fortified barrier, dividing the works into an outer and inner fort. This fortress was built about the middle of the 15th century, and was successfully strengthened by its Mohammedan and Mahratta possessors. It surrendered to the British in 1761, and has since been completely neglected. *Nellore*, situated on the right bank of the Pennair River, is a populous place, and has a considerable amount of trade. *PONDICHERRY*, formerly the principal seat of the French power in Hindustan, will be described in a separate article. *Pulicat* stands on the edge of a lake separated from the sea by a low sandy beach, in 13° 25' N. lat., 80° 24' E. long., 23 miles N. from Madras. The Dutch formed a settlement here as early as 1609, and after the loss of Negapatam made it their chief station on the Coromandel coast. *Vellore* is situated on the right bank of the river Palair; in 12° 55' N. lat., 79° 12' E. long., about 20 miles W. from Arcot. Vellore is a large fortress, containing spacious barracks and a curious pagoda, commanding the main road from the coast of the Carnatic to the province of Mysore. The fortress is surrounded by a strong stone wall, with bastions and round towers at short distances, and by a wide and deep ditch, over which is a causeway, forming the only entrance. The town, which is large and populous, is connected with the fortress by extensive outworks. It was besieged by Tippoo Saib in 1781, but unsuccessfully, and after the conquest of Seringapatam it became the residence of his family, but on their joining in a revolt in 1826 they were removed to Bengal. *Wallajabad* is 14 miles N.W. from the town of Chingleput, in 12° 48' N. lat., 79° 53' E. long., and contains extensive military cantonments. *Saumgaum* is situated in 14° 25' N. lat., 79° 47' E. long., 17 miles N.W. from Nellore.

The climate of the Carnatic Payceughaut, which lies the sea on one side and an abrupt mountain ridge on the other, is considered to be the hottest in India. Contiguous to the coast the heat is somewhat mitigated by the sea-breeze. The failure of this sea-breeze, which sometimes occurs for several successive days, occasions a degree of heat highly distressing to the inhabitants, the thermometer rising to 130° in the shade. From May to July occasional showers occur, and sometimes it rains heavily and continuously for three or four days, by which the air is cooled and vegetation assisted. The soil of the province near the coast is a mixture of sea-sand and loam, sparingly intermixed with the remains of marine animals. In many parts the earth is strongly impregnated with iron, and in others there is in dry weather a considerable efflorescence of common salt upon the surface.

The principal rivers of the province are the Pannair, the Palair, the Coleroon, and the Vaygaru. The Pannair rises in Mysore, near the fortress of Nundydrag, and taking a south-easterly direction, falls into the sea at Cuddalore, after a course, including its windings, of about 250 miles. The source of the Palair is very near that of the Pannair: it has a winding course towards the north-east of about

220 miles, and falls into the sea near Sudras, in $12^{\circ} 31' N.$ lat., and $80^{\circ} 14' E.$ long. The Colorun as above mentioned is a branch of the Cavory. The Vaygaru rises in the highlands to the south of Mysore, flows with a tolerably direct course south-east past Madura, and falls into the sea about 20 miles south of Tondi, in $9^{\circ} 25' N.$ lat., and $79^{\circ} 5' E.$ long. During its course the waters of this river are much employed for irrigation, and near its mouth there is a large tank, by which it is in great part absorbed: its channel is partially dry during some months in the year.

The lowlands are chiefly devoted to the cultivation of rice, and their rent depends upon the facility with which they can be irrigated. There are four harvests in the year, two of which are raised upon the same ground. The increase in ordinary seasons is usually for the first crop fifty-fold, for the second and third each forty-fold, and for the last from twenty to thirty-fold of the seed, the proportion sown being about ten bushels to the English acre. The high grounds which cannot be watered are principally employed for raising different descriptions of millet and a few leguminous plants. Sugar and indigo are cultivated to a small extent, and cotton in some situations grows luxuriantly.

The great bulk of the inhabitants of the Carnatic are Hindoos. A great part of the land is rented by Brahmins, who employ labourers of the inferior castes. The most numerous class of cultivators is that of Sudras, many of whom perform all the operations of the farm with their own hands.

The first invasion of the Carnatic on the part of the Mohammedans was in the year 1310, when the Hindoo sovereign was made tributary to the Mogul emperor. In 1717 Nizam-ul-Mulk obtained independent possession of the south of India, and the dependence of the Carnatic upon the throne of Delhi ceased. On the death of the Nabob of the Carnatic in 1749 the succession was disputed by Chunda Saheb and Mohammed Ali, more commonly called Wallajah. Wallajah was supported by the English, and through their exertions was established as Nabob of the Carnatic. Wallajah was retained by the English as a subsidiary ally until his death, which occurred in 1795, when he was succeeded by his son, Ooindut-ul-Omrak. In 1801 the civil and military government of the Carnatic was transferred to the East India Company by the Nabob Azim-ul-Omrak, upon the Company engaging to pay him annually one-fifth of the net revenue of the country, and providing for the principal officers of his government. [ARCOT.] In every part of the province there were formerly numerous fortresses. Many of the forts have crumbled to pieces, and those still visible are fast falling to decay, while the towns and villages have multiplied in number and increased in extent.

CARNEW. [WICKLOW.]

CARNIC ALPS. [ALPS; AUSTRIA; CARINTHIA.]

CARNIOLA. [KRAIN.]

CARNLOUGH. [ANTRIM.]

CAROLINA, NORTH, one of the United States of North America, is bounded N. by the state of Virginia, W. by Tennessee, S. by Georgia and South Carolina, and E. by the Atlantic Ocean. It lies between $33^{\circ} 50'$ and $36^{\circ} 30' N.$ lat., $75^{\circ} 25'$ and $84^{\circ} 30' W.$ long. Its extreme length from near the source of the Tennessee River to Cape Hatteras is 420 miles; its extreme breadth in the eastern part is 180 miles, diminishing in the western part to only 20 miles. The area is 45,000 square miles. The total population in 1850 was 869,039, of whom 553,028 were whites, 316,011 coloured persons, and 831 Indians. The following table shows the increase of population and the proportion of slaves in this state since 1820. The total population in

1820 was 638,829, including 11,612 free col. persons and 295,017 slaves.

1830	737,987,	19,543	235,601	„
1840	753,419,	22,732	245,817	„
1850	869,039,	27,463	288,548	„

The federal representative population in 1850 was 753,619, in which number three-fifths of the slaves are included. This entitles the state to send eight representatives to Congress. To the Senate, like each of the other United States, North Carolina sends two members.

Coast-line, Surface.—The coast runs from the borders of South Carolina nearly east to Cape Fear, and thence in a generally east-north-east direction to Cape Hatteras, and thence nearly due north to the borders of Virginia. It exhibits a very peculiar character. Besides Cape Hatteras it has two other projecting points, Cape Lookout and Cape Fear, which latter is on an island about eight miles in length and from one to three miles in width, called Smith's Island. By these three capes two open bays are formed, Onslow Bay and Raleigh Bay. Near Cape Fear is a deep inlet formed by the mouth of the Cape Fear River; but along the whole shore of Onslow Bay, an extent of 120 miles, the flat coast is lined by low barren sandy islands, or more properly sand-banks, extending parallel to the shore at a distance of about a mile, the islands themselves being from half a mile to a mile wide. This series of islands is traversed by several inlets, which are not navigable, except New Inlet by Smith's Island and Bogue Inlet in Onslow Bay, and these are practicable only for small vessels. From the islands extensive shoals extend far into the sea and with the furious gales which prevail greatly increase the

dangerous character of the coast navigation. From Cape Hatteras the shoal extends farther than from any other point, and the vicinity of this cape is consequently especially dreaded by the mariner, being generally regarded as the most dangerous part of the coast of the United States. Near Cape Lookout, and between it and Cape Hatteras, the same character of coast continues, except that the islands are not so frequently broken by inlets, but continue in one place forty or fifty miles and upwards. The islands are also broader, measuring from one to two miles in width. But though along this coast the sandy islands extend in straight lines, the shores of the mainland behind them are broken by numerous arms of the sea which penetrate to a considerable distance inland, and which like the outer sea have numerous shoals. There are also two extensive sounds, Pamlico and Albemarle sounds. Pamlico Sound extends from south-west by west to north-east by east 70 miles, with a mean breadth of 15 miles, and terminates inland in the wide bays of the Neuse and Pamlico rivers. It is connected on the north-east with Albemarle Sound, and opens into Raleigh Bay by Ocracock Inlet, which may be considered as the mouth of the sound, and has 14 feet of water at mean and only six feet at low tide. Albemarle Sound runs due west into the mainland about 60 miles by 10 miles in width; but it sends off lateral branches, especially to the north, which run from 12 to 15 miles inland. Albemarle Sound has no practicable connection with the ocean. Extending northward from the mouth of Albemarle Sound is Currituck Sound, which is 50 miles long and from 2 to 10 miles wide. The peculiar character of the coast of North Carolina deprives it of good harbours, though there are several large rivers. Cape Fear, with 18 feet of water, is the deepest inlet that the state possesses.

The surface of North Carolina presents three well-marked natural divisions. The western portion, which is somewhat more than one-fourth of its surface, lies in the Alleghany or Appalachian Mountains [ALLEGHANY MOUNTAINS], and is traversed by several of its ridges. To the east of them extends the higher terrace, or the hilly country, which occupies a little more than one-fourth of its surface. Between this region and the coast spreads the lower terrace, or the level country, which comprehends nearly one-half of the state. The boundary-line between the two terraces begins on the north at the Mundford Falls of the river Roanoke above Halifax, and extends south-south-west to Smithfield on the Neuse, and to Averbysborough on Cape Fear River, and terminates on the river Pedee between Rockingham and Sheadsborough.

The low country, stretching from 100 to 140 miles inland from the coast, exhibits two different aspects. Along the shore it is partly covered with extensive swamps and marshes, and traversed by muddy sluggish rivers. These swamps are said to cover an area equal to that of one-tenth of the whole state. The largest of the swamps are near Albemarle and Pamlico sounds. Between these sounds is the Alligator or Little Disual Swamp, which is of little less extent than the Great Dismal Swamp, which lies to the north of Albemarle Sound and stretches into Virginia, and is 30 miles long and from 10 to 12 miles wide. In the centre of it is Drummond Lake, 30 miles in circuit. The swamps south of the Neuse River are of less extent, though several of them are from 15 to 20 miles in diameter. The principal are Dover, Holly, Shelter, and Green swamps. These swamps are the result of the tides and partly also of land-floods; and may be compared to the Sunderbunds in the delta of the Ganges. They are mostly covered with high trees, especially cypresses, cedars, and pines; but are in parts covered with an almost impervious growth of tall rank grass and herbage. The soil of the swamps is generally a soft bog, and is covered knee-deep with water. The dry tracts of land which intersect the swamps and the parts which have been drained have in general a good soil, and much rice and cotton is raised on them. Between the swampy country and the hilly region extends, in breadth 40 miles and upwards, a tract of sandy land which is mostly level; but in some places there are hills 200 feet above the adjacent country. The soil is sterile and the surface overgrown with pine forests. The rivers have a much quicker course than through the marshy country, and along their banks the soil is better, and the pines are replaced by oak, hickory, maple, beech, &c. This part of the country is only cultivated on the river-bottoms.

The upper terrace, or hilly country, lying between the pine lands and the mountains, is at a mean several hundred feet above the sea, and presents an agreeable succession of moderate hills with gentle ascents, and of wide and extensive valleys. The soil of the valleys is good, consisting of a black and fertile mould, and yields rich crops of grain.

That portion of North Carolina which is within the Alleghany Mountains is an agreeable alternation of hills and valleys. The mountains form two ridges, of which the west is called the Iron Mountains (and part of it also the Stone and another part the Smoky Mountains) and the east the Blue Ridge. Both are united at several places by short intermediate ridges. The highest summit is Black Mountain, the loftiest summit of the Alleghanies, which attains an elevation of 6426 feet. Roan Mountain is 6038 feet, Grandfather Mountain 5556 feet, and Table Mountain 3420 feet above the level of the sea. The Ararat or Pilot Mountain, east of the Blue Ridge, and about 16 miles N. from Salem, is a solitary pyramidal hill rising from a comparative level 1550 feet high; from the summit rises an almost perpendicular

column to the height of about 200 feet. The rivers which rise between the two ridges run west to the Tennessee River. The elevation of the whole country comprehended between the two mountain ridges is 1000 feet above the sea. The soil is in general fertile in grain.

Hydrography, Communications.—All the rivers have rapids where they pass from the hilly country to the low region. Their course above the rapids is rather swift; but below them no other current is observed than that produced by the tide, which ascends to the rapids. They offer therefore an easy navigation up to the hilly country; but shifting sand-bars invariably occur at their mouth, and they are generally shallow; they are consequently only available for vessels of light draught.

The *Roanoke* is formed by two branches, the *Dan* and *Staunton*, which rise and unite in Virginia. After their union the river runs south-east by east, and six miles above Halifax forms the *Mundford Falls*. Lower down its course is excessively circuitous; it falls into *Albemarle Sound*. Its course from the junction of the two streams is 150 miles. It is navigable nearly 30 miles from its mouth for the vessels which navigate the sound, and boats of 45 tons can ascend to the falls, which are 75 miles from its mouth. A canal enables boats to pass round the falls, and the navigation is thus continued for boats of 5 tons up to the *Dan* and *Staunton*. The *Neuse* rises in the centre of the upper terrace, and runs about 200 miles, first south-east and then south-east by east. Below *Newbern* it gradually spreads into a semicircular bay, which opens into the wider expanse of *Pamlico Sound*: it is navigable for boats in the greater part of its course. Between the *Roanoke* and the *Neuse* is the *Tar*, which also enters *Pamlico Sound*, and is navigable for vessels drawing 8 feet of water up to *Washington*, 30 miles, and for boats to *Tarborough*, 90 miles. *Cape Fear River* is formed by the confluence of *Deep River* and *Haw River*, which rise in the northern part of the state, and unite at *Haywood*, in *Chatham county*. The *Cape Fear River* flows by a general course south-east for 250 miles, till it enters the *Atlantic* about 10 miles N. from *Cape Fear*. It is navigable for vessels drawing 12 feet of water to *Wilmington*, 34 miles from the sea; and sloops may ascend to *Fayetteville*, which is 95 miles higher up. There are several other streams, but none of any great importance, for purposes of communication; many of them are capable of being made largely available for mechanical power. The only canals are the *Dismal Swamp Canal*, which with its branches is chiefly used for lumbering purposes, and *Harlow Canal*, which unites the *Neuse River* to *Beaufort*. Some important works are however projected for the improvement of the navigation of the *Deep* and *Cape Fear* rivers.

The total length of railways completed in North Carolina on January 1st, 1853, was 492 miles. The only through line yet finished is the *Weldon* and *Wilmington* railway, which unites with the *Petersburg* railway running north, and the *Seaboard* and *Roanoke* line to *Norfolk* (Virginia); and at *Wilmington* with the *Wilmington* and *Manchester* railway, which connects it with the railways of South Carolina: its entire length is 162 miles. The *North Carolina Central* railway runs from the *Weldon* and *Wilmington* line, near *Guildsborough*, through *Raleigh*, *Hillsborough*, and *Lexington* to *Charlotte*, where it unites with the *South Carolina* railways: its entire length is 223 miles. The *Gaston* and *Raleigh* line runs from *Gaston*, on the *Roanoke*, to the capital, *Raleigh* (87 miles), where it joins the *Central* line. At *Gaston* it is connected with the *Greenville* and *Roanoke* line, which is 21 miles long, and joins the *Petersburg* line at *Hicksford* in Virginia.

Geology and Mineralogy.—The geological character of this state has been incidentally noticed under ALLEGHANY MOUNTAINS. The low country stretching inland from the coast is of the tertiary and cretaceous formations, consisting generally of deposits of clay, marl, and sand, in which have been found the remains of extinct gigantic quadrupeds, as the mastodon, and large quantities of shells. Veins of limestone, copperas, and bog-iron also occur. Sir Charles Lyell assimilates these strata to the *English crag* and the *salins* of *Touraine*. West of this district are mica-schist and granite rocks, covered in parts with unconformable red-sandstone. According to Professor *Olmstead*, who has made an official survey of North Carolina, the great slate formation is about 20 miles wide, and runs from *Granville* county in a south-western direction across the state. Within this district occur numerous beds of porphyry, soapstone, serpentine, &c. Connected with these formations are the carboniferous strata, which occur chiefly in *Chatham*, *Moore*, and *Orange* counties, near the middle of the state, and afford valuable veins of bituminous coal. West of the slate and coal districts is another belt of primary, silurian, and quartziferous rocks, which reaches to the *Blue Ridge*, and in this belt occurs the celebrated *North Carolina Gold Region*—prior to the remarkable discoveries in California the richest gold district in the United States.

The mineral wealth of this state is very considerable. The gold district of this part of North America extends along the foot of the eastern declivity of the *Alleghany Mountains* between 32° and 38° N. lat., and the richest part of this district lies within the state of North Carolina. The axis of the gold formation lies generally in a north-east and south-west direction, and extends through the counties of *Rockingham*, *Guildford*, *Davidson*, *Rowan*, *Cabarrus*, *Mecklenburg*,

and *Anson*, all of which belong to the hilly country or upper terrace. The metal is found in superficial deposits and in rock-veins, and usually in connection with quartz, but in slate, gneiss, and granite strata. The superficial deposits generally yield the richest ore, in the deeper veins the gold requiring much trouble to extract from the sulphurets with which it is combined. The gold is found in small flakes and grains, and also in lumps of from 20 to 30 ounces: lumps of 4 lbs. weight have occasionally been found, and on one occasion a mass was obtained weighing 28 lbs. No authentic account has been rendered of the quantity of gold annually obtained; it has been estimated at between three and four millions of dollars, but the estimate is of little value owing to the fact of a large part of the gold being purchased on the spot by dealers for manufacturers and others, while a good deal passes into the banks as deposits, and a good deal more circulates through the mining district, the smaller grains being put into goose-quills and employed as currency; and no return of these amounts is made. The quantity converted into coin at the mint of North Carolina, though considerable, affords a very insufficient indication of the entire quantity obtained.

Iron-ore is found extensively, and largely wrought, especially in the counties of *Rockingham*, *Stokes*, *Surrey*, and *Lincoln*, where it occurs chiefly in the form of magnetic oxide; in the vicinity of the *Deep River* it is found overlying the coal, and consequently in the most advantageous situation for smelting: it also occurs in the form of argillaceous iron-ore, and as bog-iron. Copperas and plumbago are found in some places.

The great coal deposits are believed to occupy an area of 150 square miles. The region which has been most thoroughly examined occupies a length of 15 miles and a breadth of from five to six miles, chiefly in *Chatham* and *Moore* counties and along the valley of the *Deep River*, one of the principal affluents of *Cape Fear River*. The beds of coal average upwards of seven feet of thickness, and afford both bituminous and anthracite coal of the best quality. Coal is also found in some other parts of the state.

Climate, Soil, Agriculture.—The climate varies in the three natural divisions of the state. In the mountain region the frost sometimes lasts three or four months; but is not much felt in the hilly country, and still less in the low plain. The summers are hot and sultry in the plain; and the exhalations from the swamps render it unhealthy from June to October. In the hilly region the heat is moderated by cool breezes. The changes of temperature are sudden and frequent, a cold night being often succeeded by an intensely hot day. The climate of the mountains is very temperate and healthy. The average range of the thermometer at the University at *Chapel Hill*, 27 miles N.W. from *Raleigh*, is 86° Fahr., the greatest heat being 96°, the lowest 10°, mean temperature 59·7°. The average number of rainy days in the year is 98, of cloudy days 333, of clear days only 32. (Fisher.)

The difference of the climate influences the agricultural products. On the hot plain cotton is the staple production; rice also is extensively cultivated, and indigo to a small amount. Farther westward these crops are superseded by wheat, maize, and other species of grain, as well as by flax and tobacco. In the mountain region grain is the principal object of cultivation. The fig-tree and the peach generally succeed; and in the western districts apples and pears are plentiful. The pine-forests occupy a vast space, covering nearly the entire eastern section of the state. In the swamps the pine attains an immense bulk, while long spongy mosses hang in clusters from the limbs. These forests produce a large amount of lumber for exportation, and also yield a great quantity of turpentine, tar, and pitch. Cedars and cypresses abound in this low part of the country. In the hilly districts the prevalent trees are the oak, elm, walnut, cherry, lime, &c. The maple and poplar are indigenous throughout the state. Among the wild-growing plants are the ginseng, sarsaparilla, myrtle, and sugar-maple. The wild vine is found all over the country, and in some parts the vine has been successfully cultivated.

In 1850 there were in the state 5,453,977 acres of improved farmlands, and 15,543,010 acres of unimproved land attached to farms, which together were valued at 67,891,766 dollars. The number of farms under cultivation on the 1st of June, 1850, was 56,916. The total produce of the principal crops in 1850 was as follows:—Wheat, 2,130,102 bushels; rye, 229,563 bushels; maize, 27,941,051 bushels; oats, 4,052,078 bushels; potatoes, 5,098,444 bushels; rice, 5,465,868 pounds; tobacco, 11,984,786 pounds; cotton, 29,539,600 pounds. Barley and buckwheat and peas and beans are also raised in considerable quantities. The culture of flax and hemp and the making of wine appear to be declining.

The number of horses in 1850 was 148,693; of asses and mules, 25,259; milch cows, 221,779; working oxen, 37,309; other cattle, 434,402; sheep, 595,249; pigs, 1,812,813. The products of animals were thus returned:—Wool, 970,378 lbs.; butter, 4,146,290 lbs.; cheese, 95,921 lbs.; and the value of animals slaughtered during the year, 5,767,866 dollars.

Wild animals were formerly very numerous, especially deer, bears, &c.; but except wolves and wild cats few of them now remain. In the upper country the wild turkey is still common, and sometimes weighs from 25 to 30 lbs. Snakes occur everywhere; alligators inhabit the swamps and lower parts of the rivers.

Manufactures, Commerce, &c.—North Carolina is mainly an agricultural state, but has considerable manufacturing industry. The cotton manufacture employs above 1600 hands and a capital of above a million of dollars. The woollen manufacture is at present only small, but is steadily increasing. The iron manufacture employs about 500 persons. There are extensive tanneries, breweries, distilleries, potteries, soap and candle-factories, machine-works, carriage-factories, hardware works, and numerous saw and grist-mills.

The exports in 1852 amounted to 576,399 dollars, the imports to 300,488 dollars. The exports consist of live cattle, tar, pitch, and turpentine, lumber, Indian corn, cotton, tobacco, pork, lard, tallow, bees'-wax, myrtle-wax, ginseng, and medicinal roots and plants. A considerable portion of these are sent to South Carolina and Virginia to be exported thence. The number of vessels entered at North Carolina in 1850 was 188 of 28,300 tons burden, of which 140 vessels of 19,185 tons were American, the remainder being foreign. The clearances in the same year were 274 vessels of 42,232 tons, of which 212 vessels of 30,739 tons were American. The total shipping owned in the state in 1850 amounted to 45,218 tons, of which about 30,000 tons were employed in the coasting trade.

Divisions, Towns, &c.—North Carolina is divided into 79 counties. None of the towns are very populous. The following are the principal: the population is that of 1850:—

Raleigh, the capital of the state, population 4518, is situated in 35° 47' N. lat., 78° 48' W. long., about 6 miles from the Neuse River. It stands on an elevated site, and is a regularly-built town, having in the centre a square of ten acres, from which extend four main streets, 99 feet wide, dividing it into four quarters, and in the centre of each of these quarters are squares of four acres each, from which proceed streets 66 feet wide. The state-house is said to be the finest building of its kind in the Union with the exception of the state-house of Ohio in Columbia. It is intended to be a copy of the Parthenon at Athens, but has the un-Grecian addition of a dome. The other principal buildings are the court-house, governor's house, secretary of state's house, a jail, market-house, a state deaf and dumb asylum, not yet finished, the grounds of which are four acres in extent, and several churches. There are several schools. Raleigh is a place of considerable business, and the centre of the railway system of the state. Ten newspapers are published in the town.

Newbern, the former capital of the state, population 4722, is situated on the right bank of the Neuse River, 100 miles E.S.E. from Raleigh. The town is well built, and has a good deal of commercial activity. The Neuse is one mile and a half wide, and the Trent, which here falls into it, is three-quarters of a mile wide, and of sufficient depth to admit steam-vessels. The principal exports are lumber, naval stores, and agricultural produce. There is also a good inland trade. The town contains a court-house, jail, and four churches.

Wilmington, the chief port of North Carolina, population 7264, is situated on the left bank of the Cape Fear River, about 35 miles from the Atlantic, in 34° 11' N. lat., 78° 10' W. long. The site is low, marshy, and unhealthy, but well adapted for trade. The harbour has a shoal at its entrance, but admits vessels of 300 tons burden. The total tonnage of the district in 1850 was 15,198 tons. The foreign commerce during the same year was—entries, 118 vessels of 20,670 tons; clearances, 175 vessels of 31,098 tons. The public buildings are the court-house, jail, and several churches. It has five newspapers. The Wilmington and Weldon, and Wilmington and Manchester railways greatly facilitate the trade of the town.

Fayetteville, situated one mile from the right bank of the Cape Fear River, and 49 miles S. by W. from Raleigh, is one of the busiest towns in the state: population 4648. The town is regularly laid out with streets 100 feet wide, and contains a court-house, a United States arsenal of construction, and several churches. It has considerable trade in grain, flour, tobacco, and naval stores, contains cotton-mills and flour, grist, and saw-mills, and publishes three newspapers.

The only other places requiring notice are—**Beaufort**, a sea-port town and capital of Carteret county, 126 miles E.S.E. from Raleigh: population about 1300. The harbour, which is safe and spacious, admits vessels drawing 14 feet of water. The entrance to it is by Old Topsail Inlet, west of Cape Lookout. The town has a good coasting trade. **Charlotte**, the capital of Mecklenburg county, population about 1300, is situated between the Sugar and Little Sugar creeks. It is the centre of a gold mining district, and contains a branch of the United States Mint. Besides the county buildings it contains four churches, and supports two newspapers. The South Carolina railway has its terminus here. **Edenton**, population 1607, is situated at the head of Eden Bay, where the Chowan opens into Albemarle Sound. It is the capital of Chowan county, and contains the usual county buildings. A good deal of shipping belongs to the place. **Elizabeth City**, the capital of Pasquotank county, stands on the right bank of the Pasquotank River, 20 miles above its confluence with Albemarle Sound: population about 800. Vessels drawing 7 feet of water ascend to the city, and it has communication with the Hampton Roads by means of the Dismal Swamp Canal. It contains the usual county buildings, and several mercantile establishments. The exports are pine lumber, shingles, and staves, chiefly for the West Indies. Three newspapers are published here. **Elizabeth Town**, the capital of Bladen county, population about 600, is situated on the right bank of

Cape Fear River, 40 miles above Wilmington. It contains a court-house, jail, &c., and has a considerable river trade. **Greensborough**, the capital of Guilford county, population about 600, situated 75 miles W.N.W. from Raleigh, contains a court-house, jail, and several neat dwellings, and supports two newspapers; here is the junction of the North and the South Carolina railways. **Greenville** is the capital and situated near the centre of Pitt county, on the right bank of the Tar River, 35 miles above its confluence with Pamlico River: population, 1893. It contains the usual county buildings and several good stores, and is a place of some trade. **Halifax**, the capital of Halifax county, is situated on the right bank of the Roanoke, about 7 miles below the great falls, and at the head of the sloop navigation. A canal is carried round the falls and continues the boat navigation of the Roanoke 130 miles higher. The Wilmington and Weldon railway adds to the commercial facilities of the town. Halifax is a place of considerable trade in cotton, corn, and lumber. The town is regularly laid out, and contains the usual county buildings. **Lincolnton** is the capital and stands near the centre of Lincoln county, on the left bank of the Little Catawba River, 178 miles W. by S. from Raleigh: population about 1000. The town contains the usual county buildings, several large stores, and in its vicinity are some extensive cotton and paper-mills, and iron-works. **Oxford**, population 1978, is the capital and stands near the centre of Granville county, 39 miles N. from Raleigh. It contains a court-house, jail, hospital, and market-house. **Plymouth**, population 951, the capital of Washington county, is situated near the Roanoke, a few miles above its entrance into Albemarle Sound, and carries on a large trade in lumber and the building of coasting vessels. **Smithville**, population 1464, on the left bank and at the mouth of Cape Fear River, opposite Smith's Island, has a good harbour, and is a place of some trade. It contains a court-house, jail, market-house, and several churches. **Tarborough**, on the right bank of the Tar, 63 miles E. by N. from Raleigh, population about 700, contains a court-house, jail, &c.: steam-boats ascend the Tar to Tarborough. **Washington**, population about 1300, is situated on the left bank of the Tar River, at its confluence with Pamlico River. Vessels drawing 9 feet of water can load and unload at its wharfs. There is a considerable coasting trade. The public buildings are a court-house, jail, and three churches.

Government, Judiciary, Education, &c.—The legislative body consists of a Senate of 50 members and of a House of Commons of 120 members. Senators are chosen biennially in districts apportioned on the basis of taxation. Members of the House of Commons are chosen also biennially, not less than one for each county. An apportionment of both houses was made in 1851, and a new apportionment is to be made every twenty years. All free white men twenty-one years of age, who have been inhabitants of the state for twelve months preceding the election, vote for members of the House of Commons; but a freehold of fifty acres of land is a necessary qualification to vote for a senator. No descendant of a negro to the fourth generation is to be accounted a white man or admissible to the suffrage. The governor is elected for two years by the persons qualified to elect members of the house. His salary is 2000 dollars a year, with the use of a furnished house. The governor, with the council of state, which is elected in the same way, forms the executive.

The revenue from all sources for the year ending October 31, 1852, was 366,728 dollars; the expenditure was 249,254 dollars, being an excess of income of 117,474 dollars. The state debt is a contingent one arising from endorsements by the state of railway bonds, and amounted on November 1, 1852, to 1,230,000 dollars. The militia of the state is composed of 79,448 men, of whom 4267 are commissioned officers. Every white male citizen between the ages of 18 and 15 years, unless exempt by law, is liable to militia duty.

The judiciary consists of a supreme court, presided over by a chief justice and two associate justices, who have a salary of 2500 dollars each; and seven superior or circuit courts, each presided over by a judge with a salary of 1950 dollars. The judges of the supreme and superior courts are appointed by joint vote of the two houses, and hold their office during good behaviour.

The instruction of the poorer classes is less attended to than in many other states of the Union. A board of literature was established in 1837 to devise a plan of common schools, for which a fund had been provided, but nothing effectual has yet been accomplished. There are in the state about 200 academies and above 800 common schools, which are attended by upwards of 18,000 pupils. The children of the coloured people are excluded by the laws from receiving instruction. The instruction of the upper classes is better attended to. The University of North Carolina is at Chapel Hill, 28 miles west-north-west from Raleigh. It was incorporated in 1793, and first conferred degrees in 1797. In 1853 it had 11 professors and 270 students; and a library of 13,700 volumes. A school of science and art was attached to it in 1853. Davidson College, in Mecklenburg county, founded in 1838, had 81 students in 1853. There is also a Baptist Theological College. In 1850 there were in the state 1678 churches belonging to all sects, containing sittings for 558,204 persons. The number of newspapers published in the state in 1850 was 52.

History.—North Carolina is the site of the first English settlement made in North America; a small colony which was sent out by Sir Walter Raleigh to occupy the country granted to him by letters

patent, having taken possession of a site on the Roanoke, in June 1585. The colonists however suffered so much from the hostility of the Indians and from scarcity of provisions, that after a time they became discouraged and re-embarked for England July 27th 1586. A ship which had been sent to them with a supply of provisions arrived a few days after their departure, and Sir Richard Grenville with three other ships sent out by Raleigh arrived a fortnight later. Grenville left 15 men with provisions for two years to maintain the settlement. Raleigh, as soon as news of the abandonment of the colony by the original settlers arrived, sent out another colony, which landed on the Roanoke in July 1587, but found no other traces of the men whom Grenville had left there than a few human bones scattered on the beach. The governor returned to England for directions as well as for further supplies, leaving about 100 persons at the settlement. He was unable to revisit the Roanoke till 1590, when he found the site of the settlement inclosed by a strong palisade, but no inhabitants remained. Their fate was never ascertained; but there is little doubt that they like the earlier settlers fell victims to the Indians. The first permanent settlement was made in 1650 by some whites from Virginia. After other settlements the colony received a representative government in 1667, two years after which the constitution called 'Locke's Scheme of Government' was tried but soon abandoned. [CAROLINA, SOUTH.] The present constitution was adopted in 1776, and amended in 1835.

(Colton, *Statistical Gazetteer of the United States*; Darby, *View of the United States*; *American Almanac*; *State Reports*; Lyell, *Elements of Geology*, and *Travels in North America*.)

CAROLINA, SOUTH, one of the United States of North America, is bounded E. by the Atlantic Ocean for 240 miles; N.E. and N. by the state of North Carolina for 300 miles; and S.W. by the Savannah River, which divides it from the state of Georgia, for 20 miles. It lies between 32° 4' and 35° 12' N. lat., 78° 25' and 85° 19' W. long. Its length from north to south on the meridian of the Savannah River is 268 miles; its width from the head of Tugaloo River on the west to the mouth of Little River on the east is 268 miles. The area is 24,500 square miles. The total population in 1850 was 668,507, of whom 274,567 were whites, and 393,940 coloured persons. The following table shows the increase of the free and slave population since 1820. The total population in

1820	was	502,741,	including	6,726	free col. persons	and	258,475	slaves.
1830	"	581,185,	"	7,921	"	"	315,401	"
1840	"	594,398,	"	8,271	"	"	317,038	"
1850	"	668,507,	"	8,956	"	"	384,984	"

The federal representative population in 1850 was 514,513, in which number three-fifths of the slaves are included. This entitles the state to return six representatives to Congress. To the Senate, like each of the other United States, South Carolina sends two members.

Coast-Line, Surface.—The general direction of the coast of South Carolina is north-east and south-west. The northern portion of it, from the mouth of Little River, the boundary of North Carolina, to Winyaw Point forms an unbroken line of low sandy shore. South of that cape the shores, though low, are divided by a great number of inlets, which are the mouths of larger and smaller rivers, that generally divide into several branches before entering the Atlantic Ocean, and by their numerous channels cut the shores into islands, the surface of which is very little elevated above high tides. The principal of these islands are James's, John's, Edisto, St. Helena, Port Royal, and Hilton islands. These islands are covered with forests of live oak, pine, and palmettoes, and yield the black-soul or sea-island cotton. Formerly these islands were the haunts of alligators which swarmed in the inlets, and were covered with dense woods and rank herbage, nearly impenetrable to man. Now they are under cultivation and well peopled. Long sand beaches border the islands, and are the resort of thousands of sea-fowl. The line of coast, though generally uniform as to course from point to point, is very irregularly indented. The inlets dividing the islands as well as the rivers are comparatively very shallow, but the rivers in every instance are deeper within than at their bars. In two points only can the coast be approached by large vessels. One place is Charleston Harbour, which is formed by the junction of two small rivers, the Cooper and Ashley, the channel of which admits vessels of 16 feet draught. The other is Georgetown at the head of Winyaw Bay, which admits vessels of 11 feet draught. Port Royal entrance, formed by the Broad River, the common estuary of some little creeks into which the tide ascends to a considerable distance, also admits vessels drawing 10 or 11 feet of water; and on one of the numerous inlets which wind through the labyrinth of creeks and islands with which this portion of the coast is chequered, is situated the port of Beaufort, which is spacious, but does not admit vessels so large as those which enter Charleston Harbour; the place moreover is very unhealthy and few vessels enter the port. St. Helena Sound is nearly 8 miles wide, and runs 10 or 12 miles inland, but it is far too shallow and too much beset with shoals to admit vessels of even moderate tonnage. Stone Inlet has 9 or 10 feet of water, but is seldom used.

South Carolina, like North Carolina, exhibits three different regions. The most western districts are covered with ridges of mountains and hills which belong to the Alleghany system. East of this mountain region extends the hilly country, which is followed by a low

plain that spreads over the eastern districts of the state to the ocean. But the proportion of the surface belonging to each of these regions differs considerably from that of North Carolina. The low plain comprehends little more than one-fourth of the whole, and the remainder is almost equally divided between the other two regions. The line which separates the plain from the hilly region passes from Sneadsborough in North Carolina to Camden on the Wateree, and thence to Columbia on the Congaree, or to the junction of the Saluda and Broad rivers, and terminates on the Savannah at Augusta.

The plain along the sea-shore, which extends from 80 to 100 miles inland, is a uniform level. At its western border it has an imperceptible ascent to about 200 feet above the sea. The soil, which on the arrival of the Europeans was covered with trees, but is now nearly devoid of them, is in general barren, consisting either of sand or a light blackish earth; but it is intersected, especially along the rivers, by fertile tracts which yield rich crops, especially of rice. A portion is covered with numerous swamps and morasses, which though not so extensive as in North Carolina, cover an area of 2000 square miles; they are overgrown with heavy timber, such as oak, ash, and cypress. On one side of all the rivers, and generally on both, the margin is a swamp from half a mile to three miles in breadth.

To the west of this plain stretches a chain of sandy hills from 20 to 40 miles in breadth, beginning at the upper course of the river Pedee in North Carolina, and extending across the state to the banks of the Savannah. This tract, known as the 'Middle Country,' produces nothing but small pine-trees and some shrubs, except in the narrow valleys, to which the vegetable mould has been carried by the rains, and which are very fertile. Some of the sand hills are 200 feet above the adjacent valleys. In this region the rivers form rapids. The country further west, known as the 'Ridge,' rises somewhat precipitously from the Middle Country; it is agreeably broken into hill and dale, and loose stones and rocks frequently occur on its surface. But the valleys and the lower declivities of the hills have a fertile black soil which produces good crops of grain. The more elevated parts of the hills are covered with oak and other hard trees. The hilly country gradually rises into mountains, which at the western extremity of the state attain a considerable height, the Table Rock in Pendleton being 4000 feet above the sea. The country between the ridges and mountains may at a mean rise to 1500 feet above the sea. The soil is thought not to be inferior to that of the hilly tract, even the greatest part of the heights being covered with tall trees of hard wood. When it is cultivated it yields good crops of corn.

Hydrography, Communications.—South Carolina is very well watered, its rivers being numerous, and some of considerable length. But though their volume of water is considerable, and of great value for mechanical power, only two of them are fit for navigation in their lower courses, and even these only for small river boats, on account of their shallowness. But as the tide ascends to the sand-hills their navigation is easy. Higher up numerous rapids render the transport of goods tedious, difficult, and expensive. The principal rivers are the Pedee, the Santee, and the Savannah.

The *Pedee*, usually called the *Great Pedee*, rises in the Blue Ridge in North Carolina, 36° N. lat. and between 81° and 82° W. long., and is first called the *Yadkin*. It flows first north-east by east and then turns abruptly to south-south-east, in which direction it traverses the gold region of North Carolina. In South Carolina it continues in the same direction till its junction with the Little Pedee, whence it flows south-south-west to the port of Georgetown, at which place it is called Winyaw Bay, and forms a wide estuary. It is navigable for 200 miles by river-boats of 60 tons burden. The *Little Pedee* rises in North Carolina; from its entrance into South Carolina it flows south-east to its confluence with the Lumber River, which issues from the marsh district of North Carolina, when it turns to the south-west, but some distance lower again turns south-east to its junction with the Great Pedee 32 miles above Winyaw Bay. The Great Pedee is joined by several other tributaries in its course through this state, of which perhaps the most important is *Lynch's Creek*, which after a generally south-south-eastern course of 125 miles from its rise in North Carolina falls into the Great Pedee on the right bank, about 30 miles higher than the Little Pedee. Lynch's Creek is navigable by boats for about 60 miles. The *Santee* is formed by two great branches, the Wateree and the Congaree. The *Wateree* rises in North Carolina, a little west-south-west of the source of the Yadkin, and is there called *Catawba*. It runs first east, and then south-south-east, in which direction it continues through South Carolina to its junction with the Congaree, having flowed more than 150 miles. It is navigable for boats of 70 tons burden to Camden, above which town are the Catawba Falls, where the river in a mile and a half descends 90 feet; but as the falls may now be avoided by a canal cut along the river, called the Wateree Canal, it may be ascended much higher, at least by river-boats. The *Congaree*, the other great branch of the Santee, is formed by the confluence of two rivers, the Broad River which rises in North Carolina, and the Saluda which takes its origin near the Table Rock, in the most western portion of South Carolina. By their junction near Columbia the Congaree is formed, and to this point vessels of 70 tons burden may ascend. The Congaree, running in a curve to the south-east, unites with the Wateree, from which point the river is called Santee. It flows first south-east, and then turns by degrees to the east and is navigable for large barges

and steam-boats, but its mouth is shallow. Its course considerably exceeds 250 miles. All these rivers have numerous affluents. The *Savannah*, the noblest of the rivers, belongs equally to this state and Georgia. It has its farthest branches in the north-western district of South Carolina and the north-eastern parts of Georgia, and forms, during all its course, a distance of 250 miles south-south-east, the boundary between both states. It has 17 feet of water on its bar, and is navigable for large vessels to the town of Savannah, 17 miles above its mouth, and for river-vessels and steam-boats to Augusta, above which town some rapids occur. The tide ascends about 45 miles: the average fall from Augusta to its mouth, a distance, including the windings, of about 250 miles, is about one foot a mile. The *Edisto* is formed by two confluent streams, the South and the North Edisto, which rise in the western part of the state, and after being swelled by numerous small affluents unite near Branchville; the Edisto then flows east-south-east to its junction with the stream which flows through Four Holes Swamp, when it turns to the south, in which direction it continues during the remainder of its course. Some distance above its outfall a branch divides from the main stream and forms Edisto Island, which is 12 miles long, and from one to five miles wide. The Edisto is navigable by large boats for 100 miles. There are several smaller rivers in the southern part of the state which, though their mouths are obstructed by bars, are navigable by river-boats for a few miles. Among them are the *Ashley*, which issues from Cypress Swamp and is navigable by schooners for 20 miles above Charleston; near which city it joins *Cooper's River*, which is navigable for 30 miles, and is connected with the Santee by a canal: the *Coosawatchie* and the *Combahee* are also navigable for a short distance. Besides these rivers there are several short canals, such as the Santee Canal, extending from Charleston Harbour to the Santee River; the Winyaw Canal (7 miles), which connects Winyaw Bay and Kinlock Creek; the Saluda Canal, from Saluda Shoals to Granby Ferry (6½ miles); five canals cut for the improvement of the navigation of the Catawba River; and a few more of a similar kind. According to a statement of Governor Seabrook, South Carolina has now, apart from the creeks and inlets of the sea, an inland navigation of 2100 miles.

South Carolina was the first of the southern states to adopt the railway system. The lines of railways completed in this state in 1853 amounted to 649 miles. The South Carolina line commences at Charleston and terminates at Hamburg (137 miles), where it unites with the Georgia railway. It is connected with the railways of North Carolina by the South Carolina and Charlotte railway, 109 miles long. The Greenville and Columbia line, which connects the towns of those names, is 114 miles long. The Wilmington and Manchester line connecting Manchester in South Carolina with Wilmington in North Carolina is 115 miles long. Besides these there are the Columbia and Branchville, 67 miles; the Camden Branch, 37 miles; King's Mountain, 32 miles; Laurens, 15 miles; Anderson Branch, 13 miles; and Abbeville Branch, 12 miles. Several extensions of these lines, as well as entirely new lines, are in progress or projected.

Geology, Mineralogy, &c. In its general geological character this state resembles North Carolina. There are first the low alluvial tertiary plains bordering the Atlantic, which rise into the cretaceous rocks of the middle country; and then west of these the belt of slate rocks running still further west into the primary formations of the mountain district. The low country is wholly tertiary, consisting mainly of sands and marly clays, with veins of burr-stone and white limestone. The burr-stone and limestone are stated by Lyell to belong to the Eocene period. In the alluvial strata have been found numerous remains of mastodons and other extinct gigantic quadrupeds, and vast numbers of shells occur in the Eocene strata. The clays afford good fire-clay and excellent materials for the manufacture of pottery and bricks. The rocks between the clay slate and new red-sandstone, among which are the valuable carboniferous strata of North Carolina, are entirely wanting in this state. The gneiss rocks afford excellent building stones, but the slates do not generally split well. Several quarries of promising mica-slate have however been opened. Beds of fine soapstone, whetstone, &c., occur. Within the series of metamorphic rocks occurs the continuation of the auriferous veins of North Carolina. The granitic rocks afford excellent building materials: among the finer sorts may be mentioned the red granite of the neighbourhood of Columbia, and the porphyritic granites of Camden and Buffalo Creek. The sienites of Abbeville, Fairfield, and Lexington are said by Professor Tuomey to be very beautiful. According to the same authority, the white and variegated marbles of Spartansburg and Laurens form excellent materials for building and ornamental purposes; and porcelain-earth abounds throughout the primary region wherever the feldspathic granite is found in a state of disintegration. The undecomposed feldspar of the granites also affords a good glaze for pottery.

Among the minerals of South Carolina gold occupies a prominent place. The veins have been for some time worked to advantage, though the yield is considerably less than in North Carolina. The largest quantities have been obtained by washing the river deposits, but lumps or nuggets of a good size have been obtained by digging. Iron-ore of very fine quality is said to abound. Copper and lead have been met with in small quantities. Coal is not found in the state. Red and yellow ochres of superior quality abound in Chesterfield dis-

trict. Many of the precious stones are found in various parts of the state.

Climate, Soil, Agriculture.—The climate of the low plain is very hot in summer, but comparatively mild in winter. Snow seldom falls near the sea, and is soon dissolved. The thermometer ranges between 17° and 93°. In the months of July and August the country is deluged with torrents of rain accompanied by hurricanes, thunder, and lightning, and the air is loaded with noxious vapours which generate bilious fevers and other diseases. The driest months are April and May, which are also the healthiest, but November is considered the most agreeable. The cold weather seldom begins before December, and terminates in March. The temperature is liable to sudden and great changes. "It is not unworthy of especial remark," observes Governor Seabrook, "that the atmosphere of the swamps and marshes, so poisonous to the white man, are at all times innocuous to his slave. If it were not for this merciful provision of an All-Wise Being, the alluvial region of South Carolina in the immediate vicinity of its water-courses would soon become a dreary waste, and tenanted only by the beasts of the forest." In the upper country snow and frost occur annually, and the snow is sometimes from 12 to 18 inches deep, and remains on the ground for weeks and even months. The thermometer ranges in summer between 65° and 85°, and sometimes rises to 94° and 95°. In winter it ranges between 20° and 25°, and falls to 10° or 11° during the greatest cold, which lasts but a few days. But this country is healthy at all seasons. Hurricanes sometimes cause great damage in the lower country, and earthquakes are felt from time to time, though not frequently.

Respecting the soil, &c., of this state, we cannot perhaps do better than quote the official statement of Governor Seabrook:—"The soils though of every kind may be said to comprehend six varieties, each the best suited to a certain crop, yet all of them capable of advantageously producing three-fourths of the vegetable products grown in its limits. While local differences are everywhere observable, the surface and soil of the upper districts present a great similarity; and this is equally true of the lower districts. In the former the lands are broken and hilly, in the latter level; oak is the natural growth of the one, pine of the other. Clay is the soil of much the largest portion of the state, and, except in the immediate vicinity of the ocean, is almost the universal substratum. A close stiff land predominates generally in the parishes south-east, and an open sand on the sea-islands. The highlands of the country above the falls of the rivers are naturally much superior to those of the pine-covered region, but the alluvial bottoms of the former are greatly surpassed in richness by the river swamps of the latter. In its capacity for permanent improvement, the granite half of the state has been more highly favoured by nature than the alluvial. This is mainly ascribable to the open texture permeable to water of its clayey subsoil, and the potash in the soil and subsoil, formed by the decomposition of the feldspar and mica of the granite. In a few localities however the depth of the substratum and its proximity to the surface offer serious obstacles to its higher productions. These among other causes seem yet to be operating against the cultivation of perhaps the greater part of those peculiar soils known as the 'Flat Woods' of Abbeville; those in the neighbourhood of Dutchman's and Wateree creeks, in Fairfield, and the Black-Jack lands of Chester. Deriving their fertility from the hornblend disintegrated rocks, which lie below the close clay subsoil, it would appear that steady industry, incited and directed by ordinary skill, was alone wanting to preserve and perpetuate the uncommon productiveness which, in spite of long-continued and unimprovident tillage, still distinguishes these remarkable tracts of land. . . . The swamps, covering 2000 square miles of land of inexhaustible fertility, are capable of thorough and economical drainage and conversion into active and available capital. The pine-lands, embracing 6,000,000 of acres, constitute the most neglected portion of the state; . . . yet this is in all its relations a district of country of immeasurable value.

"The natural means of resuscitating the soil are abundant and widely diffused. A large portion of the lower country shows exhaustless beds of the richest marl. Limestone, though obtainable only in York, Spartansburg, Laurens, and Pickens, exists in such quantities in the first two districts, that by railroad communication the entire primitive region will at no distant day be furnished with this earth, so essential to the nutrition and development of plants. While the sea-shore parishes possess unfailing supplies of salt mud, salt grass, and shell marl, two-thirds of the state are most amply furnished with swamp, mud, and peat.

"The botany of the state consists of about 3000 species of plants; of these 2000 are flowering, and 1000 unprovided with flowers, as parts of their organs of fructification. In relation to the former, about 65 are naturalised—that is, foreign plants introduced and now growing wild. There are about 150 grasses, of which 15 are native: 30 species of esculents (for man), of which three or four are naturalised, and about 70 more used in medicine, agriculture, and the arts, of which five or six are naturalised."

The principal objects of agriculture in the low plains are rice and cotton, the latter being also cultivated in some districts farther inland. The finest cotton known to commerce is that grown on the sea-islands. About three-fourths of the rice raised in the United

States are grown in South Carolina. The sugar-cane is only grown with advantage in the Beaufort district, which forms the most southern part of the state. The fruits of the sea-coast are those of the southern countries of Europe—oranges, lemons, pomegranates, olives, and figs. In the upper country all the grains and vegetables of England are grown, with maize in addition. The fruits are also those common in this country. Tobacco, indigo, and hemp were once staple products, and tobacco is still grown very largely. Hops, sesamum, &c., are also cultivated. Among the wild plants the ginseng, gentian-root, and wax-myrtle may be noticed. The forests contain many fine timber-trees, especially oak, beech, and hickory.

On June 30th 1850 there were in the state 29,669 farms under cultivation. The improved farm-lands amounted to 4,072,651 acres, unimproved lands 12,145,049 acres, valued together at 82,431,684 dollars. The principal grain crops in 1850 were, in bushels:—Wheat 1,066,277, rye 43,790, maize 16,561,454, and oats 2,322,155. The rice raised in the same year amounted to 159,930,613 lbs.; peas and beans, 1,026,900 bushels; potatoes, 136,494 bushels, and sweet potatoes, 4,837,469 bushels; sugar, 671,200 lbs.; cotton, 132,396,400 lbs., being an increase of 70,686,126 lbs. over the cotton raised in 1840; tobacco, 74,285 lbs.; hay, 20,295 tons; wine, 5880 gallons.

The domestic animals are those of Europe; black cattle are the most abundant. Many of the wild animals with which the country formerly abounded have disappeared; but still there are found in the mountainous districts, and even in some parts of the lower country, deer, bears, wolves, wild cats, foxes, squirrels, rabbits, racoons, opossums, and polecats. The wild turkey is pretty common in the upper country, and the wild pigeons come at certain seasons in great numbers. Several kinds of serpents are known, among which is the rattlesnake; but they become continually less numerous. Alligators abound near the head of tide-water in the rivers, and grow to a great size.

In 1850 there were in the state 97,171 horses; 37,483 mules and asses; 193,244 milch cows, and 584,439 other cattle; 285,551 sheep, and 1,065,503 swine. The products of animals amounted to:—Wool, 487,233 lbs.; butter, 2,981,850 lbs.; cheese, 4970 lbs. The value of animals slaughtered during the year was 1,302,637 dollars.

Manufactures and Commerce.—The manufactures are chiefly such as are required in an agricultural country. The number of manufacturing establishments in operation on the 30th of June 1850, and producing to the annual value of 500 dollars and upwards was 1473, of which 197 were in Edgefield district, 156 in Abbeville, and 141 in Laurens. Of these establishments 18 were cotton factories, employing 919 persons; 91 tanneries employing 264 persons; and 6 iron works employing 155 persons; the iron manufacture is confined to that of castings.

The commerce of South Carolina is very considerable, and chiefly centres in CHARLESTON. The exports consist of cotton, rice, tobacco, myrtle-wax, and hides; and the imports of manufactured goods, and the productions of the East and West Indies, with wines from the countries of Southern Europe. Both the exports and imports are chiefly made through the port of New York, so that the South Carolina trade is chiefly coasting. The railways which centre in Charleston, and the extensive inland navigation greatly facilitate the commerce of the state. The value of the exports in 1852 was 11,670,021 dollars, the whole of which consisted of the produce of the state. The imports amounted to 2,176,614 dollars—1,742,492 dollars in American and 433,122 dollars in foreign ships. The exports in 1851 were 15,316,578 dollars, the imports 2,081,312 dollars. The number of ships which entered in 1850 was 305 of 96,916 tons burden; cleared 375 of 125,052 tons. The total amount of shipping owned in the state was 36,072 tons, of which 7455 tons were propelled by steam.

Divisions, Towns, &c.—South Carolina is divided into 29 districts. The principal town in the state is CHARLESTON, which will be noticed in a separate article; the capital is Columbia, which with some of the other more important towns we notice here; the population is that of 1850.

Columbia, the capital, is situated on the left bank of the Congaree, immediately below the confluence of the Saluda and Broad rivers, in 33° 57' N. lat., 81° 7' W. long.: population, 6060. The town, which stands on an elevated plain, was laid out in 1787 on a rectangular plan, the streets being 100 feet wide. The principal buildings are the State-house, which is 170 feet long and 60 feet wide, the district buildings, the churches, market-house, banks, academics, a state lunatic asylum, and a jail. The buildings of Columbia College are extensive, but of no great architectural merit: one of them is an observatory well supplied with instruments. There are two theological institutions in the town. The dwelling-houses are mostly of wood, but many are of brick. The town is well supplied with pure water; and is considered to be very healthy. A good deal of trade is carried on: the river is navigable up to the town for boats of light draught; the Columbia Branch, the Charlotte and South Carolina, and the Greenville and Columbia railways meet in the town; and the surrounding country is a highly cultivated corn and cotton district. Five newspapers are published here.

Camden, on the left bank of the Wateree River, 31 miles N.E. from Columbia, population about 1200, is the capital of Kershaw district,

and contains the usual district buildings, several churches, a masonic hall, a library, and an arsenal. The river is navigable for boats of 70 tons, and the commerce of the place is further facilitated by the Camden Branch of the South Carolina railway. Some manufactures are carried on. Camden is noted as the scene of two engagements in the war of independence; and the most conspicuous ornament of the town is a white marble memorial of Baron de Kalb of revolutionary celebrity, the foundation of which was laid by Lafayette in 1825. *Edgefield* is the capital and stands near the centre of Edgefield district, 64 miles W.S.W. from Columbia: population, 2200. It contains a court-house, and the other usual district buildings, and three or four churches; and has a good local trade. *George Town*, the capital of the district of the same name, stands at the upper end and on the west side of Winyaw Bay: population, 2904. It is the next and indeed only other port of any consequence in the state after Charleston, but has comparatively little foreign commerce, though a good coasting-trade. The entrances in 1850 were 2 foreign vessels of 297 tons, the clearances to foreign countries 24 vessels of 3685 tons. The vessels of the district, mainly engaged in the coasting-trade, amounted to 2770 tons. Steamers ply regularly between George Town and Charleston. The harbour admits vessels drawing 11 feet of water. The principal buildings are the court-house, jail, and six churches. *Greenville*, population 1305, the capital of Greenville district, stands near the source of the Reedy River, one of the upper affluents of the Saluda, 106 miles N.W. from Columbia; it contains the court-house, jail, market-house, four churches, and two academics. *Hamburg*, 73 miles W.S.W. from Columbia, stands on the left bank of the Savannah, opposite to Augusta (Georgia), with which it is connected by a bridge 1000 feet long, and a railway viaduct: population about 2600. Hamburg consists of a lower town which lies by the river and contains the business houses, and an upper town which stands back from and 60 or 70 feet above the lower town. Hamburg is an important cotton mart, and has a large interior trade. Steam-boats ply regularly to the town, and the South Carolina and the Georgia railways connect here. *Newberry*, the capital of the Newberry district, is on the line of the Greenville and Columbia railway, 47 miles W.N.W. from Columbia: population, 1250. It contains the court-house, jail, six churches, and two academics; and is a wealthy and flourishing place. *Windsborough*, the capital of Fairfield district, on the Charlotte and South Carolina railway, 21 miles N. by W. from Columbia: population, 1050. The town stands on an elevated and healthy site; and contains the district buildings, which are of a superior character, five churches, and four academics. A Baptist theological seminary, consisting of four handsome granite buildings, is in the vicinity.

Government, Judiciary, &c.—The legislative body is composed of a Senate and a House of Representatives. The senators, 45 in number, are elected by districts and by ballot for the term of four years; but half the number vacate their seats every two years. The representatives, 124 in number, are chosen for two years. Every free white male citizen 21 years of age paying taxes, or having a certain freehold qualification, and having resided in the state for two years, has a vote in the election. The executive power is vested in a governor elected by the joint vote of the legislature for two years, being the only governor of a state who is not elected by the people: his salary is 500 dollars a year, and house-rent.

The revenue of the state for the year ending September 30, 1852, was 739,696 dollars; the expenditure was 359,913 dollars. The absolute debt of the state was 1,914,438 dollars, and the contingent debt 1,051,422 dollars. The total property of the state was 5,240,467 dollars.

The militia consisted in 1850 of 55,209 men, of whom 2591 were commissioned officers.

The judiciary consists of law and equity courts of appeals, courts for correction of errors, and courts of common pleas and general sessions, which take cognizance of all civil and criminal cases in which white men are concerned. These courts are presided over by four chancellors in equity and six judges of general sessions and common pleas, who are appointed by a joint ballot of both houses, and hold their office during good behaviour, and each of whom has a salary of 3000 dollars. For contracts under 20 dollars, magistrates' courts have exclusive jurisdiction. For the trial of slaves and free people of colour for criminal offences, courts of magistrates and freeholders have been established.

In 1850 there were in the state, belonging to all denominations, 1163 churches, which afforded accommodation for 453,930 persons.

Of late years the instruction of the lower classes has been attended to by the legislature. A sum of 40,561 dollars was appropriated in 1850 to the maintenance of a free-school system; and in that year there were 1023 public schools, attended by 9122 scholars. The children of the coloured people, comprising a considerable majority of the children in the state, are entirely destitute of education, the law excluding them from all instruction. The education of the middle and higher classes is much better provided for than in the neighbouring states. The state college at Columbia enjoys considerable reputation: in 1853 it was attended by 120 students. There are also a college in Charleston having 70 students, a state medical college, three theological seminaries, and two learned societies.

History, &c.—The first settlement of whites in South Carolina was about 1670; but the first permanent establishment was made in 1680 on the site of Charleston. Previously to this, in 1662, Charles II. had granted to Lord Clarendon and seven others all that part of North America which lies between 31° and 36° N. lat.; shortly after the northern boundaries were extended to 36° 30'. The proprietary government of Carolina lasted till 1719, when the two Carolinas were separated and a royal government was established. During the continuance of the proprietary government Locke's scheme or constitution was tried, but not found to answer. The present constitution was adopted in 1790, since which date it has been twice amended. South Carolina was the scene of several serious engagements during the war of independence. Its more recent history has been almost wholly connected with the strife of parties, and consequently only of local interest.

(Colton, *Statistical Gazetteer of the United States*, 1853; Darby; Hassell and Smith; *American Almanac*, 1854; *State Reports*; Lyell, *Travels in America*, and *Manual of Elementary Geology*; Featherstonhaugh, *Slave States*, &c.)

CARPATHIAN MOUNTAINS; Karpaten; Krapacks. This great mountain range of Central Europe extends from the Danube at Presburg to the same river near Orsova in the form of a vast curve, with its concave side towards the south-west, and inclosing all of Hungary that lies on the left bank of the Danube and north of Transylvania. Its whole length perhaps exceeds 800 miles, for nearly one half of which it forms the watershed between the North Sea and Black Sea. On the north and north-west the mountains slope down to the great level of Northern Europe: on the south to the plain of Hungary. The range lies between 44° 28' and 49° 38' N. lat., 17° 0' and 26° 20' E. long. Its crest separates Hungary from the archduchy of Austria, from Moravia and Galicia; and Transylvania from Moldavia and Wallachia. In ancient times that portion of the range that lies north of Hungary was called Carpiates Mons, and sometimes the Bastarnic Alps. It separated Dacia from Sarmatia.

The rock on which the castle of Presburg in Hungary stands is the most western point of the whole system. From this point the mountains extend north-north-east towards the sources of the Morava and Waag, and between the two wide valleys in which these rivers flow. This range, which is about 100 miles in length by 16 or 18 miles in width, is of moderate height, not exceeding 2000 feet above the sea, and is called the Little Carpathians, or White Mountains. The declivities are rather steep and covered with forests. It is traversed by numerous passes—one leads from Tyrnau on the Waag to Bruun; a second from Trentschin to Olmütz; and a third, the Jablunka Pass, at its northern extremity from Czolna to Teschen in Austrian Silesia.

At the Jablunka pass the Carpathian range turns east, and continues in that direction from 18° 40' to 23° E. long. Within these limits it bears different names. The most western portion is called Magura; the middle, Baba Gura; and the eastern, Beszkid, though it seems that the last name is frequently applied to all this range. Its length may be somewhat more than 200 miles, and its width about 20 miles or somewhat more. Its height increases towards the centre; the Lissa Hora, the highest summit of the Magura range, attains only 4500 feet; but the highest summit of the Baba Gura rises to 5760 feet. Between the north-western extremity of this range and the most eastern point of the Sudetic Mountains, which extend between Silesia and Bohemia, lies a plain of no great extent, traversed by the upper course of the river Oder; it has an elevation of about 1000 feet above the sea. A road traverses this range from the vale of the Arwa by the pass of Jordanow into Galicia, and leads to Cracow.

To the south of the Baba Gura Mountains, and divided from them only by a deep and not very wide valley, lies the highest part of the Carpathian Mountains, called Mount Tatra. It is, properly speaking, not a range, but one enormous rock, extending from west to east about 50 miles, and nearly 30 miles from north to south in the middle, but decreasing in breadth towards the west and east. This rocky mass is furrowed by numerous deep ravines on all sides. On the highest part of its surface, whose average elevation is estimated at about 7000 feet, rise several high summits in the form of peaks, of which some pass above the line of perpetual congelation. The highest is the peak of Lomnitz, which attains 8779 feet above the level of the sea. The peak of Eisthal (Ice Dale) is only about 36 feet lower, and on its northern declivity is the only glacier that occurs in the Carpathians. The number of peaks exceeding 8000 feet is about twelve, among which the Krywan is one of the most famous, though it does not exceed 8150 feet, and is lower than most others. This portion of the Carpathians presents generally bare rocks on its surface where it is not covered with snow; it contains several small alpine lakes. This enormous mass of rock is divided from all the surrounding ranges and masses by deep depressions. From the Baba Gura Mountains it is separated by the valleys of the Arwa and Donajec, which at their upper extremities, where they meet, hardly rise much more than 2000 feet above the sea. From the Beszkids, which extend farther east, the Tatra Mountains are divided by the river Poprad, which surrounds the eastern extremity, and running north joins the Donajec. The river Waag rises near the source of the Poprad, and running west separates the Tatra Mountains from the lower ranges, which extend farther south and west, and which from containing

numerous mines of metals are called by the Germans Ungarisches Erzgebürge (the Ore Mountains of Hungary). These Ore Mountains occupy a much larger surface than all the ranges already noticed, inasmuch as they extend over all that part of Hungary which lies to the north of 48° N. lat., between the river Hernad (which rises near the sources of the Poprad and Waag and falls into the Theiss) and the bend of the course of the river Waag. Its most southern extremity, Mount Matra, stretches even south of 48°. Its length exceeds 120 miles, and its width 70 miles; but the whole of this surface is not covered with mountains: it presents only a few ranges running west and east, and separated from one another by wide valleys, which at some places might be called plains. The range nearest to the Tatra Mountains rises to a considerable height, Mount Dumber attaining 6500 feet, and Kralova Hora, at the source of the Waag, about 5700 feet; but the ridges farther south are much lower, and their summits rarely exceed 3000 feet above the plain of Hungary, which is about 350 feet above the level of the sea.

The high country extending east of the river Hernad runs to 22° E. long. due east: it then declines to east-south-east, and where it approaches 49° N. lat. to south-south-east till it reaches the sources of the Pruth, Suczava, and Theiss, a little south of which the Transylvanian portion of the mountains begins. The western portion of this elevated region is called Beszkids, but the whole is commonly comprehended under the name of the Waldgebürge (Forest Mountains) of the Carpathian range. In length it exceeds 200 miles, and its average width may be estimated at from 50 to 70 miles. The mountain masses do not rise to a great height, nor are the declivities steep; on their upper surface they do not exhibit high peaks, but extend in uneven plains, on which a few elevations with a very gentle ascent rise considerably above them. Only two ranges, of no considerable length and height, branch off from the Forest Mountains. One leaves the principal range between the sources of the Saan, an affluent of the Vistula, and those of the Dniester, near 49° N. lat., 23° W. long., passes south of the town of Lemberg, and dividing the Russian governments of Volhynia and Podolia advances towards the Dnieper, on whose banks it continues in a direction south-east to the cataracts between Kidak and Alexandrowaka. Between the sources of the Pruth and those of the Sereth and Suczava, several lateral branches run to the north-east and east across the Bukowina; but they do not extend farther than to the banks of the Dniester and Pruth, with the exception of one range, which divides these two rivers, and terminates in low hills north of Kischenoff, the capital of Bessarabia. In Bukowina they are called Czorno Mountains.

The most remarkable ridge, branching off to the south, is the Telkabanga Mountains, which are united to the main range at the sources of the Hernad and Bodrog rivers, and run between these rivers to their junction with the Theiss, a distance of about 90 miles. The average width does not exceed 10 or 12 miles, and its elevation is not great, especially to the south, where it terminates with the hills, on which the wine of Tokay is grown.

Two great roads pass over the Forest Mountains. The most western runs north in the valley of the Bodrog, and traverses the mountains between Sztrapko and Dukla by the Dukla Pass. The other road, farther east, unites Hungary with eastern Galicia, and the town of Munkacs with Lemberg, traversing the pass of Vereczke.

The Eastern Carpathians, called also the Transylvanian Carpathians, stretch southward from the sources of the Theiss and the Pruth, and surpass the Tatra range both in extent and elevation. They surround with their offshoots the high rugged plateau of Transylvania. Near the borders of the Bukowina and Transylvania the mountains attain an elevation of 6834 feet in Mount Petrosch; thence the main range runs under the names of Borszek, Kelemen Habash, and Lipschen to the Bozza Pass, to the east of Kronstadt in the angle where Wallachia, Moldavia, and Transylvania meet, and reaches in Mounts Budös and Butescz the respective elevations of 9000 and 8160 feet above the sea. From the angle just mentioned the Carpathian Mountains turn west-south-west, separating Wallachia on the south from Transylvania and the Banat. The eastern end of this part of the system is called the Fagarasch Mountains, the highest points of which are Mount Szaral (7122 feet) and Mount Budislav (6888 feet). The average height of these mountains is about 5000 feet; they extend westward to the Rothenthurn Pass, where the Aluta breaks through the chain into Wallachia on its way to join the Danube. West of the pass the range continues in the same direction under the name of the Hatzeg Mountains, which attain their highest elevation in Mount Retyezat (7755 feet). The termination of the range westward along the frontier of the Banat (the eastern part of which like the whole of Transylvania is traversed by its offshoots) does not exceed an average elevation of 3000 feet. At Orsova the Carpathian ridge slopes gradually down to the left bank of the Danube, and is connected by ledges of rock which form the last rapids in that river with a low offshoot from the Balkan on the Serbian bank of the Danube.

Of the great offshoots of the Eastern Carpathians towards the west, two are remarkable for their height and extent. One separates the upper valleys of the Theiss and the Szamos; the other divides the basins of the Szamos and the Körös from the basin of the Maros; both of them contain some lofty summits. [TRANSYLVANIA.] The principal offshoot on the eastern side of the Transylvanian Carpathians

runs between the Pruth and the Sereth, and traverses in a southern direction the Bukowina and Moldavia.

The principal passes in the Eastern Carpathians are—the Borgo Pass, which connects the basin of the Szamos with the Bukowina and the towns Bistritz and Suczawa; the Gyms Pass, leading from the source of the Aluta into Moldavia; the Bozza or Bouza Pass south-east, the Tomos Pass south, and the Torzburg Pass south-west of Kronstadt in southern Transylvania, which connect the town just named with Wallachia and Bukharest; the Rothenthurn Pass, which is traversed by the Aluta and connects Hermannstadt with the Wallachian town of Rimnik; and the Vulkhan, over which the road from Hatoag in the valley of the Syll, a feeder of the Maros, to the town of Krájova in Little Wallachia, is carried.

To a height of between 8000 and 4000 feet the Carpathians are very generally covered with forests; higher up they present bare precipitous rocks which frequently have a pyramidal form.

The Carpathians are composed largely of sandstone diversified by quartzose deposits, clay-slate, and beds of limestone; greensand occurs at rare intervals, and also masses of porphyry and hornblende. Only an inconsiderable portion of the Carpathians is of primitive formation. Tatra Mountain and the ridges south of it are composed of granite, gneiss, and mica-slate. The Forest Mountains consist almost entirely of sandstone and slate, and contain only iron in abundance and a small quantity of copper. The Transylvanian Mountains are composed chiefly of mica and clay-slate with masses of magnesian limestone and syenite interspersed. Trachytic rocks occur in the northern part of the Eastern Carpathians between Munkacz and Neustadt. Mount Budoz, in the south-east of Transylvania and near the point where the Carpathians turn westward along the north of Wallachia, is of volcanic origin; its flanks are covered with sulphurous deposits.

The Carpathian Mountains are richer in metals than any other mountain system of Europe. Gold and silver are got from the mountains which surround the valley of the river Gran, at Bocza, Kremnitz, Königsberg, and Schemnitz. Copper is very abundant, and occurs in numerous places between the Gran and Hernad. Lead is found in great abundance in all the silver mines, and also in other places. Iron occurs over the whole system, but more especially in the Forest Mountains, and is worked with great advantage in many places. Quicksilver, zinc, antimony, arsenic, and cobalt are also extracted, and some of them in considerable quantity. Opals, chalcodones, garnets, and other precious stones are found in the district of Scharosh, to the north of Eperies, in the valley of the Hernad, and also near Tokay, Kremnitz, and Kaschau.

Perhaps in no part of the globe is there such an extensive salt-rock formation as that which lies on the lower declivity of the north and north-east descent of the Carpathian Mountains, beginning at the town of Wieliczka, south-east of Cracow, and extending round the chain east and south-east to the boundary of Wallachia; its length cannot fall short of 600 miles; in width it varies very much. Its depth is conjectured to be upwards of 120 fathoms, at least this is the depth at Wieliczka and Bochnia, the only two places where it is worked by the Austrian government. But in many other places salt is obtained by boiling the water of salt-springs.

CARPENTARIA, GULF OF. [AUSTRALIA.]

CARPENTRAS. [VAUCLUSE.]

CARRARA, a town and territory of Italy, with the title of principality, is annexed to the neighbouring duchy of Massa, both of which belong to the Duke of Modena. The total area of the province of Massa Carrara is 245 square miles, and the population in 1850 was 56,867. The territory of Carrara consists of about 30 square miles, mostly mountainous, but well cultivated, and with a population of 11,500 inhabitants. It is bounded N. by the territory of Fivizzano, which belongs to Tuscany, E. by the duchy of Massa, S. and S.W. by the Mediterranean, and W. and N.W. by the province of Lunigiana, which partly belongs to Sardinia and partly to Modena. It extends in length about eight miles from the sea, to the summit of the Monte Sagro, N.E. from the town of Carrara. The Monte Sagro is 5540 feet high, being one of the principal summits of the Alpe Apuana, a group of the Ligurian Apennines. From the south side of this mountain several lower projections or buttresses extend to the south-west, being separated from each other by narrow valleys, drained by small streams, all of which unite near the town of Carrara, and form the Carrone, which flows past Avenza into the sea, about three miles below Carrara. These lower ridges furnish the well-known white marble of Carrara. There are more than a hundred different quarries of marble of various qualities, some of which is streaked with purple or blue, and is called Bardiglio. Some of these quarries were worked in the time of the Romans. In the time of Augustus the marbles of Luna (for so they were called from the town of Luna, the ruins of which are seen about six miles S.W. from Carrara) were employed in the buildings of Rome (Strabo, p. 22, Casaub.); but the finer sort, for statues, was discovered about the time of Pliny, when it was substituted by the sculptors at Rome for the marbles of Paros and Pentelicon. After the fall of the empire the quarries lay neglected till the 12th century, when, the republic of Pisa having taken possession of this district, the works were resumed and furnished the marble for the school of Niccolo Pisani and his disciples. Since

that time new quarries have been opened in succession. The various streams turn a number of mills for sawing the marble. The principal quarries employ 1200 workmen. The blocks are carried down in carts, drawn by oxen, to the beach of Avenza, where the storerooms are, and whence the marble is shipped on board the vessels that anchor in the roads.

The name of Carrara is supposed to come from 'Carraria,' the mediæval Latin for 'quarries.' The town, which contains above 6000 inhabitants, is situated at a distance of 60 miles S.W. from Modena, and near the mouth of the Avenza. It has a fine collegiate church, begun in the 18th century and finished in the 15th; also the church of La Madonna delle Grazie, rich in marbles, and that of S. Giacomo, annexed to the hospital, which has some good paintings. The principal square is called Alberica, from the name of the first prince of the house of Cibo. A colossal statue of the Duchess Bentrice d'Este adorns the square. In the town are shops for the sale of common objects and ornaments of marble, which are worked by native artists. There is also an academy of drawing and sculpture, founded by a former duchess of Massa and Modena: it has a president and several professors, and a good collection of models. Many foreign artists repair to Carrara for the sake of purchasing the blocks which they require for their works, and which are rough-hewn on the spot. The Court of Appeal is at Massa, where the governor of the province of Massa-Carrara also resides. Avenza, the second town of the principality of Carrara, has 1900 inhabitants: it lies in a plain, about one mile from the sea, the lower hills around being all planted with vine and olive-trees. The high road from Genoa and Sarzana to Lucca and Pisa passes through Avenza. The principal agricultural produce is oil and wine; the corn raised on the territory is not sufficient for one-half of the consumption: the northern mountains are covered with chestnut and beech-trees, and pastures. Pellegrino Rossi, a distinguished French jurist, a peer of France, prime minister of the Pope in 1848, was a native of Carrara. He was assassinated as he was going to open the session of the Chamber of Deputies in Rome, Nov. 15, 1848, at the outbreak of the Roman revolution.

CARRICK. [AYRSHIRE.]

CARRICK-ON-SHANNON, county of Leitrim, Ireland, in the parish of Kiltoghart and barony of Leitrim, with a small suburb in the parish of Killukeu, barony of Boyle and county of Roscommon, a market, post, and assize-town, and the seat of a Poor-Law Union, lies in 53° 57' N. lat., 8° 5' W. long., 98 miles N.W. from Dublin. The population in 1851 was 1366, of which number 134 were in Roscommon county. Carrick-on-Shannon Poor-Law Union comprises 25 electoral divisions, with an area of 100,736 acres, and a population in 1851 of 34,821. The town is situated on the left bank of the Shannon, where that river is crossed by the leading road from Dublin to Sligo. The approach to the bridge is by a narrow lane diverging from the main street, which terminates in an open space on the river bank. Here are arranged the county jail, county court-house, and market-house, adjoining a small floating dock above the bridge. The church and Roman Catholic chapel are on the north side of the town; the barracks on the south. Here is also a small Methodist meeting-house. Carrick-on-Shannon, formerly called Carrickdrumrusk, returned two members to the Irish Parliament, but was disfranchised at the time of the Union. The assizes for the county of Leitrim and quarter-sessions in rotation are held here. Carrick-on-Shannon is the headquarters of the county constabulary force. The town is in the Dublin military district.

(Fraser, *Handbook for Ireland; Ordnance Survey Map.*)

CARRICK-ON-SUIR, county of Tipperary, Ireland, a market and post-town, and the seat of a Poor-Law Union, chiefly in the parish of Carrick-on-Suir and barony of Iffa and Offa East, lies in 52° 21' N. lat., 7° 26' W. long., distant 99 miles S.S.W. from Dublin. The population in 1851 was 6223, besides 1289 in the workhouse and other public institutions. Carrick-on-Suir Poor-Law Union comprises 22 electoral divisions, with an area of 112,629 acres, and a population in 1851 of 37,469.

The principal part of the town stands on the left or Tipperary bank of the Suir, and consists of one long street parallel to the river, with two streets leading to the fair green on the north, and another forming the approach to the bridge on the south. It was a place of considerable note soon after the Conquest. Here are the remains of a fine castle built by Sir Edmund Butler in 1309 on the site of an old priory of the knights of St. John of Jerusalem. The same Sir Edmund, who was created Earl of Carrick in 1315, built the bridge which is still standing. Carrick-on-Suir was formerly celebrated for its flourishing manufactures of woollens. The place is now chiefly remarkable for the fine scenery of its environs, which a late intelligent traveller considers superior to the vale of Clwyd; it has also been unfavourably distinguished by the wretchedness of its pauper population. The Suir has recently been rendered navigable to the town for vessels of considerable burden. The public buildings are the parish church, a large and handsome Roman Catholic chapel, a monastery of the Christian Brotherhood, a convent for nuns of the Presentation order, a bridge-well, sessions-house, barracks, and fever hospital. Quarter sessions for the county of Tipperary are held here in rotation.

(Fraser, *Handbook for Ireland; Ordnance Survey Map; Thom, Irish Almanac.*)

CARRICKFERGUS, Ireland, a county of a town, a sea-port town, and parliamentary borough, is situated in 54° 42' N. lat., 5° 47' W. long.; distant 112 miles N. from Dublin, and 9½ miles N. from Belfast by the Carrickfergus branch of the Belfast and Ballymena railway. The population of the town in 1851 was 3543. Carrickfergus returns one member to the Imperial Parliament. It is governed by town commissioners. The borough income in 1850 was about 821*l*.

The town stands on the north-western shore of Belfast Lough at the junction of the small river Undhum with the sea, and is favourably situated for commerce and manufactures. The houses are generally of stone and slated. The principal street, called High Street, is terminated by the former county jail and court-house. The county business is now however transferred to Belfast. At the opposite end of the main street where it diverges, one branch leading to the quays and castle, and another to the Belfast road, is the market-house, a respectable building, erected in 1755. The parish church of St. Nicholas, an ancient and commodious cruciform edifice, is situated on rising ground on the southern side of the town. The chancel window is of stained glass, and represents St. John baptizing Christ in the river Jordan. The old steeple at the west end of the building was taken down in 1778, when the present handsome spire was erected. The Presbyterians, Independents, Wesleyan Methodists, Roman Catholics, and Unitarians have places of worship. On a rock projecting into the sea is the castle, an extensive and imposing pile. It is still kept up as an arsenal, and is mounted with heavy guns. A small pier projects from the southern extremity of the rock on which the castle is built, and incloses a dock where vessels of 100 tons can lie at the quay. An extensive fishery is carried on in the vicinity of Carrickfergus. The town is not lighted, and water is procured from pumps.

Carrickfergus Castle is supposed to have been founded by De Courcey about the end of the 12th century. From the middle of the 14th to the end of the 16th century it was the only stronghold north of Dundalk which remained uniformly in the hands of an English garrison, and to the loyalty of the townsmen of Carrickfergus is chiefly to be attributed the recovery of the Northern Pale in the reign of Elizabeth. The castle was besieged and taken by Edward Bruce in 1315. In 1386 the town was burned by the island Scots, and suffered again in 1400. In 1555 the Scots, under Mac Donnell, lord of Cantyre, laid close siege to the castle till July 1556, when Sir Henry Sidney relieved the garrison with great slaughter of the besiegers. In 1573 the town was burned by Brian Mac Phelimy O'Neill, chief of Claneboy, who was hanged here along with Mac Quillan, chief of the Route, in 1575; the same year Sorley Boy Mac Donnell (a son of Mac Donnell of Cantyre, who had seized upon Mac Quillan's country a short time before) attacked the town and was repulsed with great loss. Sir Henry Sidney found the place in a very impoverished condition. The town had already begun to be walled with an earthen rampart in 1574, and in 1575 the corporation agreed with Sir Henry to build a stone wall 7 feet thick and 16 feet high round a part of the town. The work however was not completed till 1608, when after various delays the walls were finished with a wet ditch and seven bastions. In the wars consequent on the rebellion of 1641 the inhabitants had their full share of the troubles of the times. On August 29th, 1689, it surrendered to Duke Schomberg, commanding the army of William III. On Saturday June 14th, 1690, King William landed here in person, and immediately proceeded southward, on that important campaign which at the Boyne decided the future prospects of both countries. On the 21st February 1760, Commodore Thurot arrived in the bay with one 44-gun frigate and two sloops of war, and having disembarked about 800 men, attacked the town, which together with the castle he carried after a smart action the same day. Five days later the French forces re-embarked, having taken a supply of victuals and ammunition from Belfast, and were captured on the 28th off the Isle of Man, after a severe action with Commodore Eliot, in which Thurot was killed and 300 of his men killed and wounded. The last scene of violence connected with the history of this veteran fort was the capture of the Drake, a British sloop of war, in the roads opposite the town by Paul Jones, in the Ranger, an American vessel, on the 24th of April 1778.

Of the antiquities of Carrickfergus the castle is the most interesting. The castle rock, from which the town takes its name (meaning the rock of Fergus, an Irish king of that name, drowned there in pagan times), rises gradually to an elevation of about 30 feet towards the sea, and is entirely occupied by the works of the fortress, consisting of a double ballium, or upper and lower yard, with batteries mounting about 25 pieces of cannon. In the upper yard stands the keep, a square tower 90 feet high, formerly entered by an arched doorway in the second story. The court-house and jail occupy the site of a Franciscan monastery, founded here in 1232 by the famous De Lacey, who was buried within the precincts in 1264. Half a mile west of the town is the site of the priory of Woodburne or Goodburne, on the banks of the Woodburne River, which has here some pretty falls. Part of the town wall and one of the gates are still standing.

The cotton trade was at one time carried on with vigour here, but it has declined. There are three extensive flax spinning-mills, a muslin bleach-green, and a linen bleach mill and green in the vicinity. Some trade is also carried on in tanning, brewing, and distilling.

(M'Skimmin, *History and Antiquities of Carrickfergus*, 8vo. Belfast, 1823; Thom, *Irish Almanac*.)

CARRICKMACROSS, county of Monaghan, Ireland, a market and post-town and the seat of a Poor-Law Union, in the parish of Carrickmacross and barony of Farney, lies in 53° 58' N. lat., 6° 43' W. long., 50 miles N.N.W. from Dublin: the population in 1851 was 2524. Carrickmacross Poor-Law Union comprises 14 electoral divisions, with an area of 60,664 acres, and a population in 1851 of 28,207.

The town is well built of stone, and consists of one main street, on the line of road from Ardee to Monaghan, having the market-house in the centre, with two lateral streets terminating in the Dundalk road on the east. Near the parish church are the ruins of a castle built here by Robert, third earl of Essex, about 1621. The market-house was built from the materials of this castle in 1780. On the western side of the town, between the main street and a small river, is one of the residences of the Shirley family, the principal proprietors of this district. There are in the town a brewery, malt-stores, and an extensive distillery. There is a large weekly market for corn and provisions.

(Fraser, *Handbook for Ireland; Account of the Territory or Dominion of Farney*, by E. P. Shirley, Esq., London, 1845.)

CARRON. [STIRLINGSHIRE.]

CARSHALTON. [SURREY.]

CARTAGENA, a town and sea-port of Spain, in the province of Murcia, is situated on the shore of a bay of the Mediterranean Sea, in 27° 36' N. lat., 1° W. long., 30 miles S.S.E. from the city of Murcia. The population in 1845 was 27,727; in 1786 the population was 60,000. The bay forms a natural harbour capacious enough to contain the largest fleets, and is encompassed by hills which shelter it from all winds; the entrance is narrow, and is covered by a lofty island, La Isoleta, also called La Escombrera: the depth of water is 30 feet close to the shores. Forts and batteries on La Isoleta and on the hills defend the harbour and town. The great arsenal, once the largest in Europe, is now in a state of dilapidation; the pavements are broken up, the long ranges of magazines and store-rooms are empty and deserted. The dockyards also, whence many of the great Spanish ships of war were launched, are now unoccupied, and the whole presents a scene of comparative ruin and desolation.

The town occupies the declivity of a hill and a small plain which extends to the harbour. It is inclosed by walls, and near the centre the ruins of a Moorish castle crown the summit of a precipitous hill, which rises above a large pile of buildings called the Marine School. The town contains some good streets, but all the pavements are in a bad state except that of the Calle Mayor, the principal street, which is paved with flat stones. A fine red marble is used not only in the buildings but for the commonest purposes, such as curb-stones. All the old streets have a Moorish aspect; the houses are irregularly built, and most of them have look-out towers (miradores); the windows are generally small, barred with iron, and where exposed to the sun screened with coloured matting. The cathedral is of Moorish architecture, and seems to have been a mosque; it is surmounted by a dome, and the interior consists of several small naves. There are several other churches, a town-hall, a custom-house, a royal hospital, a theatre, and a bull-arena. The town is unhealthy owing to an adjacent swamp, and the water is brackish. It communicates with the river Segura by the Lorea Canal. The loss of the Spanish American colonies put an end to the best part of its commerce, and what remained has mostly been transferred to Alicante. It has some manufactures of sail-cloth and glass, and exports barilla. The tunny-fishery is valuable, and the silver and lead mines in the neighbouring Sierra de Almagra have of late years been re-opened, and are now wrought profitably by several joint-stock companies.

Cartagena was a colony of Carthage, and was built B.C. 242 by Hasdrubal, the son-in-law of Hamilcar Barca, and his successor in Spain. It was named *Carthago Nova* to distinguish it from the great city of Carthage in Africa. The Greek name was *Καρθηδών η Νέα*. The old city seems to have stood on the site of the present town, was strongly fortified, and was 20 stadia in circumference (2 miles, 50 yards). It was the great seat of the civil administration and military power of the Carthaginians in Spain. Here Hannibal regularly established his winter quarters, and here he received the ambassadors from Rome. It was taken by assault by the Roman general P. Scipio (afterwards Scipio Africanus the Elder) B.C. 210. Under the early Roman emperors it was a colony, and had the full title of 'Colonia Victrix Julia Nova Carthago.' The mines were wrought by the Carthaginians and afterwards by the Romans, who are stated to have employed 40,000 men in them.

(Ford, *Handbook of Spain*; Havorty, *Wanderings in Spain*, 1843; Polybius, x. 10, 11, 15; Strabo, iii. p. 158.)

CARTAGENA, a sea-port in the republic of New Granada, on the northern shore of South America, is situated in 10° 25' 48" N. lat., 75° 30' W. long., about 70 miles S.W. from the mouth of the Magdalena. The harbour of Cartagena is one of the safest and most convenient in all America. It is formed by two islands extending along the coast southward and northward. The most southern island, called Tierra Bomba, is about two miles long and wide, and between it and the Cape Barn is the narrow entrance of the port called Boca Chica. The northern island is on an average hardly half a mile wide,

and low, whilst Tierra Bomba rises to a moderate height. The entrance of the port is so narrow that only one vessel can enter at a time, and as some sandbanks occur in it a pilot is always required. It is defended by two strong castles. The harbour itself is about six miles long; its width varies from two to four miles. It has a sufficient depth of water and good anchorage, and its surface is as little agitated as that of a river.

On the northern island and at the most northern corner of the harbour is situated the town, on a sandy tract of land. It occupies the whole width of the island, so that its north-western walls stand on the beach, and the south-eastern on the harbour. To the east of the town is another low island, on which the suburb, called Xiximani, stands: both are connected by a wooden bridge. Another bridge unites the suburb with the mainland.

The town is regularly built, with straight but rather narrow streets, which are still more narrowed by the projecting balconies, so that they nearly exclude the daylight, and give the town a gloomy aspect. The houses have commonly two stories, and are built in the usual Spanish style, with dead walls towards the streets, but inclosing a fine open space within, on which lofty and airy rooms open, and which is surrounded by a corridor. The town is strongly defended, and on the land side surrounded by several fortresses and by a massive citadel.

Among the public buildings are several fine churches and seven convents. The immense cisterns situated within the walls of the town are justly admired by travellers, and the water preserved in them is excellent. The climate is hot and yellow fever often makes great ravages.

The inhabitants, who amount to between 18,000 and 20,000, are mostly a mixed race, descendants of Spaniards and Indian women. The majority are sailors and fishermen, but many are shopkeepers and mechanics.

The commerce of this town was formerly considerable. But since the revolution in South America its commerce is limited to exporting the produce of the valley of the Rio Magdalena, and importing the manufactured goods which are consumed in it. Even this trade has recently declined in favour of Savanilla, a small port a little west of the mouth of the Magdalena. The chief exports of Cartagena are now confined to the precious metals.

CARTHAGE, called by the Romans *Carthago*, by the Greeks *Karchedon*, an ancient city and state in the north of Africa, long the rival of Rome, was a colony of the Tyrians, and one of the latest Phœnician settlements on the African coast of the Mediterranean. There seems to have been an older Phœnician settlement on the spot (probably an emporium or trading establishment), which, according to Appian and others, was founded before the siege of Troy, and hence much confusion has arisen concerning the foundation of Carthage, which Appian refers to the year B.C. 1234, and others assign to various dates between this year and that of the building of Rome. According to Aristotle, Carthage was founded 287 years later than Utica. The name Carthago is most probably the Roman pronunciation of the Phœnician *Karthadtha*, which means 'new city.' Most ancient writers agree in following an old tradition that Carthage was founded by Elissa or Dido, whose husband being murdered by his brother-in-law Pygmalion, king of Tyre, fled with many attendants and other citizens, and landed on a peninsula on the coast of Africa, between Tunis and Utica, which were older Phœnician colonies. She purchased or agreed to pay rent for a piece of ground to build a town upon, which was called Bozra ('a fortress'), a name which the Greeks altered into Byrsa ('a hide'). The name of Byrsa, and perhaps the shape of the peninsula, which resembled an ox-hide, gave rise to the well-known fable of the manner in which the Libyans were cheated out of their ground. As the town increased, the inhabitants excavated a port, which was called Cothon, and became a great maritime and commercial emporium. This is the part of the town which Dionysius and Velleius Paterculus say was built 60 years before Rome (B.C. 813). Megara, Magar, or Magalia, which was like a great suburb with fine gardens, probably owed its name to the first Phœnician habitations, called Mugar or Magalia in the language of the country.

Of the early history of Carthage we know little or nothing except that it soon became a great commercial and maritime state. What we know of its institutions is derived chiefly from a chapter in Aristotle's 'Politica.' The government of Carthage was municipal; and the city ruled over all the rest of the country. The spirit of the constitution seems to have been highly oligarchical. The chief authority was vested in the senate, which appears to have been composed of the heads of a few rich, old, and powerful families, who divided among themselves the chief offices of the state. The senators appear to have been for life. The senate contained within itself a select body or council of state, which the Greek writers call *Gernsia*, or 'council of ancients.' Aristotle ('Politica,' ii. 20) says the Carthaginians had a body of 104 magistrates, similar to the Ephori of Sparta, but selected with greater discernment from among the most worthy; and that the kings and the *Gernsia* of Carthage resembled the kings and the *Gernsia* of Sparta in their respective offices. Justin says that the *Gernsia* was a select body chosen from among the senators to watch over and investigate the conduct of the magistrates and especially of the generals returning home from foreign command, and that it was first established at the time when the house of Mago, by its vast

influence and popularity, excited fears of some ambitious designs. Two attempts at establishing tyranny were actually made; one by Hanno (B.C. 340), and the other by Hamilcar (B.C. 306). They both failed, and their authors suffered death. This 'Council of the Hundred' is also mentioned by Aristotle as forming the highest magistracy, and deciding all causes. It was probably the same as the *Ordo Judicum* spoken of by Livy (xxxiii. 46). The Council were also guardians of the public morals, and, like the other civil magistrates, received no salary. The members, according to Aristotle, were elected by the Pentarchies, or 'Boards of Five' (probably a permanent committee of the senate), who are supposed to have managed the financial affairs of the state. They filled up their own vacancies, and no one was admitted into them who had not previously served the state in some official capacity.

At the head of the executive were two Suffetes (Shophetim, or judges, like those of the Hebrews), whom the Greek and Roman writers call kings. They presided in the senate, and laid before that assembly their reports on public affairs. It would seem that the Suffetes were renewed annually, but whether the same persons were re-elected is not known: they were always selected out of a few leading families. The election of the generals and foreign governors, which was the next office to that of suffete, took place in the *Gernsia*, but was afterwards referred to the senate and the people for their approbation. A suffete was at times general also, and as such headed the armies of the republic, while his colleague remained at home. When the senate and the suffetes could not agree upon some particular points, the question was referred to the people or citizens at large for their decision. Aristotle observes that bribery was resorted to, and that offices were bought and sold at Carthage. One variety of this corruption was the habit of constantly regaling the citizens in collective banquets of the curia, or political clubs. What proportion the demos, or people, bore to the whole population, is unknown; "but whether more or less considerable," says Grote, in his summary on the political constitution of Carthage ('History of Greece,' vol. x.), "it is plain that its multitude was kept under dependence to the rich families by stratagems such as the banquets, the lucrative appointments, with lots of land in foreign dependencies, &c. The purposes of government were determined, its powers wielded, and the great offices held—Suffetes, Senators, Generals, or Judges—by the members of a small number of wealthy families; and the chief opposition they encountered was from their feuds amongst each other. In the main the government was conducted with skill and steadiness, as well for internal tranquillity as for systematic foreign and commercial aggrandisement. Within the knowledge of Aristotle Carthage had never suffered either the successful usurpation of a despot or any violent intestine commotion." In the later ages of the republic however, bitter factions divided the state, and boys as eagerly as men took part in the popular tumults. (Polybius, xv. 30.)

Of the private and domestic manners of the Carthaginians we know very little. Their punishments were severe, and even cruel. Crucifixion was the most common mode of death. We may gather from Polybius, Appian, and others that conjugal and parental feelings were strong among them. The magistrates during the time of their office were required to abstain from wine. Their religion which was originally gloomy and cruel, they derived from Phœnicia. Melcarth ('king of the city'), the Tyrian Hercules, was the tutelary deity of Carthage, as he was of Tyre and all her colonies; he is identified by some with Baal and the Sun, by others with the Assyrian Bel and the plaut Jupiter. The Carthaginians also worshipped Saturn, Melec or Moloch, to whom they immolated the children of the noblest families, and sometimes the captives taken in war to propitiate his wrath. Astaroth or Astarte, the goddess of the moon, was another of their deities. They had also on the summit of Byrsa a magnificent temple sacred to Esmun or Æsculapius. Among Genii and Heroes the Genius of Death, and Dido, Hamilcar (who fell at the battle of Himera), the brothers Phileni and Iolaüs (a Sardinian worthy) were worshipped. There was probably no sacerdotal caste at Carthage. Sacrifices were offered by the highest personages in the state.

The wealthy citizens of Carthage paid great attention to the cultivation and improvement of their estates, which were tilled by the forced labour of the subject Libyans and slaves (for Carthage trafficked largely in slaves both white and black). The country in the neighbourhood of Carthage, and indeed all that tract which formed its real territory, and which nearly corresponds to the present Regency of Tunis, was beautifully cultivated and extremely fertile. When Agathocles landed in Africa, and when Regulus half a century later, Scipio Africanus half a century later still, and Scipio Æmilianus another half a century after that, invaded the Carthaginian territory, their march lay through rich fields covered with herds of cattle, and irrigated by numerous streams; vineyards and olive grounds were spread on every side, innumerable small towns and villages were strewed over the country, and as they drew near to the 'Great Carthage' the neighbourhood was thickly studded with the country seats of the wealthy citizens. Mago, a suffete of Carthage, who is supposed by some to be the same as the head of the powerful family of that name, who flourished about B.C. 550, wrote a work on agriculture in 28 books, which is the only work mentioned as having been carried away by the Romans out of the libraries of Carthage.

distributed in six settlements on the west coast of Africa. Hanno wrote an account of his voyage which he hung up on his return in the temple of Kronos or Saturn in Carthage; there is a Greek translation of it in Hudson's 'Geographi Græci Minores.' The other expedition under Himilco, another son of Hamilcar, was sent round the coast of Lusitania and northward as far as the Estremou Cape, which some suppose to be Cape Finisterre. But the only information that we have concerning this voyage is derived from Festus Avienus's poem, who says that he wrote it from the Punic annals: his account is extremely confused and perplexing.

The second Carthaginian expedition into Sicily took place about B.C. 410. The people of Egæta or Segeste, being oppressed by those of Selinus, applied to Carthage for assistance. The Carthaginians sent first a small force to relieve Segeste, and afterwards landed a much larger force, with which they besieged Selinus. In this siege they employed moveable towers and battering-rams. After a desperate defence Selinus was taken, plundered, and burnt. They next took Himera, which they treated in a like manner, 3000 prisoners being slaughtered to appease the manes of Hamilcar. The next attack was on Agrigentum, which was also taken B.C. 406. When the Carthaginians attacked Gela, Dionysius the elder, tyrant of Syracuse, interfered, and a series of wars began between him and the Carthaginians, which, with some interruption by truces, lasted till the death of Dionysius. The wars were renewed under Timoleon, who at last made peace with Carthage, by which the territory of the latter state in Sicily was limited to the west extremity of the island, the river Halicius, between Selinus and Lilybæum, forming its eastern boundary. War broke out again between Carthage and Syracuse about B.C. 310, when Agathocles was tyrant of the latter city. It was on this occasion that a large fleet, intended for Sicily, soon after leaving Carthage, was dispersed by a storm, in which 60 galleys and 200 transports were lost. They however assembled an army in Sicily, and totally defeated Agathocles, B.C. 309, who resorted to the bold attempt of carrying the war into Africa. This was the first deadly thrust at the power of Carthage, whose weak point being thus discovered, the example was afterwards followed by the Romans.

After the death of Agathocles, Pyrrhus, who had married his daughter, came over to Sicily to oppose the Carthaginians. He overran their territory, and took all their towns, except Lilybæum. Pyrrhus however returned to Italy, and the Syracusans elected Hiero for their commander. Hiero began by attacking the Mamertines, a body of Campanian mercenaries who had served under Agathocles, but being dismissed after his death, had gone to Messina, where after being kindly received they suddenly fell upon the citizens, killed or drove them all away, and took possession of their houses, wives, and property. Being hard pressed by Hiero, they applied to the Carthaginian naval commander, who was stationed at Lipara. The Carthaginians came and took possession of the citadel. The Mamertines afterwards revolted against them, and applied to Rome for assistance against both Hiero and the Carthaginians. This gave rise to the first contest between Carthage and Rome, B.C. 265.

The result of the first Punic war, which ended B.C. 242, was that Carthage lost Sicily and the Lipari Islands. This war was followed by another nearly as destructive to Carthage. The mercenary troops which had served in Sicily, and had been disbanded in Africa after the peace, without being paid their full stipend, revolted, and being joined by the subject Libyans devastated the territory of Carthage, threatened the city, and carried on the war (B.C. 240-237) until Hamilcar Barca, who had already distinguished himself in Sicily, succeeded in subduing or rather destroying the mutineers. Polybius calls this the Libyan war, and he gives a detailed account of it. It was attended with circumstances of the greatest atrocity on both sides.

At the end of the war of the mercenaries, which gave the Romans a pretext for seizing Sardinia, Corsica, and the smaller islands subject to Carthage, Hamilcar Barca was sent over to Spain to establish the power of Carthage over that rich country, and thus gain a compensation for the loss of Sicily and Sardinia. It was before setting out for Spain that he made his son Hannibal, then a boy nine years old, swear on the altar eternal hatred against Rome.

The inhabitants of Gades, an old Phœnician colony connected with Carthage by common descent and commerce, had asked assistance against some native tribes, and this had probably furnished a pretence for the first Carthaginian settlements on that coast. During nine years that Barca remained in command in Spain he extended the dominion of Carthage over the south and east part of that country, and founded the town of Bærcino (Barcelona). Hamilcar was killed in a battle against the natives (Appianus, 'De Reb. Hispan.' v.), and was succeeded by Hasdrubal, his son-in-law, who took young Hannibal as his colleague. The Saguntini, who are said to have been a colony from Zacynthus, being pressed on all sides by the Carthaginian conquests, sent deputies to Rome for protection. The Roman senate sent deputies to Carthage, and a treaty was concluded, by which the river Iberus (Ebro) was to be the limit of the Carthaginian possessions in Spain, and moreover the Saguntini and other Greek colonies south of the Iberus were to remain free and independent. Hasdrubal some time after was killed by a native while hunting, and Hannibal, then twenty-six years of age, was proclaimed his successor by the army, a choice which was confirmed by the senate of Carthage.

He began his command by the siege of Saguntum, which led to the second Punic war, B.C. 218. By the peace (B.C. 201) which terminated that memorable contest the power of Carthage as an independent state was annihilated. She lost her fleet and all her possessions out of Africa, and even there Masinissa, king of Numidia, was planted as a thorn in her side. By the administration of Hannibal however the tribute imposed by the peace was paid in ten years, and the great general was meditating to aid Antiochus the Great with what force Carthage could yet muster in order to check the triumphal career of Rome, when he was compelled by faction to fly from the city which his great talents had immortalised B.C. 195, and to seek refuge with Antiochus. Masinissa seized upon a territory called Tysca, with fifty villages upon it, within the Carthaginian boundary. Complaint was made to Rome, which sent a commission, of which Cato the elder was one. That inflexible old man inspected every part of the great commercial city, and being astonished at the sight of its still remaining wealth and magnificence, persuaded himself that nothing but its ruin could insure the dominion of Rome. Hence his well-known burthen to the senate on his return, "Delenda est Carthago." Some of the Roman senators were for moderate and conciliatory measures. Scipio Nasica, next appointed commissioner to arbitrate between Carthage and Masinissa, went to Carthage, and had nearly settled all controverted points when Gisco, a Carthaginian demagogue, roused the populace to assault Scipio, who was obliged to save himself by flight.

There is no doubt that, in the impending struggle with Antiochus in the east, Carthage, reduced as she was, would have been a source of danger to Rome; and the only safe policy of the latter was the total destruction of her rival, as expressed in the celebrated sentence of Cato. The armed resistance to which Masinissa at length drove the Carthaginians was looked upon at Rome as a violation of the late treaty (a clause of which bound Carthage not to undertake war without the permission of Rome), and seized as a pretext for the third Punic war. The consuls Marcus Censorinus and Manilius Nepos were appointed to the command of the fleet and of the land force, and they received secret orders from the senate not to desist from hostilities until Carthage was destroyed. The consuls sailed for Utica, where, having landed their troops, they encamped at the old Castra Scipionis. They then gave a public audience to the Carthaginian deputies, who appeared as suppliants before them, and were required to give up all their arms, as they had no more occasion for them, the Roman people taking them under their protection. The arms were delivered to the number of 2000 catapultæ, 200,000 complete suits of armour, besides an immense number of spears, swords, bows and arrows, &c. This being done, the deputies waited to hear the final sentence. The consuls then signified to them that Carthage must be razed to the ground, but that the inhabitants might rebuild their houses anywhere, provided it were ten miles distant from the sea, and there were no walls or fortifications. The indignation of the citizens at the base treachery of the Romans overcame all considerations of prudence or personal safety. They determined on defence, and the third Punic war began. It lasted only three years, and ended with the utter destruction of Carthage in the same year (B.C. 146) in which the fall of Corinth completed the subjugation of Greece. The horrors of that siege, the desperate resistance of the Carthaginians, the self-devotedness of their women, are described by Appian. Of 700,000 people who lived within Carthage only 50,000 surrendered to Scipio and were saved. By a decree of the Roman senate every part of the city was razed to the ground. The literature of Carthage likewise perished; the Romans gave its libraries, with the exception of Mago's work on agriculture already mentioned, to their Numidian allies; and we know through Sallust that King Hiempsal had a collection of Carthaginian historians from which Sallust derived some information on the early history of Africa.

Twenty-four years after the destruction of Carthage (B.C. 122) the Græchi made a vain attempt to establish a colony on its ruins. Julius Cesar revived the project B.C. 46, but was not suffered to live to complete his design. His successor Augustus sent 3000 new colonists, who were joined to the inhabitants of the neighbouring country, to build a new town, which was called Colonia Carthago, and which Strabo says soon became as populous as any city of Africa. Pliny calls it 'Colonia Carthago Magnæ vestigiis Carthaginis.' It rose to considerable splendour, had its cathedra, or harbour, and became the first city of Roman Africa. In Christian history it is known for its councils and for the spiritual labours of Cyprian and St. Augustine. In 439 it was taken by the Vandals under Genserich: it was retaken by Belisarius in 533; and lastly was taken and utterly destroyed by the Saracens in 697. Thus ended Roman Carthage, after an existence of about seven centuries.

The topography of Carthage is a difficult and much disputed subject. In the following details we have adopted the views of Falbo and Barth, which are confirmed in many particulars by inferences fairly drawn from the ancient descriptions of the siege of the city.

Carthage was built on a high peninsula, bounded N. and E. by the Gulf of Carthage; and S. by the lake, or bay, that now forms the harbour of Tunis. The peninsula terminated eastward in capes Ghamart and Carthage, which rise respectively to above 300 and 400 feet above the sea; and on the western side it was joined to the mainland by an isthmus between two and three miles across from the

Lake of Tunis to the sea. The alluvial deposits of the Bagradas (now Mejerda) have made great alterations in this part of the coast; so much so that the sea, which in ancient times washed the northern shore of the peninsula, is now converted partly into firm land and partly into a salt marsh: the consequence is that the isthmus is greatly enlarged in breadth, and the peninsular form of the site has nearly disappeared. The Lake of Tunis itself from a deep open bay has become, in consequence of its receiving for so many ages the filthy deposits of the sewers from the city of Tunis (which stands on its western shore), a shallow lagoon. Southward from the peninsula a Tania, or sandy spit of ground, ran between the Gulf of Carthage and the lake and terminated at the north of the entrance to the latter; this strip of land is also enlarged since ancient times, so that the once wide entrance to the bay is now a mere narrow passage, called Hak-el-Wad, or Goletta ('throat'). It seems probable that the city did not occupy the northern slope of Cape Ghamart nor the southern slope of Cape Carthage, on the east of the peninsula; and that it did not quite extend to the isthmus on the western side; but stretched in the form of an irregular oblong, with its southern end resting on the lake before mentioned, the Tania and the gulf; its northern end on the sea, and its greatest length extending nearly due north and south.

Towards the east the city, the whole circuit of which was 360 stadia, or about 36 miles, was defended only by a single wall, as it was naturally defended by the precipitous nature of the coast. But on the land side it was defended by a triple line of walls, each 30 cubits high, below the parapets, and strengthened with towers four stories high and 200 feet apart. On the inside of each wall were two stories of vaulted chambers, formed into stables below for 300 elephants, and above for 1000 horses, with stores of forage for both. Between the walls were barracks, with magazines and stores, for 20,000 infantry and 4000 cavalry. These landward fortifications seem to have been strongest just behind the Byrsa, or citadel; where they approached the suburb of Megara on the north-west, and the Tania near the harbours at their southern extremity, they seem to have been weak and low, and accordingly Scipio in his assaults upon the city attacked these parts, while Marcius from the sea attacked the single wall on the eastern side. The walls of the Punic city cannot be traced with any certainty; but the remains of the walls of Roman Carthage, erected in A.D. 421, are clearly visible.

The port of Carthage was on the south side of the city, and was formed of a part of the Lake of Tunis, while the lake itself was probably used as a roadstead. It consisted of an outer harbour for merchantmen, there being a passage from the one to the other; and an inner harbour for ships of war. An island of considerable elevation, called Cothon (it is now a peninsula), situated within the entrance, gave its name also to the inner harbour; its height concealed the harbour from view to seaward, and made it serviceable as a signal station. On the land side the inner harbour was jealously screened from observation by a double wall. Wide quays lined the shores of the island and the inner port, and around it were 220 docks, each constructed for only one ship, with naval magazines and storehouses. As each dock was entered between two Ionic columns, the circuit of the island and the landward side of the harbour presented the appearance of a magnificent colonnade. Persons frequenting the outer harbour passed at once into the city through gates provided on purpose, that they might not pass through the docks. When Scipio had blocked up the entrance to the harbour by constructing a mole across the eastern angle of the Lake of Tunis, from near the south end of the land-wall to the Tania, the Carthaginians cut a new channel from the inner harbour direct into the Gulf of Carthage. The two basins, which were most probably formed by excavation, still remain, but their masonry has disappeared, having been probably used as a quarry by the natives that afterwards settled on the site of the Phœnician city. Of a spacious basin formed for merchantmen, on the sea-shore outside the walls, the substructions are still visible.

Immediately to the east of the central and strongest part of the landward fortifications was the Byrsa, or citadel of Carthage. It was connected with the forum which lay between it and the harbours by three narrow streets composed of houses six stories high. The Byrsa is an eminence, supposed to be partly artificial, about two Roman miles in circuit and 200 feet high, its upper surface forming a plateau that slopes gently towards the sea. On the sides of the hill are traces of its ancient fortifications, which seem to have risen in terraces one above another. On it stood the rich temple of Esmun, or Æsculapius, raised on a platform ascended by 60 steps: the senate held secret meetings on important occasions in this temple. The Byrsa continued to be the citadel of Carthage under the Romans also, who restored the temple of Æsculapius. The Roman pro-consuls, the Vandal kings, and the Byzantine governors of Africa resided upon it. It is now called the Hill of St. Louis, from a French chapel erected on its summit in memory of that royal crusader, who died of the plague whilst laying siege to Tunis in A.D. 1270. It is supposed that the hill occupied by the Byrsa was formed when the Carthaginians excavated their harbours, and that the name of the original Phœnician settlement (which most probably occupied the height of Cape Carthage) was transferred to this their new citadel.

South of the citadel, and between it and the harbours, lay the forum, in which were the senate-house, the courts of justice, and the temple of the Phœnician god corresponding to Apollo, whose golden image stood in a shrine overlaid with 1000 talents weight of gold. The three streets connecting the forum with the citadel were stormed by Scipio house by house. The other streets seem to have been straight, and to have crossed each other at right angles.

On the lower terraces of the north side of the Byrsa are the ruins of two temples, supposed to be those of Saturn and Astarte, whom the Romans called Cœlestis. On the west and south-west side of the hill are the ruins of baths (famous in the Christian history of Carthage), a circus, and an amphitheatre. The city was supplied with water by an aqueduct 50 miles long: it derived part of its supply from the Jebel Zaghuwan, which is above 30 miles in a straight line S. from Carthage, and the rest from Zung-gar, considerably farther south. Both fountains were covered in by domed temples of the Corinthian order: there are considerable remains of those at Zung-gar. The aqueduct may be traced all the way, and indeed in some places it is in a good state of preservation—as at the village of Arriana, two leagues N. from Tunis, where is (says Shaw) "a long range of its arches, all of them entire, 70 feet high, supported by columns (piers) 16 feet square. The channel that conveyed the water lies upon these arches, being high and broad enough for a person of ordinary size to walk in. It is vaulted above, and plastered on the inside with a strong cement, which by the stream running through it is discoloured to the height of about three feet." The part of it that runs along the peninsula was elegantly built of hewn stone. Some suppose the aqueduct to be a Carthaginian work; others ascribe it to the Romans. The great reservoir also remains almost entire near the line of the western fortifications; it consists of more than twenty contiguous cisterns, each of them at least 100 feet long and 30 feet broad. Near the Cothon also is a less reservoir, which was contrived also for collecting the rain water from the Byrsa and adjacent pavements: the small earthen pipes for conducting the water from the roof still remain. Besides these there are numerous cisterns remaining for the supply of private houses. In rowing along the sea-shore Shaw observed the terminus of the sewers, "which, being well built and cemented together, length of time has not been able to impair."

The broken foundation of two buildings—one supposed to have been a theatre, the other a temple of Astarte, and apparently the largest structure in Carthage—complete our enumeration of the remains on this interesting site.

The north-west side of the peninsula was occupied, as before stated, by the suburb of Magalia (called also Magar and Megara); this was surrounded by a wall and adorned with gardens irrigated by canals. The wealthy citizens of Tunis still have gardens here near the village of El-Mersa, which is situated near a salt-marsh to the north of the isthmus. Roman Carthage stood not as some assert on the site of Magalia, but on that of the Punic city. The land to the west and north-west is divided by roads into rectangular plots, each containing 100 heredia. There are twenty-eight of these plots distinctly visible, and the gardens of El-Mersa cover an area sufficient for two more, making altogether 3000 heredia (or farms of about two acres each) for the 3000 colonists settled in Carthage by Augustus. Cape Ghamart is supposed to have been the necropolis of Carthage: some few graves have been discovered in its rocky soil.

CARTMEL, Lancashire, a market-town in the parish of Cartmel and hundred of Lonsdale, north of the sands, is situated in 54° 12' N. lat., 2° 56' W. long.; distant 26 miles N.W. by N. from Lancaster by road, or 14 miles across the sands at low water; and 254 miles N.W. by N. from London by road. The population of the entire parish of Cartmel was 5213 in 1851. The living is a perpetual curacy in the archdeaconry of Richmond and diocese of Chester.

Cartmel is situated in a vale surrounded by high and rugged eminences. In 1188 a priory for canons regular of St. Augustine was founded in Cartmel by William Mareschal, earl of Pembroke. The funds of the ancient parish church of Cartmel were incorporated with the priory endowment, and the parishioners purchased the building that they might still use it as their parish church. It is a cruciform building with a central tower, a choir with richly ornamented stalls, and a fine east window. The nave is comparatively modern. The length of the church is 157 feet, that of the transepts 110 feet, and the height of the walls 57 feet. Cartmel Grammar school has an endowment of 110*l.* per annum; it was in existence in 1635, but the exact date of its foundation is unknown. There were about 25 scholars in 1851.

The streets of Cartmel are narrow and irregular. Most of the houses are built of stone. There is very little trade. There are cotton-mills at upper Holker. The market-day is Tuesday; fairs are held on Whit-Monday, Monday after October 23rd, Wednesday before Easter, and November 5th.

Three miles to the south of Cartmel is a medicinal spring of some repute, called Holy Well. Near the town is Holker Hall, a seat of the Earl of Burlington. In the vicinity are many private mansions, surrounded with plantations and pleasure-grounds which extend along the slopes of the fells, and impart to the scenery much beauty. From the rapidity with which the tide flows over such an extensive level surface the passage across the sands is attended with danger. Guides are appointed by government to conduct passengers from shore to shore. The distance across Lancaster sands to the east is about 9 miles, that across Leven sands to the west not quite 4 miles.

(Palmer, *History of Lancashire; Communication from Cartmel*.)

CASALE, a province and town of the continental Sardinian States. The province is bounded to the N. and E. by the Po, which divides it from the provinces of Verceili and Mortara; on the S. it borders on the province of Alessandria, and on the W. on the provinces of Asti and Turin. It is intersected from north-west to south-east by the ridge of the Monferrato hills, which divide the valley of the Tanaro from that of the Po. The vine thrives on this tract, which produces some of the best wine in Piedmont. It is also known for its truffles. Great numbers of sheep are reared in the province. Silk is another of its chief products. The area is 334 square miles, and the population of the province in 1848 was 120,425.

Casale, the chief town of the province and formerly the capital of the marquisate of Monferrato, an important city with 21,000 inhabitants, is situated on the right bank of the Po, 37 miles E. from Turin. It was formerly fortified, and its citadel, built at the close of the 16th century, was one of the strongest places in Italy. Since the disastrous campaigns of Sardinia against Austria in 1819, the town of Casale has been strongly fortified under the direction of General de la Marmora. The Po is crossed here by an iron bridge. The old castle which was once the residence of the marquises of Monferrato, is still standing. The cathedral of San Evasio, a Lombard structure, said to have been founded by King Luitprand in A.D. 742, contains some fine paintings, a richly decorated shrine, and a chapel paved with costly marble; the church of Santa Caterina is also rich in paintings. The church of San Donato was built at the expense of the prince's Paleologi, and consecrated in 1513. A tomb in memory of the Paleologi was erected in the church over their remains by the late king of Sardinia in 1835. The church was built after a design of Bramantino; it has a splendid facade, and for elegance of proportions and richness of decoration it is surpassed by few churches in Piedmont. The other remarkable churches are those of Sant' Ambrosio and Sant'uario; the latter was once a pagan temple, its consecration took place in the 4th century. Among the ancient civil structures of Casale mention must be made of the clock tower, built before the year 1000, and repaired in 1510; and the town-house, supposed to have been built by Bramante.

Casale has also several palaces belonging to the nobility, a theatre, a royal college, and a college for boarders. There are several silk factories in the town, and a considerable trade is carried on in corn, wine, and other agricultural produce. Casale is a bishop's see, and the residence of the Intendente, or governor of the province; it has a court of justice, from which appeals lie to the supreme court of Turin. The town of Moncalvo, with 3700 inhabitants, is next to Casale in importance. Its industrial products are spun silk and leather.

CASAN, properly *Kazan* or *Kazan*, the name of a khanda, or kingdom, founded by the Tartars in the north-east of Europe in 1411, and subjected to Russia in 1552. The five governments formed out of it, namely, *Kazan*, *Penn*, *Simbirsk*, *Penza*, and *Viedka* are sometimes historically spoken of as the kingdom of *Kazan*. The Russian government or province of *Casan* includes a portion of the basin of the Volga and its tributary the Kama; and is bounded N. by *Viatka*, E. by *Orenburg*, S. by *Simbirsk*, and W. by *Nischni-Novgorod*. It lies between 51° 10' and 56° 45' N. lat., 46° 20' and 51° 45' E. long. The area according to official survey measures 23,868 square miles, and the population in 1816 was 1,342,900.

The surface is in general an undulating level, the south-eastern part of which is varied by the western branches of the Ural Mountains, while a small range of limestone hills, called the *Undurian Mountains*, runs parallel with the right bank of the Volga, but nowhere attains a greater elevation than 1000 feet.

The principal river in *Casan* is the *Volga*, which enters it from *Nischni-Novgorod* in the north-west, runs through the heart of the province, where it is increased by the large river *Kama*, and quits it in the south, on the borders of the province of *Simbirsk*. The *Volga* has considerable breadth before the *Kama* joins it, but is enlarged to 2400 feet by the accession of that stream. The *Verluga*, the larger and lesser *Kokshaya*, *Sviaya*, *Tsyvil*, and *Kasanka* contribute also to augment the *Volga* in this province. The province contains many small lakes, which as well as the rivers are well stocked with fish. In the *Undurian Mountains* are many sulphurous springs, and much liquid naphtha is found.

The climate is on the whole salubrious; but the winter is so severe that the rivers are covered with ice from November to the end of March. The *Volga*, on the breaking up of the ice, rises above seven feet beyond its level in summer. The fruits of Western Europe ripen in the open air.

Agriculture is pursued to a limited extent; and a sufficient quantity of rye, wheat, flax, hemp, fruit, and vegetables is grown for ordinary consumption. The soil is generally fertile, but lands are wanting for its proper cultivation. Whole districts are occupied by forests and swamps; the chief kinds of trees are the pine, fir, and oak; and the woods abound in bears, wolves, and feathered game. Large herds and flocks are reared on the rich pasture-grounds which border the rivers; and the fleeces of *Casan* are of good quality. Horses are of good breed, and several fine studs are kept up. Goats are numerous, pigs much less so. Among wild animals are bears and wolves. The Tartar inhabitants collect much wax and honey. The province contains stone for building, chalk, and lime, alabaster, salt-petre, iron, and copper.

The inhabitants are engaged generally in spinning and weaving, tanning, turning and making articles of wood, and oil-pressing, for which last purpose they employ hemp-seed as well as nuts, of which large quantities are obtained, particularly in the districts that lie between *Casan* and *Simbirsk*. The population is composed chiefly of Russian Poles and Cossacks, who make up about half of the inhabitants. The Tartars who inhabit a particular slobode, or quarter of the towns and villages, are chiefly artisans, and number about 300,000; the rest of the inhabitants are composed of Tatars, Circassians, &c., who occupy farms or live in detached villages, and are distinguished from the rest of the population by their dirty habits.

This part of Eastern Europe was formerly called *Volgaria*, or *Bulgaria*, from the river *Volga*, and was inhabited by a Tartar tribe. Forced from their settlements by new hordes of Tartars, the Bulgarians left their homes and finally settled among the Slavonic population of the right bank of the Lower Danube, whom they subdued. The name *Bulgaria*, by which this part of *Moestia* has been since distinguished, was thus derived from the Tartars of the *Volga*. [BULGARIA.] A great-grandson of Genghis Khan founded the city of *Casan* in 1257, which became the capital of the Kiptchak Tartars. In 1441 the Khan of *Casan* became independent, and erected his province into a kingdom, which subsisted till 1552, when it was conquered by Ivan II. and annexed to Russia.

CASAN (*Kazan* or *Kasan*), the capital of the province, is an ancient Tartar town, which stands on a hill rising out of a low plain between the *Casanka* and the *Bulak* which flows into it, and about five miles above the influx of the *Casanka* into the *Volga*; population about 60,000. It is composed of the kremlin or citadel, the middle town, and the lower town; the whole is encircled by gardens, fields, and meadows, which, when the *Casanka* is swollen by the waters of the *Volga* in the spring, are subject, as well as the lower town, to inundations. The kremlin, which is on the banks of the *Casanka*, contains the governor's palace, archiepiscopal residence, barracks, prisons, and houses of correction, but particularly the highly-venerated 'Karsian-skaya Boyeniatser', or Cathedral of the Holy Virgin of *Casan*, the prototype of other Greek churches in various parts of Russia. The middle town is chiefly distinguishable by the *Gostini-Dver*, or Bazaar, and the market-place, which is surrounded in most parts by lofty houses, chiefly built of stone, and planted with rows of trees. Several of the churches are well built. The lower town, next to the *Bulak*, contains a number of rows of houses, separated by gardens, which are the residences of the merchants and dealers; and also the university buildings, a handsome pile embellished with Corinthian columns, and containing a library of 30,000 volumes, a cabinet rich in Russian and Tartar coins, collections in natural history and for experimental philosophy; a botanical garden, and a well-furnished astronomical and magnetic observatory. *Casan* has 41 Greek churches, 4 monasteries, 8 Tartar medshets, or places of worship; a Greek seminary for divinity students, 2 gymnasias and 4 other public schools, 9 Tartar schools, a military school for 350 boys, an orphan asylum, and a Russian and a Tartar printing house. The city is strongly fortified, and contains an arsenal and an imperial powder-manufactory. From the lowness of its situation the town is unhealthy, and there is also a want of good water for drinking. *Casan* is the seat of several manufactures, particularly woollens, cottons, Morocco and other leather, soap, cutlery, jewellery, ironware, earthenware, tiles, gunpowder, spirits, and beer. It is the great mart for the products of the adjacent parts of Russia, and carries on an extensive trade by the *Volga*, of which teas and Asiatic manufactures are leading articles. There is an active transit trade with *Siberia*, *Bokhara*, and several parts of European Russia. The Tartars live as a distinct community from the Russians, and have settled on the opposite bank of the *Bulak*, upon the eminences around *Lake Kaban*; their dwellings are small and rude. *Casan* was captured by the Czar Ivan II., after a siege of 43 days, in the year 1552. The town was nearly destroyed by fire in 1774, again in 1815, from the explosion of the government powder stores; and in 1842, when more than half the city was reduced to ashes. These disasters are soon repaired in a country where timber abounds and houses are chiefly constructed of wood.

CASBIN, otherwise written *Casvin* or *Kazvin*, a city in Persia, is situated in about 36° 12' N. lat., 49° 53' E. long., 90 miles W.N.W. from *Teheran*. It was built about the middle of the 4th century. Under the princes of the Saffide dynasty *Casbin* became the capital of the kingdom, and remained so until *Shah Abbas* removed the seat of

government to Ispahan. Although now of diminished importance, it may still be considered a flourishing place. The town stands in an extensive valley or plain upwards of twenty miles in breadth, called the Plain of Casbin. This plain affords good pasturage. An extensive system of irrigation by means of subterraneous aqueducts called 'kanauts,' with the natural fertility of the soil, formerly rendered the plain of Casbin one of the most productive districts in Persia. Captain Wilbraham, who travelled through this part of Persia in 1837, describes the plain of Casveen as almost destitute of cultivation, owing to the want of water. "In the neighbourhood of Casveen," he adds, "long lines of canuts, or subterranean aqueducts, now choked with rubbish, intersect the plain, and bear evidence to the former cultivation of the district." The town is approached through a vast extent of vineyards and orchards interspersed with olive-trees and inclosed by high walls. From this it is clear that in the immediate environs of the town the system of irrigation still prevails. The grapes of Casbin are considered the best in Persia; and its pistachio-nuts also are abundant and highly esteemed. "The wine of Casveen," says Captain Wilbraham, "made by the Armenian inhabitants, is better than that generally met with in Persia." The town itself is inclosed by a mud wall with towers, but without any ditch. In extent it is said to exceed Teheran, but "whole streets lie in ruins, and it contains no buildings of note." The old traveller Herbert estimated the population at 200,000: in 1812 the males were estimated at 25,000. Velvets, brocades, and a coarse cotton-cloth called 'kerbas,' are manufactured at Casbin; and the place has also a considerable trade in raw silk and in rice obtained from the provinces along the Caspian. Any grandeur or magnificence which Casbin may once have possessed has been destroyed by repeated earthquakes, which have left little remaining of the more ancient structures but broken masses of domes, towers, and old walls. A ruined mosque, with a conspicuous dome, and the palace built by the Sufide princes, are the most remarkable remains. The palace, although surrounded with ruins, and for the most part abandoned, still serves as the residence of the prince-governor.

CASERTA. [TERRA DI LAVORO.]

CASHEL, county of Tipperary, Ireland, a bishop's see, a parliamentary borough, and the seat of a Poor-law Union, in the parishes of St. John the Baptist and St. Patrick's Rock, and barony of Middlethird, is situated in 52° 31' N. lat., 7° 54' W. long.; distant 105 miles S.W. from Dublin by the Great Southern and Western railway, from the Dundrum station of which it is distant 5 miles east. The distance from Dublin by the high road is 100 miles. The population in 1851 was 4798, besides 3449 inmates of the workhouse and other public institutions. The borough returns one member to the Imperial Parliament. Cashel Poor-law Union comprises 24 electoral divisions, with an area of 156,822 acres, and a population in 1851 of 45,176.

The city is built round the eastern and southern slopes of the remarkable eminence known as the Rock of Cashel, which rises abruptly from a rich plain about two miles east of the Suir. In the widest part of the main street are situated the market-house and shambles, and a public fountain. The principal public buildings are the modern cathedral, a large and handsome building with a lofty spire; the Roman Catholic chapel and a convent adjoining; the sessions court-house, bridewell, fever hospital, and infirmary. On the north side of the main street are the barracks, and on the southern acclivity of the hill is the deanery house, formerly the archiepiscopal palace, a handsome mansion with fine gardens and a good diocesan library of 9000 volumes annexed. Near the northern extremity of the main street access is had to the summit of the rock by a lun which passes behind the deanery gardens. The assemblage of buildings which occupies the summit is of remarkable interest, comprising, in addition to the extensive ruins of the old cathedral, a ruined tower and singular stone-roofed chapel of early Norman architecture, erected by Cormac Mac Carthy, petty king of Munster, in A.D. 1127.

The cathedral is in the form of a cross, the choir and southern transept embracing Cormac's chapel on two sides; the chapel however not being built due east and west, stands a little out of line, flanking the southern side of the choir, to which it serves as a chapter-house, and which is interposed between it and the round tower on the northern side. The other buildings on the rock are a hall for the vicars-choral, built by Archbishop Rd. O'Hedian (1421), who also repaired the cathedral, the old episcopal palace at the west end of the cathedral, and the remains of the abbey of the Rock of Cashel, founded by David Mac Carwell about 1260. A wall, intended for defence, some bastions of which were standing at the beginning of the present century, surrounds the platform on which the ruins stand, and completes the pile of building which, from its commanding situation, massive proportions, and singular variety of outline is justly considered the finest of the kind in Ireland. The chapel, an object of the highest architectural interest, consists of a nave and a small choir. There is a slender square tower built in the re-entrant angle of the choir at the south side, and rising considerably above the roof, which is of stone, of a very lofty pitch, springing from corbels, and concentrically vaulted underneath. The upper vault is gothic, being the only arch of that description in the entire building, and forms the ceiling of an apartment, the floor of which rests on the arch of the lower vault, which is Norman, and in like manner forms the ceiling of the nave below. This under-arch springs partly from

the thickness of the wall, and partly from the architraves of a double range of rudely-carved columns at either side: those of the lower range are square, adorned with a lozenge net-work, and form pedestals to the round columns of the upper tier, which are ornamented with bands and capitals. Outside, the corbels supporting the pedimented roof form the architraves to two similar tiers of pillars at either side, between the columns of the lower of which ranges the windows that light the nave are pierced. The principal dimensions are as follows: Length of the whole building outside, 53 feet; length of nave, 30 feet; breadth of nave, 18 feet; length of choir, 13 feet 8 inches; breadth of choir, 11 feet 6 inches; height of the roof from ground outside, 52 feet; slant of roof, 24 feet; mean thickness of the walls, 4 feet 1 inch; length of square tower, 10 feet: breadth, 6 feet 3 inches; height, 68 feet. These dimensions are given the more minutely as Cormac's chapel is by far the most perfect specimen of this description of building in the country, and as it gives a convincing proof not only of the existence but of the excellence of some works in stone and lime, exclusive of round towers, in Ireland before the coming of the English.

Donat O'Lonargan, the first bishop of Cashel who received the archiepiscopal pall, was succeeded in the see (1152) by Donald O'Hullucan, in whose time (1172) the great synod was held here, which has been so much celebrated by the early historians of the conquest as that at which the Irish prelates are alleged to have recognised the civil authority of the English king and the ecclesiastical superiority of the Anglican church. By this time a town had grown up around the seat of authority, large enough to make its burning in 1179 worthy of mention in the Irish annals. Donat O'Lonargan, the third archbishop of the name, erected the town of Cashel into a borough in 1223. David Mac Carwell, who became archbishop in 1253, founded the Chantry of St. Nicholas, the Abbey of the Rock of Cashel, and Hoar Abbey, a monastery for Cistercian monks, in the vicinity of the town, the ruins of which, still standing, attest its former splendour.

In the wars subsequent to the rebellion of 1641, Cashel was for some time garrisoned, and the rock put in a state of defence by Lord Taaffe, on the part of the Irish royalists; but Lord Inchiquin, who commanded the Irish parliamentary forces, having approached the town, which had been left by Lord Taaffe to defend itself, the inhabitants refused to accept Lord Inchiquin's terms, on which he carried the place by assault. On this occasion there was a great slaughter of the besieged, of whom above twenty priests and friars were slain before the assailants gained possession of the cathedral, when at length quarter was given, and the survivors suffered to return to their homes. The city was again taken by Cromwell. Up to the end of the last century Cashel seems to have been a flourishing place. Before the passing of the Irish Municipal Reform Act the town had fallen greatly to decay. The local administration is now vested in town commissioners, under whose care much improvement has taken place. The ancient water-works, alleged to be as old as the time of Edward II., have been repaired, and the streets have been lighted with gas. The income of the borough was 3679*l.* in 1849. Quarter sessions for the county of Tipperary are held here in rotation. Cashel possesses a National school and a savings bank. The market days are Wednesday and Friday. Fairs are held on the 26th of March, 7th of August, and on the third Tuesday in each month.

Prior to the passing of the Church Temporalities Act, 3 and 4 William IV. cap 37, Cashel was an archiepiscopal see, and united with the diocese of Emly; by that Act it was reduced to a bishopric, and united with the sees of Emly, Waterford, and Lismore. The income of the united dioceses is 5000*l.* a year. The diocese of Cashel comprises thirty-eight benefices, including all in the county of Tipperary. The chapter consists of a dean, archdeacon, precentor, treasurer, and five prebendaries.

(Kaiser, *Handbook for Ireland*; Petrie, *Ecclesiastical Architecture of Ireland*; *Trans. Royal Irish Academy*, vol. xx.; *Ordnance Survey Map*; Thom, *Irish Almanac*.)

CASHMERE, the most extensive of the alpine valleys of the Himalaya range, lies imbedded in high mountains, between 33° and 35° N. lat., 74° and 77° E. long. It extends from south-east to north-west, between 74 and 75 miles, and about 40 miles in breadth, when the declivities of the mountains are included. In the middle of the valley, near the capital, Sirinagar, there is a level plain some miles in width, which seems to have been once a lake. The plain of Sirinagar is surrounded by high hills, with rather a gentle slope, and covered with fine large trees and excellent pastures. Behind them rise the mountains, the loftiest of which is about 15,000 feet high.

Almost innumerable rivulets descend from the sides of the mountains on the margin of the snow-line, and are abundantly filled with water at all seasons. They join in the centre of the valley a river, which rises at its south-eastern extremity. This river called the Jehum, or Behut (the Hydaspes of Alexander), has at Sirinagar, about 60 miles from its source, so much water, that Bernier compares it with the Seine at Paris. Its course through the plain is gentle, and it continues so to the Lake of Wular, issuing from which in a westerly direction, the river enters a hilly country, where it is soon harrowed by steep rocks. It forms several rapids and cataraets, until it reaches Muzafforabad, a town of the Panjab. The Jehum joins the Chenab

(Acesines), and flows into the Indus. The Lake Wular has a circuit of about 40 miles. It is partly surrounded by extensive forests, in which there are numerous wild animals. Near the capital is another lake called Dhál, which, though shallow, is of considerable extent; it is divided by duns into several parts, and contains many floating islands.

Numerous canals intersect the plain in every direction, which, besides watering the contiguous lands, afford great facilities to communication, being large and deep enough to be navigated by river barges. In summer the heat though great is less oppressive than on the banks of the Ganges or Jumna. The winters are of course cold in a valley which is 5000 or 6000 feet above the sea. In 1822 Moorcroft found that the snow began to fall in the middle of December, and the plain was not clear of it before the end of March. The sky during the winter months (from December to March) is so misty that the sun is seldom seen, and when seen it is only for a short time. Towards the end of March and in April it is more frequently visible, but attended by a rapid succession of gusts of wind with hail. June, July, and August are hot; but the mornings, evenings, and nights are generally cool.

Sometimes, though rarely, a failure of the rice crop has been experienced, owing to the summer heat not lasting long enough to ripen the grain. Cashmere produces wheat, barley, buckwheat, millet, maize, pulse, and rice. Rice may be considered as the staple. It is grown at a considerable elevation on the declivities of the mountains, as the streams which descend from their sides afford facilities for watering the fields. The singhara, or water-tan, which during eight or nine months of the year is fished from the bottom of the Lake Wular, affords a supply of food for many of the poorer inhabitants. Of this article 60,000 tons are procured annually, sufficient for the support of 20,000 persons. The pith of the water lily also supports a considerable number of people during eight months. Turnips, spinach, loose-leaved cabbages, and lettuces of the same description, are raised in the usual way; and cucumbers, gourds, and melons, in great quantities, by the ingenious and simple contrivance of platform floating on the lakes. These swimming beds are commonly 2 feet thick, 7 feet broad, and of considerable length. Among the cultivated plants the crocus is the only one which furnishes an article of export, the saffron of Cashmere being known in all parts of Western Asia.

The principal fruits are apples, pears, peaches, quinces, apricots, almonds, pomegranates, mulberries, walnuts, hazel-nuts, pistachios, plums, cherries, and a nondescript species of grapes, called 'sangut' by the natives. This grape yields by distillation a beverage which, in the opinion of the Chinese, is not inferior to that of the ordinary grape. Common grapes also abound, and the wine which is made resembles Madeira. Most of these fruit-trees cover large tracts of ground on the declivities of the hills, and have no owners; the fruit is gathered by the labouring classes, and often constitutes their principal subsistence. No trees are cultivated with any care except the walnut, of which there are three different kinds. The kernel is eaten, and used for making oil; and the husks of the fruit are employed in dyeing black. Cashmere is famous for its flowers, especially roses, which are cultivated with care, and from them 'attar' is extracted.

Horses are not numerous, and are of a small size but hardy. More attention is paid to black cattle; the breed is not large, but gives abundance of milk. Sheep are very plentiful and their flesh is well flavoured; goats abound in different places. Neither poisonous nor carnivorous wild animals are said to exist in Cashmere; but the forests abound with some kinds of deer, and the rivers with fish and water-fowl. Bees are very numerous, and each farmer has several bee-hives in the walls of his house. These hives are of a cylindrical form, and extend quite through the wall. Silk-worms are reared to some extent. Iron is abundant. Copper, plumbago, and lead exist, but are not worked.

The population of Cashmere, formerly a million, was reduced by the tyranny of the Sikhs to about 200,000. It consists, with few exceptions, of the natives, who appear to be of Hindoo origin. The Cashmerians are industrious, which is shown in the excellence of their cultivation, and the perfection which their manufactures have attained. The principal branch of industry is shawl-making, in which 60,000 individuals are employed, though the number of looms, which two hundred years ago amounted to 40,000, has been greatly reduced. According to an estimate, 80,000 shawls are annually made, but the number is constantly fluctuating, so that no correct estimate can be formed. Paper is manufactured, and is considered the best made in Western Asia. The Cashmerians work with great skill and taste different objects in wood, which, as well as lacker-work, are exported to the neighbouring countries. The extraction of the attar of roses is an important branch of industry. The transport of goods over the high mountains is chiefly effected by men who carry them on their backs. Between Cashmere and Ladak sheep are employed to carry burdens.

Srinagar (Srinagari), the capital, contains not more than 40,000 inhabitants. It is nearly in the centre of the plain, on the right bank of the Jelum, and is traversed by two small rivers. The streets are narrow and dirty. The houses, built of wood, are commonly four stories high, and sometimes higher. The ground-floor serves as stables, and for holding agricultural or other utensils. The family

live in the first floor, and the third and fourth are used as magazines of goods and provisions. The roofs of the houses are covered with tulipan beds. There is no good public building. *Islamabad*, higher up the river Jelum, is also a considerable town, situated on the right bank, where the river becomes navigable for barges. *Sampre*, likewise a populous town, is also on the right bank of the Jelum, but about twelve miles below Srinagar.

Cashmere seems to have formed an independent kingdom up to the 13th or 14th century, when it was subjected to the Gaznevites, and afterwards united to the dominions of the emperors of Delhi. When that empire was destroyed, about the middle of the last century, Cashmere was taken by the Afghans, who remained in possession of it until 1819, when it became a part of the extensive dominions of the Maharaja Runjeet Sing, the sovereign of the Sikhs. It at present forms part of the territories held by Gholab Sing under British alliance and supervision. The area of the entire territories of Gholab Sing is 25,123 square miles, and the population amounts to 750,000. By the terms of the compact between the Maharaja and the British government the British supremacy is acknowledged on the one hand, and on the other the Raja is to be assisted in defending himself against his enemies. The Maharaja maintains a large military force.

(Bernier; Forster; Moorcroft in *Geographical Journal*; Von Hugel.)

CASOLI. [Abruzzo.]

CASPIAN SEA, an inland salt lake of great extent, which lies on the boundary-line between Europe and Asia. It extends from its most northern point, near the mouth of the river Ural (47° 20' N. lat.), to its most southern point (36° 40') which is nearly at an equal distance from the towns of Resht and Asterabad, in a straight line about 740 miles; but a curve drawn through the centre from its north-eastern corner at the mouth of the river Elba Djem or Kumba to its most southern shores measures about 900 miles. The general direction of its length is from south by east to north by west, but the northern part is curved to the east, and there forms a bay nearly as wide as the main body of the lake. Here its width from west to east is 430 miles, but its average breadth is only about 210 miles. Its most eastern point is the Gulf of Mertvoi Kultuk, which extends to 54° 10' E. long.; the Bay of Kuma on its western shore reaches to 46° 50'. The area covered by the Caspian Sea probably exceeds 180,000 square miles, a surface as large as that of Spain.

The Caspian Sea has very few bays. The most important are the Mertvoi Kultuk, or the Dead Sea, which forms the most eastern corner, and by one of its branches, the Tuk-Kara-su, incloses the peninsula of Manghislak on the east. Farther south, nearly in the middle of the eastern shores of the lake, is a smaller lake called Kooli Deria, which contains bitter water, and is united with the Caspian by an open strait. Still farther south is Balkan Bay, where the ancient mouth of the Amoo Deria, or Oxus, is said to have entered, and which Dr. Eichwald says he traced up its old bed for 5½ miles ('*Atto Geographie des Caspischen Meer*'). On the western side is the Bay of Salian, into which the Kur empties itself; and farther north the Bay of Kuma, which contains the mouths of the Terek and the Kuma. At the mouth of the Volga, the largest of the rivers that fall into the Caspian, there is no bay; the numerous islands formed by the deposits of the stream project some miles into the sea.

The shores of the Caspian are in general so low and flat that most parts are inundated when a strong gale from the opposite point blows for a few days. The highest shores are those of the peninsula of Abcheron, or Apsheron, which projects on the western side from 40 to 50 miles into the sea; but even here they do not rise to a great height. The southern portion of the sea, from the peninsula of Abcheron to the Bay of Asterabad, the south-eastern corner of the Caspian, is inclosed by the high range of the Elburz Mountains from 15 to 30 miles distant from the beach, between which and the water extends a low flat country.

The eastern shores, with the exception of the few gulfs above named, extend in nearly a straight line between 37° and 47° N. lat., from the Gulf of Asterabad to the bight of Emba, which receives the waters of the Emba at the north-east extremity of the sea. All the shore of this bight, as well as that adjoining it to the north and north-west, is extremely flat and shallow, in consequence of the sandy and other deposits carried down by the Volga, the Ural, the Tuck, and other large rivers. The consequence is that for several miles from the north and north-eastern shores there is only a few feet depth of water, and the great number of sand-banks and sand-hills make it difficult to land. There are similar sand-hills along the shore and inland among the steppes, but they do not form connected chains. From the Mertvoi Kultuk a small chain of calcareous hills called the Chink Hills forms the rampart of the plateau of Usturt, or the Turkman Isthmus, which extends nearly in a straight line with a breadth of about 150 miles between the Sea of Aral and the Caspian. This plateau descends abruptly to the basin of both seas; its height in some places exceeding 727 feet, and never being less than 550 feet above the level of the Caspian. The extreme headlands of this high plain surround the bight of Tuk-Kara-su, the southern branch of the Mertvoi Kultuk. The promontory of Tuk-Karagan is formed by the extremity of the Manghislak and Tuk-Karagan hills, which inclose the whole coast southward to Alexander's Bay, and extend nearly from

north to south. These hills consist throughout of recent tertiary formations. The depth along this coast is seldom so little as 6 fathoms, generally between 10 and 18 fathoms. Several rivers flow from the plateau into Alexander's Bay. Round the Bay of Kenderlin, still farther south, which is said to be very deep, the land shelves off, but a small chain of hills runs inland and is lost in the plateau. From 40° N. lat. the Bay of Balkan is bounded by the extreme points of the elevated plateau rising steep and precipitously from the shore, and presenting on the top porphyritic formations, which in remote times have broken through beds of granite, and which occur in some of the islands in the bay, and also at a great distance from the shore on the flat and elevated plateau. The plateau here also however is generally composed of the tertiary calcareous rocks, which towards the bay crop out in single protuberances. The extreme part of the plateau of Usturt is the Krasnovodo Mountains, which join the chain of the Great Balkan Mountains; these lie between the Bay of Balkan and the desert of Khiva. The south shores of the Caspian are low and swampy; but the mountains at a considerable distance show the porphyritic formations, especially about the snow-capped volcano of Demavend. The only considerable river that enters it from Persia is the Kizil-Ozein.

The depth of water is considerable towards the south extremity, where it attains 600 feet. In general the depth decreases considerably towards the shores. Along the western shore its waters deepen gradually by shallow steps. Its waters are not so salt as those of the ocean, as might be expected from the great volume of water thrown into it by the Volga and its other tributaries; along the shores, near the mouths of the rivers, horses do not refuse to drink.

The Russians of Astrakhan use brigs from 150 to 200 tons; but the Persians only small vessels from 50 to 70 tons. Russian steamers now ply on this sea between Astrakhan and the Persian coast. The navigation is dangerous, owing to the prevalence of north-west and south-east gales, which sometimes blow with great violence for many days together. They raise the surface of the sea from 3½ to 4 feet along the shores on which they blow, and inundate the contiguous low countries to a distance of several miles. The

give employment to the inhabitants of the adjacent countries. Numerous shoals of sturgeons, belugas, sterlets, salmon, and other fish at certain seasons ascend the rivers, especially the Volga, where such large quantities are taken that this fishery thought to be only inferior to that on the banks of Newfoundland. Seals are common, and are taken on some islands and on the eastern coast. [ASTRAKHAN.]

Naphtha or petroleum frequently occurs on the shores of this sea. In the peninsula of Abcheron the whole soil seems to be strongly impregnated with it. [BAKU.] It is perhaps found in still greater quantity on the island Naphthalin, or Tchileban, the largest of the islands of the Caspian Sea, situated in the Bay of Galkan.

The Caspian appears to be subject to some extraordinary changes in the level of its surface, which have not yet been completely investigated. The inhabitants of Enzillon, the port of the town of Readi, assured Colonel Monteith that it rises and falls several feet in periods of nearly thirty years; and Hanway has collected some facts to prove that in his time (1746) it had a much greater depth at several places than when it was navigated by the expedition of Peter the Great. Monteith himself observed in a few years a considerable decrease of its waters. There are no tides on the Caspian. The northern portion of it is annually covered with ice.

Since the middle of the last century it has been known that the surface of the Caspian Sea is lower than that of the ocean. It was observed that in Astrakhan the barometer was generally above 30 inches. In 1812 an attempt was made by Engelhardt and Parrot to settle this question by a series of levellings and barometrical measurements. They effected this across the Caucasian isthmus at two different places. One of these measurements made the Caspian Sea 54 toises, or about 248 feet lower than the Black Sea; the other gave a difference of about 47 toises, or about 301 feet. Doubts being reasonably entertained respecting the correctness of these measurements, the Russian government ascertained by a trigonometrical survey and a system of levellings executed in 1836-7 that the surface of the Caspian was only 84 feet lower than that of the Black Sea.

Strabo (xi. p. 509) says that the Caspian was connected with the Euxine through the Palus Mæotis (Sea of Azof) — an opinion revived by Pallas and other modern writers, who maintain that the Caspian Sea at some very remote period covered the extensive plain which lies between the most southern ranges of the Ural Mountains and the Black Sea. Pallas inferred this from the peculiar nature of the soil, which consists of sand partly mixed with other kinds of earth, and partly containing a portion of clay loosely mixed with it. There is no grass upon it; and shells frequently occur which are met with in the Caspian Sea. It is also impregnated with salt, and contains a great number of smaller and larger salt lakes, among which that of Elton is the best known, from which large quantities of salt are annually procured. This plain is bounded on the north by a wall-like ascent, elevated at an average 300 feet above it, which in the peculiar form of its margin resembles very much that of the coast of the sea. This ascent extends from the south-western extremity of the Ural

Mountains (the Obshtshei Syrt) in a south-western direction, crosses the Volga below its great bend to the east, and divides the source of the small river Sarpa (an affluent of the Volga) from that of the Manytsh. Hence it runs west, and terminates not far from the confluence of the Manytsh with the Don. According to appearances it is very probable that when the surface of the Caspian Sea was at a higher level there was a passage along the present course of the Manytsh River between the Caucasus and the above-indicated ascent, which united the Caspian and the Black Sea. Engelhardt, who determined by a series of levellings and by barometrical measurements the difference in the level of the two seas, estimated the source of the Manytsh to be only 16 toises, or 102½ feet above the Black Sea.

It is the opinion of some writers, both ancient and modern, that the Sea of Aral once formed a part of the Caspian, or rather that they were connected by an arm of the Oxus; but from the nature of the Turkman Isthmus, which is stated in our article on the Sea of Aral, it is extremely improbable that any river from Central Asia ever flowed into the Caspian. A further erroneous opinion, which is sanctioned by Strabo, extended the connection of the Caspian beyond the Aral, even to the Arctic Ocean; and Humboldt, in his 'Fragmens Asiatiques,' has traced out a comparatively narrow low tract of land, which extends on the eastern side of the Ural Mountains from the northern part of the Sea of Aral between the rivers Ishim and Irtysh, through the steppe of Buraba, and thence on the west of the Oby to the swampy coasts of the Arctic Sea. This low ground is indicated by a continuous series of lakes. Another ancient notion, preserved in a fragment of Hecateus, was that the Caspian and the Euxine were connected by the Phasis.

The Caspian was known to the Greeks and Romans. Herodotus (i. 203), the first who mentions it, calls it the Caspian Sea, a name probably derived from the Caspii, who inhabited its western coast. This name it has preserved, though later writers limited the term Caspian to the western portion, calling the eastern the *Hyrcanian Sea*. Herodotus gives a pretty just idea of its extent, stating that its greatest width was about one-half of its length; that it took a vessel with oars 15 days to traverse its length, and 8 days to cross its broadest part. He also maintains (i. 202) that it is an inland sea having no connection with the external ocean. Aristotle ('Meteorologica,' chap. 2) does not differ from the historian in his opinion as to the Caspian lake; but about this time an opinion began to prevail that the length of the Caspian Sea was in the direction from east to west. This form of the Caspian is preserved on all our maps up to the beginning of the last century, when Peter the Great sent an expedition to explore the sea.

(Pallas; Engelhardt; Humboldt; Col. Monteith, Eichwald, *Lomb's Geogr. Journal*.)

CASSAGNE-BÉGONHES. [AVEYRON.]

CASSEL, HESSE, Electorate of. [HESSE CASSEL.]

CASSEL, the capital of the electorate of Hesse Cassel, is situated in the province of Lower Hesse, on the Fulda, which is navigable, in about 51° 18' N. lat., 9° 30' E. long.; at a distance of 124 miles by railway from Frankfurt-am-Main, and has about 33,000 inhabitants. It is surrounded by walls on every side except that which is bounded by the Drusel. It has 11 large and small gates, and is divided into the Old Town, Upper New Town, and Lower New Town, and the three suburbs of Wilhelmshöhe, Frankfurt, and Leipzig. The Old Town is a collection of crooked, narrow, and dirty streets, which are rendered still darker by the height of the houses. It contains the spacious square called the Palace Square, which is 900 feet long and commands a prospect of the beautiful valley of the Fulda; the market-place; the first story of a vast unfinished palace begun by a former elector of Hesse in 1820; the public offices; the old town hall; the government buildings; the Stadtau, appropriated to public ments; the packing-hall, and the furniture-hall. There are likewise St. Martin's Church, with the catacombs beneath it, in which the remains of the sovereigns of Hesse Cassel are deposited; several other churches, a synagogue, an orphan asylum, and an hospital; an arsenal, foundry for cannon, a house of correction, and other public establishments. The Upper New Town is the finest quarter of Cassel, and may vie in splendour with any city in Germany. It contains the Friedrichsplatz, 1000 feet in length and 400 feet in breadth. In the square stands the Elector's palace, a building of no pretensions to elegance; in the centre of the square is a statue of the elector Frederick II. In this part of the town also are several smaller squares; the boulevards; the Royal Street, nearly a mile long; the barracks; and the street of Bellevue, which overlooks a splendid country. Among other edifices in this quarter are the museum, which is considered the finest structure in the town, and contains a library of 90,000 volumes, collections in numismatics, natural history, antiquities, experimental philosophy, &c., and an observatory; the Bellevue palace, and other palaces; the electoral stables and 'ding-house, town-hall, mint, the academy, lyceum, a normal, and civic school, the theatre, the New Town and Roman Catholic churches, an hospital and infirmary, a poor-house, &c. The Lower New Town is the site of the Castell, an ancient structure surrounded by walls and a ditch, for the safe custody of state and military offenders: it contains the Lower New Town church, a Protestant orphan-asylum, infirmary, lying-in-hospital, house of correction, prison, &c.

In the Leipzig suburb are an hospital, an infirmary, and a spacious building with laboratories; in the Frankfurt suburb, a bridewell or house of industry, poultry-hall, &c.; and in the Wilhelmshöher suburb, a large hospital. The town and its environs abound in beautiful promenades. Among these must be mentioned the Angarten with its marble baths, statues, and bas-reliefs; the summer palace-gardens at Wilhelmshöher famous for their water-works, their conservatories, and the theatre, built by King Jerome Bonaparte, and now converted into ball-rooms, and the cascade of Karlburg with its colossal statues of the giant Enceladus and Hercules, in the hollow of whose club eight persons may stand.

Independently of the establishments already mentioned, Cassel possesses an academy of arts, with schools of painting, sculpture, and design; a society of antiquarians, an agricultural association, a bible society, and a medical college. The manufactures of the town, none of which are on an extensive scale, consist of silks, cottons, hats, tobacco, earthenware, refined sugars, woollens, gloves, cutlery, &c. Cassel has two large fairs annually, but although it lies on a navigable river, it is not the seat of any great trade. Every great road about Cassel has avenues of trees.

CASSEL. [NORM.]

CASSINE. [ALESSANDRIA.]

CASSIS. [BOUCHES-DU-RHÔNE.]

CASSITERIDES, a group of islands, generally supposed to be the Scilly Islands. They are first mentioned by Herodotus (iii. 115), who professes however his entire ignorance of them. Strabo (iii. 175) observes—"The Cassiterides are ten in number, and lie near to one another, to the north of the port of the Artabri (Cape Finisterre), out in the open sea. One of them is uninhabited, but the rest are occupied by people who wear black clothing coming down to the feet and tied round the chest. They go about with sticks in their hands, and with beards as long as that of a goat. They live mainly on their flocks in nomadic fashion. They have mines of tin and lead, which with skins they give in exchange for earthenware, salt, and copper vessels, to the foreign merchants. In former times, the Phœnicians alone used to make this voyage from Gadeira (Cadiz), and kept it a secret from all the world.—The Romans, after repeated efforts, became acquainted with this navigation. P. Crassus having passed over to the islands, observed that the mines were worked at a very small depth, and that the inhabitants were peaceably disposed," &c.

The Greek name of the metal 'tin,' which is 'cassiteros,' occurs in the Iliad of Homer, and the name of the islands is obviously derived from the name of the metal. Cassiteros however may not be a genuine Greek word; it is probably derived from 'kastira,' the oriental term for tin, which may have been introduced to western Europe by the Phœnicians, who very probably traded in the tin of the Malayan Archipelago before they discovered that of Britain. It is difficult to suppose that Strabo's description applies to any other place than the Scilly Islands, and yet their position is not very accurately given by him.

CASTEL DI SANGRO. [ABRUZZO.]

CASTEL GANDOLFO. [ALBA LONGA.]

CASTEL RODRIGO. [BEIRA.]

CASTEL SARRASIN. [TARNE-ET-GARONNE.]

CASTEL VETRANO, a town in the province of Trapani, in Sicily, is situated near the left bank of the Delia, 30 miles E. from the town of Trapani, about five miles from the nearest point of the south coast of the island, and has a population of about 13,000. The town is famous in works in coral and alabaster. It is built on a hill, and is an old-looking place, with an old castle, several churches, convents, and palaces. The country round Castel Vetrano is fertile in wine and rich pastures. A few miles from Castel Vetrano, to the south-eastward, are the ruins of the ancient *Selinus*. This ancient site is covered with broken columns, capitals, and other architectural fragments. The columns are all Doric, and of large dimensions; they are called 'Giants' Pillars' by the peasantry. A few columns are still standing. Some finely-sculptured metopes were discovered at the base of the façade of the central temple in 1822. There are ruins of six temples in all. [TRAPANI.]

CASTELLAMMARE, the chief town of a subdivision of the province of Napoli, in the kingdom of the Two Sicilies, is situated near the head of the Bay of Naples, on the lower slopes of the Monte d'Auro (an offshoot of the limestone ridge of Monte Sant'Angelo), 18 miles by railway S.E. from Naples, and has a population of 18,000. It is connected by a branch railroad with the Naples-Nocera line, the first railway opened in Italy. The town stands on or near the site of the ancient *Stabiae*, which was ruined by Sylla in the Social war, and afterwards covered by ashes from Mount Vesuvius in the eruption of A.D. 79. During this eruption Pliny the elder lost his life at Stabiae. The hill above Castellammare is called Monte Qui-si-sana from its proverbial salubrity; it is covered with villas and casini; among the latter is the royal casino of Qui-si-sana, founded by Charles II. of Anjou, and now the property of the Russian prince Lieven. Behind the hill rises the imposing mass of Monte Sant'Angelo, which with its triple crest runs through the Sorrentine peninsula, and forms a conspicuous object between the bays of Salerno and Naples. The town derives its name (signifying 'castle by the sea') from its castle, which was erected by the emperor Frederick II., surrounded by walls and towers by Charles I. of Anjou in the 13th century, and subsequently strengthened by

Alfonso I. of Aragon. The town was sacked by the army of Pius II. in 1461, and again in 1654 by the Duke of Guise. The harbour has a depth of three to four fathoms water; it is surrounded by spacious quays and protected by a mole. In connection with the harbour are a bagnio for galley slaves, and a royal arsenal and dockyard, where the ships of the Neapolitan navy are built. These establishments contribute materially to the prosperity of the town. Castellammare has been celebrated since the time of Galen for its mineral springs, which are very efficacious in gouty and rheumatic affections. There are twelve of these,—four chalybeate, four saline, and four sulphureous,—and they all rise at the base of the Monte d'Auro, within a short distance from one another. They are all of moderate temperature, seldom exceeding 65° Fahr. Great numbers of visitors frequent Castellammare and its delightful neighbourhood during the summer and autumn; the temperature is 8 or 10 degrees lower than that of Naples. The town, which gives title to a bishop, and has a handsome cathedral, is well built, partly on the lower slopes of Monte d'Auro but chiefly along a sheltered beach commanding a view of the whole bay of Naples. Some wheat is exported; the chief imports are coal, timber, and machinery. Among the industrial products are macaroni, silk and cotton goods, and sail-cloth. The fisheries along the coast employ a good many hands. Some excavations made among the ruins of Stabiae in 1745 brought to light a few fragments of sculpture, some papyri, and paintings, which are now in the Museum of Naples.

There is another *Castellammare*, or *Castellamare*, in the province of Trapani in Sicily. It is situated on the southern shore of the Gulf of Castellamare, 22 miles E. from the town of Trapani, 27 miles W.S.W. from Palermo, and has about 6000 inhabitants. The town, which is ill-built and dirty, is named from its old decaying castle. It carries on a considerable trade by sea, and has large granaries; the exports are corn, wine, fruit, cotton, manna, shumac, &c. The remains of the ancient Segesta are near Castellamare: they consist of a Doric temple in tolerable preservation, the ruins of a theatre, and a part of the city walls. Castellamare is said to occupy the site of the port of Segesta. [TRAPANI.] The town was half destroyed by a waterspout in December 1851.

CASTELLANE. [ALPES, BASSES.]

CASTELLAZZO. [ALESSANDRIA.]

CASTELLO BRANCO. [BEIRA.]

CASTELLON DE LA PLANA. [VALENCIA.]

CASTELLUCIO. [BASILICATA.]

CASTELNAU. [LOT.]

CASTELNAUDARY. [AUDE.]

CASTILE, the name generally given in English to the ancient Spanish kingdom and provinces of Castilla. [CASTILLA.]

CASTILLA, the name of one of the ancient kingdoms of Spain, which was at first a condado (county), subject in some degree to the kings of Leon. In 1028 the last Conde de Castilla died without issue, and the condado fell by inheritance to his sister, who was the wife of Sancho III., king of Navarra. In 1033 the condado was created into a kingdom, in favour of Fernando, second son of Sancho, by treaty with Bermudo III., king of Leon, whose wife was sister to the wife of Fernando. The kingdom of Castilla thus established was on the death of Bermudo in 1037 united to that of Leon, and so continued till 1479, when Fernando II. of Aragon succeeded his father, Juan II., as king of Navarra. Fernando in 1469 had married Isabel, queen of Castilla, and the kingdoms thus united under Fernando and Isabel afterwards, on the death of Isabel in 1504, when Andalucia and the eastern kingdoms had been wrested from the Moors, constituted the present kingdom of Spain.

Castilla seems to have been so called from the number of forts or castles (castillos) which had been erected for the defence of the territory recovered from the Moors. The northern part of this territory, which was first recovered, and which is separated from the southern by a mountain range, received the title of *Castilla la Vieja* (Old Castile), and the southern that of *Castilla la Nueva* (New Castile), and they constituted two of the ancient provinces of the kingdom of Spain. They occupy the largest portion of the great central plateau or table-land of Spain, which has an average elevation of 2500 feet above the level of the sea.

CASTILLA LA NUEVA, an ancient province of Spain, one of the two divisions of the ancient kingdom of Castilla, is bounded N. by Castilla la Vieja, S. by Andalucia and Murcia, W. by Estremadura, and E. by Aragon and Valencia. It is situated between 38° 23' and 41° 15' N. lat., 1° and 5° 25' W. long. Its greatest length from east to west is about 250 miles, from north to south about 195 miles. It comprises the following modern provinces:—

Provinces.	Area in Square miles.	Population in 1849.
Madrid	1,315	405,737
Toledo	8,773	330,600
Guadalajara	1,946	199,746
Cuenca	11,295	252,723
Ciudad Real (La Mancha)	7,513	302,594
Total	50,872	1,190,800

Madrid, Toledo, and Guadalajara, occupy the northern portion of the province, Cuenca and Ciudad Real (La Mancha) the southern.

Surface.—The northern boundary of Castilla la Nueva is formed for the most part by a range of high mountains, which, sweeping round from the mountain mass of the Moncayo, on the borders of Aragon, extends in a west-south-west direction to the Tagus in Estremadura. This mountain range at the western end is named the Sierra de Gata, Sierra de Gredos, and Sierra de Avila; north of Madrid it is named the Sierra de Guadarrama, the Somosierra, and the Sierra de Guadalajara. Further east it is called the Sierra de Deza, which is connected with the lofty sandstone mass of the Moncayo. It forms an unbroken chain which prevents all direct communication northward from Madrid, except by the lofty pass of the Somosierra. Two other roads however extending in a north-east direction cross the Guadalajara range, and uniting before they reach Calatayud, lead to Zaragoza. The summits of several parts of this mountain range are covered with snow all the year. Another mountain range of less elevation than the former commences also at the mountain knot of Moncayo, and entering Castilla la Nueva near the sources of the Tagus, takes first the name of the Sierra Molina and afterwards that of the Montañas de Toledo. The general direction of this series of mountains is from east-north-east to west-south-west, and they divide the province into two extensive plains. The more northern has a uniform inclination from east to west, and is watered by the Tagus and its tributaries. The southern plain, which is separated from Andalusia by the Sierra Morena [ANDALUCIA], has not a uniform inclination, the eastern part having a southern slope, while the western part has a general slope towards the west. The Sierra Molina taking a south-west direction separates into two ridges, one running west and joining the Montañas de Toledo, the other, called the Sierra de Cuenca, running south to the Sierra de Alcaraz, in the south-east of La Mancha.

The mountains consist chiefly of limestones, marbles, clay-slates, and gypsum. The province is rich in minerals, but they have not been wrought to any extent, with the exception of salt, iron, jasper, in the quarries near Cuenca, and quicksilver, in the great mine of Almaden. [ALMADEN.]

Rivers.—The northern plain of Castilla la Nueva, comprising the provinces of Madrid, Toledo, and Guadalajara, is drained by the Tagus (in Spanish Tajo) and its numerous tributaries, which before they reach the city of Toledo flow for the most part in a west-south-west direction across the great plain; but the Tagus, after passing Toledo, runs through a deep and long valley walled in on both sides by lofty mountains, offsets from the Montañas de Toledo on the south, and from the Sierra de Gredos on the north. The principal feeders of the Tagus, in Castilla la Nueva, are, on the northern bank, the Tajuña, the Henares, and the Jarama, which enter the Tagus by one channel near Aranjuez; the Guadarrama, which enters it below Toledo; and the Alberche, which enters it a little above Talavera de la Reyna. On the southern bank the Cedron and the Algodar unite, and fall into the Tagus above the city of Toledo; below, a large number of short tributaries reach it from the Montañas de Toledo. Neither the Tagus nor any of its tributaries is navigable in this province.

The southern plain, comprising the provinces of Cuenca and Ciudad Real, or La Mancha, is drained chiefly by the Guadiana and its tributaries, which have a general western direction, and by the Jucar and its tributaries, which flow to the south and east, passing through Murcia and Valencia to the Mediterranean Sea. The Guadiana rises about 39° N. lat., and after making a curve towards the south, runs north-west past Argamasilla; below this it flows underground for about 15 miles, reappearing through a series of small lakes called the Ojos de Guadiana (Eyes of the Guadiana) a little above the town of Daimiel, near which it receives the Gigueta on the northern bank and the Azuer on the southern; thence its course is west till it receives the Cambron from the north, after which it takes a southern direction till the Jabalon enters it from the south-east, when its course becomes west, and having received the Bullacho from the north enters Estremadura. It is not navigable in any part of this province. The Jucar rises in the Sierra Molina, and flowing south receives the Jara, and then turning east enters Valencia, where it receives the Cabriel with its tributaries the Moya and Guadazaon.

Climate and Productions.—The climate is dry and healthy, but owing to the elevation of the surface the winter is very cold. In summer the heat is great; violent winds sweep the plains, which then become dry and dusty. The soil is generally fertile, and produces abundant crops of wheat. Water is scarce, the average fall of rain on the table-land being only ten inches. There are few trees, and the plains being without hedges or inclosures of any kind have a cheerless and monotonous aspect. The slopes of the mountains and the valleys afford plentiful pasture to large flocks of sheep. Cattle and horses are also reared, but not in large numbers. Mules and asses are numerous and of great beauty. The principal objects of cultivation besides wheat are olive-oil, wine, fruits, saffron, honey, hemp, silk, and garbanzos, a sort of pea much used for food. The wines of Almagro and Val de Peñas are in high estimation. Wood for fuel is scarce except in the vicinity of the mountain forests, which contain plenty of timber and smaller wood, but are difficult of approach for want of good roads, in consequence of which almost the only means of transport for all kinds of produce is on the backs of mules. The

manufactures consist mostly of coarse cloths and other articles of common use.

Towns.—*Madrid* is the capital of the kingdom of Spain, of the ancient province of Castilla la Nueva, and of the modern province of Madrid. [MADRID.] *Alcalá de Henares*. [ALCALÁ DE HENARES.] *Arganda*, 16 miles S.E. from Madrid, has a population of 3800. It stands in a fertile district between the rivers Jarama and Tajuña. *Escorial*, 24 miles N.W. from Madrid, stands on the southern slope of the Sierra de Guadarrama: the population is about 1500. The town grew up round the magnificent monastery of San Lorenzo, founded by Philip II. The ground-plan of the building is in the form of a gridiron. It contains a fine collection of paintings; a library rich in ancient and especially in Arabic manuscripts; and vaults in which are the tombs and monuments of some of the kings and queens of Spain. A royal residence is attached to it. The grounds are beautifully laid out, planted with trees, and adorned with fountains.

Toledo is the capital of the province of Toledo. [TOLEDO.] *Alcazar de San Juan*, 57 miles S.E. from Toledo, is a small town, in the neighbourhood of which are mines of iron, and which has saltpetre-works and powder-mills. *Aranjuez*, 25 miles N.E. from Toledo and 28 miles S. by E. from Madrid, stands on the south bank of the Tagus, and contains a royal palace and gardens: the permanent population is about 4000. The situation is beautiful, and is much resorted to in summer. The town contains a large bull-arena (Plaza de Toros), a theatre, and numerous hotels, cafés, and public walks. *Consuegra*, 35 miles S.E. from Toledo, stands on the Amarguilla. There are remains of an ancient castle and Roman antiquities. Coarse woollens are manufactured: the population is about 5000. *Herencia*, 54 miles S.E. from Toledo, stands on the southern bank of the Amarguilla. It is a considerable town, with manufactures of soap and a large weekly market: population, 6400. *Madridejos*, 42 miles S.E. from Toledo, is situated near the northern bank of the Amarguilla, which sometimes overflows and damages the town. It is an ancient well-built town, with two parish churches. It has manufactures of serge and a large annual fair: population, 6000. Saffron is largely cultivated in the vicinity. *Talavera de la Reyna*, 45 miles W. from Toledo, stands on the northern bank of the Tagus. It is surrounded by walls flanked with towers. It contains eight churches and a college, and has manufactures of earthenware, leather, and soap: population, 8000. The Tagus is here crossed by a stone bridge. In the vicinity was fought the battle of Talavera, July 27th and 28th, 1809. *Tarancon*, 60 miles W.N.W. from Toledo, stands near the northern bank of the Rianzaros: population, 5000.

Guadalajara is the capital of the province of Guadalajara. It is 35 miles N.E. from Madrid, and stands on the eastern bank of the Henares. The town is large, but ill-built; it contains however several imposing edifices, among which are eight churches, a fine old palace of the Mendozas, and a royal cloth manufactory: population about 7000. Guadalajara is the chief town of the fine pastoral and wheat district called the Alcarria, which is an Arabic word meaning 'a place of farms.' *Brivega*, 20 miles N.E. from Guadalajara, stands on the west bank of the Tajuña, also in the district of Alcarria. It is an old town, with a population of 5000. *Siguenza*, 40 miles N.N.W. from Guadalajara, stands on the left bank of the Henares. It is an ancient episcopal town, and contains a large gothic cathedral richly decorated in the interior, and containing several fine monuments. There are three other churches, a college, and two hospitals: population, 5000.

Cuenca is the chief town of the department of Cuenca. It is 90 miles E.S.E. from Madrid. It stands on a high hill not far from the Jucar, and has a population of 8000. It is the seat of a bishop, and has a large handsome and richly-decorated cathedral. The town is surrounded by walls, is well supplied with water, and has some woollen factories, paper-mills, and establishments for washing wool. *Utiel*, or *Hiniesta*, 48 miles S.S.E. from Cuenca, contains a fine parish church, and has manufactures of coarse woollens: population, 4000. There are some jasper-quarries in the neighbourhood. About two miles E. from *Minglanilla*, a village with 1500 inhabitants, there are very extensive mines of pure rock-salt. *Molina de Aragon*, 65 miles N. by E. from Cuenca, stands on a slope overlooking the Guilo, a small stream. It is surrounded by walls, and has a castle. A large part of the town was burnt by the French in 1810. There are manufactures of cloth and soap, and it has a good trade in corn and wool: population, 4000. Molina originally belonged to Aragon, but was incorporated with Castilla in 1293. *Requena*, 70 miles S.E. from Cuenca, is situated on an elevation which overlooks a rich plain. It contains two gothic churches, and has manufactures of woollen, cotton, and silk: population, 11,000. *Utiel*, 9 miles N.W. from Requena, has manufactures of hemp, linen, silk, soap, and leather: population, 6000.

Ciudad Real is the capital of the province of Ciudad Real, which comprises the greatest part of the old province of La Mancha. It is a city, 97 miles S. from Madrid, and stands in a plain between the Jabalon and the Guadiana, on the road from Madrid to Cordova. It is surrounded by walls, is tolerably well built, and has 10,000 inhabitants. In the Plaza Mayor there is a large bull-arena. The town has three fine churches, a college, and five hospitals, one of which, founded by Cardinal Lorenzana, is a noble building. A great fair for cattle, mules, and asses is held yearly. *Almaden* is celebrated for

its quicksilver-mines. [ALMADEN.] *Almagro*, 12 miles S.E. from Ciudad Real, is situated in a fertile plain, which produces corn, oil, and wine. It is celebrated for its mules, which are considered among the best in Spain, for the sale of which an annual fair is held. It has extensive manufactures of lace: population, 12,000. *Daimiel*, 20 miles N.E. from Ciudad Real, stands in a district where there are extensive salt-marshes. It has manufactures of woollens and linens, and is a flourishing place: the population in 1845 was 9128. *Manzanares*, 27 miles E. from Ciudad Real, stands in a plain. It contains a parish church, hospital, cavalry barracks, and an old castle: population, 8500. *Solana*, 5 miles S.E. from Manzanares, has manufactures of linens and woollens: population, 4400. *Val de Peñas*, 30 miles S.E. from Ciudad Real, is a large straggling town, celebrated for the red wine which is made from the vines grown in the surrounding rocky district: population, 9870.

(*Mifano, Diccionario Geografico de España; Dictionnaire Géographique; Maps of the Society for the Diffusion of Useful Knowledge; Ford, Handbook of Spain; Madoz, Diccionario de España.*)

CASTILLA LA VIEJA, an ancient province of Spain, one of the two divisions of the ancient kingdom of Castilla, is bounded N. by the Bay of Biscay and province of Vizcaya, W. by Leon and Asturias, E. by Navarra and Aragon, and S. by Castilla la Nueva. It is situated between 40° 5' and 43° 32' N. lat., 1° 40' and 5° 35' W. long. Its form is very irregular: the greatest length from north to south is about 220 miles, the greatest breadth from east to west is about 130 miles, but in some parts less than 30 miles. It comprises the following modern provinces:

Provinces.	Area in Square Miles.	Population in 1849.
Burgos	7674	231,022
Logroño		185,519
Santander		190,000
Soria		110,000
Segovia	4076	155,000
Avila	3166	132,936
Total	2570	1,037,477

Burgos occupies the western part of the province, Segovia and Avila the south-western, Soria and Logroño the eastern, and Santander the northern.

Surface.—The continuous chain of lofty mountains which extends in a south-western direction from the mountain mass of the Moneayo in Aragon to Estremadura, separates Castilla la Nueva from Castilla la Vieja, and divides the waters which fall into the Tagus from those which fall into the Douro (in Spanish Duero). The names of the different portions of this series of lofty sierras have been mentioned under CASTILLA LA NUEVA. The northern part of the province is crossed by the Cantabrian mountain range, a continuation of the Pyrenees, and this range separates the province of Santander from that of Burgos. The Sierra de Deza extends from the Moneayo in a south-west direction through the province of Soria, and unites with the Somosierra; whilst other mountain groups extend from the Moneayo north-westward towards Burgos, separating the streams which fall into the Duero from those which fall into the Ebro. North-east of the city of Burgos the Sierra de Oca, one of these groups, extends northward and joins the Cantabrian chain, separating the head-waters of the Pisnerga from those of the Ebro. In the south-west the province of Avila passes over the Sierra de Avila into the basin of the Tagus. The greater part of Castilla la Vieja is mountainous, but it has one large plain which is crossed by the Duero and its numerous tributaries, the northern part of it belonging to the department of Burgos, which extends south nearly to the Duero; the eastern part, which is hilly, to that of Soria, while the southern and western portions of it form the greater part of the departments of Segovia and Avila. There are other smaller plains between the different mountain groups, as well as numerous fertile valleys. The general height of the plains is not much less than 3000 feet. The province of Santander is almost entirely covered by high mountains, offsets from the Cantabrian chain; they are furrowed by deep and narrow valleys, and extend northward about 25 miles to the shores of the Bay of Biscay. The coast-line of this province is about 80 miles in length.

The great mountain range which separates the two Castillas consists of primitive rocks; the two great plains on each side of that range are lacustrine deposits of limestone, with fresh-water fossils. The Moneayo is a mass of old red-sandstone and mountain-limestone.

Rivers.—Castilla la Vieja has a general slope to the west, and is drained by the Duero and its affluents; but the portion which is north-east of the Sierra de Oca is drained by the Ebro and its affluents; while the rivers of the province of Santander have all a short and rapid course northward to the sea. The Duero rises in this province, and after flowing southward past the town of Soria takes a western course, and enters the province of Leon. [Douro.] The Ucero has a southern course, and falls into the Duero on the north side. The Arlanzon has a western course past Burgos; it then turns to the south-west, and having received the Arlanza, which has

a western course past Lerma, enters the Pisnerga, a large tributary which flows south and south-west through the province of Leon. The Riaza, the Piron and Cega (which unite), and the Eresma and Adaja (which also unite), fall into the Duero on the southern side. There are several smaller affluents, which in summer are reduced to mere brooks, but during the rains of spring and autumn become rapid torrents. The Ebro crosses the northern part of the province of Burgos, and forms the north-eastern boundary of that of Soria. It receives the Neba on the northern bank, and the Oca, the Tiron, and the Oja on the southern bank. The principal rivers of the province of Santander are the Deba, the Nansa, the Besaya, the Miera, and the Anson.

Climate and Productions.—The climate is excessively hot in summer, and very cold in winter. A cold boisterous wind blows in October, and snow covers the ground often for three months, and rests on the summits of the mountains for a great part of the year. The surface of the great plain is of a truly monotonous character: it is arid, without meadows or trees, covered with a scanty vegetation, which in summer almost entirely disappears. A considerable quantity of wheat is exported, but care is paid especially to the rearing and feeding of sheep, the number of which is very great. In summer the mountain pastures of the sierras are frequented by countless numbers of migratory sheep, which remain here till the beginning of October, when they commence their return to Andalusia for the winter. The inhabitants live in hamlets, which are often several miles distant from each other. The want of wood for fuel is greatly felt. The offshoots of the mountains on the borders of the plain are covered with underwood and evergreens, and in many places with extensive forests; and in the sheltered parts peas, wine, wheat, and oil are abundantly produced. The manufactures of Old Castile are confined to coarse woollens, cotton, linen, leather, and glass. On the eastern side of the Sierra de Oca the country is very mountainous, but contains many fertile valleys and high plains, in which corn, wine, and all kinds of fruits, except oranges and lemons, are produced. This portion of the province forms the northern part of the provinces of Burgos and Soria. Sheep, mules, pigs, asses, and horned cattle are very numerous, and form the principal wealth of the country. The mountains are cold and wild, but in summer afford excellent pasturage; and in many places they are covered with forests of chestnut, fir, and pine. Iron and other minerals abound, but no mines are worked. In the province of Santander, maize, wheat, and wine of inferior quality are produced. The highlands contain fine pasturage, and in many places are covered with forests of chestnut, oak, pine, and fir. A great deal of butter is made. Goats are very numerous. There are iron-mines, from which a considerable quantity of iron of the best quality is obtained.

Towns.—*Burgos* is the capital of the province of Burgos. [BURGOS.] *Aranda*, 48 miles S. from Burgos, stands on the north bank of the Duero, among plantations of vines. The river is here crossed by a good bridge. The town contains a gothic church and a bishop's palace: population, 4000. *Briviesca*, 25 miles N.E. from Burgos, stands near the west bank of the Oca. It is a square town, regularly built, and walled: population, 2500. *Lerma*, 25 miles S. from Burgos, stands on the south bank of the Arlanza. It contains a fine old palace, built by the Cardinal-Duke of Lerma: population, 2000. *Miranda del Ebro*, 50 miles N.E. from Burgos, is situated on the southern bank of the Ebro, which is here crossed by a stone bridge of six arches: population about 3000.

Logroño is the capital of the province of Logroño. This province is of recent formation. It extends along the right bank of the Ebro, from near Miranda del Ebro to Alfaro and southward to the Sierra de Oca, thus including portions of territory which previously belonged to the provinces of Burgos and Soria. The town of Logroño is about 67 miles E. by N. from Burgos. It is situated on the southern bank of the Ebro, which is here crossed by a strong bridge, built in 1138. It is surrounded by walls, outside of which there are two suburbs. It is a well-built town. There are several churches, a college, and a theatre, and some manufactures of leather, hats, and brandy: population, 7000. The plains about the town are very fertile in corn. *Alfaro*, 37 miles E.S.E. from Logroño, stands on the Alhama near the right bank of the Ebro. It is a walled town, contains a collegiate church, and has manufactures of soap and leather: population, 4000. *Arnedo*, 32 miles S.E. from Logroño, is situated in a fertile district, and has a good trade in wine and fruits: population, 3500. *Calahorra*, 21 miles E.S.E. from Logroño, is situated on a gentle eminence, at the foot of which the Cidacos enters the Ebro. It is the *Calagurris* of the Romans, and was a very strong place, celebrated for the sieges by Pompeius and Afranius. It was the birthplace of Quintilian. Portions of a circus, an aqueduct, a naumachia, and towers, have been traced. It contains a cathedral of mixed gothic. It is now a decayed town: population, 6000. *Haro*, 46 miles E.N.E. from Burgos, is situated at the foot of a hill near the southern bank of the Ebro. It has manufactures of hats, leather, brandy, and liquors: population, 6000.

Santander, the capital of the province of Santander, is a large town and sea-port, on the shore of the Bay of Biscay, about 85 miles N. from Burgos. It stands on a headland, and is a well-built town, with a capacious well-sheltered harbour deep enough for large vessels. It

is a place of considerable commercial activity, and carries on an extensive trade with Cuba, to which it exports flour ground at the large mills in the neighbourhood. Wool is exported to England and other countries. The imports consist chiefly of colonial produce. The town is the seat of a bishop, and has a cathedral, three other churches, three hospitals, a prison, college, theatre, and baths. The population in 1845 was 15,286. *Laredo*, 17 miles E. from Santander, is a small town with a harbour formerly deep but now choked up with sand, population, 3000. *Santillana*, 17 miles S.W. from Santander, stands near the coast in a rich valley on the Besaya, a feeder of the Besaya: population, 2000. *Santona*, 15 miles E. from Santander, is a small fortified town on a peninsular headland in the Bay of Biscay. It has a good harbour, and the town contains an arsenal and barracks, and there are anchor-forges: population, 1000.

Soria, the capital of the province of Soria, is 75 miles S.E. from Burgos. It stands on the right or western bank of the Dnero, about 30 miles from its source. It is surrounded by a thick wall, but the citadel, formerly strong, is now in ruins. It has manufactures of silks and a good trade in wool. Much corn is produced in the plains near the town, and numerous sheep are pastured on the slopes of the neighbouring hills: population, 3500. *Agreda*, 30 miles W.N.W. from Soria, stands at the foot of the Moncayo, and is divided into two portions by the Quieles, which is here carried under ground, with the plaza, a fountain, and houses over it: population, 3800.

Segovia, the capital of the province of Segovia, 100 miles S. by ... from Burgos, stands on a rocky eminence between two deep valleys, one of which is watered by the Eresma, and the other by the Clamores. It is a very ancient city, and was the residence of the early kings of Castilla. It is a long city with narrow streets, is surrounded by walls, and contains many remarkable buildings, among which is a vast gothic cathedral, which has a tower 330 feet high. The alcazar, formerly the residence of the Moorish governors, is now converted into a military college. A magnificent Roman aqueduct, consisting of two tiers of arches built of square blocks of granite without cement, is in a state of great perfection. Segovia is the seat of a bishop, has a handsome plaza, a mint, and five churches. There are manufactures of woollen cloths, paper, earthenware, and glass: population, 7700. *San Ildefonso*, 8 miles S.E. from Segovia, stands on the northern slope of the Sierra de Guadarrama. It is famous for its manufacture of glass, and still more so for the splendid palace and grounds of *La Granja*, which is one of the seats of the Spanish kings, and the highest royal residence in Europe, being 3840 feet above the sea-level. The palace grounds include fine gardens, a richly-decorated church, and beautiful water-works. The palace contains many splendid apartments: population of the town 3890. *Sepulveda*, 35 miles N.E. from Segovia, is beautifully situated on the Duraton, an affluent of the Duero. It is an ancient town, now in a decayed state: population, 2000.

Avila, the capital of the province of Avila, is 50 miles S.W. from Segovia. It was formerly a place of importance, but is now decayed. It has still however a fine old cathedral and a Dominican convent, both of which contain beautiful monuments. The extramural church of San Vicente is curious. It is said to have been built in 313. The town has manufactures of woollen: population, 4000.

(Miñano, *Diccionario Geografico*; Madoz, *Diccionario de España*; Ford, *Handbook of Spain*; Macgregor, *Statistics*.)

CASTILLON. [GIRONDE.]

CASTLE CAREY. [SOMERSETSHIRE.]

CASTLE COMBE. [WILTSHIRE.]

CASTLE HEDINGHAM. [ESSEX.]

CASTLE RISING. [NORFOLK.]

CASTLE WARD, Northumberland, the south-eastern division of the county, and giving name to a Poor-Law Union. The river Tyne separates the ward and the county from the county of Durham. Castle Ward Poor-Law Union contains 78 parishes and townships, with an area of 85,107 acres, and a population in 1851 of 13,897.

CASTLEBAR, county of Mayo, Ireland; a market, post, and assize-town, and the seat of a Poor-Law Union, in the parish of Aglish and barony of Carr, lies in 53° 51' N. lat., 9° 15' W. long., distant 159 miles W.N.W. from Dublin: the population in 1851 was 4436, besides 1584 in the workhouse and other public institutions. Castlebar Poor-Law Union comprises 19 electoral divisions, with an area of 151,900 acres, and a population in 1851 of 36,746.

Castlebar is situated on the Castlebar or Clydagh River, which, rising in the little lake of Castlebar, within a mile and a half of Clew Bay on the west, flows north-east with the Moy, which it meets in Lough Cullin, to Lough Conn, an inland lake in the centre of the barony of Tirawley, and thence runs northward to Killala Bay by Ballina. The river, winding in a serpentine direction through the town, is crossed by three bridges. The principal street, upwards of half a mile in length, occupies the line of road leading from Westport to Swineford. The public buildings are chiefly grouped together round an open space called the Green, near the entrance from Westport. They consist of the county jail, a large building with a castellated front, a county court-house for Mayo, the church, with a handsome embattled tower, the infirmary, and artillery barracks. A cross street, occupying the line of road from Dublin to Newport, leads by a bridge over the Clydagh to the northern division of the

town. The old jail and infantry barracks adjoin the entrance from the Dublin road by this street. The suburbs on both sides consist of wretched cabins.

The town is of comparatively modern origin; it is stated in the 'Report of the Commissioners on Bogs in Ireland' (1814), that 80 years before that time there was but one cultivated field of about eight acres between Castlebar and the sea. The castle, which gives its name to the place, was a stronghold of the De Burghs. In the wars of the rebellion of 1641 it was held by Sir Henry Bingham for the Parliament, when, being besieged by Lord Mayo and his son Sir Theobald Burke, on the part of the Irish Catholics, he surrendered on terms of being conveyed with his troops in safety to the next garrison town, but after three days' forbearance the fury of the insurgents could no longer be restrained, and Bingham, with all his company, was barbarously massacred. After the old lord's death his son Sir Theobald, then Lord Mayo, was tried for the offence by a special commission appointed for that purpose, 17th December, 1652, and being found guilty and sentenced to death was shot on the 15th January, 1653. Towards the end of the rebellion of 1798, General Humbert, having landed at Killala with a force of not more than 1000 French infantry, reinforced by about an equal number of undisciplined peasants of the country, met at Castlebar and put to rout 6000 British troops commanded by Generals Lake and Hutchinson. The action has since been generally known as 'the race of Castlebar.' The town fell into the hands of the insurgents, by whom it was occupied for about a fortnight, till the surrender of Humbert at Ballinamuck (8th September 1798) put an end to the expedition.

Castlebar has some trade in linens, but the vicinity of Westport, which at a distance of eight miles has the advantages of being a sea-port town and the residence of an enterprising proprietor, operates considerably to its disadvantage. The vicinity is picturesque and well cultivated. Castlebar as a parliamentary borough was disfranchised at the Union. It is the county town for Mayo, and suffered extreme impoverishment in consequence of the potato famine of 1846-7. There is a savings bank in the town.

(Carte, *Ormond*; Fraser, *Handbook*; *Ordnance Survey Map*.)

CASTLEBLAYNEY, county of Monaghan, Ireland, a market and post-town, and the seat of a Poor-Law Union, in the parish of Muckno and barony of Cremorne, is situated in 54° 7' N. lat., 6° 46' W. long.; distant 62 miles W.N.W. from Dublin by road, and 73 miles by the Dundalk and Enniskillen railway. The population in 1851 was 2084, besides 757 inmates of the Union workhouse and other public institutions. Castleblayney Poor-Law Union comprises 21 electoral divisions, with an area of 94,213 acres, and a population in 1851 of 46,511.

The town is prettily situated adjoining the richly planted and picturesque demesne of Castleblayney, within the grounds of which the parish church is situated. There are chapels in the town for Presbyterians, Methodists, and Roman Catholics. The town consists of three principal streets radiating from the market-house, and is substantially built, clean, and airy. Quarter sessions for the county of Monaghan are held here in rotation. There are here a bridewell, and a station of the revenue police. The town is the head-quarters of one of the constabulary districts. The adjoining country is hilly and much encumbered with bogs and lakes.

(Fraser, *Handbook*; *Ordnance Survey Map*.)

CASTLECOMER, county of Kilkenny, Ireland, a market-town and the seat of a Poor-Law Union, is situated on the river Dinan, 11 miles N. by E. from Kilkenny. The population in 1851 was 1695, and 29 inmates of the fever hospital. Castlecomer Poor-Law Union contains seven electoral divisions with an area of 57,820 acres, and a population in 1851 of 18,472. The town is neat and well-built, and is sheltered by extensive plantations, which contrast strongly with the bleak sterile country to the north of it. The public buildings include an Episcopal church, a Roman Catholic chapel, a small Wesleyan Methodist meeting-house, a court-house, and infantry barracks. Close to the town is Castlecomer House, which stands on the Comer, a feeder of the Dinan, and facing the ruins of an old castle. A weekly market is held on Saturday.

CASTLEDERG, county of Tyrone, Ireland, a market and post-town and the seat of a Poor-Law Union, in the parish of Skirts and barony of Omagh, is situated in 54° 42' N. lat., 7° 37' W. long.; distant 140 miles N.N.W. from Dublin, on the road from Pettigo to Strabane. The population in 1851 was 596 and 225 in the workhouse. Castlederg Poor-Law Union comprises 14 electoral divisions, with an area of 91,775 acres, and a population in 1851 of 18,741.

CASTLEDERMOT. [KILDARE.]

CASTLEISLAND. [KERRY.]

CASTLELYONS. [CONK.]

CASTLEMARTYR. [CONK.]

CASTLEPOLLARD. [WESTMEATH.]

CASTLEREAGH, county of Roscommon, Ireland, a market and post-town and the seat of a Poor-Law Union, in the parish of Kilkeevan and barony of Castlereagh, is situated in 53° 46' N. lat., 8° 27' W. long.; distant 124 miles W.N.W. from Dublin. The population in 1851 was 1211, besides 1392 in the workhouse and 10 in the bridewell. Castlereagh Poor-Law Union comprises 19 electoral divisions, with an area of 162,363 acres, and a population in 1851 of 45,299. The town is pleasantly situated adjoining the extensive demesne of

Castlereagh, the residence of Lord Mount Sandford. It consists chiefly of one principal street, which is wide and straight and tolerably well built, having the market-house and bridewell at one end and a bridge over the river Suck at the other. Connected with the town are extensive distilleries. Quarter sessions for the county of Roscommon are held at Castlereagh in rotation. There are here a bridewell, a barrack station, and stations of the revenue police and the constabulary of the district. Petty sessions are held in the town.

CASTLETON. [DERBYSHIRE.]

CASTLETOWN. [ISLE OF MAN.]

CASTLETOWN, or CASTLETOWN-BEREHAVEN, county of Cork, Ireland, a village and the seat of a Poor-Law Union, in the parish of Killaconenagh, and barony of Bere, is picturesquely situated at the head of Berhaven, on the north-west side of Bantry Bay, in 51° 37' N. lat., 9° 54' W. long.; distant 27 miles S.W. by W. from Bantry. The population in 1851 was 1931, including 12 in the bridewell and 941 in the Union workhouse. Castletown Poor-Law Union contains 7 electoral divisions, with an area of 73,444 acres, and a population in 1851 of 18,269. Petty sessions are held at Castletown. There are here a bridewell and a dispensary. Fairs are held on January 1st, Easter Tuesday, May 12th, and September 4th.

CASTLETOWNDELVIN, county of Meath, Ireland, a small post-town and the seat of a Poor-Law Union, in the parish of Castletowndelvin and barony of Delvin, is situated on the road from Dublin to Granard, in 53° 33' N. lat., 7° 2' W. long., distant about 10 miles E. from Castletown: population 348 in 1851, with 6 inmates of the bridewell. Castletowndelvin Poor-Law Union comprises 19 electoral divisions, with an area of 74,775 acres, and a population in 1851 of 15,627. The town consists of a single street. In it there are an old church, which has been well repaired, a Roman Catholic chapel, the Union workhouse, a dispensary, a bridewell, and a loan-fund office. It is a station of the county constabulary. Petty sessions are held here monthly, and annual fairs on May 1st, August 1st, and December 1st. The ruins of a castle built by the De Laeys, consisting of the walls in a quadrangular form with towers at the corners, and several other ruined castles, are in the neighbourhood. Clonyn, the seat of the Marquis of Westmeath, is in the vicinity.

CASTLETOWNROCHE. [CORK.]

CASTLETOWNSEND. [CORK.]

CASTRES, a town in France, in the department of Tarn, is situated on the river Agout, in 43° 37' N. lat., 2° 15' E. long., 46 miles E. from Toulouse, and has a population of 19,250, including the whole commune. In the middle ages this town was remarkable only for an abbey, the heads of which were temporal lords of the place. It subsequently came into the possession of the counts of Vendôme, and passed from them by marriage to the counts of Armagnac. In 1567 Castres was taken and pillaged by the Huguenots, who destroyed the cathedral. It became one of the strongholds of the reformed party, but it was reduced to submission in the reign of Louis XIII., and the fortifications demolished. In 1316 Castres was made an episcopal town by Pope John XXII.; the diocese included Upper Languedoc; it was abolished at the Revolution, and the town is now included, with the rest of the department, in the archdiocese of Alby.

The south-eastern part of the town called Villogoudon, is joined to Castres properly so called by two stone bridges. The streets are pretty well built, and have been much improved of late years. The Place-Royale is the principal square. The most important public buildings are—the town house, formerly the episcopal palace, to which is attached the public library and a beautiful garden; the churches of St. Benoît and Notre-Dame; the two hospitals; the cavalry barracks; the abattoir; and the theatre. Tribunals of first instance and of commerce are held in the town, which has also a chamber of commerce, a college, two theological seminaries, and a Calvinistic church. Castres is surrounded by beautiful shady promenades, called 'líces,' from their occupying the site of the ditch that formerly surrounded the town, and in the Villegoudon quarter an extensive esplanade is crossed by five shady alleys of trees. In the neighbourhood of the town there is an immense rocking stone on the top of a hill, at the foot of which is a grotto that was once the retreat of St. Dominic.

Castres is a place of great manufacturing industry; for their care and skill, and the finish given to their productions, its artisans are considered the best in the south of France. It is particularly celebrated for its fine wool-dyed cloths, called 'enirs de laine,' but all other sorts of woollen stuffs are manufactured, as well as linen, soap, leather, glue, and paper. There are also several bleaching, dyeing, and silk-weaving establishments, and iron and copper foundries. The commerce of the town is very considerable.

CASTRIES. [LEWIS, ST.]

CASTRO MARINO. [ALGARVE.]

CASTROPOL. [ASTURIAS.]

CAT ISLAND. [BAHAMAS.]

CATALUÑA (in English generally written *Catalonia*), an ancient province of Spain, is bounded N. by the summit-level of the Pyrenees,

W. by Aragon, S.W. by Valencia, S.E. and E. by the Mediterranean Sea. It is situated between 40° 30' and 42° 50' N. lat.; 0° 12' and 3° 20' E. long. The shape is triangular, one side extending about 200 miles along the shore of the Mediterranean, another about 150 miles along the frontiers of Valencia and Aragon, and the third about 140 miles along the crests of the Pyrenees. It is governed by a Captain-General, and is divided into the following modern provinces:—

Provinces.	Area in Square miles.	Population in 1849.
Barcelona	12,180	533,695
Tarragona		290,000
Lérida		197,445
Gerona		262,591
Total	12,180	1,283,731

The province of Barcelona comprises the eastern part of Cataluña, Tarragona the southern, Lérida the western, and Gerona the north-eastern.

Surface.—The northern frontier of Cataluña being formed by the crests of the Pyrenees, the whole of the northern part of the province is occupied by lofty ridges, offsets from the mountain chain. These ridges descend southward from the most elevated summits, such as the Maldeleta, the Moncal, and the Canigü. From the last-mentioned summit especially, one great ridge, or rather series of ridges, extends through the centre of the province, dividing the waters of the Segre and its affluents, which enter the Ebro, from the Llobregat and numerous other rivers which flow directly to the Mediterranean. The upper portion of this central ridge has no general name. The lower portion, called the Sierra de Llena, runs parallel to the coast at the distance of about thirty miles, and, with the addition of the Monserrat, extends from the Ebro to the Llobregat. Cataluña is thus for the most part a mass of rocky mountains and precipitous valleys. The only exceptions are the rich plains about Lérida, Urgel, and Manresa, and the smaller portions of flat land behind Barcelona, Tarragona, and Tortosa.

Rivers.—The Ebro enters Cataluña at Mequinenza, where it receives the Segre united with the Cinca from Aragon. It has a winding course through this province to the sea below Tortosa. [Ebro.] The Segre rises among the south-western offsets of the Canigü, near Puigcerdà, and flowing down the valley of Cerdanya, receives below Urgel the Valira from the valley of Andorra. [Annona.] It then flows south by west through a long valley, receiving several feeders from the ridges on each side, till the Llobregat enters it below the village of Pons, when it takes a western course till it is joined by the Noguera Pallaresa, a large affluent which comes down from the slopes of the Moncal. It then flows south-south-west past Lérida, and receives the Noguera Ribagorçana, another large affluent, which descends from the Maldeleta, and for more than fifty miles forms the boundary between Aragon and Cataluña. It soon afterwards takes in the Cinca, and enters the Ebro. The Llobregat and the Cardener both rise on the eastern flanks of the great central series of ridges, and after receiving many small streams unite below Manresa. After the junction the river retains the name of the Llobregat, and passing through a narrow gorge at the foot of the Monserrat, takes a south-eastern direction, receives the Noya on the south-western side, and enters the sea about five miles south of Barcelona. The Fluvià has a short eastern course, and falls into the gulf of Rosas. The Ter has a long semicircular course from the slopes of the Canigü, and passing by Gerona falls into the sea a short distance south of the Gulf of Rosas. The Besos enters the sea north of Barcelona. South of the Llobregat, the Foy, the Gaya, the Anguera, and the Francolí, run in deep channels, and in nearly parallel lines to the coast, the spaces between them being filled up with rocky hills. Between the mouths of the Francolí and the Ebro no river enters the sea. South of the Ebro the Cinca divides Cataluña from Valencia.

Climate and Productions.—The climate is variable, and subject to fogs and rain. In summer the heat in the valleys is excessive, but is tempered on the coast by the sea-breezes. In winter the cold on the mountains is very severe, but mild on the lower tracts along the margin of the sea. The valleys and plains of Cataluña are fertile, but a large proportion of the country is rocky and naturally barren. The system of irrigation is generally followed. Corn enough for home use is not grown, and there is also a want of cattle; but a good deal of wine is produced. Other articles of produce are oil, hemp, nuts, almonds, fruits, silk, and barilla. The forests abound with cork-trees, the bark of which is a considerable article of commerce. Cataluña is rich in mineral wealth, coal, copper, lead, zinc, manganese, cobalt, nitro, salt, and marble being found. It is the chief manufacturing province of Spain, the principal fabrics being woollens, cottons, silks, lace, leather, paper, iron, brandy, and liqueurs. The coasts abound with fish, and the industry of the Catalans renders the fisheries very productive. Since the loss of the Spanish American colonies the trade of Cataluña has greatly declined.

Towns.—Barcelona is the capital of the province of Barcelona. [BARCELONA.] Cardona, 50 miles N.W. from Barcelona, stands on the right bank of the Cardener, close to a hill nearly 500 feet high, which is a mass of pure crystallised salt. The town has a population

of about 3000, and has a castle and long lines of fortifications. It contains a gothic church, in which are some sepulchres of the Cardona family, whose palace also still remains, but in a dilapidated state. *Iguada*, 40 miles W. by N. from Barcelona, stands on an eminence near the northern bank of the Noya. The streets of the older parts of the town are narrow and tortuous, but the Rambla is a wide street, and there is a handsome suburb. It contains a parish church, college, hospital, and cavalry barracks, and has manufactures of cotton and woollen goods, hats, and fire-arms: population, 10,000. *Mauresa*, 37 miles N.W. from Barcelona, is situated on an eminence in a fertile and well-irrigated district near the left bank of the Llobregat. It is a very picturesque town, and contains a collegiate church, four parish churches, an hospital, and barracks, and has manufactures of cotton and silk fabrics, broadcloths, ribbons, gunpowder, and brandy: population, 15,400. Between Iguada and Mauresa stands the mountain Monserrat, 4000 feet high, celebrated for the large monastery built upon it. *Mataró*, 20 miles N.N.E. from Barcelona, with which it is connected by a railway opened in October, 1848, is situated on a hill which slopes down to the coast, where it has a small harbour with docks. The town is chiefly old, with narrow streets, but has a new quarter, a good principal street (the Riera), and two good plazas. It has a fine parish church, two or three other churches, an hospital, and manufactures of silks, cottons, velvets, ribbons, and leather. Ship-building is carried on, and it is a busy and flourishing place: population, 14,000. *Vich*, 40 miles N. from Barcelona, stands on the slope of a hill in a fertile plain, and consists of several irregular streets branching out from a central group. It is an episcopal town, and has a gothic cathedral. It has manufactures of coarse woollens and cottons: population, 11,000.

Tarragona, the capital of the province of Tarragona, is 55 miles S.W. from Barcelona. It is the *Taraco* of the Romans, and was in their times a very large and important city and sea-port. It is situated at the mouth of the Francoli, and consists of an upper and lower town. The upper town is surrounded by ancient walls, now partly in ruins, but consisting of huge blocks of stone and of the most solid masonry. The lower town is protected by a range of bastions fronting the Francoli and the harbour. There are also two castles. Ships of war can lie at anchor inside the mole, and outside there is a roadstead. Beyond the rocky heights on which the town is built there is an open country called the Campo de Tarragona. The town contains a cathedral of early gothic architecture, an archbishop's palace, theatre, and barracks. It has manufactures of coarse woollens, cottons, hats, and soap, and a good export trade of nuts, almonds, cork, wine, and brandy: population, 12,000. There are remains of an amphitheatre, circus, aqueduct, and other works of the Romans. Tarragona was taken by the French under Suchet, by siege and assault, June 29, 1811, and they held it till the termination of the war. *Reus*, 8 miles W. from Tarragona, consists partly of an old town, but chiefly of a modern town which has arisen within the present century. It contains several churches, barracks, a theatre, hospitals, and manufactures of silk, cotton, and linen, soap, leather, glass, and spirits. A canal connects it with the small port of Salou, through which it exports nuts and other articles of Spanish produce to England. The population in 1845 was 25,043. *Tortosa*, 50 miles S.W. from Tarragona, stands on the eastern or left bank of the Ebro, 20 miles from the sea. The river up to Tortosa is an estuary, and is there crossed by a bridge of boats. The town is built partly on the rocky slopes of a hill and partly on the flat ground close to the river. It is strongly fortified by walls and outworks, and is entered by seven gates. It contains a large cathedral, a bishop's palace, a town-hall, a college, an hospital, and a palace of the Valcabra family. There are manufactures of earthenware, glass, and paper, and an active fishery at the mouth of the river. The town was taken by the French under Suchet, by siege and assault, Jan. 1, 1811. The population in 1845 was 20,573.

Lérida, the capital of the province of Lérida, is 95 miles W. by N. from Barcelona. It is the *Ulerda* of the Romans, and when held for Pompeius by Afranius and Petreus was besieged and taken by Caesar. It is situated near the west bank of the Segre, on the slope of a hill surmounted by fortifications, a tower, and an old cathedral. The Segre is here crossed by a good stone bridge. In the lower town is a cathedral of Corinthian architecture, built in the reign of Fernando VI. It has three other churches: population, 6650. *Cervera*, 35 miles E. from Lérida, is built on an eminence, and contains a large unsightly edifice built by Felipe V. for the university of Lérida, which he transferred to this place, but which has in recent times been removed to Barcelona. The town is well built, and is surrounded by old walls. It contains a gothic church, and there is a fine cloister in the Dominican convent: population, 5000. *Solsona*, 60 miles N.E. from Lérida, contains a cathedral and has manufactures of woollens and hardware: population, 2200. *Urgel*, 75 miles N.N.E. from Lérida and 80 miles N.W. from Barcelona, is situated beneath a spur of the Pyrenees, in the angle just above the junction of the Valira with the Segre. It has been the see of a bishop since the year 820. The hill which overlooks the town is surmounted by a citadel. The bishop is the spiritual head and in a great degree the temporal head of the small republic of Andorra. [ANDORRA.] Population, 3000.

Gerona, the capital of the province of Gerona, is 60 miles N.N.E. from Barcelona. It is a city, and has been the see of a bishop since

786. It is situated at the junction of the Oña with the Ter, is of a triangular form, and lies under a fortified hill called the Monjuich. The streets are narrow, but clean. There are three plazas. The early cathedral was pulled down, and the construction of the present was commenced in 1316. The approach is very imposing, a superb flight of 86 steps leading to the façade. The interior consists of a single noble nave, with a semicircular apsis, and contains some interesting sculptures. There is also a massive half-fortified collegiate church. The town has manufactures of coarse woollen and cotton goods, stockings, soap, and leather: population, 7660. The defence of Gerona, when besieged by the French in 1809, equalled if it did not surpass in heroism and perseverance, that of the two sieges of Zaragoza. *Ampurias*, 23 miles N.N.E. from Gerona, a village in the fertile district called Ampurdan, with a small harbour on the Gulf of Rosas. The town was once important, was called Emporion, and was occupied by a Greek colony from Marseilles about B.C. 545. *Figuera*, 20 miles N. by W. from Gerona, is situated in a rich plain above the junction of the Muga and Manol, which flow westward from the Pyrenees, and enter the Gulf of Rosas. It is a straggling town, but is defended by a large pentagonal citadel strongly constructed on the principles of Vauban, capable of accommodating 16,000 soldiers and vast stores. It was gained by Napoleon in 1808 by a deception. It was recaptured in 1811 by a Spanish partisan with some peasantry, by means of well-managed surprise, but was retaken by the French after a siege of nearly five months, when the ammunition of the garrison was all expended. The town has trade with France, and manufactures of leather and paper: population, 8000. *Hostalrich*, 22 miles S. from Gerona, was an important fortress during the Peninsular war. The town is the see of a bishop, but has a population under 1000. *Olot*, 21 miles W.N.W. from Gerona, is situated between a volcanic hill and the south bank of the river Fluvia. The base of the hill is chiefly basalt. There are several craters of extinct volcanoes in the vicinity. The town has good streets and squares, two parish churches, a cavalry barracks, and an hospital. There are manufactures of woollen and cotton goods, leather, soap, and paper: population, 12,000. *Ripoll*, 32 miles W. by N. from Gerona, is beautifully situated in the angle of the junction of the Fresne with the Ter, in a district of coal and iron, and has manufactures of fire-arms and nails: population, 3000. *Rosas*, 28 miles N.E. from Gerona, the ancient Rhode, was formerly an important place, strongly fortified, and carried on a brisk trade by means of its fine harbour in the Gulf of Rosas; it is now a mere fishing village with 2200 inhabitants.

History.—On the decline of the Roman empire in the west, the territory of this part of Spain was seized by the Goths and Alans, when it is said to have been called Goth-Alania, whence by corruption came the present name Cataluña. During a part of the 8th century Cataluña was held by the Moors, till they were driven from it by Charles Martell and afterwards by Charlemagne. The counts of Barcelona from that time were the rulers of Cataluña and the French county of Roussillon; but when Raimond Beranger, Conde de Barcelona, was allied to Petronila, the infant heiress to the crown of Aragon, Cataluña was annexed to Aragon, and he governed both with the title of Principe (prince). Cataluña afterwards became one of the provinces of Spain, with the title of Principality. It held its municipal privileges till the Wars of the Succession, when it supported the Archduke Charles of Austria, after which it was formally deprived of its cortes and liberties by the conqueror, Felipe IV.

The dialect of Cataluña is a mixture of the Romance language, or Langue d'Oc, with the Spanish.

(Minao, *Diccionario Geográfico*; Madoz, *Diccionario de España*; Ford, *Handbook of Spain*; Napier, *Peninsular War*; Vacani, *Storie delle Campagne e degli Assedi degli Italiani in Spagna, dal 1808 al 1813*, 3 vols. 4to., with Atlas, Milan, 1823-5.)

CATAMARCA, one of the upper provinces of the Argentine Confederation, South America, is bounded N. and N.E. by the province of Tucuman, E. by Santiago, S. by Cordova, and S.W. by La Rioja, and comprehends the little visited country between the mountain ranges of the Sierra de Aconquija and Ambato on the east, and the Andes on the west. The inhabitants do not exceed 30,000. The country consists of a principal valley, Catamarca, from which the province derives its name and in which most of the inhabitants are settled; and of some other valleys, running between mountain ranges south-east and north-west, and terminating at their southern extremity on the borders of the Gran Salina, being thus separated from the other inhabited countries by high mountains and deserts. The rivers which water these valleys are lost in the Gran Salina. The climate is sultry, especially when the south winds blow, which come over the desert. Maize and wheat are raised to a considerable extent, but cannot be exported over the mountains. The province sends only cotton and red pepper (dried capsicums) to the adjacent countries, the latter chiefly to Buenos Ayres, where it is extensively used. The present capital is Catamarca, or San Fernando del Valle de Catamarca, in 27° 28' S. lat., whose population is stated to be 4000. The first capital, called London, being founded at the time when Philip II. of Spain married Queen Mary of England, was destroyed by the Indians. [ARGENTINE CONFEDERATION.]

CATANIA, a province in Sicily, is bounded N. and N.E. by the province of Messina, N.W. by that of Palermo, W. by

Catania, S. by Siracusa, and E. by the sea. It is 55 miles in length from south-east to north-west, and about 35 miles in its greatest breadth. The area is 1761 square miles, and the population in 1851 amounted to 379,991. The province includes the region of Mount Ætna, and extends along the coast from the mouth of the Giaretta to that of the Alcantara, a distance of about 30 miles, including the windings of the Gulf of Catania. The Alcantara and the Dimari and Nettuni Mountains form the northern boundary. An offset from Ætna runs north-west above Bronte, joins the Nettuni Mountains, and forms the watershed between the basin of the Giaretta and the Alcantara. Westward the province extends to the source of the Traina, a feeder of the Giaretta, and to the limestone mountains of Enna, which run southward from the Nettuni range, and form the watershed between the Giaretta and the Salso. The lower offsets of the mountains of Noto, which consist of tertiary formations, bound the basin of the Giaretta and the plain of Catania, on the south. A great part of the surface is covered with ramifications of the mountains named; these are, with the exception of the region of Mount Ætna, already noticed [Ætna], generally bare of timber. The valleys have a very fertile soil, and are very productive. The basin of the Giaretta is drained by several streams—the Adrano, the Traina, the Dittaino, and the Chirius, which unite in the lower part of the plain of Catania and form the Giaretta, the ancient Simethus, which falls into the Gulf of Catania. The plain of Catania, 20 miles long and 15 miles broad, is the largest plain in Sicily, and produces a great quantity of corn. The lower hills and valleys which belong to the volcanic mass of Ætna produce excellent wine. Oil, silk, liquorice, and all kinds of fruit are the other chief products of the country.

Towns. Catania, the ancient *Catana* or *Catanæ*, the capital of the province, is situated on the sea-coast, at the foot of the most southern offsets of Ætna, in 37° 29' N. lat., 15° 5' E. long., and has a population of about 55,000. Though not the largest it is the handsomest town in Sicily. Catania was a colony (B.C. 750) from Naxos in Sicily, which Naxos was founded by a colony from Chalcis in Eubœa. (Thucyd., vi. 3.) It suffered greatly in the wars between the Carthaginians and Syracuse, and was taken in the first Punic war by the Romans, who plundered it of its riches and statues. Among other things a sundial from Catania was sent to Rome and placed on the rostra. In ancient as well as modern times Catania has suffered greatly from earthquakes and the eruptions of Ætna, one of which is recorded by Thucydides (iii. 116) as having taken place B.C. 425; and he mentions another as said to have happened B.C. 475. The great earthquake of 1693 destroyed it, but the town has been completely rebuilt since that time. The streets are wide and regular, and the buildings are handsome, being mostly built of lava, faced with limestone and enriched with marble. Lava forms the pavement of the streets, and a natural mole of lava shelters the harbour. The university of Catania, which was founded by Alfonso of Aragon in 1445, is frequented by about 500 students, and has a good library, which is open to the public.

Coin of Catania.

British Museum. Actual size. Silver. 260 grains.

The splendid Benedictine monastery and church of San Nicolò d'Arena is, after Mafra in Portugal, the largest and finest monastic building in Europe, in connection with which are a museum and a gallery of paintings. The cathedral of Catania, rebuilt since the earthquake of 1693, and dedicated to Santa Agata, is a vast building: the front is ornamented with fine granite columns taken from the theatre of the ancient city. In the square before it is a fountain, with an elephant made of lava, bearing on its back a small granite obelisk. Among the other buildings must be mentioned the senate-house, about thirty convents, and nearly double that number of churches, some of which are magnificent structures; the government Monte-di-Pietà; the several charitable institutions, such as hospitals, and houses for the destitute; the Magdalen asylum; and the Gioeni academy, which has rich collections in natural history, and publishes its memoirs. The port of Catania, which in ancient times was large and much frequented, is now very small, having been almost filled up by the lavic-floods of 1693. It is only fit for small craft, by means of which however a considerable export trade is carried on in wine, corn, oil, almonds, figs, soda, manna, silk, cheese, macaroni, amber, (which is found at the estuary of the Giaretta), lava, and snow from Ætna, which is sent to Malta. The principal industrial products are silk goods and articles made from lava. Catania ranks as the third city in Sicily: it gives title to a bishop, and has a Gran Corte, or upper tribunal for civil and criminal causes, and a board of trade.

The remains of ancient Catania include a large theatre, an amphitheatre, a small theatre, ruins of baths, and fragments of an aqueduct. All these are of Roman construction, the Greek city having probably been destroyed by some of the earthquakes to which the city has in all ages been exposed. Catania was the birth-place of Charondas, the legislator and philosopher, and of the poet Stesichorus. The coins of Catania are of very superior execution.

Callagirone, the second town in the province of Catania, is built on two hills joined together by a bridge; it has several palaces, a royal college, a town-house, Monte-di-Pietà, and about 20,000 inhabitants. Good pottery is made in this place. Callagirone is a corruption of Calata Girone. The Arabic word Calata, or Kalat, signifies an eminence, and was given as a prefix to the names of several towns in Sicily during the occupation of the island by the Saracens. The town gives title to a bishop, and is 30 miles S.W. from Catania.

Nicosia, 35 miles W.N.W. from Catania, is built on two hills, and has about 13,000 inhabitants, who live chiefly by agriculture, and by trading in wine, oil, corn, and cattle. In the neighbourhood are two petroleum and several sulphureous springs, a mine of rock-salt, and beds of clay-slate and iron pyrites.

Aci Reale stands on a lava rock, which projects into the sea at the eastern base of Ætna, with a castle above it on a higher cliff, which forms a little town by itself. The town is built chiefly with lava: it has many good buildings, a small harbour, and an active trade. Linen, silk, and cutlery are the chief industrial products. Aci Reale is famous for its mineral waters. In the neighbourhood are pointed out the cave of Polyphemus and the grotto of Galatea. The town stands on the site of the ancient *Acium*, which took its name from the river Aci, now the Fiume-di-Jaci, which rises under a rock of lava and has a short course to the sea below Aci Reale. The river Aci is celebrated in fable, which ascribes its origin to the blood of the youthful Aci, who was crushed under an enormous rock by his rival Polyphemus. Aci Reale has a population of about 20,000.

Paternò, the ancient *Hylla Major*, is situated at the foot of Ætna, 10 miles W.N.W. from Catania, and has about 10,000 inhabitants. It gives the title of prince to a Sicilian family, who are the richest land-holders in Sicily. The town contains many convents and churches, and has a fruitful territory, yielding abundance of oil, wine, flax, hemp, and timber, the chief articles of trade. There are warm chalybeate springs at Paternò.

Adernò, 16 miles N.W. from Catania, is situated at the western base of Mount Ætna, near the Simeto or Adrano, and has above 6000 inhabitants. It is surrounded by walls, and contains several churches and convents. The principal church stands in a fine square, and its façade is decorated with columns of lava. Adernò occupies the site of the ancient *Adranum*, founded by Dionysius the Elder B.C. 409; but a temple to the old Sicilian god Adranus was built on the spot from very ancient times. (Diodorus, xiv. 37.) Adranum was taken by Timoleon in B.C. 345, and by the Romans in the first Punic war. Parts of the ancient walls and towers built of large square blocks of lava still remain, as well as massive substructions of the temple of Adranus, and Roman baths.

San-Filippo-d'Argiro, 27 miles W.N.W. from Catania, situated on an isolated rock near the right bank of the Traina, has a ruined Saracenic castle, several churches and convents, and about 7000 inhabitants. The neighbourhood of the town produces much sullion of good quality. San-Filippo occupies the site of the ancient *Aggrum*, the birthplace of Diodorus Siculus, and one of the most ancient cities in Sicily. It was a Sicilian and not a Greek city. About B.C. 400 it was under the government of a prince named Agryis, and had a population of 20,000 citizens (Diod. xiv). It was long in alliance with the kings of Syracuse, and continued a wealthy city under the Romans. In the middle ages it became celebrated for a church (St. Philip's), a place of pilgrimage from all parts of the island. Scarcely any remains of antiquity are now visible. The territory of San-Filippo has been in all ages celebrated for its fertility in corn.

Bronte has been already noticed. [BRONTE.]

Among the other places are *Nicosia*, situated high up the southern flank of Mount Ætna, population about 3500; and *Traina*, a poor place in the interior, situated on a hill, 8 miles E. from Nicosia: population, 7500. At Traina is the oldest monastery (it is said) in Sicily.

CATEAU-CAMBRESIS, LE. [NORD.]

CATELET, LE. [AISNE.]

CATHAY. [CHINA.]

CATHERINGTON, Hampshire, a village and the seat of a Poor-Law Union, in the parish of Catherington and hundred of Finch-dean, in Petersfield division of the county, is situated in 50° 55' N. lat., 1° 1' W. long.; distant 10 miles N. by E. from Portsmouth, and 62 miles S.W. from London. The population of the parish in 1851 was 1094. The living is a vicarage in the archdeaconry and diocese of Winchester. Catherington Poor-Law Union contains five parishes and townships, with an area of 12,265 acres, and a population in 1851 of 2298. The parish church, dedicated to St. Catherine, is an ancient edifice. It has a tower, which contains five bells. In the parish are two Endowed schools for boys and girls, and a National school for boys. The population is chiefly agricultural.

CATMANDOO, or KHATMANDU. [NEPAUL.]

CATON, Lancashire, a village and the seat of a Gilbert's Poor-Law Incorporation, in the parish of Lancaster and hundred of South Lonsdale, is situated on the left bank of the river Lune, in $54^{\circ} 4' N.$ lat., $2^{\circ} 41' W.$ long.; distant 5 miles N.E. by N. from Lancaster. The population of the township of Caton with Littledale was 1434 in 1851. The living is a perpetual curacy in the archdeaconry of Lancaster and diocese of Manchester. Caton Poor-Law Incorporation contains 17 parishes and townships, with an area of 46,212 acres, and a population in 1851 of 9044.

The village of Caton existed at an early period; as far back as 1266 there was a church here, of which the Norman doorway still remains. The present church is a modern gothic building. There are a chapel for Wesleyan Methodists and a National school. Cotton, silk, and flour mills give employment to many of the inhabitants. The scenery of Caton Vale is much admired.

CATRINE. [AYRSHIRE.]

CATSKILL MOUNTAINS. [ALLEGHANY MOUNTAINS.]

CATTARO. [DALMATIA.]

CATTEGAT, or KATTEGAT. [BALTIC SEA.]

CATTERICK. [YORKSHIRE.]

CATTYWAR, or KATTYWAR, a district occupying a portion of the interior of the Guzerat peninsula, is bounded N. by Jhallawar, E. by Goelwara, S. by Babreewar, and W. by Sorat. The surface towards the north is irregular; in the south are jungles. The soil is variable, but sand prevails on the plains, where it is mixed with reddish-coloured rock, of which the hills are mainly composed. The hills are deficient in trees. The more usual kinds of produce are wheat and a few coarser grains. Many horses are reared, the breed being considered among the best in India. The inhabitants, who are not numerous, are known by the name of Catties. The men are an athletic race, and such of the females as are allowed to live grow up with a considerable share of personal beauty. The Catties are worshippers of the sun. The men are robbers by profession. The country is divided among numerous tributary chiefs and princes, each exercising independent power within the limits of his own division. There are 10 talooks, or districts, with 216 chiefs in all. Some of these chiefs are under the direct authority of the British, but the greater number are subject to the Quicowar, although these are also placed under the control and management of the Company's officers, by whom the tribute is collected and accounted for to the Quicowar. This arrangement has been found necessary in order to preserve peace in the country. The interference of the British extends to criminal as well as financial matters. All the rights which the British possess in Cattywar have been acquired from the Peishwa and the Quicowar; from the former by conquest, from the latter by mutual arrangement. These rights have been considered as limited to the collection of tribute and the preservation of peace; in other respects the Cattywar chieftains have been left to exercise all the functions of government within their own immediate territories. The entire district includes an area of 19,850 square miles, with a population of 1,468,900. The total yearly revenue amounts to about 450,000*l.*; the annual tribute to the British government is nearly 105,000*l.*

CAUCASUS (*Kaukas*, *Goffkas*), an extensive mountain chain extending between the Black and Caspian seas, and forming part of the boundary between Asia and Europe, but in ancient times belonging entirely to Asia. The general direction of the range is from W.N.W. to E.S.E. It begins on the shore of the Black Sea, at a short distance south of the town of Anapa, at about $41^{\circ} 40' N.$ lat., $37^{\circ} 10' E.$ long., and terminates on the west coast of the Caspian Sea, in the peninsula of Apsheron, $40^{\circ} 20' N.$ lat., $50^{\circ} 20' E.$ long. The length of the range is about 700 miles; the width varies from 60 to 150 miles; the area covered by it is about 56,000 square miles, or nearly the surface of England and Wales taken together.

The Caucasus, in some summits in the centre of the range, rises to a greater height than the Alps, while its extremities subside into mere hills. The highest summit, formed by the rocky mass of the double peaked Mount Elbruz, in $43^{\circ} 20' N.$ lat., $42^{\circ} 30' E.$ long., rises to between 17,000 and 18,000 feet above the sea, and stands quite isolated, being surrounded by low and marshy ground. That portion of the range which extends west of Mount Elbruz to the shores of the Black Sea is called the Black Mountains, to distinguish them from the snowy crests and peaks of the more eastern part of the range. They do not rise to a great elevation. Along the shore the hills seldom exceed 200 feet in height. East of Mount Elbruz there are numerous summits and ridges which rise above the snow-line. Mount Kasbek, $42^{\circ} 50' N.$ lat., $44^{\circ} 20' E.$ long., is 16,000 feet high. It is of volcanic origin. The granite and porphyry of which its nucleus is composed are covered with volcanic deposits, and on the east they are flanked by limestone and clay. Farther east occur other high summits, as Mount Terzh, Shah-Dagh, and others, all of which are above the line of perpetual snow, which is here between 10,000 and 11,000 feet above the sea. On the peninsula of Apsheron the chain has only the appearance of moderate hills.

The offsets of the Caucasus approach near to the Black Sea, and often advance close to its shores between Anapa and the mouth of the Ingour, a distance of about 250 miles. Within these limits the shores of the Black Sea are high, bold, exposed, and rocky, except at a few points. On the Caspian side the mountains seldom approach the

shores. From the region of Mount Elbruz several mountain ranges run north-eastward and eastward, separating the head streams of the Kuban, the Kuma, and the Terek. Another offset on this side runs between the two arms of the Koi-Su, which inclose the country of the Avars, or Avari, to within a few miles of the Caspian. Farther south the mountains do not approach the Caspian nearer than about 30 miles, but the rock on which Derbent is built, which forms the extremity of another offset, is less than two miles from the Caspian. Another plain follows, which however only extends from 10 to 15 miles inland, and terminates about 12 miles N. of $41^{\circ} N.$ lat. The remainder, including the peninsula of Apsheron, is rather high, and the country is hilly. The country that extends between the crest of the Caucasus and the shore of the Caspian from the lower Terek to some distance south of Kuba forms the territory of Daghestan, the greater part of which is covered with mountains, the abode of the Leaghis, who, led on by their prophet-chief Shainyl, have arrested the progress of Russian conquest in the Caucasus since 1831.

The Caucasus is connected with only one great mountain system, that of the Taurus. On the southern side of the range an offset branching off from the central mass, near $41^{\circ} N.$ lat., and dividing the sources of the Faz, or Rion (Phasis), from the basin of the Kur (Cyrus), unites the Caucasus with the mountains north of the central table-land of Armenia, and with the Lazistan Mountains, from which it is divided at its western extremity only by the lower course of the Chornuk-Su. [ARMENIA.] The plain to the south of this range is traversed by the Kur and slopes gradually to the Caspian. The plain, or steppe, which extends along the north side of the Caucasus, hardly contains an elevation that deserves the name of a hill; between the innermost corner of the Sea of Azof and the Gulf of Kuma, in the Caspian, it sinks so low that it is probably nowhere 120 feet above the Black Sea. The offsets of the Caucasus towards the steppe are by far the most numerous, and sometimes extend to 100 miles; but here as well as to the south the mountains terminate so abruptly that even many of the summits, which attain no great elevation, are nearly inaccessible.

As in the Alps glaciers are common in the higher parts of the Caucasus, and the scenery of both mountain systems has a strong resemblance, except that in the Caucasus there are no lakes, with the exception of a small one on Mount Khoi. There are however several marshes.

The sides of the mountains are furrowed by innumerable valleys, most of which have a very fertile soil, yielding abundance of corn of every sort, the cultivation of which is carried to a height of about 8000 feet above the level of the sea. The lower valleys produce cotton, flax, rice, tobacco, wine, and indigo. The mountain sides are covered with noble forests. The Caucasus presents a great variety of climates, according to the elevation. An arctic winter prevails on the summits while an Italian summer is felt at the foot of the range; the harvest is ripe below while the first buds of spring are only bursting in the forests on the mountain top. But with the exception of Mingrelia the climate is generally very healthy. The most beautiful and rare flowers enameled the meadows and mountain pastures. Wines and silk, both of superior quality, are the chief commercial products. Madder is extensively grown, and saffron is gathered. The Kur and the Phasis carry off the chief part of the drainage of the southern slopes of the Caucasus into the Caspian and the Black seas respectively. On the northern side the principal rivers are the Terek and the Kuban, the former rising in Mount Elbruz and flowing north-west into the Black Sea; the latter rising in Mount Kasbek and running first north and then east into the Caspian. The Kuma, another large tributary of the Caspian, carries off the streams that rise in the mountains between Mounts Elbruz and Kasbek. All the rivers abound in fish. Most of the other rivers are mere torrents, confined generally to narrow beds, and running rapidly towards the sea through a stony soil; but in spring they inundate their banks in some parts to a great extent.

In the Caucasus the argali (*Ovis Ammon*) is found, which was long considered peculiar to the table-land of Central Asia and the mountains of Siberia. This mountain range is also the native country of the common and gold pheasants. The auroch, a species of ox, is still found in some parts of the Caucasus, and fur-bearing animals abound in all the forests. The Caucasian breed of horses is highly esteemed for their speed, hardiness, or temperance in food: they are used only for war and plundering excursions. Oxen are used for the plough. In Daghestan, owing to the mountainous nature of the country, horses are scarce, but small vigorous asses are numerous and the principal beasts of burden. Camels of the common and of the white species are used to carry loads in most of the Caucasian countries. The mountains abound in goats, chamois, and izzards. The wild goat, or touri, also is hunted; to escape its pursuers it precipitates itself down frightful chasms and precipices, alighting on the tip of its horns, which, as well as its neck, are of great strength. Numerous flocks of sheep are kept in some parts of the Caucasus, especially in the Circassian country, where mutton is the principal article of food: of the wool of good cloth is manufactured. The heaths, underwoods, forests and plains abound with game. Vultures and eagles are numerous in the high mountains. Jackals, wolves, and bears are the principal carnivorous quadrupeds; the bears often devour the grapes. In mineral riches the Caucasus is probably superior to the Alps. Traces of gold

are found, and silver and copper mines are worked near Tiflis. Iron abounds in many places, and is worked by the natives in a rude way.

The chain of the Caucasus is composed chiefly of secondary rocks, interspersed with those of volcanic origin. There are no active volcanoes however, but earthquakes happen sometimes. Naphtha or petroleum occurs in no part of the globe in such abundance as on the peninsula of Apsheron [BAKU]; but it is not limited to this part of the Caucasus: it occurs in several places on its southern side, and on the north, on the island of Taman, formed by the two branches of the Kuban. The mud-volcanoes of the Caucasus seem to be connected with the naphtha, for they occur only in the neighbourhood of it, especially on the island of Taman, and between Baku and Nawagi, where they are conical hills of earth, without any signs of vegetation on them. From a small crater on their summit issues the thick mud, with which a quantity of naphtha is mixed. Sometimes these eruptions are attended with flames, and followed by a gushing out of columns of water. On the north side of the Caucasus there is a great number of hot, warm, and sulphuric springs. Salt lakes abound on the peninsula of Apsheron.

The intercourse between the countries south and north of the Caucasus is carried on by two roads. The most eastern runs along the shores of the Caspian Sea, sometimes close to it, and sometimes traversing the plains which lie between the sea and the eastern extremity of the mountains. This road unites Baku with Derbent, and the latter town with Kizlar, or Kisdar, on the Terek. Though this road does not pass over high mountain ridges, it is not much frequented, a circumstance which may be attributed to the difficulty of crossing the numerous rivers which in spring and summer after the melting of the snow cover a considerable part of the plains with water. Its insecurity against the attacks of the Caucasian freebooters is another strong reason for its being disused for commercial purposes. The inundations also make the plains along the Caspian for the greatest part of the year very unhealthy.

The most frequented road, and the only one practicable for carriages, is that which traverses the Caucasus nearly in its centre, beginning on the south at Tiflis, on the banks of the Kur, and terminating on the Terek at St. Ekaterinograd, whence it branches off eastward through Modzok to Kizlar, and westward through Gheorghievsk and Stavropol to the mouth of the Kuban. The road on leaving Tiflis runs along the Kur, through a plain; it then ascends the valley of the small river Arakui, or Aragbor, which grows narrower as the road advances northward. Near its upper extremity is the small fortress of Passanaur, erected for the protection of travellers against the Caucasian mountaineers. Between this fortress and another, Kazibag, lies the highest part of the pass, which is more than 8000 feet above the sea; and on each side of it mountains rise several thousand feet higher, the summit of Mount Kasbek being at a short distance from it to the westward. In other places the road runs on the edge of an abyss, which descends as far under it as the mountains rise above it. This pass preserves the same character as far as the fortress of Dariel (from which it has received the name of the *Pass of Dariel*), and even to that of Vladikaukas, where the valley of the Terek may be considered to begin. The part farther south is hardly more than a mere ravine. The difficulties encountered on this road by the traveller are often increased by the fall of avalanches, or the sudden swelling of the torrents which descend from the high mountains.

Both these roads were known to the ancients. That which passes the town of Derbent was called *Porta Albanica*, from Albania, the name of the country watered by the lower course of the Kur. It was sometimes also called *Caspian Pyle*. The Pass of Dariel was called by the ancients *Porta Caucasica*, and sometimes *Sarmatica Pyle*.

There is probably no country on the globe, of so small an extent, which contains such a number of different nations as the valleys of the Caucasus. The natives speak at least seven different languages; but the Tartar is understood by most of the tribes, except the Lesghis. Strabo states that in his time at least seventy languages were spoken on the Caucasus. The Abasians, who with their numerous tribes are in possession of the southern declivity of the range between the Black Sea and Mount Elbruz, differ from the other tribes of the Caucasus in features, and in their peaceful disposition, which has made them willingly submit to the Russians, with the exception of two tribes—the Onbikhs and the Tchigutes—who form the confederation of the Chapsouks; these have frequently repulsed the Russians, and seized their forts. The Abasians were partially converted to Christianity in the time of Justinian; they are now chiefly pagans, and pay particular veneration to the oak. They are the most ancient inhabitants of the Caucasus. The northern side of the range, with its numerous valleys, is occupied by the Circassians, or Tcherkesses, among whom the tribe of Adighe holds the first rank, as being the purest in race. The Adighe are pagans, with the exception of the chiefs, who profess Islamism. Anapa is their chief town. Blood-feuds are indulged in among these and all the Caucasian peoples to an extent and with a ferocity unknown even in Corsica: there are families at feud from time immemorial. The Circassians are said to number 700,000. The centre of the range, on both sides of the Pass of Dariel, is in possession of the Ossetes, who are said to be descendants of the

Alani. The Lesghians, or Lesghis, the most powerful of the Caucasian mountaineers, occupy the greatest portion of the range east of the Pass of Dariel, and approach the peninsula of Apsheron. They are a warlike people, the terror of all their neighbours and the most determined enemies of Russia. Their number is about 400,000. The Tchechenes inhabit the country between the lower Terek and the Kuma. They number only about 25,000, but are in a state of almost constant revolt against Russia. The extensive mountain tract bordering on the north of Mount Tersh is inhabited by the numerous tribes of the Kisti, or Misheghes. The country about the sources of the Terek, to the east of Mount Elbruz, is called Kabardah, and is subject to Russia. In the plains south of the Caucasus live the Mingrelians, Imeritians, and Georgians. All these nations differ in their language. As great perfection of form and an ancient origin have been attributed to the inhabitants of this region, the highest rank in ethnological classification has been termed the Caucasian race.

Besides these aboriginal tribes, many others of foreign origin are met with in the valleys of the range. The most numerous are the Tartars. There are also Cossaks and Magyars, and on the south of the Caucasus, about Tiflis, there are several German colonies.

The Greeks became vaguely acquainted with the name and position of the Caucasus at an early period, as the expedition of Jason and the mythology of Prometheus evidently show. Herodotus (i. 203) describes the general position of the Caucasus with sufficient accuracy. The detailed description in the 11th book of Strabo evidently shows that in his time the country to the south of the Caucasus was well known. This was owing to the expedition of Pompey, who, in his war with Mithridates, advanced to the very foot of the great range, and got possession of both banks of the Cyrus and Araxes.

(Reinegg, *Beschreibung des Kaukasus*, Petersburg, 1796-7; Koch, *Karte des kaukasischen Isthmus*, Berlin, 1850; *Reise nach den kaukasischen Isthmus*, Stuttgart, 1843; Ivan Golovin, *The Caucasus*, London, 1854; Pallas; Klaproth; Biberstein; Engelhardt, &c.)

CAUDEBEC. [SEINE-INFÉRIEURE.]

CAUX. [SEINE-INFÉRIEURE.]

CAVAILLON. [VAUCLUSE.]

CAVAN, an inland county of the province of Ulster, Ireland, bounded N. and N.E. by Fermanagh and Monaghan, S.E. and S. by Meath, an angle of Westmeath and Longford, and W. by Leitrim, is situated between 53° 46' and 54° 18' N. lat., 6° 32' and 8° 3' W. long. Its length from south-east to north-west is 51 miles, its breadth from north to south 28 miles; the area is 746 square miles, or 477,360 acres, of which 375,473 are arable, 71,918 uncultivated, 7325 in plantations, 502 in towns, and 22,142 under water. The population in 1851 was 174,071.

Surface, Hydrography, Communications.—Cavan is the southernmost county of Ulster. Stretching across the narrowest portion of Ireland, it extends on the east to within 18 miles of the Irish Sea at Dundalk, and on the west to within 20 miles of the Atlantic at Sligo Bay. The county is in form an irregular oval. It rises into mountains of considerable height at its north-western extremity, but the greater part of its surface, although high and very irregular, presents no elevations of any consequence. Cuileagh, the highest point of the north-western chain (2188 feet), forms with the remainder of the Bullynaheenagh Mountains the southern boundary of the basin of Lough Erne, the chief feeders of which lake flow from this county. From Lough Dawnagh on the south, where Cavan joins the county of Longford, the river Erne flows northward through Lough Oughter and Belturbet to the borders of Fermanagh, where, after nearly bisecting the county of Cavan, it enters Upper Lough Erne at the same point with the Woodford, a considerable stream which also crosses the county a little farther north from a small lake on the borders of Leitrim. The Erne between Lough Oughter and Upper Lough Erne receives the waters of the Annalee, which, rising from two lakes on the borders of Monaghan, runs nearly west through the flat country between Cootehill at its source and Butler's Bridge near its confluence. Lough Sheelin and Lough Ramor, or Virginia Water, are also two considerable lakes in this county: the first discharges its waters through Westmeath by the Inny, a feeder of the Shannon; the second through Meath by the Blackwater, a tributary of the Boyne. The chief lines of road are in the direction of the greatest length and breadth of the county, from Navan in Meath on the south-east to Belturbet and Florence Court on the borders of Fermanagh on the north-west, and from Killeshandra on the south-west to Cootehill on the north-east; the point of intersection is at Cavan, the assize town, situated very nearly in the centre of the county. The line of navigation of the Ulster Canal connects Belturbet with Lough Erne and Lough Neagh.

Geology, Mineralogy, &c.—In geological distribution Cavan belongs to the clay-slate and grauwaacke district. Indurated schist constitutes the surface rock throughout the whole of the county, except where it is overlaid by tabular masses of millstone grit in the mountainous district on the north-west and in the low ground containing the lakes of Upper Lough Erne, which is occupied by an extension of the limestone central plain. A patch of granite about seven miles square occurs in the eastern part of the county, and assists in explaining the broken character of the hills in that district, the presumption being

that the granite extends at no great distance under the grauwacke from this point to the neighbouring granite district of Mourne, and that to this is owing the contortion of the incumbent strata. The county boundary also includes a small portion of the coal-field extending from the northern extremity of Meath to the south of Armagh by Kingscourt. The whole county is rich in minerals. At Swanlinbar and Cnileagh among the Ballynageeragh Mountains are mines of coal and iron; lead and silver ore have been discovered near Ballyconnell in the same district; lead and copper occur near Cootchill: coarse manganese and ochres are found in abundance in different parts of the county. A strong vein of blind coal occurs at Sbercock on the east of the county, and at Ballyjamesduff, a village between Virginia and Cavan, indications of a vein of very good quality have been discovered. Excellent marl, fuller's-earth, potter's-clay, and brick-clay are abundant throughout the county. There are numerous mineral springs, particularly at Swanlinbar and at Kingscourt, on the eastern border of the county. The spring at Kingscourt feeds a remarkable lake on the summit of an adjacent hill. The lake is about half a square rood in area, has no outlet, preserves a constant level, and never freezes. The water for about six feet from the surface is pure and clear, but lower down becomes gradually more and more muddy, until at a depth of about thirty feet it approaches to the consistence of tar. In this and the healing virtue of the spring is supposed to reside, and it has been found particularly efficacious when applied as poultices in scorbutic complaints. On the plain below is a chalybeate spring which is also resorted to by invalids, but has no connection with the pool above. The name of this pool in Irish is Lough-an-leighgh.

Soil, Climate, Agriculture.—The soil of Cavan is described as being naturally cold, spongy, and inclined to rushes, but with proper draining and manuring it can be rendered highly productive. In the district watered by the Erne and its feeders the crops are luxuriant, and the face of the country rich and pleasing. In the mountainous country the soil is very poor; plough-labour is totally unknown; and the crops, which consist of potatoes and a poor sort of black oats, are put in with a narrow-bladed spade called a sloy. In this part of the county there are few roads, and the slide-car is still in general use. In both districts the dry-stone fence is almost universal, quick and thorn hedges being only found on the farms of the wealthy or in the demesnes of the great resident proprietors. Such demesnes are however numerous, and some of them, particularly those of Lord Farnham near Cavan town and of Mr. Coote at Bellamont Forest near Cootchill, are of great extent and of remarkable beauty. The farms in general are very small.

The linen trade has declined here for some time back, but its revival in Antrim and Down is likely to render it again the staple trade of all Ulster. The ground in the lowlands is chiefly under tillage, but there is a little wheat grown; potatoes, oats, and flax are the principal crops raised. Grain is almost universally sown in ridges in consequence of the wetness of the soil. The corn-mills are small and for the most part attached to the several estates, as manor-mills, at which the tenants are obliged by their leases to grind. The breed of cattle is poor; but great exertions have been made of late years by spirited resident proprietors to introduce an improved stock, as well as to improve the system of farming by the example of green crops and stall feeding.

Divisions, Towns, &c.—Cavan is divided into 8 baronies, namely, Tullaghaw, comprising the mountainous district on the north-west; Tullaghonoh on the south-west; Clannaghon and Castleraghan on the south; Clonkee on the east; Tullaghgarvey on the north-east; Upper Loughtee on the north; and Lower Loughtee in the centre.

CAVAN, the county town; BAILIEBOROUGH, BELTURBET, and COOTEHILL are described in separate articles. The following smaller towns and villages may be noticed here:—

Arvagh, population 698, is finely situated near Lake Garty amid picturesque scenery. The shores of the lake have been planted by the proprietor, the Earl of Gosford, who has also considerably improved the town. The soil in the vicinity is fertile. Besides the Episcopal church, which was built in 1821 and enlarged in 1827, there are chapels for Roman Catholics and Presbyterians. Petty sessions are held in the town, and there is here a sub-inspector's station of the county constabulary. Ten fairs are held in the course of the year. *Ballyconnell*, population 503, on the Woodford River, 5 miles W. from Belturbet, occupies a romantic situation at the foot of the mountain Ligavregan, or Slieve Russel. The town contains a court-house, a bridewell, and a dispensary. Petty sessions are held here, and there is a monthly fair. *Ballyhaise*, population 356, on the Annalee River, 3 miles N.N.E. from Cavan, possesses a market of some importance, held weekly. The market-house is of peculiar construction, being raised upon a series of arches. Nine fairs are held in the course of the year. Several large corn-mills are in the vicinity of the town. *Ballyjamesduff*, population 875, is beautifully situated in a hilly district about 11 miles S.S.E. from Cavan. It is a post-town, and possesses a weekly market. The soil in the neighbourhood is fertile. Petty sessions are held, and there is a monthly fair. The Episcopalians, Roman Catholics, and Presbyterians have places of worship. Near the town is an extensive lake. *Bawnboy*, although only a village of not more than twenty houses, is noticed here as it has been made the

seat of a Poor-Law Union: the Union comprises 25 electoral divisions, with an area of 104,504 acres, and a population in 1851 of 29,104. *Bellanagh*, or *Bellinagh*, population 631, about 4 miles S.S.W. from Cavan, is situated in a very pleasing part of the county, the neighbourhood being adorned with numerous mansions and diversified by wood and water. Petty sessions are held, and there are ten fairs in the course of the year. *Killashandra*, population 932, besides 235 in the auxiliary workhouse, is picturesquely placed on a ridge of low elevation, surrounded by a series of beautiful lakes which flow into Lough Oughter. A considerable amount of farm produce is disposed of at the weekly market; some coarse linens also are sold, but there is little other trade. The Episcopalians, Presbyterians, Methodists, and Roman Catholics have places of worship. The town consists chiefly of one wide street. Petty sessions are held, and there is a sub-inspector's station of the county constabulary. Seven fairs are held in the course of the year. *Kingscourt*, population 1143, situated near the junction of the counties of Meath, Cavan, Louth, and Monaghan, consists chiefly of one long irregular street, and contains an Episcopalian church, a chapel for Roman Catholics, and several good dwelling-houses. Petty sessions and a monthly fair are held in the town. At the weekly market a good deal of agricultural produce is sold. *Mullagh*, population 358, is pleasantly situated on the road from Virginia to Moynalty. The site is elevated, and in the neighbourhood are several lakes, the banks of which are clothed with wood. There are places of worship for Episcopalian and Roman Catholics. Fairs are held on the last Friday in January, March, May, July, September, and November. Petty sessions are held on the second Tuesday of the month. *Shercock*, population 359, a rural village on the road from Dublin to Clones, about 6 miles N.N.W. from Kingscourt, has an Episcopalian and a Roman Catholic chapel, and a dispensary of the Bailieborough Poor-Law Union. Petty sessions and a monthly fair are held at Shercock. Near the village is Lough Shillan, a picturesque lake; and there are several good country seats, of which one named Shinan is surrounded by several small loughs. *Swanlinbar*, population 406, is situated on the Cloddagh rivulet in a wild district of country near the border of Fermanagh county, about 9 miles S. by W. from Enniskillen. There are here places of worship for Episcopalian, Roman Catholics, and Wesleyan Methodists. Petty sessions and a monthly fair are held, and there is a dispensary of the Bawnboy Poor-law Union. The constabulary force has a station here. A chalybeate spring near Swanlinbar enjoyed for some time considerable reputation, and attracted numerous visitors. *Virginia*, population 559, is a small town, prettily situated on the shore of Lough Ramor. The town has been much improved in appearance of late years. It forms part of the extensive estate of the Marquis of Headfort. The church is a small but remarkably neat edifice. There is a fever hospital. Petty sessions and a monthly fair are held. Lough Ramor with its small wooded islands presents much varied and beautiful scenery.

The county returns two members to the Imperial Parliament. It is in the north-west circuit. The assizes are held at Cavan, where are the county jail and the county infirmary. Quarter sessions are held at Bailieborough, Ballyconnell, Cavan and Cootchill; petty sessions at twenty-one places. There are bridewells at Bailieborough, Ballyconnell, and Cootchill. The district lunatic asylum, to which the county is entitled to send 33 patients, is at Armagh. Fever hospitals are at Bailieborough, Cavan, Cootchill, and Virginia. There are 21 dispensaries in the county. Cavan possesses a savings bank, and there is a loan-fund at Ballyjamesduff. The Poor-Law Union workhouses are at Bailieborough, Bawnboy, Cavan, and Cootchill. There are barracks at Cavan and Belturbet, the former of which is in the military district of Belfast. The police force, numbering in all 419, is divided into 8 districts, comprising 39 stations: Cavan is the head-quarters. Revenue police-stations are at Bailieborough and Belturbet.

History and Antiquities.—Cavan was anciently called Breifne (*Brenny*), by which name it is distinguished in the history of the Conquest as being part of the territory of O'Rourke, the seduction of whose wife by Dermot Mac Murrough was the proximate cause of Strongbow's invasion. It was first made shire-ground about 1590. On this occasion the boundaries of the baronies were fixed, and the whole county was divided among the native possessors, five baronies being allotted to different members of the O'Reilly family alone, with a reservation of 220 beeves as a chief rent to the crown. In 1610 the O'Reillys having forfeited their possessions by rebellion, Cavan reverted to the crown. On the general plantation of Ulster, the introduction of a civilised and industrious population had the best effects in reclaiming the country, which up to this time had been waste and barbarous. Castles were built on all the chief undertakers' portions; the foundations of towns were laid at Virginia, Belturbet, and Ballyconnell, and of numerous considerable villages throughout all the low part of the county. The principal settlers were Lamdons, Auchmuties, and Bailies, from Scotland; Lamberts, Parsons, Ridgways, and Butlers, from England and the pale; and of the re-stated Irish the chief were O'Reillys. There is very little of interest connected with the subsequent history of Cavan. In this county are remains of raths, tumuli, castles, and religious houses, but none of any extent or historical interest. On the hill of Cnileagh near Swan-

linbar, in the north-west part of the county, was formerly the place of inauguration for Macguire, lord of Fermanagh; the spot is still regarded with superstitious veneration by the peasantry.

(*Statistical Survey of Cavan; Pynnar, Surrey; Thom, Irish Almanac; Ordnance Survey and Geological Map.*)

CAVAN, county of Cavan, Ireland; the county town, a market and post-town, and the seat of a Poor-Law Union, in the parish of Urney and barony of Upper Loughitee, is situated in 53° 58' N. lat., 7° 13' W. long., and 70 miles N.W. from Dublin. The population in 1851 was 3254, besides 1266 in the Union workhouse and other public institutions. Cavan Poor-Law Union comprises 33 electoral divisions, with an area of 160,662 acres, and a population in 1851 of 67,065.

Cavan is situated in a rich and well cultivated vale adjoining the extensive demesne of Farnham. The principal public buildings are grouped together on the western out-skirt of the town. They consist of the county jail and courthouse, both spacious and handsome buildings, the barracks, and a remarkably fine parish church. A public pleasure-ground, bequeathed by the late Lady Farnham for the recreation of the inhabitants, forms a pleasing feature in connection with this part of the town. The houses of the main street occupying the line of road from Dublin to Enniskillen are old and irregular, and the suburbs consist for the most part of wretched cabins. The Roman Catholic chapel is a large commodious building. There are also Presbyterian and Methodist meeting-houses; a fever hospital, and an infirmary. The Royal Endowed school, founded in the reign of Charles I., has a variable income arising from the rent of 800 acres of land; the number of scholars in 1851 was 26. Five exhibitions or Queen's scholarships, of 25*l.* a year each, have been attached to this school by the Board of Education. The neighbourhood is rich and closely cultivated; but the farms are very small, and much land is wasted by injudicious inclosures. Petty and quarter sessions are held in the town, and there are six fairs in the course of the year. A weekly market is held on Tuesday: a considerable retail trade is carried on in the town.

(*Fraser, Handbook of Ireland; Ordnance Survey Map.*)

CAVERY. [HINDUSTAN.]

CAWNPOOR, a district in the province of Alluhabad, lies between 26° and 27° N. lat., 79° and 81° E. long.; bounded N. by the Etawah district, W. and S. by the Jumna, and E. by the Ganges. The soil of about two-thirds of the district yields maize, barley, and wheat, turnips, cabbages, and other European garden vegetables, with grapes, peaches, and several other fruits which have been introduced by European residents; the sugar-cane also grows luxuriantly. Irrigation is much practised.

From a statistical report recently made concerning this district, it appears that the number of townships it contains is 2279; its area is 1,480,101 acres, of which 781,173 are cultivated, 163,563 fit for cultivation, free land 44,015, and 499,350 acres are wholly unproductive. The government assessment amounted to 2,046,197 rupees, or about 2½ rupees per acre on the cultivated portion of the land.

Cawnpoor, the capital of the district, situated on the right bank of the Ganges, in 26° 30' N. lat., and 80° 13' E. long., is one of the largest military stations in India. The old town stands a short distance north-west of the modern buildings, and higher up the Ganges. The principal street is composed of well-built brick houses two or three stories high, with balconies in front; the other parts of the town consist of mean houses built in a straggling manner. There are many handsome shops in the principal street containing generally an abundant supply of European goods, which are sold at moderate prices. Along the banks of the Ganges are many detached houses, or bungalows, the residences of the officers stationed at Cawnpoor.

The other principal towns are *Resoulabad*, in 26° 40' N. lat., and 79° 40' E. long., about 30 miles S.S.W. from Kanooje; *Jaujemow*, in 26° 26' N. lat., and 80° 16' E. long., 8 miles S.S.E. from the town of Cawnpoor; and *Akbarpore*, in 26° 23' N. lat., and 79° 52' E. long., 25 miles W.S.W. from Cawnpoor.

CAWOOD. [YORKSHIRE.]

CAXTON, Cambridgeshire, a decayed market-town in the parish of the same name and hundred of Long Stow, and conjointly with Arrington the seat of a Poor-Law Union, is situated in 52° 12' N. lat., 0° 5' W. long., distant 10 miles W. from Cambridge, and 50 miles N. from London by road. The population of the parish of Caxton, inclusive of 180 persons in Caxton and Arrington workhouse, was 630 in 1851. The living is a vicarage in the archdeaconry and diocese of Ely. Caxton and Arrington Poor-Law Union contains 26 parishes and townships, with an area of 48,853 acres, and a population in 1851 of 11,058.

The church, dedicated to St. Andrew, consists of a nave and north aisle, of the late perpendicular, and a chancel of the early English style, with a tower at the west end, embattled and surmounted with pinnacles. There is a chapel for Baptists. The inhabitants are chiefly employed in agriculture. A market was granted to the town in 1247, but it was discontinued about the middle of last century. A small fair is held in October.

CAYENNE. [GUYANA.]

CAYMAN. [JAMAICA.]

CAYSTER, RIVER. [ANATOLIA.]

CELA'NO, the ancient *Fucinus*, a lake in the Abruzzo in Italy. It

is remarkable as being almost exactly in the centre of the Italian peninsula and the only lake of any considerable extent in the Central Apennines. The lake is nearly oval in shape, about 20 miles round, 2176 feet above the level of the sea, and situated in a basin without visible outlet and screened on all sides by mountains. To the north rises Monto Velino with its double peak to the height of 8180 feet. To the east and west are limestone ridges steep and rocky, and of much inferior elevation. On the north-west a moderate acclivity separates the lake from the valley of the Salto, an affluent of the Tiber. The lake it appears was traversed in ancient times by a river called Pitonius, which must be the Giovenco, the only perennial stream of any magnitude that now enters the lake; and its surplus waters were carried off by subterranean channels, the opening of uno of which is still visible and called La Pedogua, a name clearly derived from Pitonius. The outlets however being insufficient the lake frequently overflowed the low grounds along its banks. To obviate the evil Julius Caesar designed to cut a tunnel from the lake into the valley of the Liris; his plan however was not carried into effect till the reign of Claudius, who celebrated the opening of the tunnel with great magnificence. In the middle ages the tunnel became obstructed by the falling in of stones and earth, and many attempts have been made since the year 1240 to render it efficient in preventing inundations of the lake, but without success. Between 1745 and 1830 the encroachments of the lake had swallowed up 10,000 acres of the best land in the Abruzzo. Important repairs however were made at the expense of the king of the Two Sicilies under the direction of Signor de Rivera (who examined the tunnel in detail and described it in 1825), and the ancient tunnel was so far rendered available as to carry off a constant though not a large stream of water into the Liris, or Garigliano. The area covered by the lake according to a late official survey is 36,315 acres. A company was formed at Naples in September 1852 to effect the complete drainage of the lake.

Considered as a remnant of antiquity, the tunnel of Claudius is an exceedingly interesting object. At the opening of it near the lake, the tunnel is about 30 feet high and 28 feet broad; but it contracts considerably as it advances through the mountain. Its whole length is three miles. It is in part cut through the solid limestone of Monte Salviano, and in part through a chalky earth that has little tenacity. Wherever the latter substance occurs the tunnel is supported by masonry of admirable workmanship. To admit light and air the Romans sunk shafts from above. The entrance to this tunnel is about a mile and a half to the south of the town of Avezzano on the north-west shore of the lake. [Abruzzo.]

CELBRIDGE, county of Kildare, Ireland, a small town, and the seat of a Poor-Law Union, partly in the parish of Kildrought and barony of Salt North, and partly in the parish of Donaghempur and barony of Salt South, is situated in the midst of a highly improved country on the river Liffey, 11 miles W. from Dublin, by the Great Southern and Western railway, from the Hazelhatch station of which it is one mile distant. The population in 1851 was 1674. Celbridge Poor-Law Union comprises 15 electoral divisions, with an area of 86,839 acres, and a population in 1851 of 22,543. The river Liffey flows for several miles in the neighbourhood of Celbridge through demesne lands of great beauty. A handsome stone bridge crosses the Liffey at Celbridge. The town contains some good houses, and presents rather a neat appearance. Petty sessions are held, and there are a savings bank, and a fever hospital. Fairs are held on the last Tuesday in April, September 8th, and November 7th. In the town is a large woollen factory, erected in 1805, but not recently at work.

CELEBES, a large island of singular shape in the eastern seas, lying between 2° N. lat. and 6° S. lat., 119° and 125° E. long. The extreme length of the island from north to south is nearly 500 miles. The coast on the south and east is so deeply indented by three bays as to give to the whole island the appearance of four large limbs or peninsulas united together. The central and widest part of the island lies between Tolo Bay on the east and Macassar Strait on the west, and measures about 130 miles. Tomini or Oarong-tan Gulf, the most northern of the three, separates the peninsulas that project eastward. The other two peninsulas take a southern direction, and are separated by Sewa or Boni Gulf. The area of Celebes is about 70,000 square miles, and the population is estimated at between 2,000,000 and 3,000,000.

This island is separated from Borneo by the *Strait of Macassar*. This strait, which is 300 miles long from north to south, is about 120 miles broad, except at its northern termination, where it is contracted to half that breadth by Kaninagan Point on the eastern coast of Borneo. The gulf, which is formed by the northern peninsula of Celebes, by the north-eastern coast of Borneo, by the Sooloo Archipelago, and the island of Mindanao, is called the *Sea of Celebes*.

The island is divided into several small states, many of which are actually or virtually subject to the Dutch; but some of them, as Mandhur on the western coast and Boni to the east of it, and near the centre of the island, maintain a show of independence. The native sovereignties are all subdivided under numerous feudatory chiefs. The Dutch have exercised sovereignty over the island since 1660 when they drove out the Portuguese. Their principal settlements in Celebes are—in the north Menado, which comprises the northern peninsula; population in 1849, 183,000. In the south

Macassar or Mankasser, embracing the two southern peninsulas, population 1,569,000; and Ternate, which comprises the more southern of the two peninsulas that run eastward with several small islands to the east of it, and is probably named from its being included in the jurisdiction of the governor of the island of Ternate: population, 97,329. The chief towns of the Dutch are Menado and Kema in the north peninsula, both of which were made free ports in 1849, and Mankasser (5° 9' S. lat., 119° 36' E. long.) which was declared a free port in 1846. Mankasser has good anchorage; the harbour is defended by Fort Rotterdam. There is a considerable trade with China, and Chinese form the bulk of the inhabitants of the town.

The centre of the island, the nucleus of the four peninsulas, is a mountainous tract from which four arms branch out into the four peninsulas respectively, and terminate in promontories. The central district is composed of primitive rocks; but in the northern and in the southern peninsula the soil is in many parts of volcanic origin, and in the Menado district there are said to be some active volcanoes. In the low parts of the island there are extensive grassy plains.

The island contains three considerable rivers. The largest, the Chinrann, rises in the Wadjo country, in the centre of the island, crosses the kingdom of Boui, and discharges itself by several mouths into the Gulf of S'wa. This river is navigable to a considerable distance by ships of 300 or 400 tons burden; the native proas ascend much farther, to a fresh-water lake called Sedenveug. The river Boli has a bar at its mouth with three fathoms' water; it discharges itself on the north coast after a long and winding course. The third river has its mouth on the west coast to the south of Macassar. Besides these rivers, there are numerous small streams, especially on the south coast, which are navigable for a few miles by the vessels of the country.

The island is for the most part fertile, but agriculture is generally in a very backward condition, the inhabitants preferring navigation, fishing, and commercial pursuits to the more quiet employments of farming. The Bugis, or inhabitants of Boui, are excellent seamen: their proas visit every part of the Indian Archipelago, and even go as far as the Gulf of Carpentaria for the purpose of taking the tripang, or sea-slug, which is a profitable article of trade with China. They also convey the native produce of the Eastern Archipelago to Singapore, where they exchange their cargoes for British and Indian manufactures, calicoes, ironware, gunpowder, and muskets.

The principal productions of the island are rice, maize, cassava, yams, sago, sugar, with some cotton and tobacco. Timber is not abundant, but in some parts there are said to be forests of teak. Iron mines are worked, yielding metal of an excellent quality. The island also contains gold mines, which have never been regularly worked. The whole coast abounds with fish, and the number of turtle taken is so considerable that 50,000 pounds weight of tortoise-shell is annually shipped. The women of the country weave cotton-cloths for domestic use, and for export to Java and other of the Indian Islands, and they manufacture also great numbers of variegated mats, which are in large demand all through the archipelago.

The Macassar horses are larger, stronger, and more mettlesome than those of Java, to which island many hundreds of them are annually taken for sale.

The population of Celebes is composed of several distinct races, speaking different languages. The Bugis are the most numerous, and include a large proportion of the coast population. The Macassar language is spoken by several tribes who inhabit the south-western limb. The Mandharese language prevails in the central part of the island and towards the western coast: the Mandos inhabit the north-eastern limb. The centre of the island towards the north is inhabited by Turajas or Huraforas, who are supposed to be the aborigines of Celebes. Of all these people the Bugis are the first in enterprise and intelligence; they engross nearly all the carrying trade of the Indian Archipelago, the trading of other tribes being almost entirely confined to coasting voyages. The Bugis are esteemed to be very fair dealers, and they often embark in extensive speculations. The Portuguese formed a settlement at Macassar in the year 1512, and it was not until after that time that the Mohammedan religion was introduced. In 1603 the Raja of Macassar with the whole of his subjects embraced Mohammedanism, and soon after compelled their weaker neighbours to follow their example. In 1811 the Dutch authority in Celebes was transferred by conquest to the English, who ceded the island to the Dutch at the peace of 1815.

(Stavorinus, *Voyages*; Forrest, *Voyage*; Crawford, *Indian Archipelago*; Count Hogendorp, *Coup d'Œil sur l'Île de Java*, &c.; *Report of Committee of House of Lords on the Affairs of India*.)

CELLE. [LUNEBURG.]

CENTRAL AMERICA is the central portion of the long isthmus which unites North and South America, and extends from 8° to 18° N. lat., and from 82° to 94° W. long. Its greatest length is about 1000 miles, its width varies from 100 to 300 miles; the area is about 150,000 square miles. During the Spanish occupation Central America, with the exception of British Honduras and the Mosquito coast, formed the kingdom of Guatemala. For a short time after the declaration of independence by the Spanish colonies, this country was united to the Mexican kingdom of Iturbide; but in July 1823 a

new constitution was published, according to which the states of Guatemala, Honduras, Nicaragua, and San Salvador were formed into a federal union under the title of the United States of Central America. The union was however soon dissolved, and the several states became independent. At the present time Central America comprises the independent states of GUATEMALA, SAN SALVADOR, HONDURAS, NICARAGUA, and COSTA RICA, the settlement of HONDURAS BRITISH, and the protected MOSQUITO KINGDOM, which will be found described under their respective titles, and to which we refer for the physical geography &c. of this portion of America.

CEPHALONIA. [JONIAN ISLANDS.]

CEPHISSUS. [ATTICA; ATHENS.]

CERAM, an island in the Eastern Archipelago, between 3° and 4° S. lat., 128° and 131° E. long., is next to Gilolo the largest of the Molucca Islands. Its length from east to west is 230 miles, and its greatest breadth above 50 miles. The estimated area according to Captain Koppel ('Indian Archipelago') is about 10,000 square miles. The population is said to be close upon 30,000. The peninsula of Hoewamochil or Little Ceram is united to the island at its western extremity by a narrow isthmus, called the Pass of Tamoeno. A chain of mountains runs through the island from east to west, ranging between 6000 and 8000 feet above the sea, and 'sending down innumerable streams to the sea.' The vegetation is everywhere luxuriant, and the trees gigantic. Cloves and nutmegs grow wild, but the Dutch take great pains to extirpate them in order to preserve their monopoly in the spice trade. A cluster of small islands off the east end of Ceram is called the Ceramlant Islands. To the west of it is the mountainous island of Booro, which gives name to the Booro Strait between the two islands. At a short distance from the south coast are Amboyna and the Banda Islands. The soil in the valleys of Ceram appears to be fertile. The peninsula of Hoewamochil formerly produced great quantities of cloves and nutmegs, but the trees were destroyed by the Dutch about 1657. The cabinet wood known in commerce as Amboyna wood is for the most part the produce of Ceram, which contains also several large forests of the sago palm. The inhabitants of Ceram who are of the Papuan race, have been described by Dutch writers as the most bloodthirsty cannibals in the Indian Archipelago. The Malays have several settlements along the coast; they trade extensively with China in sea-slugs. They hoist the Dutch flag, and assist the Dutch in maintaining their protective system. Owing to the jealousy of the Dutch the interior of Ceram is very imperfectly known. Beautiful shells are found on the shores of this and the neighbouring islands.

The larger islands of the *Ceramant* group are called Great Kelling (or Kossing), Little Kelling, and Ceramlant. They all lie on a coral bank covered with between two and four fathoms' water. In climate and productions the Ceramlant Islands do not materially differ from the Moluccas, of which they are considered to constitute a portion. Many of these islands are well cultivated and very populous. The villages are large, and each of them constitutes an independent community, governed by a chief. These small states are continually quarrelling, and often at war, and the villages are fortified by walls of considerable height and thickness; and other walls have been erected to mark the respective boundaries. The inhabitants are Mohammedans, and almost every place contains a mosque.

The *Goram Islands*, a group immediately east of the Ceramlant, consist of three rather large islands, Goram, Manowoko, and Salawako. These are remarkable as constituting a link in the commercial intercourse of the world. By means of these alone the inhabitants of Papua or New Guinea export the produce of their country, and are supplied with those articles of foreign merchandise which are in demand among them. Each island has a district on the coast of Papua with which it carries on an exclusive commerce. If the inhabitants of another island went to visit it for commercial purposes it would be the cause of a war. The inhabitants of Papua, on their side, are also disinclined to enter into a commercial intercourse with any persons except those who commonly visit them. The articles which are exported by them from Papua are slaves, nutmegs, tripang, tortoiseshell, and edible birds'-nests; and the imports consist of guns, gunpowder, small cannons, cotton-cloth, corals, Chinese goods, iron, hardware, and some smaller articles. The imported goods are sent by the islanders to Bali and Sumbawa, or the Bugies carry them to Singapore.

The Ceramlant, as well as the Goram Islands, are frequently visited by English and American whalers, which export a considerable quantity of nutmegs, mace, and cloves, obtained by barter for guns, gunpowder, cotton-cloth, and some other articles. The Dutch consider these islands as forming a portion of their widely-spread dominions in the Indian Archipelago. From time to time they send a vessel there to settle the disputes which have arisen between the small independent states. The commercial intercourse between Banda and the Ceramlant and Goram groups is very great. The agricultural produce of the islands finds a ready market at Banda, where sago, oil, coconuts, live stock, wood, sweet nuts, and betel are imported in large quantities.

(Koll, *Reize door den weinig bekenden zuidelijken Molukschen Archipel*; Captain Keppel, *Visit to the Indian Archipelago*, London, 1853).

CERDAGNE, FRANÇAISE, a district ceded by Spain to France, in 1660, in virtue of the treaty of the Pyrenees. It was included in Roussillon and now forms the arrondissement of Prades, and part of the arrondissement of Ceret in the department of Pyrénées-Orientales. It is a mountainous country, and contains abundant upland pastures. Its capital was Mont-Louis. [PYRÉNÉES-ORIENTALES.]

CERET. [PYRÉNÉES-ORIENTALES.]

CERIGO. [IONIAN ISLANDS.]

CERILLY. [ALLIER.]

CERNE ABBAS, Dorsetshire, a market-town and the seat of a Poor-Law Union, in the parish of Cerne Abbas, in the combined hundred of Cerne, Fotecombe, and Mothbury, and in the Bridport division of the county, is situated on the little river Cerne, a feeder of the Frome, in 50° 48' N. lat., 2° 48' W. long., distant 7½ miles N. by W. from Dorchester, and 127 miles W.S.W. from London by road. Dorchester is 141 miles from London by railway via Southampton. The population of the parish of Cerne Abbas in 1851 was 1343. The living is a vicarage in the archdeaconry of Dorset and diocese of Salisbury. Cerne Poor-Law Union contains 20 parishes and townships, with an area of 43,237 acres, and a population in 1851 of 7777.

Cerne Abbas formerly possessed a Benedictine abbey of great antiquity; the abbey was rebuilt and endowed in the 10th century. The only remains are a stately square embattled tower, or gate-house, which is in a dilapidated condition. Of two stone bridges which cross the river Cerne here, one, of ancient construction, was formerly an appendage of the abbey. The parish church is a fine building in the perpendicular style, with a tower which has octagonal turrets and pinnacles. There are places of worship for Wesleyan Methodists and Independents, and National and British schools.

Cerne Abbas is pleasantly situated in a vale, surrounded by steep chalk hills. The town is of small extent. The property being for the most part let out on lives, old houses are being replaced by new ones as the leases fall in. There is little trade in the place. Tanning, glove making, malting, and brewing afford employment to some of the inhabitants. The market is on Wednesday for corn and provisions; there are three annual fairs. About 15 acres of land have been laid out in allotment gardens for the poor, which have proved of considerable benefit.

On the southern slope of Trendle Hill, a little to the north-west of the town, is a colossal figure of a man bearing a club, carved in the chalk. The figure is about 180 feet in height; the outlines are about two feet broad. On the same hill are the site of an ancient fortification and a barrow; and several barrows are on other hills.

[Hutchins, *History of Dorsetshire; Communication from Cerne Abbas.*]

CETTE, a flourishing sea-port town in the department of Hérault, in France, is built on the slope and at the foot of a hill (the ancient *Mons Sétius*, about 600 feet high), on a tongue of land between the shore-lake of Thau and the Mediterranean, which are united by a canal that runs through the town and terminates in the harbour. It stands in 43° 24' N. lat., 3° 42' E. long., at a distance of 422 miles S. from Paris, and has a population of about 18,000. The town owes its rise to the mole, which was commenced in 1666, and which, extending 656 yards into the sea, shelters the harbour from the south and south-east winds. At its extremity on the left of the entrance to the harbour is fort St. Louis, which is surmounted by a lighthouse with a fixed light 82 feet high. The other side of the harbour is formed by a pier; and to prevent the accumulation of sand a break-water has been constructed in front of the entrance of the harbour. Fort St. Pierre on the extremity of the pier and a citadel erected on the opposite cliffs complete the defences of the harbour. The space inclosed is about 30 acres, in which there is a depth of about 19 feet of water. A broad deep canal, lined with handsome quays and warehouses, connects the harbour with the shore-lake of Thau; and a new dock, 17 acres in extent, with quays above a thousand yards in length, was commenced in 1850. This basin is also connected with the harbour by a canal.

The town, which is entered by a causeway raised above the shore-lake of Thau, and by a bridge of 52 arches, is well-built, has tribunals of first instance and of commerce, a college, a public library, marine baths, a customs entrepôt, ship-building yards, and large salt works. The church of St. Louis is the most remarkable building. The importance of Cette is owing to its being an outlet in the centre of the great wine districts of the south of France, and to its communication with Bordeaux by the Canal du Midi (which enters the shore-lake of Thau at Agde, and may be said to enter the Mediterranean through the harbour of Cette), with Lyon by the Canal des Etangs, the Canal de Beaucaire, and the Rhône. Its railway communications already reach to Nîmes, Marseille, and Avignon, and will soon be completed to Paris and Bordeaux. The foreign commerce and the coasting-trade of Cette are important and active; and there is besides an extensive traffic with the interior. The town has ship-building yards, and is largely engaged in the cod, anchovy, and oyster fisheries. The imports consist of wool, raw cotton, corn, oil, cork, colonial produce, hemp, timber, pitch, tar, iron, tallow, fish-oil, and Benicarlo wines from Spain to mix with French wine for the English and other markets. The manufactured articles are verdigris, green soap, brandy, sugar, perfumes, corks, liqueurs, glass, confectionary, great numbers

of wine casks, &c. The exports consist of these articles, and of wine to the amount of about 40,000 tons annually, salt which is made in large quantities in vast salterns near the town, brandy (about 5000 tons), besides almonds, dried fruits, dye stuffs, and flour. Steamers ply regularly to Marseille and the Languedoc Canal. In 1852 the total number of vessels that entered and left the harbour of Cette amounted to 3903, with an aggregate burden of 367,487 tons. Foreign consuls reside at Cette. The Duchess de Berri landed at Cette on her way to La Vendée in 1832.

[*Dictionnaire de la France; Macgregor, Statistics; Official Papers.*]

CEUTA, or SEBTA, a town and fortress belonging to the Spaniards, is situated on the north coast of the kingdom of Fez in the empire of Morocco, and at the eastern entrance of the Strait of Gibraltar, where a small peninsula about 3 miles in length juts out in a north-north-east direction exactly opposite Gibraltar. The peninsula is joined to the mainland of Africa by a narrow isthmus on which the town is built, and is well fortified on the land side against any attacks of the Moors. To the north-east of the town the peninsula spreads out in a rounded shape, and is almost entirely occupied by a mountain called El-Mina and also Monte del Hacho, a spur of the range of mountains (Jebel Zatout, anciently Septem Fratres) that runs parallel to the coast, and may be considered as the north-western end of the Lesser Atlas. The Monte del Hacho rises precipitously from the sea; it is the ancient *Abyla*, which with the opposite rock of Calpe (Gibraltar) formed the celebrated Pillars of Hercules. On the highest part of Abyla stands the citadel of Ceuta. Provisions for the inhabitants and the garrison are chiefly brought from Spain, for little peaceable communication is kept up between the inhabitants and the Moors. Ceuta has a small and not safe harbour, and 9200 inhabitants, exclusive of the garrison, which generally numbers 5000 men. The town is well built, very clean, and well paved. The chief objects in the town besides the fortifications are the cathedral, several convents, an hospital, and a convict establishment. Ceuta gives title to a bishop who is suffragan of the Archbishop of Sevilla. It is the seat of a royal court of justice, and the chief of the Spanish presidios, or convict establishments, on the African coast. The military commander is also political governor of the place, and has under him the other presidios on the coast of Morocco, namely, Peñon de Velez, Alhucema, and Melilla, the latter of which is about 150 miles east of Ceuta towards the frontiers of Algiers. The total area of the territory of these presidios is 32 square miles, and their population not including soldiers in 1849 was 11,481. Ceuta, or Septa, was a town of Mauritania Tingitana under the Romans. John I., king of Portugal, took it from the Moors in 1415. It came under the dominion of Spain in 1580, when Philip II. conquered Portugal. The Portuguese afterwards formally ceded it to Spain by the peace of Lisbon in 1668. In 1690 the Moors besieged it unsuccessfully. The Monte del Hacho is in 35° 54' N. lat., 5° 16' W. long.

CEVENNES, a chain of mountains in the south of France, forms the watershed between the Lower Saône and the Rhône on the east and the Loire and the Garonne on the west; and extends from the Canal du Centre, a few miles north-west of Chalon, to the Canal du Midi, or Languedoc Canal. These dimensions, which are those of a writer in the '*Dictionnaire de la France*,' give the chain a length of about 280 miles—much more than is commonly assigned to it, for generally the Cévennes are supposed to terminate northward to the west of Lyon. Geographically considered however the range has the length here given. The valley of the Dhuone, which is traversed by the Canal du Centre, divides the Cévennes from the Côte-d'Or hills, which are connected by the plateau of Langres with the Vosges; and in the south the Canal du Midi marks the depression that divides the region of the Cévennes from that of the Pyrenees. On the eastern side these mountains slope down rapidly to the valley of the Rhône, into which they send out numerous short offsets; on the west they subside gradually into the plains of the west and south-west of France, except at one point (near 44° 30' N. lat., 4° E. long.), where they are joined to the Auvergne Mountains by the Margeride chain, which forms part of the watershed between the Allier and the Lot.

The general direction of the chain is from north-north-east to south-south-west. Immediately east of Castelnau-d'Aud, near the Canal du Midi in the department of Aude, the Lower Cévennes Mountains commence under the name of Montagne Noire, and run north-east through the departments of Hérault and Gard, sending forth numerous offshoots into those of Tarn and Aveyron, and dividing the basin of the Tarn from that of the Hérault. On leaving Gard the chain increases in height, and running north-east by north enters the department of Lozère, where one of its summits, Mont-Lozère, attains the height of 4890 feet. From this point the Margeride ridge springs off towards the north-west, and unites the Upper Cévennes with the mountains of Auvergne. The Margeride Mountains attain the height of 4987 feet, and send out amongst other branches those of Levezou and Aubrac, which extend into Aveyron. Continuing in the same direction, the Cévennes cover nearly the whole of the department of Ardèche; from the south-west of which a ridge runs northward through the department of Haute-Loire, and divides the basin of the Allier from that of the Loire. In the department of Ardèche the Cévennes Mountains reach their culminating point in Mont-Mézen, which has an elevation of 6561 feet. [ARDÈCHE.] Leaving Ardèche, the chain

enters the eastern part of Haute-Loire, and taking a northern direction passes, under the names of the mountains of Vivarais, Lyonnais, Beaujolais, and Charolais, and with greatly diminished elevation through the departments of Loire, Rhône, and Saône-et-Loire, on the northern boundary of which it is separated by the Dheune from the Côte-d'Or Mountains, which divide the feeders of the Seine from those of the Saône. Thus throughout their whole length the Cévennes Mountains form the watershed between the Atlantic and the Mediterranean.

The Cévennes Mountains consist principally of granite; but basalt, lava-streams, extinct craters, and other evidences of volcanic action at some remote period abound in the central and highest part of the chain and its offshoots, especially in those that run eastward through the department of Ardèche. [ARDÈCHE; AVEYRON.] Gold dust is found in the granite deposits after inundations to which most of the rivers of the Upper Cévennes are subject. In some parts the rocks are calcareous, and contain grottoes and caverns of great extent. In the calcareous districts the disappearance of a river (locally called an 'aven') for one or two miles is not uncommon. Tale and clay-slate are found in different parts of the chain, while towards the base considerable beds of roofing-slate are found. The Cévennes afford abundant pasture for large numbers of cattle and sheep, and in some parts the higher summits are covered with forests of pine; chestnuts also are produced in immense quantities, and form an important article of food and of commerce. On the lower slopes the vine and other fruit-trees flourish. Game is abundant, and wolves are far from being rare. Iron, lead, antimony, copper, coal, gypsum, and marble are met with in various parts of the chain.

The cultivation of the lower slopes of the Cévennes is carried on in parts with great diligence, and places which would seem to be the least suited to it have been rendered available by the careful industry of the inhabitants. They raise across the ravines formed by the mountain torrents a wall of loose stones, through which the waters when clear pass readily; but when after a storm or sudden shower they bring down earth and stones, these walls act as a filter: the earth and stones are deposited, and in time form a platform of good ground. Successive platforms are raised one above another like a flight of steps. On these platforms vines and mulberry trees are planted, and potatoes, maize, and other species of grain are produced. In other places natural terraces are inclosed by walls of loose stones, and the basins thus formed are filled with vegetable soil obtained from the cavities of the mountain, or conveyed by the peasants from the foot of it upon their backs.

These mountains are mentioned by ancient authors, both Greek and Latin. Cæsar ('De Bel. Gal.' vii. 8) calls them Cevenna; Pliny (iii. 4) calls them Gebenna. Cæsar crossed them in his contest with the Arverni and their confederates under Vercingetorix. The presumed difficulty of the passage had encouraged the Arverni, who deemed themselves covered from attack by these mountains as by a wall. The passage was made early in the year, and Cæsar had to make a road through snow six feet deep. Strabo gives to this range the name of *Κέμμενον ὄρος*, while Ptolemaeus uses the plural form, *τὰ Κέμμενα ὄρη*. The fastnesses of these mountains afforded refuge to the Huguenots in the religious wars of France. In 1703 the Huguenots of these mountains rose in arms and committed the most fearful excesses. They had been driven into rebellion by persecution. The revolt was of sufficient importance to justify the employment for its suppression of Marshal de Villars, who however was soon recalled to more important service, and it was not till 1705 that the revolt was put down by the Duke of Berwick.

Cévennes was also the name given to the northern part of Languedoc traversed by the highest part of the range. It included the districts of GEVAUDAN, VIVARAIS, and VELAY.

CEYLON, an island lying between 5° 54' and 9° 50' N. lat., 79° 50' and 82° 10' E. long. It is separated on the north-west from the continent of India by the Gulf of Mannar. Its extreme length is about 270 miles from north to south, and its extreme breadth 145 miles: the circuit is about 850 miles. Its area is about 24,664 square miles, or about 2000 square miles less than that of Ireland; but no accurate survey has been made. The population in 1843 was 1,442,062, of whom 8275 were whites, 1,413,456 coloured persons, and 20,431 aliens and resident strangers.

In Sanscrit writings Ceylon is called Lunka (holy or resplendent); in the Singhalese annals it is called Sinha-la-dwipa (the island of lions). The Arabs named it Serendib, which is only a corruption of the genuine name; and the Portuguese, Selan. It has been called Hebenaro (the fertile island); Eelam (the insular kingdom); and Tencasserim (the place of delight). To the Greeks and Romans it was known under the name of Taprobane, and Salice. (Ptolemaeus.) Being favourably situated at the western entrance of the Bay of Bengal, and bounded on the south and east by the Indian Ocean, it is admirably adapted for an entrepôt of eastern commerce; and though at present but thinly peopled it promises to take rank among the most important of the English possessions.

Surface, Hydrography, Communications.—The eastern shore of the island is in many parts bold and rocky, and the water deep. The north-western and the western shore from Point Pedro to Colombo is uniformly low, and indented with bays and inlets. On this coast

about midway between Mannar and Colombo is the Gulf of Calpenty, on the west side of the peninsula forming which is the town of Calpenty, with the harbour of the same name. The south and south-eastern shore is elevated, and presents a highly picturesque appearance. At Trincomalee on the east coast, and Point de Galle on the south-west, there are harbours capable of containing the largest ships; and the roads of Colombo afford a secure anchorage at certain seasons. In the harbour of Trincomalee all the navies of the world might anchor, and be protected at any season. On the south-eastern coast there are four ports in which small vessels may find shelter, and five on the north-western coast.

The north-western coast of Ceylon is almost joined to India by the island of Manaar, ADAM'S BRIDGE, and the island of Rameserum. There are only two passages through the strait. One of these, called the Manaar Passage, which separates the island of Manaar from the opposite coast of Ceylon, near Mantotte, was formerly not above four feet deep at high water. The other, called the Panntheen Passage, separates the island of Rameserum, celebrated throughout India for its pagoda, from the opposite coast of India, near Tonitorré Point. This passage is very narrow, and was once only six feet deep at high water. Both the passages have been deepened and widened.

The physical structure of the interior of Ceylon is but imperfectly known. Its mountain ranges do not in general approach nearer to the sea than 40 miles, leaving the island nearly surrounded by a rich belt of alluvial earth, well watered by numerous rivers and streams. The great mass of the high land is in the southern and wider part of the island, the central parts of this mountain region being intersected by the seventh parallel of N. lat. Numerous offsets from this nucleus are detached towards the south, south-eastern, and south-western coast, forming the boundaries between valleys which are drained by rivers rising in the central mass, and running south, south-east, and south-west. This part of the island contains Adam's Peak (7420 feet high), which was supposed to be the highest mountain in the island. But the most elevated point is now ascertained to be Pedrotallagalla, near the European station of Newerra Ellia, which is 8280 feet above the sea, and is surrounded by a tract of elevated country of very irregular surface, and well adapted for almost all the productions of temperate countries. This table-land is generally from 2000 to 3000 feet above the sea. From the central mass in the territory of Kandy, a range of high land runs northward nearly as far as 9° N. lat., forming the western boundary of the basin of the Mahaveli Ganga (the chief river of the island), and separating the waters which flow into this river, or towards the east coast, from those which run westward into the Gulf of Mannar. This range is very little known. The interior mountainous district contains numerous beautiful valleys, and prodigious forests. The northern parts of the island are generally flat.

The island abounds with mountain streams and rivers. The rivers are more numerous on the south and south-west than on the north-east side. Those which flow through the districts on the east and north formerly filled the numerous but now ruinous tanks which once rendered these districts the most fertile and populous in the island. The principal rivers are the Mahaveli Ganga (the Ganges of Ptolemaeus), the Kulani Ganga, the Kalu Ganga, and the Walawe Ganga, all of which rise in the central mountain region. They are navigable only for boats and rafts. The Mahaveli Ganga, after descending from the mountains, and traversing the valley of Kotmale under the name of Kotmale Ganga, is joined near Passabage by a smaller branch issuing from the base of Adam's Peak. It then passes through the village of Peradenya, four miles from Kandy, where it is crossed by a modern bridge of one arch, 205 feet in span, constructed of satin-wood. Between Kandy and Bintenne the river descends above 1000 feet, and receives in this part of its course numerous streams. At Bintenne, at the foot of the mountains, its average breadth is 340 feet, and its depth at the ford 5 feet; in the dry season 1 or 2 feet, and during freshes 25 or 30 feet. After a slow northern course through the country of Bintenne it separates into two branches: the smaller, the Vergel Ganga, enters the sea 25 miles south from Trincomalee; the larger, retaining the name of Mahaveli Ganga, falls into the great Bay of Trincomalee. It flows through a country once the granary of the island, as indicated by the numerous remains of works of art for the irrigation of the land, which, now fallen into decay, serve only to form pestilential morasses. Its whole course is near 200 miles, and it might be rendered navigable for at least 80 miles. The Kulani Ganga runs a westerly course to Colombo, and is the medium for much internal traffic thence to Ruwanwelle, a distance of 50 miles. The Kalu Ganga takes a western direction, and after passing through the districts of Saffragam and Three Korles enters the sea at Caltura. It is navigable a little above Ratnapoorn. The Walawe Ganga has a south-eastern course to the sea, 8 miles to the north of Hambantotte.

In the highlands are several lakes which afford abundant supplies of fish, and are of use for irrigating the rice lands. The flatness of the districts bordering on the sea-coast has occasioned the formation of extensive salt-water lakes or lagunes, which are connected by canals having stupendous embankments, constructed by the Singhalese three centuries before the Christian era. These works greatly facilitate the intercourse between the maritime provinces. Small vessels from

India may land their cargoes at Calpenty, and have them conveyed by canal to Colombo.

The country being intersected by deep ravines, often impassable, and covered with thick jungle, the communications are rendered extremely difficult. Under the Kandian government the opening of roads was prohibited, and the passes were strictly guarded. Narrow paths were made by which men on foot could pass singly, climbing over the rocks and through the thickets. In thus providing for the defence of the country its improvement was necessarily retarded; and from the little intercourse which subsisted with the maritime provinces, the habits and institutions of the people were of the most simple and primitive kind, exhibiting curious remains of their social condition in very remote ages. But since the occupation of the country by the British many excellent carriage roads have been constructed at a vast expense. One of the finest of these is the main road to Kandy, a work of great magnitude, which has been carried through some difficult passes in the hills, and connected by several bridges, the largest of which, over the Mahaveli Ganga, has been already noticed. A sum of 10,000*l.* was appropriated in 1852 for the construction of an important line of road from Gampola to Yattenotte; and the construction of new roads, as well as the maintenance and repair of those already existing, constantly engages the attention of the authorities. The government outlay on roads for the year 1852 was 36,520*l.* from the treasury, and 17,951*l.* from the road ordinance. There are now about 3000 miles of road open, of which a third has been added during the last ten years. That civilisation receives a powerful impulse by the opening of communications, and that it advances in proportion to the facilities of commercial intercourse, are facts which have been remarkably illustrated in Ceylon. Roads being opened they were soon covered with the vehicles of commerce. Bazaars and villages have sprung up along the roads, and the productions of Europe are sold in every village. A mail coach has been for some time established between Colombo and Kandy.

Geology and Mineralogy.—Primitive rocks in numerous varieties constitute the principal formations of the island. Granite and gneiss are the more prevalent; quartz, dolomite, hornblende, primitive greenstone, and a few others occur less frequently. The varieties of granite and gneiss which often pass into each other are very numerous. Regular granite is not common, but it is met with at Point-de-Galle. Gneiss is far more abundant than granite; a beautiful kind is found at Annapoora (7° 15' N., 80° 30' E.), which contains a very large proportion of felspar. At Trincomalee quartz occurs in veins and in masses embedded in granite. Hornblende and primitive greenstone are found on Adam's Peak. Dolomite exists largely in the interior, and is used for making lime. It is in this rock that the nitro caves are found. The more recent rocks occur in the level belt near the sea. Fine-grained compact limestone is found in great abundance on the northern extremity of the island. Along the remainder of the coast sandstone generally prevails, lying in horizontal beds along the beach, but seldom extending beyond it.

Ceylon contains numerous useful minerals and many valuable gems. Iron is very generally diffused. The black oxide of manganese is found. Plumbago abounds, and is exported in considerable quantities. Tin has been found; copper exists, with quicksilver and coal. There are no less than 22 caves from which nitre, nitrate of lime, and a small proportion of alum are obtained. The sulphate of magnesia is found in only one cave, and according to Dr. Davy it is equal to the best Epsom salts. Salt is found in natural deposits, and is formed by artificial means in several parts of the maritime provinces, particularly in Mahagampattoo; it yields a revenue of 40,000*l.* per annum.

Of the gems of Ceylon those principally valued are the ruby, the cat's-eye, the sapphire, the amethyst, the topaz, the garnet, the cinnamon stone, the turmeline, the zircon or Matura diamond, and the golden beryl. Among the King of Kandy's jewels (sold by auction in London in 1820) was a beryl which measured two inches in diameter, and sold for more than 400*l.*

There are several hot springs in the island: five at Kannya, in the neighbourhood of Trincomalee, and two in the province of Uva. The former are resorted to by invalids suffering from rheumatic and cutaneous disorders: at 7 A.M. the temperature of the air being 77° of Fahrenheit, their heat varies from 86° to 107°. The water is pure, with the exception of the slightest trace of common salt and a little carbonic acid gas and azote. The Uva springs are more than 1000 feet above the sea, and have a temperature of 76° and 85° respectively. At Aloochoowera there are two springs, the temperature of which is sufficiently high to dress food. In 7° 15' N. lat., 81° 20' E. long. near the Patapala river, there is a hot spring which constantly emits air bubbles.

Climate.—The climate of Ceylon is principally influenced by the two monsoons. The north-east monsoon prevails from November to February, and the south-west monsoon from April to September. In the intervening months variable winds and calms prevail. The seasons are however subject to fluctuation, the south-west wind being generally most prevalent. Sometimes indeed at Colombo this wind blows for five months together, and the north-west wind blows during the months of December and January only. Local circumstances modify the winds of the interior according to the distance from the

east and west coast; thus, at Badulla, in Upper Ouvah, during the months of June, July, and August, the wind is variable, and for the remaining nine months it blows from the north-east. The heat is not so great as on the neighbouring coast of India, the sea-breezes moderating the temperature, and making the air more agreeable and salubrious. At Colombo the mean daily variation of the temperature does not exceed 3 degrees, and the annual range of the thermometer is from 76° to 86½° Fahrenheit. At Galle the mean daily variation is 4 degrees, and the annual range from 70° to 87°. At Jaffnapatam the mean daily variation is 5 degrees, and the annual range from 70° to 90°. At Trincomalee the greatest daily variation is 17 degrees, and the annual range from 74½° to 91½°. At Kandy, 1457 feet above the sea, the mean daily variation is 6 degrees, and the annual range from 66° to 86°; and at Newerra Ellia, 6210 feet above the sea, the mean daily variation is 11 degrees, and the annual range 85½° to 80½°. The eastern part of the island, which is open to the north-east monsoon, partakes of the hot and dry climate of the coast of Coromandel. The western division, which is open to the south-west monsoon, has a climate like that of the Malabar coast, which is temperate and humid. The north-east winds although accompanied by rain are drier than those from the south-west, and the country over which they blow has an arid appearance as contrasted with the luxuriant verdure of the southern and western districts, which continues during the greater part of the year. The driest seasons are those which occur between the range of the two monsoons, partaking slightly of the influence of both.

The climate and seasons of the northern and southern districts may be thus strikingly contrasted:—On one side of the island, and even on one side of a mountain, the rain may fall in torrents, while on the other the earth is parched and the herbage withered. The inhabitants in one place may be securing themselves from inundations, while in another they are carefully distributing the little water of former seasons which is retained in their wells and tanks.

The salubrity of Ceylon has been greatly increased of late years by the extension of cultivation and the clearing and draining of jungle land, but very much remains to be accomplished. There can be little doubt that were the island cleared and generally brought under cultivation it would be as healthy as England.

Soil, Agriculture, &c.—Quartzose gravel or sand, and felspathic clay, mixed with oxide of iron, derived from the decomposition of the prevailing rocks, generally compose the soil of Ceylon, which seldom contains more than 3 per cent. of vegetable matter, while quartz often constitutes nine-tenths of the whole. In the cinnamon gardens at Colombo the soil is composed of pure and perfectly white quartzose sand. A brown loam formed by the decomposition of gneiss and granite, and a reddish loam resulting from the decomposition of clay iron-stone called 'cubook,' are the most productive soils, and the quartzose the least so. The soils in the elevated lands of Saffragam and Lower Ouvah, and the granitic soils in the mountains above, are fertile. The soil of the northern division is sandy and calcareous. Agriculture in all its branches is in a very backward condition. Notwithstanding all the advantages of Ceylon in variety of soil, gradations of temperature, and adaptability of climate, the cultivation of rice may be said to be the only successful tillage of the natives. Yet it is impossible to foresee the extent to which the productions of nearly every other country might be domesticated and extended throughout this island. Agriculture flourishes most among the Jannul population of the north. At Jaffna every cultivated spot is securely fenced; there is one well or more in every field, and by incessant watering the farmers succeed in obtaining a third harvest in each year. For home consumption they grow an innumerable variety of fruit and vegetables almost unknown to the rest of the island; and for trade and export, in addition to their great staple, tobacco, which is the finest in the east, they produce grain of all kinds and curry stuffs, especially onions and chilies, for shipment to India and the coast of Ceylon.

Among the trees indigenous to the island cinnamon, of which Ceylon may be said to have the monopoly, is the principal; but the cocoa-nut tree is the most important to the island. The cocoa-nut contributes largely to the subsistence of the people, and when the grain crops fail, or are destroyed by inundation, averts much of the misery of so serious a calamity. The leaves, each 12 or 13 feet long and 3 feet broad, are excellent food for elephants, and are plaited into 'cadjans' and 'cusingoes' for thatching houses. They are also wrought into brooms, and 'ohools,' or torches for travellers. The sap, called 'toddy,' is extracted and used as a beverage in its natural state, and converted by distillation into arrack. Vinegar is also made from this sap, and by boiling, a coarse sugar called jaggery is formed from it. The kernel of the nut is used in culinary purposes; but the principal part is converted into 'copperah,' by being dried in the sun, and in this state is transferred to the oil-press. The refuse oil-cake, called 'poonat,' furnishes good food for poultry and pigs. The shells of the nut are formed into goblets, ladles, and other domestic utensils; and from the capsule cordage of all kinds, from the smallest yarn to a ship's cable, is manufactured. During the six years preceding 1848 about 20,000 acres were surveyed and sold for cocoa-nut planting at Batticaloa and Jaffna; and at Calpenty, on the western coast, equally extensive tracts were in process of cultivation. When the addition thus made within so short a time is taken into consideration, along

with the prodigious extent of native plantations previously existing, which extend in a belt along the western coast of the island almost from south to north, and on the east as low as Batticaloa, an idea may be formed of the remarkable capabilities of Ceylon in this one article, now in so much demand in Europe. Large establishments for crushing the oil by steam have been opened at Colombo, where it is shipped to England for the manufacture of candles.

The Palmyra palm abounds in Jaffna, and being productive in seasons of drought, when the crops fail, is of great value to the people. The leaves are used in the construction of huts, and also as a substitute for paper, and various other purposes. Toddy is extracted from it as from the cocoa-nut tree. The timber is used for rafters, and is exported in large quantities. The kittul-tree is peculiar to the south: its sap produces a coarse sugar, and its fruit dried and pulverised serves as a substitute for rice flour. The leaves of the talipot-tree are so large that one will shelter many individuals. They are used by the natives to protect them from the sun and rain. When softened by boiling they serve to write upon, and are of great durability. The Ceylon arca-nut is celebrated for its superior quality, and is exported in great quantities.

The cinnamon grounds are situated between Timgalle on the south and Chihaw on the west, and in the more temperate part of Kandy. They present, when the tree is in flower, an extremely beautiful prospect, the small white petals affording an agreeable contrast with the flame-coloured extremities of the upper and the dark green of the inferior foliage. About half a million of pounds are exported in a year, but the amount is gradually decreasing.

A great variety of timber abounds in this island, and the restrictions by which government formerly prevented its being cut without a licence have been removed. Calamander, satin, rose, ebony, sapan, iron, jack, halmulle, and other beautiful woods for cabinet-work are in profusion.

The coffee-plant thrives, particularly in the interior, and has of late been greatly improved by culture. The number and size of the coffee plantations had largely increased for several years before the recent equalisation of the duty in England, which appears for a while to have checked the progress of the planters; but the quantity annually raised is still very great. The importation of coffee from Ceylon into the United Kingdom in 1832 was 2,824,998 lbs.; in 1852 it had risen to 35,316,916 lbs.; the entire quantity exported from Ceylon in 1852 was 41,706,448 lbs. It is only within the last few years that any attention has been paid to the sugar-cane in Ceylon; but there are now several extensive and flourishing plantations, and it is highly probable that sugar will soon form an important article in the export trade of the island. Chaya root, which yields a scarlet dye, was once monopolised by the government; but the monopoly has been relinquished. Tobacco is raised principally in the northern and southern districts. Indigo grows wild, but is turned to little account, though it was in ancient times exported from Trincomalee and celebrated all over India, Arabia, and Persia, and greatly enriched the Ceylon merchants. Some cotton is raised, but at present little more than is required for consumption in the island; 64,848 lbs. were however exported from Ceylon into the United Kingdom in 1852. The pepper-vine grows almost in a wild state. The cardamom plant is abundant. Fruits and culinary vegetables are produced in great variety and profusion. The cultivation of rice had become neglected, hardly enough being produced for the consumption of the inhabitants; its culture has however been vigorously resumed, and a considerable quantity is now annually exported to Great Britain. There are two rice harvests in the year; the first about February, the second in September. Gamboge, gum-lac, and cardamom seeds are among the articles produced in Ceylon.

The quadrupeds of Ceylon are for the most part like those of the opposite continent. Elephants are most numerous in the northern and eastern provinces; one European officer in two years killed 400. They often make predatory incursions in troops, and do great injury to the crops. Among the ancients the elephant of Ceylon was celebrated for its extraordinary size and beauty. Leopards, tiger-cats, hyenas, jackals, bears, racoons, and monkeys are among the more numerous of the wild animals. There are several species of deer, of which the elk and fallow-deer are found in the greatest number; there is also another of very diminutive size called the moose-deer (*Cervus Aris*), which is caught by the natives, and exposed for sale in the markets. Wild hogs abound in the plains to the eastward.

Of 20 different species of snakes examined by Dr. Davy, 16 were found harmless. The *Tic polonga* is the most venomous. Pea-fowl abound wild. Beche de Mer, used for food and paste in China, is collected off Chilaw and Jaffna.

The chank, a species of cowry (*Voluta gravis*), abounds on the north-west coast of Ceylon. There are two kinds, payel and patty, one red and the other white. A third species, opening to the right, is very rare, and highly valued by the Hindoos. It has occasionally been sold for 10,000 rupees, or 1000*l*. The demand for chanks, caused by the rites of the Hindoo religion, was once so great that the right of fishing for them was sold by the government for 60,000 rix dollars per annum; but the demand decreased, until the revenue from this source became not worth collecting, and now this fishery is free to all. The chank fishery was important as a nursery for divers.

The most productive pearl banks are situated off Condachy, extending 30 miles from north to south and 20 miles from east to west. The fishery generally commences in March, when the calm weather permits the boats to go out and return daily. Killecarré is probably the Colohi mentioned in the Periphs of the Erythræan Sea as the site of these fisheries, and they are carried on in the same manner as described by travellers several centuries ago. The ancient towns of Mantotte and Putlam probably derived much of their importance from their vicinity. In 1833 there were 1250 divers employed, of whom 1100 were volunteers from the opposite coast. Each pearl bank is available only for one period, of about 20 days in every 7 years; in no season does the fishery last for more than 30 or 35 days, commencing with the calm weather, about the 5th of March. If the oyster is taken before seven years old, its pearls are imperfectly developed; vigilance is therefore necessary to prevent indiscriminate fishing, which would destroy the banks, or at least render them quite unproductive. The banks are let, or the pearls sold by the government to the highest bidder. In 1797 the revenue derived from the pearl-fisheries was 140,000*l*., being the largest ever obtained by the British government. From that time the fisheries gradually declined, until they at length became wholly valueless as a source of revenue: they are closed until 1855, when a valuable fishery is anticipated by the governor. The sea-fisheries are very productive on all parts of the coast.

Commerce.—We have historical proof that, from the Christian era until the beginning of the 6th century, Ceylon was the emporium of the trade carried on between Africa, India, and China. The Romans particularly, after the discovery of the passage by way of Bab-el-mandeb to Guzerat, by Hippalus, until the decay of their empire, traded extensively with India and Ceylon; the latter place being the usual limit of their navigation, where they exchanged their gold and silver, the chief instruments of their commerce, for the silks, fine cloths, and costly commodities of Eastern India and China. This trade was afterwards engrossed by the Persians, the principal part of whose imports consisted of horses for the king. The persons on the island engaged in this trade were settlers—Arabs, Persians, and Malabars successively. The great commercial ports were Colombo and Galle, though grain and provisions were exported in abundance from Trincomalee to the opposite coast. In the 11th century the trade was entirely in the hands of Mohammedan Arabs, who circulated its productions through the Red Sea and Persian Gulf, and various countries of Asia, Europe, and Africa.

The vast commerce of Ceylon was not materially checked till the Portuguese engrossed the trade of its principal productions, and interrupted those maritime relations which had existed previous to the discovery of the passage round the Cape of Good Hope. But it was reserved for the Dutch system of pernicious monopoly to inflict vital injury on its commercial interests. The narrow policy or individual interest of the Dutch governors shackled the commerce of the island, and almost destroyed her natural powers of production. These impolitic restraints have been removed; but it may be still long before Ceylon will cease to feel the effects of the evils which she has suffered from misgovernment in her commercial affairs.

The value of the exports from Ceylon in 1833 was estimated at 32,530*l*.; of imports at 320,891*l*. In 1852 they had increased to 948,000*l*. and 1,000,474*l*. respectively; exclusive of the specie from India, and of the imports re-exported. The principal articles of export are coffee, cocoa-nut oil, cinnamon, and areca-nuts. In 1847 the tariff of the island was entirely remodelled; a low fixed duty, instead of an ad-valorem duty, being charged upon nearly all articles imported; upon the exempted articles a duty of 5 per cent. ad-valorem is still charged. Cinnamon is the only export paying duty, and the duty on that is about to be removed; there has been for some time a falling off in the quantity exported. It used to average upwards of a million pounds annually; in 1850 it was 644,857 lbs., in 1852 it had fallen to 427,666 lbs.

Inhabitants.—The population is at present composed of Singhaliese, Malabars, Mohammedans or Moors, Veddas or Beddas, a small proportion of Europeans and their descendants, and negroes, Malays, Chinese, &c. The Singhaliese inhabit Kandy and the south and south-west coasts from Hanbantotte to Chilaw, and comprise the great body of the people. They are probably descended from the aborigines and the Gangetic nations, who invaded the island about B.C. 543. The language and customs of the Singhaliese are in some respects peculiar. A woman was frequently married to all the brothers of the same family, but this practice is going out of fashion like many others. The civil distinctions of caste are strictly observed. The abolition of the religious distinction of caste constitutes a remarkable peculiarity in the institution of the Buddhists.

The Malabars or Tamuls occupy the northern and north-eastern coast, and the peninsula of Jaffnapatam. Their own traditions and the Singhaliese annals inform us that they came as invaders from the opposite coast, and formed a powerful kingdom in Jaffna, besides a number of petty states. They are Hindoos, and have retained the religious as well as the civil distinctions of caste, and the language and customs of southern India, under some modification, occasioned by their intercourse with the Singhaliese.

The Mohammedans or Moors are derived from the various neighbouring islands and the continent, with the converts they have made.

They are found on all parts of the sea-coast, as well as in the interior, and in Pultam district they form the mass of the population. They tolerate the distinctions of caste, and class themselves into four orders: merchants, weavers, fishermen, and bankers. They are a fine, energetic, industrious race, who engross a large proportion of the commerce and traffic of the island. The Veildas, or Baddas, the aborigines of the island, are reduced to a very low grade of savage life, having neither habitations nor clothing. They dwell in the great forests which extend from the south to the east and north, and also in the most inaccessible parts of the interior.

The descendants of Europeans of unmixed blood, and the race which has sprung from the intercourse of Europeans with the natives, are called Burghers. From these Burghers, almost exclusively, individuals have hitherto been selected for the clerkships in public offices, and for subordinate magistracies.

Language.—The spoken language of the Singhalese is peculiar to themselves, but their classic and sacred writings are either in Pali or in Sanscrit. The Malabars use the Tamul, both for colloquial and literary purposes—except the Brahmans in Jaffna, who write Sanscrit in the 'grantha' characters. The Ceylon Portuguese prevails in the European settlements, but its use is not universal among the natives.

Religion.—Nicephorus supposes that St. Thomas, the apostle, preached the gospel in Ceylon; but modern writers agree in assigning to Nestorian missionaries, who accompanied the merchants from Persia, the introduction of Christianity into the island. From Cosmas Indicoplestes we learn that about the middle of the 6th century there were churches established here, but they no longer existed when the Portuguese arrived, and the permanent establishment of Christianity seems to have been effected by St. Francis Xavier, styled the apostle of the Indies. He preached in the neighbourhood of Manaar in 1544, and 600 of his converts fell martyrs to the faith which they adopted. By far the larger number of Christians in the island belong to the Roman Catholic communion. It numbered at the end of the year 1848 about 115,000 members, under a bishop and a vicar-apostolic, his coadjutor, and 28 apostolic missionaries. They have above 300 churches, which are maintained altogether from private resources. Of the Protestants, those of the Church of England are most numerous. The establishment is under the presidency of the Bishop of Colombo, who has an allowance of 1600*l.* a year from the East India Company. His diocese comprises the whole island. There are some Presbyterians, Lutherans, Methodists, and Baptists. Buddhism prevails among the Singhalese. In conformity with the treaty of 1815, the Buddhist religion is maintained in the interior by the British government, but the charge of the Dalada relic, or tooth of Buddha, and the temple patronage, which were important privileges of the kings of Kandy, and to which the British government succeeded, have very properly been relinquished since 1847 to the priests. In the northern parts the Hindoo religion prevails; its professors are followers of Siva.

Education.—There are a great many village and temple schools, conducted by Buddhist priests, in which reading and writing are taught; but there are few useful books in the Singhalese language. The portion of the population receiving education from approved sources scarcely exceeds one-eightieth of the whole. The government elementary and English schools, to which scholars are admitted at a very low charge, while the vernacular schools are free, had 5676 pupils in 1852: in a few of the mission schools English is taught as well as the vernacular. The advantages of education are eagerly sought by the natives, and its progress is only impeded by the want of competent teachers. The expenditure on the government schools during the year 1852 (exclusive of rent of buildings) was 8648*l.*, and the receipts from school fees were 1121*l.* A college has been founded at Colombo under the patronage of the Bishop of Colombo, who very largely contributed to the funds, for the education and training of a body of native clergy, catechists, and schoolmasters for the service of the church. There is also a government academy or college at Colombo. The education of the native children is to some extent provided for by the missionaries of different denominations, who have also translated several English religious books into the Singhalese language for the use of the native converts.

The island is divided into five provinces, denominated respectively the Eastern, Western, Northern, Southern, and Central; and each province is subdivided into districts. The principal towns are Colombo, the capital; Kandy, the former capital of the dominions of the King of Kandy; Galle, or Point de Galle, the chief port; Calpenty, Caltura, Jaffnapatam, Newerra Ellia, and Trincomalee. COLOMBO, POINT DE GALLE, and TRINCOMALEE are noticed under their respective titles, the others we notice here.

Calpenty is situated on a peninsula on the west side of the Gulf of Calpenty, 8° 14' N. lat., 79° 58' E. long., and about 93 miles N. from Colombo: population, 3000. It was anciently called Arasadi, but the natives now call it Kalputti. The town consists of mud-thatched huts and a few large houses roofed with tiles. The extensive groves of cocoa-nut trees with which it is stocked, and the rich foliage of the Looria, forming a line on each side of the road leading to the bazaar, give it a pleasing appearance. In the town and its vicinity are numerous places of worship, Protestant, Roman Catholic, Hindoo, and

Mohammedan. A charity school is supported by government. On account of the shoals in the harbour, vessels exceeding 100 tons are obliged to lie in the bay at Mutwal, and unload and convey their cargoes to Calpenty in small boats (dhonies), of which a great number belong to the place. The exports from Calpenty to Madras and other ports on the Coromandel coast are coppernails, cocoa-nuts, oil, shark's fin, coir-rope, honey, bees'-wax, ghee (clarified butter), fish-oil, wood-oil, daumer, moss, chaya roots, and palmyra timber. The imports consist of cloths, paddy, rice, crockery, hempen-thread, pieces, minerals, and drugs. The opening of the canal between Chiaw and Colombo proved very beneficial to the inhabitants of Calpenty, and the trade by means of inland navigation rapidly increased. The soil in the vicinity is very productive. In and about the town are about 600 groves of cocoa-nut and palmyra trees. The gardens produce every kind of vegetable, and mangoes, bananas, guavas, papayas, pomogranates, citrons, shaddocks, bread-fruit, and very fine grapes. The fisheries of Calpenty have greatly increased within the last few years. A large quantity of lime is made from shells found here in great abundance.

Caltura, the principal town of the district of the same name, is situated on the left bank of the Kalu Ganga River, about 25 miles S. from Colombo. A small fort stands on a neighbouring mound commanding the river, but it is not now garrisoned. The soil of the surrounding district is remarkably productive. A great number of Jutra dhonies belong to the port, which trade to Madras and other places on the Coromandel coast. The Wesleyan missionaries have a handsome chapel and school-house here. There is also an excellent rest-house for travellers, which is much frequented in consequence of its being on the high road to Galle. The town is the seat of an assistant government agent, and assistant judge. Its climate is remarkably pleasant and salubrious, and the scenery of the vicinity very picturesque; it is therefore a favourite resort of invalids from Colombo. Since the establishment of the government sanatorium at Newerra Ellia it has however been less frequented than formerly.

Jaffnapatam, the chief town of the province of Jaffna, is situated on a peninsula at the north end of the island, 215 miles N. from Colombo: population, about 8000. It is defended by a large fort, which includes a church, the house of the commandant, and other good buildings. The town is to the east, half a mile distant, and consists of several broad parallel streets intersected by smaller streets. The inhabitants are mostly Dutch and their descendants. The bazaar is abundantly supplied with provisions at a cheap rate. The harbour is only accessible to small vessels, the water being shallow. The cargoes of large vessels are unshipped at Kails, and conveyed to the town in boats. Jaffnapatam is the seat of a government agent and of a provincial judge.

Kandy or Candy, formerly the capital of the King of Kandy's dominions, is situated in 7° 20' N. lat., 80° 50' E. long., about 65 miles direct distance E.N.E. from Colombo: the population is about 3000. The town stands in the midst of steep and lofty hills covered with jungle, and is very insalubrious. It is nearly encircled at the distance of about 3 miles by the Mahavelli Ganga. The principal street is on the declivity of a hill, and is nearly 2 miles long. The houses are of mud, and thatched, but those of the chiefs are tiled and whitewashed. There is a handsome new church; the governor's residence and the artillery barracks are the other public buildings. The palace of the Kings of Kandy covers a considerable space, and contains a great number of rooms. It was once a building of great magnificence, but has been permitted to fall into a very neglected and dilapidated condition. Among the objects of interest in Kandy are the temples and tombs of the kings, although now more ruins. The town is surrounded by a mud wall, and thick thorn hedges are also extended round it along the sides of the hills, so as to form lines of circunvallation, leaving only narrow passes. Four miles from Kandy is Peradenya where are the Ceylon botanical gardens, and near which the Mahavelli Ganga is crossed by the great satin-wood bridge before mentioned.

Newerra Ellia stands on a lofty table-land 6200 feet above the level of the sea, about 7° 5' N. lat., 80° 54' E. long., and has risen into importance since its selection as the principal government sanitary station of Ceylon. Its elevated site renders the climate though keen peculiarly invigorating to Europeans, and the scenery by which it is surrounded is remarkably picturesque. Pedrotallagalla, the loftiest of the Ceylon mountains is a striking object from the station. The soil, which is very fertile, produces all kinds of European vegetables and cereals. Game is very abundant. In the town and its immediate vicinity are houses belonging to the governor, the bishop, the commander of the forces, and various government offices, barracks, an hospital, &c.

Government, Laws, &c.—The native government of Ceylon was strictly monarchical. The king was proprietor of the soil, regulator of the feudal payments and services, and distributor of all public honours and emoluments. The classification of the people and the distribution of lands being the basis of the system of government, the civil and judicial administration of the country was entrusted to chiefs placed over different departments and in various provinces and districts, with a gradation of inferior functionaries. The services of all were rewarded with certain privileges or possessions. The head

man of each village, to whom the people immediately referred, directed the labour of the people under the authority of the provincial chief, and superintended the police. But the superintendence of agriculture was the duty of a particular class of persons who attended to the embankments of tanks and canals, and to the distribution of water.

The government of Ceylon as a British colony is at present carried on by a governor and two councils—executive and legislative. The executive council consists of the governor, who is president, and of the following members: the officer commanding the forces, the colonial secretary, the treasurer, the queen's advocate, and the government agent of the central provinces. The legislative council is presided over by the governor, and consists of the following members: the chief justice, the commander of the forces, the secretary, the treasurer, the auditor-general, the government agent for the western provinces, the government agent for the central provinces, and the surveyor-general. With the legislative council are associated six unofficial members, natives or naturalised subjects of Ceylon, being chief landed proprietors or principal merchants. The governor, the commander of the forces, the chief justice, the queen's advocate, and the surveyor-general, are appointed by the secretary of state from England.

Until within the last year or two the revenue of the island has, ever since our acquisition of it, been below the expenditure. It appears from the report of Governor Sir G. W. Anderson, dated April 1852, that the revenue is now "fairly in advance of the expenditure;" the revenue for 1851 was 429,700*l.*, and the expenditure 409,128*l.*; the revenue for 1852 was 411,806*l.*, and the expenditure 412,871*l.*

In every province is stationed a government agent, and an assistant agent is stationed in each district. These functionaries administer the affairs of government and officiate also as magistrates. Every village has its native headman elected by the inhabitants, and officially recognised by the government.

For the administration of justice throughout the island there are in the civil and criminal departments—a supreme court, established at Colombo; a vice-admiralty court, and provincial courts stationed in various districts; besides magistracies. The powers of the supreme court are similar to those of the Queen's Bench and the High Court of Chancery combined. Justice is administered by judges appointed from England. There are in this court—a queen's advocate, with functions like those of the lord advocate of Scotland; a deputy queen's advocate and registrar; and a proctor, who is a barrister, for pleading the causes of prisoners and paupers. Trial by jury has subsisted since 1811.

In each district there is a court held before a judge and three assessors; the judge is appointed by the crown and removable at pleasure. The assessors are selected from amongst the inhabitants, duly qualified, not under 21 years of age. The district courts have civil and criminal jurisdiction. They try all offences except those punishable with death, transportation, or banishment, imprisonment for more than one year, whipping exceeding 100 lashes, or a fine of 10*l.* Appeals may be made from these courts to the supreme court. The criminal jurisdiction of the supreme court extends throughout the island. The sessions are held twice a year in each circuit, being presided over by one of the judges. Sentence of death pronounced at the criminal sessions by the supreme court is not executed until confirmed by the governor. Appeals from the supreme court are allowed to the Queen in council. The Dutch or Roman law, with certain exceptions, is administered in both the district and the supreme courts. All the witnesses in criminal cases are paid by government.

A savings bank has been for some years established with great success at Colombo, under the patronage of government, with nearly the same regulations as in England.

The British currency is in circulation throughout the island, and accounts are becoming generally kept in the same. The silver coinage of the island is the rupee, the current value of which is fixed at 2*s.* sterling, its real value being 1*s.* 10½*d.* The silver coin formerly issued by the British government, the six-dollar, is equal to 1*s.* 6*d.*, or to 12 fanams (a copper coin which is equal to 4 pice). English weights and measures are also becoming generally used.

There are four regiments of European infantry, two companies of the royal foot artillery, and a regiment composed principally of Malays, a fine body of men, nearly 2000 strong.

History.—Onesicritus and Nearchus, commanders of the fleet dispatched by Alexander from the Indus to the Persian Gulf, brought the first accounts of the island to Europe. Its character and productions are described by Pliny and Ptolemæus. Cosmas Indicopleustes relates, on the authority of his friend Sopator, a merchant, who visited Ceylon in the 6th century, that the coast inhabitants differed from those of the interior (the land of precious stones), and consisted of a proportion of Persians, who had formed a Christian establishment. In the latter part of the 13th century the island was visited by Marco Polo, who describes it as the finest island in the world. About half a century later it was visited by Sir John Mandeville, who mentions Adam's Peak.

The Singhalese annals extant profess to contain an uninterrupted historical record of events for 24 centuries, according to which their first king Hijaya founded his kingdom by the extirpation of the

original inhabitants about B.C. 543, and their last king, Shri Wikrama Raja Singha, was deposed by the British in A.D. 1798. Many remarkable vestiges of the Singhalese yet remain in various parts of the island.

Of European nations the Portuguese first established a regular intercourse with Ceylon. The island being torn by internal wars, and invaded from Arabia and Malabar, the king purchased the assistance of the Portuguese with a stipulated annual tribute of 250,000*lbs.* of cinnamon. The allies gradually gaining a footing in the island, at length, in 1520, strongly fortified themselves at Colombo, subjected the whole of the maritime districts, and retained possession of them for about 150 years. The Kandians having called in the Dutch, the Portuguese were expelled, but the struggle lasted from 1632 to 1656. The Dutch, like their predecessors, established their dominion over the maritime provinces, and in 1761, having taken Kandy, they would have subjected the whole island had not the sickness of their troops obliged them to withdraw from the interior. In the war with the French, in 1782, the British took possession of Trincomalee, but it was shortly after retaken by the French, and the sea-coast remained in the hands of the Dutch until 1796, when it was wrested from them by the British, to whom it was formally ceded by the treaty of Amiens.

In 1815 the tyranny of the native king, who had forced the wife of his prime minister to pound to death her own children in a mortar, and committed other atrocities which rendered his dominion intolerable, led to his being deposed; upon which the British took possession of his dominions at the invitation of the Kandian chiefs, and have retained them ever since.

In 1848 an insurrection, which at first assumed a somewhat serious character, broke out in the Kandian part of the island, avowedly in consequence of the imposition of several new taxes by the British government. The insurgents collected in considerable numbers, and set up a native king; but the rebellion did not spread very widely, and was suppressed with little difficulty. The pretender was transported; a priest who had taken an active part in the rebellion was shot in his robes, and numerous executions and other severe punishments were inflicted after the suppression of the insurrection. The extent and character of these punishments caused much discussion, and the appointment of a committee of inquiry by the House of Commons. The committee decided not to report to the House their opinion on the evidence which they had taken, a decision which led to prolonged debates, while the investigation resulted in the recall of the Governor of Ceylon, Lord Torrington.

CEYZERIAT. [AIN.]

CHABLAIS (Sciablès), a province of Savoy, in the administrative division of Annecy, extends along the south coast of the lake of Geneva, and inland as far as an offset of the Alps, which detaches itself from the Dent du Midi, on the borders of Valais. Chablais is bounded S. by the province of Faucigny, W. by the Canton of Geneva, and E. by the Valais. Its greatest length from east to west is 25 miles, its greatest breadth from north to south is about 20 miles. The area is 228,045 acres, or about 356 square miles, and the population in 1848 was 57,562. It is a very mountainous country, with the exception of a strip of land along the shore of the lake of Geneva, which produces corn, wine, and fruit. A high country crowned by several lofty summits runs generally westward from the Dent du Midi, forming the watershed between the Dranse, which runs northward into the lake of Geneva, and the Arve, a feeder of the Rhône. Numerous ramifications run northward from the range between the tributaries of the Dranse, the principal river of Chablais, and subside into the plain that bounds the lake of Geneva towards the south-west; but in the eastern part of the province the mountains approach close to the shore. Several narrow valleys run inland between the offsets of the Alps, along the course of the Dranse and its affluents. These valleys abound in rich pastures, on which large herds of cattle are fed. Very good cheese is made in this part of the country, both for consumption and for exportation. The country abounds also with chestnut and walnut trees. The great Simplon road made by Napoleon I. traverses the north part of the province, following the curve made by the south shore of the lake of Geneva.

Towns.—Thonon, built on an eminence above the lake, 16 miles E.N.E. from Geneva, 31 miles N.N.E. from Annecy, in the midst of a fine and well wooded country, is the residence of the intendant, or governor of the province. It has a court of justice, a royal college, an academy for boarders, several churches and convents, a handsome town-house, an old castle, and about 4000 inhabitants. At Ripaille, near Thonon, is the once rich and handsome convent founded by Amadeus VIII., duke of Savoy and bishop of Geneva, afterwards Pope Felix V., all of which titles and dignities he resigned and retired to this retreat as an Augustinian monk. The building has been converted into a farm-house and dwellings for the labourers. Evian, a small town, likewise on the coast of the lake, nearly opposite Lausanne in Switzerland, has about 1800 inhabitants. Between Thonon and Evian, on the right bank of the Dranse, are the chalybeate waters of Amphion, which were much frequented in the last

century by visitors from Geneva. Inland among the Alps, is the village of *Abondance*, with 1400 inhabitants, in the valley of the same name, so called from the richness of its pastures. On the coast of the lake towards the borders of Valais, was a town called *Tauretunum*, which was destroyed by the fall of a mountain A.D. 568. The rocks of Meillerie, celebrated by Rousseau, and blasted by Napoleon to form the Simplon road, which is here carried partly through them in a terrace between 30 and 40 feet above the lake, are in this neighbourhood. Opposite Meillerie the lake of Geneva attains its greatest depth, 980 feet. At the village of St.-Gingough a deep ravine divides Savoy from the Valais. The highest summits in the Chablais are—the Dent d'Oche, on the borders of the Valais, 7000 feet above the sea; the Col de Jouxplane, which rises between the Chablais and Faucigny, above the valley of the Giffre, a feeder of the Arve, and is about 100 feet higher than the Dent d'Oche; and the Roc d'Enfer, which rises above the valley of the Dranse, near the centre of the province, and is about the same height as the latter.

CHABLIS. [YONNE.]

CHÆRONEIA, an old city of Boeotia, situated at the head of a small plain on the borders of Phocia, near the pass which led to Delphi by Panopeus and Parnassus (Thucyd. iv. 72; Pausan. x. 4). The name of this place does not appear in Homer's catalogue; Pausanias however conjectures (ix. 40, 3) that it is a later name for Arnæ, which stood on the same ground. It is principally celebrated for two battles fought here; one in which Philip of Macedon (Aug. 7, B.C. 338) signally defeated the united forces of Athens and Thebes; the other between Sulla and Mithridates (B.C. 86), in which the Romans gained a decisive victory. The Thebans slain in the former battle of Chæroneia we learn from Pausanias (ix. 40) were buried under a mound surmounted by a lion. The mound still exists about a mile from the village of Kapurnia, which now occupies the site of Chæroneia; a few years ago it was examined, and a colossal lion sculptured in the best style of Grecian art, was found in detached fragments about the sides and interior of the excavation. "This lion," says Colonel Mure, in his 'Tour in Græco,' "may upon the whole be pronounced the most interesting sepulchral monument of Greece." During the Peloponnesian war Chæroneia was tributary to Orochomenus (Thucyd. iv. 76); but in later times it was one of the confederate Boeotian towns (Pausan. ix. 3, 4). Its situation was the cause of much good and evil to it; on the one hand its neighbourhood to the pass exposed it occasionally to plunder (Thucyd. i. 113); while on the other hand, as the main road from Rome to Athens passed through it, many of the advantages of the carrying-trade accrued to it. Pausanias tells us (ix. 41) that its inhabitants derived a great profit from the cultivation of the olive, and the manufacture of perfumes from flowers. There are some ruins of the citadel which stood on a high projecting rock (called Potrachus or Petrochus) above the town; there are also some remains of a theatre and other buildings. Chæroneia was the birthplace of Plutarch.

CHAGRES is a river in the republic of New Granada in South America. It traverses in a longitudinal valley a considerable portion of the Isthmus of Panama, rising in about 9° 10' N. lat., 79° 10' W. long., among the high mountains which approach the Bay of Mandinga. Its upper course is westward: nearly opposite the town of Puerto Bello it receives the Pequeni, which comes from the south-west, and is as large and broad as itself. After this junction the river is considerable, and may be navigated by canoes; but the navigation is dangerous owing to the number of rapids, in some of which the stream runs with extraordinary velocity. This rapidity gradually diminishes, and at Cruces, a small town situated 23 miles direct distance from the sea, and 44 by the river, it seldom exceeds 3 or 3½ miles per hour, even in the rainy season. Here the river becomes navigable for large river barges. It afterwards gradually declines to the north, sensibly diminishing in rapidity, and enters the Caribbean Sea at Chagres, a small sea-port near 9° 18' N. lat., 80° W. long. The whole course of the river hardly exceeds 80 or 90 miles.

This small river was until lately of considerable importance, on account of its facilitating the commercial intercourse between Europe and the countries on the Pacific Ocean. Goods were brought on mule-back from Panama to Cruces, where they were embarked in river-barges of considerable burden, and carried to the town of Chagres. This town is a miserable collection of huts, and is very unhealthily situated. The port is a little sandy bay, with a ledge of rocks across its entrance, which has not more than 15 feet of water in the deepest places, and in many parts the rocks rise to the surface. On the discovery of gold in California the wretched port of Chagres and its dangerous and unhealthy river rose for a while to great importance, as they lay on the readiest route from the eastern seaboard of America to the gold fields of California. Vast numbers landed from steamers and sailing vessels at Chagres, ascended the river as far as they could in boats, and clambered over the mountainous road across the Isthmus to Panama, whence other vessels conveyed them to the much-longed-for 'diggings.' The exhaustless wealth of California still attracted more and more adventurers along the route, and it was soon resolved to lay down a railway across the Isthmus of Panama. This project is now (Feb. 1854) rapidly approaching completion; the railway is open for more than half its length, and Chagres river and town are now deserted. The latter is supplanted by the new city of Aspinwall,

which has been founded at Navy Bay, as the Atlantic termination of the railroad. [GRANADA, NEW; NAVY BAY.]

CHAILEY, Sussex, a small town, and the seat of a Poor-Law Union in the parish of Chailey, hundred of Street, and rape of Lewes, is situated in 50° 57' N. lat., 0° 1' W. long.; distant 6½ miles N. from Lewes, 47 miles E. by N. from Chichester, and 43 miles S. by E. from London by road. Cook's Bridge station of the Brighton and South Coast railway, 3½ miles from Chailey, is 47 miles from London. The population of the parish in 1851 was 1263. The living is a rectory in the archdeaconry of Lewes and diocese of Chichester. Chailey Poor-Law Union contains 11 parishes and townships, with an area of 37,040 acres, and a population in 1851 of 8054.

The town of Chailey occupies a pleasant site about the centre of the parish, on the road from Lewes to London. A good deal of timber is grown in the neighbourhood. The soil is generally productive. The parish church, dedicated to St. Peter, is a small building with a shingled spire, in which is a peal of six bells. There is a National school.

CHAILLOT, formerly a village in the immediate vicinity of Paris, from the main part of which it is separated by the Champs-Élysées: it was constituted a suburb of Paris by Louis XIV. in 1659 under the name of the Faubourg de la Conférence. It was inclosed within the wall erected in 1786-8, and now resembles a little city within a city, but still preserves a rural and suburban character, with its trees, gardens, and fine views. Chaillot is built on an eminence on the right bank of the Seine, and presents, when viewed from that river, a pleasant appearance. The salubrity of the air and the agreeableness of the prospects have led to the erection of many country houses in it: the gardens of some of these slope down to the river. It had formerly several religious houses, the most famous of which were the monastery of the Minims and the convent of the Visitation, founded in 1651 by Marie of France, the widow of Charles I. of England. On the site of the convent Napoleon I. commenced the erection of a palace for the King of Rome. The Duchess d'Abrantes, widow of Marshal Junot, died in a Maison de Santé in Chaillot in June 1838. The celebrated carpet manufactory, called the Savonnerie, is in Chaillot.

CHALABRE. [AUDE.]

CHALAMONT. [AIN.]

CHALCEDON, properly CALCIEDON, a town of Bithynia in Asia Minor, was situated on the coast of the Propontis, near the southern entrance of the Bosphorus, and nearly opposite Byzantium. It was built by a colony from Megara, B.C. 675. The earliest history of Chalcedon is connected with that of the neighbouring Megarian colonies. Its territory extended along the Asiatic side of the Bosphorus. It was taken by the Persians under Otanes after the Scythian expedition of Darius, retaken by the Athenians, then recovered its independence, and entered into a confederation with Byzantium and other neighbouring cities. It was afterwards subject to the kings of Bithynia. The city came into the possession of the Romans with the rest of Bithynia under the will of Nicomedes, B.C. 74; under the empire it was a free city. The Chalcedonians having embraced the part of the pretender Procopius, Valens, after his victory over the latter, ordered the walls of their town to be razed. Chalcedon was taken by Chosroes the Persian, A.D. 616. The final destruction of the city is owing to the Turks, who got materials for the mosques and other buildings of Constantinople from Chalcedon.

In Christian history Chalcedon is known for its council held A.D. 451, which was attended by 630 bishops from both the east and the west. It was the fourth œcumenic or general council of the church, those of Nicea, Constantinople, and Ephesus having preceded it, and was convoked by the emperor Marcianus. The council condemned the heresy of Eutyches on the nature of Jesus Christ. By the 28th canon of the same council, the see of Constantinople was declared to be equal in dignity, though next in place to that of Rome, and full jurisdiction was given to it over the churches of Thrace, Asia, Pontus, and other eastern provinces. Chalcedon is now a poor village, two or three miles south of Scutari, which occupies the site of the ancient Chrysopolis.

CHALCIS, the capital of the Island of Eubœa, is situated at the narrowest part of the Euripus—a strait which separates the island from Boeotia, and is here only 40 yards across. A rock surmounted by a square castle, partly of Venetian partly of Turkish erection, divides the Euripus into two channels, and is connected with the Boeotian coast by a stone bridge about 70 feet long, and with the island by a wooden bridge about 35 feet in length, which is capable of being raised at each end to admit the passage of vessels. The western channel has a depth of only about 3 feet of water; the eastern one is about 7 or 8 feet deep, and has been remarkable in all ages for its irregular tides. [EUBŒA.] At its eastern end the wooden bridge communicates by a gate (over which is still seen the lion of St. Mark), with the large kastro, or citadel, of Chalcis, which is built on a high promontory. The bastions of the kastro are of Venetian construction; the rest of the outer walls were built by the Turks, who have left here an enormous piece of ordnance similar to those of the Dardanelles for the defence of the strait. On the land side the kastro is surrounded by a glacis which formed the Turkish cemetery, and round this the town extends in the form of a crescent, each horn of which touches the Euripus. The town is inclosed on the land side by tur-

reted walls built by the Venetians, and now crumbling to ruin. The streets are narrow, but many of the houses are good and spacious; the best of the houses and a gothic church surmounted by square towers were built by the Venetians, who held the place for nearly three centuries before its conquest by the Turks in 1470. The only ancient remains in Chalcis are fragments of white marble in the walls of the houses and different structures in the town. The population of Chalcis is about 5000.

Chalcis is mentioned by Homer ('Il.' ii. 537). It was founded before the Trojan war by an Ionic colony from Athens, and it soon became a great commercial centre, trading with all parts of the western Mediterranean. Its early greatness is attested by its numerous colonies. The first of these was Cumæ in Campania, which was founded, it is said, *in* B.C. 1050. The peninsula between the Thermaic and Singitic gulfs took the name of Chalcidice, in consequence of the number of cities the Chalcidians founded on it. Among its other important settlements were Rhegium in Italy, and Naxos, Tauromenium, and Zancle in Sicily. In the early period of its history Chalcis was governed by an aristocracy called Hippobotæ (horse-feeders), who were probably proprietors of the fertile plain that lay between Chalcis and Eretria, and was often the cause of deadly wars between the two cities. After the expulsion of the Peisistratidæ from Athens the Chalcidians joined the Boeotians against the Athenians; but the latter entering Eubœa with a large force defeated the Chalcidians, and divided the lands of Hippobotæ among 4000 Athenian allottees, *B.C.* 506. Those settlers retired on the approach of the Persian expedition under Datis and Artaphernes. From the close of the Persian to the close of the Peloponnesian wars, with the exception of a few months, Chalcis was subject to Athens. In the 21st year of the Peloponnesian war (*B.C.* 411) Chalcis recovered her independence for a short time. It was in this interval that the Chalcidians, in order to secure a constant communication with Boeotia, constructed a mole across the Euripus with the exception of a passage in the centre wide enough for only a single ship, and defended by two towers erected on each side of the opening in the mole. Subsequently Chalcis was subject to the Macedonians. During the absence of Alexander the Great in Asia the mole was fortified with towers and gates, and the hill Canethis (now Karababa) on the Boeotian shore inclosed with walls. At this time Chalcis was nearly nine miles in circuit, and contained many temples, gymnasia, theatres, and other public buildings. In the wars against Macedon the Romans took Chalcis *B.C.* 192, but did not occupy it permanently. The Chalcidians deserted the Romans in the war with the Ætolians, and received Antiochus into the city on his arrival in Greece; they subsequently joined the Achæans, and the town was in consequence destroyed by Mummius. It was soon rebuilt however, and existed in the time of Strabo, who describes the mole. In the time of Justinian the mole was so dilapidated that communication with the mainland could be kept up only by placing wooden planks across the breaches. Chalcis was rebuilt by Justinian. Aristotle died in Chalcis; it was the birthplace of Isæus the orator and the poet Lycophron. Before the restoration of ancient names in the kingdom of Greece, Chalcis was called *Egripo*, a corruption of Euripus. Whilst the Venetians held it they called it *Negropont*—a name which was also extended to the whole of the island of Eubœa, and was most probably a corruption of *Egripo* and *ponte*, a bridge. [EUROPE.]

CHALGRAVE. [OXFORDSHIRE.]

CHALON, or CHALON-SUR-SAÔNE, chief town of the third arrondissement of the department of Saône-et-Loire in France, is 239 miles by railway S.S.E. from Paris, and 69 miles N. from Lyon. It stands on the right bank of the Saône at the point where that river is joined by the Canal du Centre which connects the Saône with the Loire, in 46° 46' 51" N. lat., 4° 51' 22" E. long., and has a population of 15,719, including the whole commune. Chalon is an ancient place. It occupies the site of *Cabillonum* or *Caballinum*, a city which belonged to the Ædni before the Roman conquest of Gaul. (Cæsar, 'De Bel. Gal.' vii. 42.) Quintus Cicero, brother of the orator, spent the winter of *B.C.* 52 in Cabillonum. It is a large and handsome town built in the centre of a vast plain covered with meadows, cultivated fields, vineyards, and patches of coppice-wood. In the middle ages the town was much smaller than at present; but a new wall having been built several suburbs were inclosed. There is still the suburb of St.-Laurent, situated on the left bank of the river, and joined to Chalon by a stone bridge of five arches. This suburb contains an hospital remarkable for its internal arrangement and the excellent state in which it is kept.

The town is well built; the finest part of it extends along the river, the banks of which are lined with quays. The most remarkable objects are the former cathedral, a gothic structure of the 13th century; the church of St.-Pierre; the hospice of St.-Laurent above mentioned, which was founded by François I. in 1529; the hospice of St.-Louis, founded in 1682, and an asylum for poor old men and orphans; the obelisk erected in 1793 to commemorate the opening of the canal; and the public library. In the centre of the Place-de-Boaune, a handsome square, there is a beautiful fountain surmounted by a statue of Neptune. Chalon has tribunals of first instance and of commerce, an exchange and chamber of commerce, a college, an agricultural society, and a theatre. Among its manufactures are silk stockings, hats, hosiery, vinegar, oil, pottery, and imitative pearls. There are also

dye-houses, iron-foundries, and oil and flour mills worked by steam machinery. Corn, flour, wine, colonial products, cattle, wood, fuel-wood for Lyon, coal, charcoal, iron, gypsum, tiles, bitumen, and the manufactures both of the north and south of France enter into the commerce of the town. By means of the Saône (which from Chalon is navigable for steamboats), of the railway, and the Canal du Centre, the town has a large transit-trade.

(*Dictionnaire de la France*; Balbi, *Géographie*.)

CHALONNES. [MAINE-ET-LOIRE.]

CHÂLONS-SUR-MARNE, on the right bank of the Marne, the capital of the department of Marne in France; head-quarters of the Fourth Military Division; the seat of tribunals of first instance and of commerce, of a consultative chamber of manufactures, of a council of Prud' Hommes, and of an agricultural society, is situated in 48° 57' 21" N. lat., 4° 21' 31" E. long., 107 miles E. from Paris by the Paris-Strasbourg railway; and has a population of about 15,000, including the whole commune.

A town existed on this site during the Roman dominion in Gaul, and is mentioned in the 'Itinerary' of Antoninus under the name of Durocatalauni, and by Eutropius under that of Catalauni: the prefix Duro, from a Celtic word denoting water, indicates its position on the bank of a river. Near this town, *A.D.* 271, Aurelian defeated the army of Tetricus, and in *A.D.* 451 Aëtius defeated Attila. Catalauni was the name of a tribe supposed to be a subordinate clan of the Remi whom Cæsar places in this part. D'Anville thinks that the ancient name of the town was Duro-Catalaunum.

Châlons is situated among meadows watered by the Marne, which is here crossed by a fine stone bridge. It was formerly surrounded by ramparts, now almost entirely demolished, and entered by six gates, one of which, on the road leading to Vitry, has the form of a triumphal arch. The town is badly built, most of the houses being timber-framed and coated with lath and plaster; but it contains some fine structures, among which are the cathedral of St.-Étienne, the churches of Notre-Dame, St.-Alpin, St.-Jean, and St.-Loup, the town-house, the former Benedictine abbey, now converted into barracks, and the residence of the prefect of the department, which is one of the finest edifices of its kind in France. The cathedral was originally built in *A.D.* 450, on the site of a pagan temple, and dedicated to St.-Alpin. It frequently suffered from fire, and has undergone many repairs. The structure, which is surmounted by three handsome spires about 120 feet high, and supported by eight flying buttresses terminating in sculptured pyramids, is entered by a majestic Greek door of the Corinthian order. The interior, 328 feet long and 72 feet wide, consists of a choir, nave, and aisles. The lofty vault of the nave is sustained by 10 columns, above 13 feet in circumference. In the sanctuary is one of the handsomest grand altars in France; it is surmounted by a baldachin supported by six marble columns. The painted windows, which have suffered much, represent the story of the creation and events related in the New Testament. Under the edifice is an ancient crypt. The church of Notre-Dame situated in the centre of the town was consecrated in 1322; it is built in the gothic style, and contains beautiful painted windows and a mosaic pavement covered with inscriptions. This church is classed among the historical monuments of France. Other remarkable objects at Châlons are the riding-school, the theatre, the college, the public library, containing 20,000 volumes, the royal school of arts and trades, in which 450 students are maintained by the government and instructed in several arts and mechanical trades; the cabinet of natural history, the botanical garden, and the magnificent promenade called 'Le Jard,' which is on the east side of the town, and covers an area of 19 acres. The Jard indeed is a sort of park laid out in plots of greensward, which are separated by 36 alleys shaded by magnificent elm-trees. St. Bernard preached to the Crusaders in the Jard. The town gives title to a bishop, whose see comprises the department of Marne, with the exception of the arrondissement of Reims. It has two ecclesiastical seminaries. The manufactures consist of fine rateens, girthweb, woolcombers' cards, hosiery, cotton yarn, and leather; the chief articles of commerce are corn, hemp, wool, rapeseed oil, and Champagne wine.

(*Dictionnaire de la France*; Balbi, *Géographie*; *Annuaire pour l'An* 1863; *Almanac de Gotha*, 1854.)

CHALOSSE. [LANDES.]

CHALUS. [VIENNE, HAUTE.]

CHAMBERY, the capital of the province called Savoy Proper, is also the most considerable town in all Savoy, and the residence of the military governor of that duchy, and of the senate or high court of justice for all its provinces. It lies at an elevation of 980 feet above the sea, in a fine valley, between two ridges which run north-west and south-east from the Rhône to the Isère. The valley is watered by the river Leisse which falls into the pretty lake of Bourget, 8 miles north-west of Chambery. The valley from Bourget to Montmélian is about 18 miles long and 3 miles broad. It abounds with vines, and the lower part is rich in pasture, but is subject to sudden inundations from the swelling of the mountain streams. The climate is mild, being sheltered from the north winds. Chambery has a royal college, an academy of sciences, which publishes its memoirs; a society of agriculture and commerce; a public library of 16,000 volumes; a museum; a theatre; and a school of drawing. There

are many hospitals, houses for refuge, and other charitable institutions in the town. General de Boigne, a native of Chambéry, having made a large fortune in the service of the East India Company, spent three millions and a half of francs in founding two hospitals and making improvements in the town. A street has been named after him, and a monument was lately erected to his memory. With the exception of the principal street and a few squares which are adorned with fountains, the town is irregularly built. The principal buildings are the cathedral, four convents, three monasteries, and three barracks. There are remains of the old castle of the Dukes of Savoy at the entrance of the town by the Lyon road. The churches of Chambéry have some good paintings. The population of the town and suburbs is about 16,000, and in addition to this there is usually a garrison of about 2000 men stationed in the town. The old ramparts have been levelled and converted into public walks. Among the industrial products of Chambéry are silk-gauze, lace, leather, soap, hats, &c. There is also some trade in liqueurs, wine, metals, &c. Many families of the nobility of Savoy reside in this town. Amadeus V. was the first duke of Savoy who established his residence here. Chambéry gives title to an archbishop. It has produced many distinguished men; among others, the Abbé de St. Réal, Vaugelas, Albanis Beaumont, known for his travels in the Alps; the painters Berengier and Berger; and the two Counts de Maistre, Xavier and Joseph, well known in contemporary literature. The province of Chambéry has an area of 634 square miles; in 1848 the population was 152,468. [SAVOY.] A railway has been projected to run from Chambéry to Turin, up the valley of the Arc as far as Modane, and thence by a tunnel under Mont Conis into the valley of the Dora. Chambéry has electro-telegraphic communication with Turin.

CHAMBORD. [LOIRE-ET-CHER.]

CHAMOND, ST. [LOIRE.]

CHAMOUNY, or CHAMONIX, an Alpine valley in Savoy, at the foot of Mont Blanc. It runs north-east and south-west, being in length about 13 miles, and about 2 miles in breadth: it is watered by the Arve, which has its source in the Col de Balme, at the north-east extremity of the valley. The Arve is joined in the middle of the valley by the Arveron, which issues out of the glacier of Montanvert. The valley is bounded to the east and south-east by the great chain of the Pennine Alps, which divides this part of Savoy from the Val d'Aosta in Piedmont, forming a succession of lofty peaks called Aiguilles (Needles), covered with perpetual snow, and known by the names of Aiguilles de Tour, Argentière, Verte, Dru, Aiguille du Midi, and lastly Mont Blanc, which rears itself high above the rest, at the south-east extremity of the valley. The clefts between these different mountains are the receptacles of extensive glaciers, which slope down to the very edge of the fields of the valley of Chamouny. The principal one called La Mer de Glace spreads itself between two parallel masses of the great chain, formed by the Géant and Iorasso on one side, and the Dru, Montanvert, Charmoz, and Aiguille du Midi on the other. The length of this icy sea is about 6 miles, and its greatest breadth about 2 miles. A branch of it slopes down through an opening between the Dru and the Montanvert towards the valley of Chamouny. On the west side the valley of Chamouny is bounded by the Brevent, 8000 feet high, which is an offset of the group of the Buet, the summit of which is covered with perpetual snow, and which divides the valley of the Arve from that of the Giffre. From the Brevent there is a magnificent view of the great chain opposite, with all its peaks and glaciers, as well as of the group of the Buet towards the north, and of the other mountains of the interior of Savoy. The view from the bottom of the valley itself is too confined (the mountains rising abruptly like walls above it) to give a just idea of the extent and height of that great mass of Alps. The Montanvert is ascended on mules, and thus the sea of ice may be reached, but the latter part of the excursion is not without some risk, on account of the numerous crevices in the ice, which are of unfathomable depth; strangers who venture on the glaciers should trust implicitly to their guides.

The road from Geneva to Chamouny follows the course of the Arve by Bonneville, St.-Martin, and Servoz. The approach to the valley of Chamouny from St.-Martin is nearly as interesting as the valley itself. The cascade and the little lake of Chede, and the scenery about Servoz, are remarkably fine. Travellers put up at Le Prieuré, which is the principal village in the valley of Chamouny.

Besides Le Prieuré, which derives its name from a former convent of Benedictines, founded here in 1099, the valley of Chamouny has several other villages or hamlets. The whole valley contains about 3000 inhabitants, and is divided into four parishes. It produces some barley and oats, but the chief property of the inhabitants consists in cattle; very good honey is also got here. From 1000 to 2000 strangers visit this valley every summer, and their expenditure forms an important addition to the income of the natives. At Le Prieuré are collections of minerals, crystals, amethysts, topazes, and other fine stones which are found in the mountains. The village of Le Prieuré is, according to Saussure, 3346 feet above the sea, so that the perpendicular height of Mont Blanc above the level of the valley is 12,386 feet. Owing however to the vast buttresses which Mont Blanc throws out towards the valley of Chamouny its height does not strike so much on this side as on the Italian side, towards the narrow valley

called Allée Blanche and Val d'Entrèves, where it rises more abruptly and in a single mass.

The valley of Chamouny was not frequented by travellers till about the middle of the last century, when Saussure, Deluc, and Bourrit made its beauties known, as well as its advantages, as a station from which to explore the group of Mont Blanc. In one respect the valley of Chamouny is inferior to the other Alpine valleys of the Bernese Oberland and other parts of central Switzerland; it has no waterfalls, but there is a stillness in its scenery which adds to its imposing effect.

CHAMPAGNE, one of the provinces into which France was divided before the revolution of 1793, was bounded N. by Belgium, E. by Lorraine, the duchy of Bar, and Franche-Comté, S. by Bourgogne, and W. by L'Isle-de-France. It was divided into 8 districts:—1. Champagne Proper, which contained the towns of Troyes, Châlons-sur-Marne, Sainte-Ménéhould, Epernay, and Vertus; 2. Reims, in which were Reims, Rocroy, Fismes, and Château-Porcien; 3. Rethelais, the chief towns of which were Rethel, Mézières, Charleville, and Donchery; 4. Perthois, in which were Vitry-le-François and St.-Dizier; 5. Vallage, containing Joinville, Bar-sur-Aube, Arcis-sur-Aube, and Vassy; 6. BASSIGNY; 7. Sononais, comprising the towns of Sens, Joigny, Tonnerre, and Chably; 8. Brie-Champenoise, which contained Meaux, Provins, Château-Thierry, Coulommiers, Montereau-faut-Yonne, and Bray-sur-Seine. The greatest length of the province was about 180 miles, and the greatest breadth 150 miles. The surface presents extensive plains with ranges of hills, particularly towards the east and north. The soil and produce are of great variety. In some parts, especially in the plains, the soil is light, resting on a chalk bottom, ill fitted for tillage, but producing tolerably good pasture; in others it is deep and loamy, yielding excellent wheat, vegetables, and fruits of all kinds. Most of the hills are planted with vines, which produce the famous Champagne wines.

The greater part of Champagne is comprehended in the basin of the Seine, by which, and by its tributaries, the Marne, the Aube, and the Yonne, it is watered. To these rivers we may add the Aisne (a feeder of the Oise), with its tributaries the Suippe and the Vêre, the Armançon, and the Serain, feeders of the Yonne; and the Meuse, which waters the north-eastern and northern parts. The Seine, Aube, Marne, Aisne, Yonne, and Meuse are navigable.

Champagne included two archbishoprics, Reims and Sens; four bishoprics, Langres, Châlons, Troyes, and Meaux, and a great number of abbeys, the most celebrated of which was that of Clairvaux. It now forms the departments of MARNE, HAUTE-MARNE, AUBE, ARDENNES, and part of those of YONNE, AISNE, SEINE-ET-MARNE, MEUSE, CÔTE-D'OR, HAUTE-SAÔNE, and VOSGES.

In the time of Julius Cæsar the territory subsequently called Champagne was inhabited chiefly by the Remi, the Sémones, the Lingones, and the Tricasses, from whom the names of the cities Reims, Sens, Langres, and Troyes are derived. It was one of the parts of Gaul which remained longest in the possession of the Roman emperors. After the Burgundians and Franks had crossed the Rhine and acquired settlements in that country, and the south and west parts had been occupied by the Visigoths, nay even after the Roman empire itself had fallen, and the last emperor of Rome had been deposed in the person of Augustulus (A.D. 476), Ægidius and his son Syagrius, who governed this part of Gaul in the name of the emperor of the West, continued in possession of their authority and still upheld the Roman name. However in 486 Syagrius was defeated by Clovis and Ragnacarius, confederated princes of the Franks, and Champagne became a portion of the extensive kingdom over which Clovis reigned. After the death of Clovis (A.D. 511) it became part of the kingdom of Austrasia, one of those into which the states acquired and ruled by him were dismembered. It probably about this time got the name of Campania (Champagne), which is met with in the works of Gregory of Tours, who wrote in the 6th century. From the time of Charles the Simple to the year 1274 Champagne was governed by counts and dukes, who, at first appointed by the king, had contrived to render their power hereditary. On the death of Henri III., count of Champagne and king of Navarre, in the last-mentioned year, Champagne reverted to the crown of France in consequence of the marriage of his daughter, Joan of Navarre, to Philippe le Bel. The female nobility of Champagne enjoyed in the middle ages the remarkable privilege of transmitting their rank to their children, even if the husband were ignoble. This privilege, called 'la noblesse de la ventre,' was granted by Charles le Chauve after the battle of Fontenay (June 25, 841) in order to repair the loss of the Champagne nobles, almost all of whom were slain on that day.

(Beaugier, *Mémoires Historiques de la Province de Champagne*; Bérault, *Histoire des Comtes de Champagne et de Brie*, Paris, 1839; *Dictionnaire de la France*.)

CHAMPAGNE. [AIN.]

CHAMPLAIN, a lake of considerable extent, situated on the northern boundary of, but almost entirely within, the United States of North America. It derives its name from Samuel de Champlain, a French naval officer, who was governor-general of Canada in the 17th century. It divides, for more than 100 miles, the state of New York from that of Vermont, and its most northern extremity belongs to Lower Canada. It stretches in a direction very nearly from south to north from 43° 30' to 45° 4', or through 109 miles. The lake may

be considered as extending still farther north in the narrow channel called the river Chambly, or Sorel, as far as the town of St. Jean, in Lower Canada; this will add about 30 miles more to its length. Its area may be between 600 and 700 square miles. Its breadth varies from about half a mile to 20 miles, and its depth from 50 feet to 280 feet. On both sides of the lake are high grounds which rise to a considerable elevation. Owing to this circumstance the numerous rivers which, from the east as well as from the west, empty themselves into the lake, though they run from 40 to 60 miles, are only navigable at their mouths; the entire fall in their course being from 500 to 1000 feet. The short river which issues from Lake George and enters Lake Champlain at its southern extremity is likewise unfit for navigation on account of its rapids and cataracts. Lake George is nearly 200 feet above Lake Champlain, and Lake Champlain only 90 feet above the tide-water in the St. Lawrence. This lake is navigated by vessels of 100 tons burden, and by steamers of large size. It discharges its waters by the Chambly, or Sorel, which leaves it at its most northern extremity and falls into the St. Lawrence near the town of Sorel, or William Henry. The Chambly is navigable for river-barges, and affords a line of communication between the United States and Lower Canada. The Champlain Canal commences at Whitehall, at the southern extremity of the lake, and runs in a general southern course to the Hudson at Fort Edward. From Fort Edward it runs southward along the west side of the river past Saratoga, and joins the Erie at Watervliet above Albany. The whole length of the canal, including about 17 miles of improved river-navigation, is 64 miles. By this canal a water-communication is opened between the Hudson and the St. Lawrence through Lake Champlain. It was completed in 1822. Among the numerous islands of Lake Champlain, the largest are North and South Hero and Lamotte, belonging to the state of Vermont. The lake abounds with salmon, salmon-trout, sturgeon, pickerel, and other fish.

The principal towns on or near the lake, are Plattsburgh, St. Albans, Burlington [BURLINGTON], and Whitehall. In September 1814, a naval battle was fought on this lake, near Plattsburgh, in which Commodore Macdonough, the American commander, defeated the British fleet. (Darby; Bouchette.)

CHANDERNAGORE, the chief town of the French possessions in India, is situated on the river Hoogly, in 22° 52' N. lat., 88° 12' E. long., distant about 16 miles N.N.W. from Calcutta. The population in 1841 was about 36,000; of which number the European residents did not amount to 300. The town is well situated, the streets are straight and the houses are well built, but the town has decreased in importance owing to its trade having declined. The French settled at Chandernagore in 1676; the British dispossessed them of it in 1759: it was restored to the French after the conclusion of the war in 1816.

CHANTILLY. [ALLIER; OISE.]

CHAOURCE. [AUBE.]

CHAPEL-EN-LE-FRITH, Derbyshire, a market-town and the seat of a Poor-Law Union, in the parish of Chapel-en-le-Frith and hundred of High Peak, is situated in 53° 19' N. lat., 1° 54' W. long., distant 40 miles N.W. by N. from Derby, and 167 miles N.W. by N. from London by road. The population of the parish was 3214 in 1851. The living is a perpetual curacy in the archdeaconry of Derby and diocese of Lichfield. Chapel-en-le-Frith Poor-Law Union contains 17 parishes and townships, with an area of 69,498 acres, and a population in 1851 of 11,493.

Chapel-en-le-Frith is situated on the edge of the Peak district, and on the border of Cheshire. The parish church, dedicated to St. Thomas à Becket, is a Grecian building, erected at the beginning of the last century. The Wesleyan and Primitive Methodists and Baptists have places of worship, and there are National and Infant schools, a mutual improvement society for young men, and a savings bank. A county court is held in the town. The town of Chapel-en-le-Frith stands on the side of an eminence, at an elevation of 566 feet above the level of the sea at low-water. The town is partially lighted with gas, which is supplied by the owners of a cotton manufactory in the neighbourhood. A cotton manufactory and a paper-mill give employment to many of the inhabitants. The Peak Forest lime-works, which are about three miles east from the town, give employment in the carting of lime to Manchester. The Peak Forest Canal runs three miles to the north-west of Chapel-en-le-Frith; communication with it is maintained by a short branch of the Peak Forest railway. There is a small market on Thursday; and numerous fairs are held in the course of the year for the sale of cattle, wool, and provisions.

(Lysons, *Magna Britannia*; *Communication from Chapel-en-le-Frith*.)

CHAPEL-HILL. [CAROLINA, NORTH.]

CHARD, Somersetshire, a market-town, borough, and the seat of a Poor-Law Union, in the parish of Chard and hundred of Kingsbury East, is situated in 50° 52' N. lat., 2° 57' W. long., distant 50 miles S.S.W. from Bristol, and 139 miles W.S.W. from London by road. Taunton, the nearest station on the Great Western line of railway, which is 13 miles from Chard, is 163 miles from London. The population of the borough of Chard in 1851 was 2291. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor.

GEOG. DIV. VOL. II.

The living is a vicarage in the archdeaconry of Taunton, and diocese of Bath and Wells. Chard Poor-Law Union contains 34 parishes and townships, with an area of 57,946 acres, and a population in 1851 of 26,085.

At the time of the Domesday Survey, the manor of Chard, then called Cerdre, was held by the bishop of Wells. The borough sent members to Parliament in the reigns of Edward II. and Edward III., but not since. The town stands on the high ground on the south border of the county, close to Devonshire. The streets, which are rather irregularly laid out, are lighted with gas; the houses are generally well-built. The market-house, an ancient structure, was originally built as a court-house for the assizes. The parish church, in the perpendicular style, was erected in the reign of Henry VII. The Baptists, Independents, and Wesleyan Methodists have places of worship. Chard possesses an Endowed Grammar school of ancient foundation, which had 30 scholars in 1852. There is a National school. An hospital founded in 1662 by Richard Harvey, and rebuilt in 1841, maintains 16 poor persons, legally settled in the borough, natives having the preference. The lace trade is carried on in Chard; two large manufactories employing several hundred persons. There are also two iron foundries. A canal connects Chard with Bridgewater, and on the wharf at Chard are extensive warehouses. The market is on Monday; fairs are held on the first Wednesdays in May, August, and November. A county court is held in the town.

(*Communications from Chard*.)

CHARENTE, a department in the south-west of France, takes its name from its principal river the Charente. It is bounded N. by the departments of Deux-Sèvres and Haute-Vienne, E. by those of Vienne and Dordogne, and S. and W. by those of Dordogne and Charente-Inférieure. The department lies between 45° 12' and 46° 7' N. lat., 0° 50' E. and 0° 30' W. long. Its greatest length from north-east to south-west is 75 miles; the average breadth is 35 miles. The area according to the cadastral returns of 1851 is 2295.6 square miles, and the population according to the census of the same year amounted to 382,912, which gives 166.68 to the square mile, being 8.03 below the average per square mile for the whole of France.

Surface.—The department comprises the whole of the former provinces of Angoumois, to which on the west has been added a small strip of Saintonge, on the north portions of Poitou and Marche, and on the east an inconsiderable part of Limousin. It presents a surface diversified by several ranges of hills, sandy and calcareous plains, artificial meadows, heaths, and rocks. The hills, which are pretty equal in height, consist of layers of the fossiliferous deposits, and are in many places covered with chestnut forests. The soil is dry, but produces abundance of corn and wine. There is but little natural grass-land, but the moorland pastures of the arrondissements of Barbezieux and Confolens serve for the support of a large number of cattle and sheep.

Hydrography and Communications.—The chief river of the department is the *Charente*, which rising in Haute-Vienne and flowing north-west crosses the north-east of the department of Charente, and enters that of Vienne as far as Civray; from this town it turns south, and again entering the department of Charente passes Verteuil, Mansle, and Angoulême, whence flowing westward past Châteauneuf, Jarnac, and Cognac, it enters the department of Charente-Inférieure; here it runs north-west past Saintes, and Rochefort, of which it forms the harbour, and falls into the ocean opposite Isle-Madame. The Charente is subject to inundations which greatly contribute to the fertility of the land along its banks; its course is rapid, but the navigation upwards is facilitated by means of 27 large sluices designed to keep the water between each pair of sluices in a state approaching to equilibrium. Its whole length is 200 miles, of which 118 miles are navigable; the tide ascends it to a little above Saintes, and steamers ply up the river as far as Angoulême. The *Tardoire* rises in Haute-Vienne, flows west past La-Rochefoucauld, below which it receives the Bandiat on its left bank. These two rivers flow in high channels through a calcareous soil, abounding in caverns and grottoes, which absorb some of their waters, for the volume of the united stream becomes very much diminished as it approaches the Charente, which it enters after receiving the *Bogneure* a little above Mansle. The lost waters are supposed to give rise to another feeder of the Charente, the *Touvre*, the source of which at Beaulieu resembles that of the Sorgue in Vaucluse, and rivals it in beauty. The *Né* rises in the south of the department, and enters the Charente below Cognac. The *Seugne* flows through the south-west of Charente-Inférieure, and joins the Charente east of Saintes. The principal feeders of the Charente on the right bank are the *Antoine*, which falls in below Cognac, and the *Boutonne*, which, rising in the department of Deux-Sèvres, flows through the Charente-Inférieure, passing St.-Jean-d'Angély and Tonnay-Boutonne, and enters the Charente about 15 miles from its mouth.

The north-east of the department is crossed by the Vienne, which is joined to the Charente by the *Canal-de-Poitou*. The southern border of the department is formed by the Nizonne and the Dronne, which receives the Nizonne and the Tude on its right bank, and falls into the Isle, a feeder of the Dordogne. In the arrondissement of Confolens, there is a great number of ponds. All the waters of the department abound in fish.

The department is traversed by 5 national and 9 departmental roads, and by one military road. The Paris-Bordeaux railway, through Orléans and Tours, has above 60 miles of its length in this department, which it enters between Ruffec and Civray on the north, and running south past Angoulême crosses the extreme southern boundary of Charente a little south of Chalais.

The department contains 1,469,201 acres, of which 917,108 acres are under tillage and meadows; 245,861 under vineyards; 195,385 are covered with woods and forests, and 89,967 acres with heaths, marshes, and waters. The annual quantity of bread-stuff and potatoes produced amount to 515,000 quarters, of oats 48,000 quarters, and of chestnuts 35,000 quarters. Of wine 25,344,000 gallons are produced, none of which is in high repute; the wine-growers apply themselves more to the distillation of brandy than to the improvement of their wines, each possessing a still, and superintending the process of distillation on his own premises. The famous Cognac brandies, called 'fines Champagnes de Cognac' (of which not more than 6000 butts are produced annually, but the quantity sold under the name exceeds 15,000 butts), are distilled from the juice of a white grape called 'folle blanche'; brandies made from red wines are considered greatly inferior. Truffles are very abundant; it is calculated that the quantity annually brought to market produces about 300,000 francs. Saffron is cultivated. A great number of pigs are fattened, and cattle for the Paris market; poultry is good and plentiful. The climate is agreeable and temperate, and the air is pure; strong winds from the west and south-west sometimes prevail.

Mines of iron, lead, and antimony are worked; a good deal of bar-iron and steel are manufactured; building stone, gypsum, and grinding stone are found. Next to brandy, paper is the most important article of manufacture; broadcloth, linen, sailcloth, cordage, hats, corks, oak-staves, hoops, and pottery are also made. There are 1444 wind- and water-mills, including paper-mills, 5 smelting furnaces, and 387 factories of various kinds. The commerce of the department consists of the agricultural and industrial products named before, and of oil, nuts, casks, rags, large chestnuts called marrons, &c.

The department is divided into 5 arrondissements, which, with their subdivisions, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Angoulême . . .	9	144	137,696
2. Cognac	4	70	57,959
3. Ruffec	4	82	59,260
4. Barbezieux	6	88	56,557
5. Confolens	6	70	71,440
Total	29	454	382,912

1. In the first arrondissement the chief town is ANGOULÊME. *Mont-Bron*, 16 miles E. from Angoulême, on the left bank of the Tardoire, has 8200 inhabitants, who manufacture iron and paper. *La-Rochefoucauld*, 12 miles N.E. from Angoulême, on the right bank of the Tardoire, which is here crossed by a very ancient bridge, has 2800 inhabitants; close to the town is an old castle, flanked by four round towers, in which the author of 'Les Maximes' was born. *St.-Amand-de-Boixe*, near the left bank of the Charente; *Blanzac*, in a fine corn and grape district, S. of Angoulême; *Rouillac*, N.E. of Angoulême; and *Ruelle* on the Touvre (which has a large foundry for iron cannon used by the French navy, a powder-mill, and several blast-furnaces and iron foundries), are the most important of the other towns, having each about 2000 inhabitants.

2. In the second arrondissement the chief town is *Cognac*, which has tribunals of first instance, and of commerce, a college, several brandy distilleries, and a population of 4118. It stands in a beautiful and fertile district, on the right bank of the Charente, and is pretty well built. It is the entrepôt for the excellent brandies of the neighbouring districts, has some potteries and tan-yards, and also a considerable trade in wine, spirits, linseed, and juniper-berries. The remains of the elm under which the Duchess of Angoulême gave birth to Francis I., in 1494, are still seen in the park that surrounds the old castle above the town. *Châteauneuf*, on the left bank of the Charente, has 2336 inhabitants; near it is a grotto containing curious stalactites. *Jarnac*, memorable for the defeat and death of the Prince de Condé in 1569, stands E. of Cognac on the Charente, which is here crossed by a fine suspension-bridge; it has large brandy distilleries, and a population of 2510. *Segonzac*, 7 miles S. from Cognac, has 2620 inhabitants, who distil brandy of the best quality.

3. In the third arrondissement the chief town is *Ruffec*, 27 miles by railway N. from Angoulême, near the junction of the Lieu with the Charente. The town is well built, has a tribunal of first instance, a college, and 3000 inhabitants, who trade in corn, chestnuts, truffles, cheese, &c. Near it there is an extensive forest, and the remains of a fine old castle called the Château de Broglie. *Aigre*, S. of Ruffec, in a district fertile in grapes, corn, flax, and hemp; *Manale*, on the Charente; *Vertueil*, 4 miles E. from Ruffec, on the left bank of the Charente; and *Villefagnan*, 6 miles W. from Ruffec, are the chief towns of the other cantons, each with less than 2000 inhabitants.

4. In the fourth arrondissement the chief town is *Barbezieux*, 20 miles S.S.W. from Angoulême, on the road to Bordeaux; it has

tribunals of first instance and of commerce, manufactures of linen and leather, and a population of 3385. *Aubeterre*, which stands on the slope of a hill near the Dronne, and has a church cut in the rock exactly under the court-yard of a castle that crowns the summit of the hill; *Baignes*, 8 miles from Barbezieux; *Chalais*, on the right bank of the Tude; *Montmoreau*, S. of Barbezieux; and *Brossac*, are small places that give names to the other cantons.

5. In the fifth arrondissement the chief town is *Confolens*, which stands at the junction of a small stream, called Goire, with the Vienne; it has a tribunal of first instance, a college, a public library of 12,000 volumes, and 2765 inhabitants, who rear great numbers of cattle on the pastures in the neighbourhood, and carry on some trade in timber, oak-staves, and leather. *Chabanais*, on the Vienne; *Champagne-Mouton*, on the little river Argent; *St.-Clément*, S. of Confolens, near which there are several iron works; and *Montembœuf*, are chief towns of the other cantons, with populations generally under 2000.

The department forms the see of the Bishop of Angoulême, is under the jurisdiction of the High Court of Bordeaux, and is included in the 14th Military Division, which has its head-quarters at Bordeaux.

(*Dictionnaire de la France*; Balbi, *Géographie*; *Statistique de la France*; *Annuaire pour l'An 1853*.)

CHARENTE RIVER. [CHARENTE.]

CHARENTE-INFÉRIEURE, a maritime department on the west coast of France, is named from its geographical position on each side of the Lower Charente. It extends from 45° 5' to 46° 19' N. lat., from 0° 7' E. to 1° 13' W. long.; and is bounded N. by the departments of Vendée and Deux-Sèvres, E. by the department of Charente, S. by that of Gironde, and W. by the Bay of Biscay. The greatest length of the department extends from north to south about 85 miles; the breadth varies from 10 to 50 miles. The area is 2628 square miles, and the population according to the census of 1851 was 469,992, which gives 178.84 to the square mile, being 4.12 above the average per square mile for the whole of France.

The department comprises the old provinces of Saintonge and Aunis, the latter forming the portion between the river Sèvre and the mouth of the Charente. The Isle of Ré, which is separated from the mainland of the department of Vendée by the channel called Pertuis-Broton; the Isle of Oleron, S. of Ré, and separated from it by the Pertuis-d'Antioche; the Isle of Aix, N. of the embouchure of the Charente; and Isle-Madame, which commands the entrance to the Charente from the south, are included in this department.

The coast line of the department, including the north-eastern shore of the Gironde, measures 105 miles, and has several good harbours and well-sheltered roadsteads. The coast is low, consisting of salt marshes, partially separated from the sea by sand-hills liable to be flooded by every tide, and extending a considerable way inland. Of these marshes however a very large extent has been converted into most productive land; the sea being shut out by means of dikes, and the surface of the marshes drained by canals, in pretty nearly the same way as the 'polders' in Holland and Belgium are drained. [ANTWERP, Province of.] In those to which the sea still has access, a great quantity of excellent salt is made. The rest of the department is level and very fertile. The soil, which consists of a vegetable and sandy mould, resting in most places on chalk, affords excellent pasture for great numbers of cattle, sheep, and horses; abundant supplies of the farm produce mentioned in the preceding article; and a vast quantity of wine, in the growth of which Charente-Inférieure ranks second among the wine-growing departments of France. The climate is temperate and healthy, except in the low grounds along the coast, in which agues and fevers prevail in summer and autumn.

The department is drained by the Charente, one of the deepest rivers in France, the Boutonne, and the Seugne, described in the preceding article [CHARENTE]; by the Gironde, which borders it on the south-west [GIRONDE]; by the Sèvre-Niortaise in the north [DEUX-SÈVRES]; and by the Seudre, which rising north of Jonzac flows north-west past Saujon, and enters the Bay of Biscay opposite the Isle of Oleron, and a little north of the Passe de Maumusson. All these are tide rivers and navigable, and together with the canal from La-Rochelle to the Sèvre-Niortaise, and that from Brouage to Rochefort, afford great facilities for internal and external trade. The department is traversed by 9 royal and 16 departmental roads, besides the military road from Saumur to La-Rochelle. A branch railroad is projected from Poitiers on the Paris-Bordeaux line to the naval harbour of Rochefort.

The department contains 1,681,205 acres, of which 812,025 acres are arable; 195,900 meadow and pasture; 276,000 under vines; and 195,217 acres under woods and forests, in which the chestnut, oak, and resinous trees are the most common. Grain of all kinds is produced in quantity more than sufficient for the consumption. The annual produce of wine, as estimated by the government, is 52,668,000 gallons, of which about one-third is used for home consumption; the remainder is distilled into brandy or exported. None of the wines of the department are of high repute; the red wines of the right bank of the Charente rank as third-class vins d'ordinaire; the white wine grown on the left bank and in the eastern part of the arrondissement of La-Rochelle are converted into brandy and sold as Cognac, but are greatly inferior to the Champagnes de Cognac, mentioned in the article CHARENTE. A large quantity of apples, plums, walnuts, peaches, &c. are grown. Other articles of produce are clover and flax-seed, hemp,

saffron, garden beans, which are an article of export, wormwood, &c. Great numbers of pigs are fattened; poultry is very abundant; hares, rabbits, and winged game are plentiful; aquatic birds in countless numbers frequent the marshes along the coast; the pilchard and oyster fisheries are extensive and valuable.

The industrial activity of the department is considerable. Besides the distillation of brandy, which is generally managed by the farmer on his own premises, and the manufacture of salt, the following industrial products, though only of secondary importance, deserve mention: namely, woollen hosiery, shoe and glove leather, fine pottery, vinegar, hoops, oak-staves, and timber. In almost all the ports, but especially at La-Rochelle and Rochefort, ship-building is carried on. The commerce of the department consists in the products already named, and in colonial produce, butter, oil, bottles, wine-casks, liqueurs, &c. Ships are fitted out for foreign trade and for the cod fisheries; the coasting trade is active; about 600 fairs are held in the department yearly. Traces of iron and copper have been found, but no mines of any kind are worked.

The department is divided into six arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. La-Rochelle . . .	7	55	82,293
2. Rochefort . . .	4	47	61,760
3. Marennes . . .	6	34	51,689
4. Saintes . . .	8	99	107,513
5. Jonzac . . .	7	120	83,706
6. St.-Jean-d'Angély .	7	126	83,031
Total . . .	39	481	469,992

1. In the first arrondissement the chief town is *La-Rochelle*, the capital of the department and of the former province of Anjou. It stands on the north side of a small inlet (which extends about two miles inland and terminates in a salt-marsh), in 46° 9' N. lat., 1° 10' W. long., 295 miles S.W. from Paris, and has 14,420 inhabitants, including the whole commune. By the marriage of Eleanor of Guienne and Poitou to Henry II. the town came into the hands of the English kings, from whom it was taken by Louis VIII. in 1224, again ceded to England by the treaty of Breigny in 1360, but finally recovered for France by Bertrand du Guesclin in 1372. The Huguenots held it from 1557 to October 28, 1628, when the garrison reduced by famine surrendered to Louis XIII., who demolished the fortifications. The present defences were erected by Vauban. The entrance to the inlet which forms the outer harbour is defended by forts. The inner harbour, round which the town is built, consists of two basins, both surrounded by fine quays, and one of them is closed by flood-gates, whereby ships are kept constantly afloat. The largest vessels can come up to Rochelle at high water. The town, which is entered by 7 gates, is well built with broad straight streets and houses adorned with porticoes. The finest square is the *Place-du-Château*, three sides of which are planted and serve for promenades. Outside the walls there are two other extensive walking-grounds, called the *Du-Mail* and *Champ-de-Mars*. The chief buildings are the cathedral, the town-house, the exchange, the tower called *Porte-de-l'Horloge*, the marine baths, and the public library, which contains 18,000 volumes. The exports consist of the produce of the department; the imports chiefly of colonial produce. The town is the seat of a bishop, has tribunals of first instance and of commerce, a college, mint, school of navigation, besides numerous glass-works, sugar-refineries, potteries, ship-building yards, and cotton-yarn factories. Vessels are fitted out here for the Newfoundland fisheries. *Marans*, which is situated in a district recovered from the sea, near the confluence of the Vendée and Sèvre-Niortaise, has a tide harbour which admits vessels of 100 tons up to the quays, while larger vessels load or unload in a safe roadstead near the mouth of the Sèvre. A canal recently cut admits vessels of 300 tons quite up to the town. The town is well built, has 4713 inhabitants, and a very important export trade in corn. It has also large timber-yards and salt-stores, and a good commerce in clover and oleaginous seeds, brandy, flax, hemp, flour, hoops, staves, &c. *Courçon* and *La-Jarrie* are small towns with rather more than 1000 inhabitants each.

To this arrondissement belongs also the *Isle of Ré*, which at its south-eastern extremity approaches within 2½ miles of the mainland; on its northern extremity there is a lighthouse called *Tour-des-Baleines*, and marking the entrance to the *Pertuis-Breton*. The isle is 17 miles long; in some places 5 miles, in others only 1 mile wide. It has neither grass, nor spring, nor tree; but vines flourish on it, and a great deal of brandy is made; salt also is manufactured and exported from the numerous harbours of the isle. Filtered sea-water is used for drink. The isle is defended by four forts, and has about 16,000 inhabitants, who are chiefly engaged in fishing and making salt. The chief towns are—*Ar-en-Ré*, on the west coast, which has a small harbour and 3668 inhabitants; *St.-Martin-en-Ré*, on the east coast, which is fortified, has a tribunal of commerce, and a population of 2617; and *La-Flotte*, which has a harbour for vessels of 300 tons and 2429 inhabitants.

2. In the second arrondissement the chief town is *Rochefort-sur-Mer*,

situated partly on a hill and partly on a marsh, on the right bank of the Charente, and 9 miles from its mouth, in 45° 56' 39" N. lat., 0° 58' W. long.: population above 20,000. The approach to the town is defended by forts all along the banks of the river. The streets of the town are broad, regularly built, and several of them planted with double rows of acacias and poplars; the houses are low. The finest buildings are—the marine hospital, which stands on a height outside the town, the residence of the port admiral, the bagnio, the civil and military hospital, and more especially the arsenal and naval artillery school, in connection with which are dock-yards, rope-walks, and other establishments for manufacturing everything necessary to the completion of the largest men-of-war, fast sailing-vessels, and steamers. Other remarkable objects are the large saw-mills, the water-works for cleansing the harbour, the theatre, &c. The naval harbour, which ranks as the third harbour of its kind in France, has a depth of 22 feet at low water, and 40 feet at full tide. In the part of the harbour allotted to merchantmen, ships of 900 tons can enter at all times. The town is the seat of a maritime prefect, has tribunals of first instance and of commerce, a college, schools of hydrography and of naval medicine, several sugar refineries and vinegar works, and a large trade in colonial produce and the staple products of the department. It is surrounded by ramparts which are planted with trees. The importance of Rochefort dates from 1666, when it was made a naval station by Louis XIV. *Tonnay-Charente*, 10 miles E. from Rochefort, on the right bank of the Charente, has a safe harbour, into which vessels of 600 tons can enter; and a population of 3435, who carry on a brisk trade in the products of the country, colonial produce, coal, deals, oak-staves, oil, bricks, &c. The other towns are *Surgères*, which has a population of 2153, and *Aigrefeuille*: population, 1688.

The *Isle of Aix*, which belongs to the arrondissement of Rochefort, is about half a mile long and a quarter of a mile wide. It is fertile, has a population of about 500, and is very important on account of its position and fortifications, which command the approach to Rochefort from the *Pertuis-d'Antioche*. Here Napoleon went on board an English line-of-battle-ship, July 15, 1815. *Isle-Madame*, which is situated close to the mouth of the Charente, and is still smaller than the *Isle of Aix*, is also strongly fortified.

3. In the third arrondissement the chief town is *Marennes*, situated on the northern side of the embouchure of the Seudre, on which there is a harbour about half a mile from the town. It is a well-built place, has tribunals of first instance and of commerce, and 4469 inhabitants, who carry on a brisk trade in the produce of the country, and in salt made in the marshes near the town, which are a source of great profit, but very insalubrious. *Koyan*, a watering-place on the north shore of the Gironde, has a lighthouse, and 2957 inhabitants; there is regular steam-communication between this place and Bordeaux. *La-Tremblade*, on the south side of the embouchure of the Seudre, has a small harbour, and a population of 2551. *Brouage*, a fortress and sea-port, a few miles N. of Marennes, and on the navigable canal of Brouage before mentioned, is now almost deserted on account of the unhealthiness of the site.

The *Isle of Oleron* (the ancient *Uliarus*), which lies off the coast, between the mouths of the Charente and the Seudre, is included in the arrondissement of Marennes. Its southern point is separated from the mainland by the *Passe-de-Maumusson*, a strait about 2½ miles wide, commanded by a fort. The length of the island is about 19 miles, its greatest breadth 5 miles. The isle is traversed in its whole length by a road which terminates at the north-west extremity, near the Chassiron lighthouse, at the entrance of the *Pertuis-d'Antioche*. It is very fertile, yielding all the products mentioned in this article, and has a population of 16,000. The western coast is bold, and without harbours. On the south-east of the isle, opposite Brouage, is the town of *Oleron* or *Château-d'Oleron*, which has a harbour, distilleries, rope-walks, ship-building yards, and 3135 inhabitants. *St.-Pierre*, which stands near the centre of the island, has a tribunal of commerce, and a population of 4769.

4. In the fourth arrondissement the chief town is *Saintes*, the capital of the former province of Saintonge, which stands on a hill above the left bank of the Charente, 43 miles S.E. from Rochelle, in 45° 44' 40" N. lat., 0° 38' W. long., and has 10,000 inhabitants. The appearance of the town from whatever side it is approached is very picturesque; but the interior consists of crooked streets, and generally ill-built houses. The former cathedral, the churches of *St.-Eutrope* and *Sainte-Marie-des-Dames*, are the most remarkable buildings. The town is the seat of the court of assize for the department, of tribunals of first instance and of commerce, and possesses a college, public library, theatre, cabinets of natural history, antiquities, and natural philosophy. The departmental nursery is close to the town. Woollens, hosiery, pottery, shoe and glove leather, and wine-casks are the chief industrial products; there is also a good trade in corn, brandy, timber, wool, &c. *Saintes* is the Roman *Mediolanum*; in the time of Ausonius it was called *Santonæ*, from the people whose capital it was, and hence the modern name. Of ancient remains the most interesting are the Roman baths, amphitheatre, and a triumphal arch which bears inscriptions dedicatory to Germanicus, Tiberius, and Drusus. Roman thermæ were discovered in 1851 in this town, with the wall-paintings in parts still fresh and perfect. *Pons*, 14

miles from Saintes, beautifully situated on the left bank of the Seugne, has an ecclesiastical school, and 4543 inhabitants; in the centre of the town are the ruins of the ancient castle of the lords of Pons, a square tower of which, 108 feet high, is used as a prison. *Saujon*, 16 miles W. from Saintes, stands on the Soudre, which here begins to be navigable, and has 2217 inhabitants. *Gémozac*, W. of Pons, has a population of 2610. *Burie*, *St.-Porchaire*, and *Cozos*, have each a population under 2000. Near the last, which is on the road from Saintes to Rochefort, is the largest oak in France, calculated to be the growth of at least 2000 years.

5. In the fifth arrondissement the principal town is *Jonzac*, which stands on the Seugne, is defended by a strong castle, and has a tribunal of first instance and 2569 inhabitants. The other towns are—*Mirambeau*, which has a fine castle, a church built by the English, and 2384 inhabitants; *Archiac*, *St.-Genis*, *Montendre*, *Montguyon*, and *Montlieu*, the population of each of which does not exceed 1500.

6. In the sixth arrondissement the chief town is *St.-Jean-d'Angély*, 20 miles E. from Rochefort, on the right bank of the Boutonne, which here begins to be navigable for small craft. It is irregularly built; but the usage common to this part of Aunis of whitewashing the houses every year gives it a clean, gay look. The town has tribunals of first instance and of commerce, a college, and a population of 6107. The corn market-house, the former abbey of *St.-Jean*, public baths, and gunpowder-mills are the most remarkable objects in the town. Brandy, wine, seeds, timber, &c., are the chief articles of commerce. *St.-Savinien*, on the right bank of the Charente, has 3507 inhabitants. *Aulnay*, *St.-Hilaire*, *Tonnay-Boutonne*, and *Matha* have each less than 2000 inhabitants.

The department forms the see of the Bishop of La-Rochelle. It is included in the jurisdiction of the High Court of Poitiers, and belongs to the 14th Military Division, of which Bordeaux is the headquarters.

(*Dictionnaire de la France*; *Statistique de la France*; *Annuaire pour l'An 1853*.)

CHARENTON. [SEINE.]

CHARING. [KENT.]

CHARITÉ, LA. [NIÈVRE.]

CHARKOFF, or CHARKOW, a province of Southern Russia; formerly called Slobodsk-Ukraine. The territory came into the possession of the Czars about the beginning of the 17th century, and being almost uninhabited in 1651, the emperor Alexei Michaelowich allowed the Cossaks of the Western Ukraine to settle in it, and to enjoy the privileges guaranteed to them by Stephen Bathory, king of Poland. They then founded five large villages, or 'slobodás'; and from this circumstance the name of Slobodsk was derived.

The province of Charkoff is bounded N. by Kursk, E. by the country of the Don Cossaks, S. by Ekaterinoslaf, and W. by Poltava. It contains 20,846 square miles, with a population of 1,467,400. The country is generally flat and the soil very fertile, yielding about 4,000,000 quarters of corn of all kinds, one-fourth of which is exported. Flax, hemp, tobacco, hops, and potatoes are grown. Cattle are excellent, and bees very abundant. The industrial establishments include numerous distilleries, some tan-yards, saltpetre-works, and salgans, or tallow-melting houses. The forests in this province belong chiefly to the crown, and cover about 2000 square miles. Game is scarce, but the forests abound in wolves and foxes.

The population consists of Malo-Russians, Cossaks, Great Russians, German colonists, converted Calmucks, Jews, and Gipsies. Besides the military population of the Cossaks there are five colonised regiments of cavalry. The chief occupation of the inhabitants is agriculture. The roads are bad and the rivers not navigable. The Sievernoi-Donetz is the principal river, which after receiving the Oskol in the neighbourhood of Izyuin falls into the Don. The other rivers are the Vorskla and the Psiol, both falling into the Dnieper, the former of which belongs to the southern districts and the latter to the northern.

The capital town, CHARKOFF, is noticed in a separate article. The other towns are:—*Akhtyrka*, in the west of the province, near the Vorskla, which has 8 churches and 13,000 inhabitants; *Sumy*, in the north, on the right bank of the Psiol, famous for its traffic in horses, population 12,000; *Walki*, S.W. of Charkoff, on the road to Poltawa, with 10,000 inhabitants; *Tchugujew*, S.E. of Charkoff, on the Sievernoi-Donetz, which is the head-quarters of a Cossak regiment, and has 10,000 inhabitants; *Belopol*, or *Bielopolje*, N.W. of Sumy, on a feeder of the Desna, population 10,000; *Lebedjan*, or *Lebedine*, S.S.W. of Sumy, with 9000 inhabitants; *Bogoduchow*, N.W. of Charkoff, population 6800; *Miropolje*, population 6800; *Krasnokutsk*, W. of Charkoff, on the right bank of the Merle, with 5000 inhabitants; and *Smijew*, or *Zmiew*, on the Sievernoi-Donetz, population 5000. Many of these towns are fortified, and nearly all of them, even including the public buildings, are constructed of wood.

CHARKOFF, or CHARKOW (pronounced Kharkoff), a town in Southern Russia, in 49° 59' N. lat., and about 33° 26' E. long., between two small rivers, the Charkowa and the Lohan, which fall into the Donetz, one of the largest tributaries of the Don. Charkoff is the capital of the province of Charkoff, and may be considered as being placed on the boundary-line between the fertile country which

extends over the centre of Russia, and the large deserts known under the name of steppes which occupy the southern districts of the empire. This town consists of numerous narrow winding streets of wooden houses: it contains about 18,000 inhabitants. Charkoff has been chosen by the Russian government as the centre of instruction for the southern provinces. The university, erected in 1803, has connected with it a botanic garden, a collection of natural objects, an observatory, and a library of 21,000 volumes. There is also a seminary for clergymen, a military academy for forty children of poor noblemen, a grammar school, and an institute of education for young ladies, with some other schools. Charkoff is a place of considerable trade; the manufactures include articles of Cossak clothing, excellent carpets, felt cloaks, soap, candles, and leather. Four great fairs are held in the course of the year; of these one is for wool; at the others vast quantities of manufactured goods are sold. The fair held in May generally lasts for about two weeks. Many merchants from the interior of Russia frequent the fairs of Charkoff.

CHARLBURY. [OXFORDSHIRE.]

CHARLEMONT, a frontier fortress of France, is so united with the adjacent town of Givet on the opposite side of the river Meuse as to form one town, which under the name *Givet* will be found noticed in the article ARDENNES.

CHARLEROI, or CHARLEROY, a town in the province of Hainault, in Belgium, situated on the banks of the Sambre, 20 miles E.S.E. from Mons, and 33 miles S. from Brussels, in 50° 23' N. lat., and 4° 25' E. long.: the population of the town is 6150. This town, with the whole of Hainault, was united to the French republic, and formed part of the department of Jemmapes. In 1814 it became part of the kingdom of the United Netherlands; and in 1815, during the hundred days, it being in possession of the Prussians, they were attacked by Napoleon, and driven from it a few days before the battle of Waterloo. Since the general peace the fortifications have been greatly improved.

Charleroi is built in the form of an amphitheatre, on the side of a steep hill which rises from the banks of the Sambre. The town contains glass-houses, tanneries, dye-houses, rope-walks, salt and sugar refineries, and factories for spinning wool. But the principal sources of prosperity are the coal-mines and iron-furnaces in the district. About 90 coal-pits, 70 high furnaces, and 50 iron-foundries are in and near the town. The iron-works are so near together that the whole are visible from one spot. In the town and neighbourhood about 6000 persons are said to be employed in nail-making.

Charleroi is connected by railway with most of the principal towns of Belgium; the high roads from Brussels, Mons, and Namur meet at Charleroi. The Brussels and Charleroi Canal affords great facilities of water communication.

CHARLESTON, the principal port and largest city in the state of South Carolina, is situated in the county of Charleston, upon a narrow tongue of land formed by the confluence of the rivers Ashley and Cooper, in 32° 46' 33" N. lat., 79° 57' 27" W. long. The population of the city in 1840 was 20,261; in 1850 it was 42,985, exclusive of the suburb of St. Philip, which contains about 16,000 inhabitants. The city is divided into four wards, and is governed by a mayor and 12 aldermen. Charleston harbour, which is spacious and convenient, is formed by the estuary of the two rivers, and protected from the Atlantic by Sullivan's Island on the north, and Folly Island on the south. The entrance, which is between these islands, is obstructed by a range of sand-banks, which make three channels by which vessels drawing 16 feet of water may enter the port, but the passage is rendered difficult and uncertain by the tides and the shifting of the sands. The city is protected by Fort Moultrie, on Sullivan's Island, Castle Pinckney two miles, and Fort Johnson about four miles below the city.

Charleston was founded in 1680, 17 years after the granting of the colony by Charles II. to the Earl of Clarendon. There had indeed been a settlement formed on the site in 1672, and another named Oyster Point Town in 1677, but both were soon abandoned. For rather more than a century Charleston was the capital of the province, Columbia, now the seat of government, not having been founded until 1787. The site on which the city is built is low, and far from healthy. The city is regularly laid out in parallel streets extending between the two rivers and crossed by other streets at right angles. The houses are for the most part of brick, spacious and lofty, and furnished with balconies and verandahs, in order to protect the interior from the sun. The streets are generally narrow, ranging from 35 to 70 feet in width, and unpaved, and the soil being sandy, considerable annoyance is experienced in windy weather from dust and sand. To shelter the passengers from the sun, rows of a tree called the 'pride of India' are planted on each side of the streets; this tree does not grow to any considerable height, but its branches are spreading and its foliage thick, and it possesses the further advantage of not harbouring insects.

The town contains a city-hall, exchange, custom-house, district court-house, guard-houses, theatre, orphan-house, hospital, almshouse, two arsenals, two markets, a college, nearly 40 places of public worship, several high-schools, an orphan asylum, and other buildings devoted to benevolent purposes. There are besides an academy of fine arts, a literary and philosophical society, and a city library con-

taining about 24,000 volumes. There are several banks and assurance companies. Four daily and four weekly newspapers are published in the city. Charleston possesses one of the finest floating dry docks in the United States. The yellow fever has made frequent ravages in Charleston, but its effects have been chiefly confined to strangers, and especially those from more northern climates. The place is not considered unhealthy by natives.

Charleston is a place of very considerable trade. Nearly all the cotton and rice exported from the state are shipped from this port. The amount of registered and licensed tonnage belonging to the port in 1850 was 33,293 tons, of which 17,916 tons were employed in the coasting trade. In the year ending 30th June, 1850, the vessels that entered and left the port in the prosecution of foreign trade were—inwards 303 of 96,619 tons; outwards 351 of 121,367 tons; but the main trade as explained under CAROLINA, SOUTH, is carried on coastwise with New York, whence the staple commodities of South Carolina are shipped to foreign countries. For carrying on this trade with New York there are several well provided lines of steam-ships and sailing vessels. Regular lines of packets also sail between Charleston and Boston, Philadelphia, Baltimore, Providence, New Orleans, Wilmington, and Savannah. The cotton received in Charleston from the interior in 1850 amounted to 400,714 bales, and of sea-island to 17,994 bales, of which 365,327 bales of upland, and 16,437 bales of sea-island were exported. The receipts of rice in the same year amounted to 147,690 barrels; and the exports to 134,417 barrels. Cotton and rice are now the staple exports; the former staple exports of Charleston, staves, lumber, furs, peltries, indigo, and tobacco being of very inferior importance. The inland communication of the city is facilitated by the Santee Canal which connects the port with the Santee River. But a far more important auxiliary has been the system of railways carried out in South Carolina, by which the city is placed in close connection with most of the more fertile districts of the state; and when the railways now in course of construction are completed Charleston will have access both to the Mississippi and the Ohio.

The Charleston College was chartered in 1785; it is now one of the most flourishing institutions of the kind in the southern states: in 1850 it had 6 professors and 70 students. The college buildings are commodious. It possesses a good philosophical apparatus, and a library of 2000 volumes. The Medical College, which was established in 1833 is empowered to confer medical degrees: in 1850 it had 8 professors and 150 students. The building is a handsome edifice, for which the city council of Charleston appropriated 15,000 dollars. The other public schools are a high-school founded in 1839, which averages from 130 to 150 pupils, and free schools with about 400 scholars.

CHARLESTOWN. [ADERDEENSHIRE; FIFESHIRE; MASSACHUSETTS.]

CHARLEVILLE. [ARDENNES.]

CHARLOTTE TOWN. [PRINCE EDWARD'S ISLAND.]

CHARLOTTENBURG. [BRANDENBURG.]

CHARLOTTESVILLE. [VIRGINIA.]

CHARLY. [AISNE.]

CHAROLLAIS, a district of Bourgogne, named from its chief town Charolles, gave during their father's lifetime the title of count to Philippe le Bon and Charles le Téméraire, the two last of the great feudal dukes of Bourgogne. It is now included in the department of Saône-et-Loire, except a small part west of the Loire, which is in the department of Allier. The Canal du Centre which connects the Loire with the Saône, is sometimes called the Charollais Canal.

CHAROLLES. [SAÔNE-ET-LOIRE.]

CHARTRAIN, a district in France comprising the territory about Chartres, formed part of the more extensive district of La-Beauce. It takes its name immediately from its capital, Chartres, but originally from the Celtic tribe *Carnutes*, by whom, at the time of the Roman invasion, it was peopled. This nation is mentioned by Livy among the tribes which invaded Italy in the time of Tarquinius Priscus. In the time of Cæsar they extended from the Seine to the country south of the Loire; their chief towns were Genabum (Orléans), Autricum (Chartres), and Durocassis (Dreux). The district of Chartain is now included in the department of Eure-et-Loir.

CHARTRES, a city in France, capital formerly of La-Beauce, now of the department of Eure-et-Loir, the seat of tribunals of first instance and of commerce, of a communal college and diocesan seminary, stands on the slope and at the foot of a hill above the Eure (a feeder of the Seine), 55 miles by railway S.W. from Paris, in 48° 26' 24" N. lat., and 1° 29' 53" E. long.; and has a population of 16,680, including the whole commune.

Chartres is a very ancient city. Under the Roman dominion it was called *Autricum* (from *Autura* the ancient name of the Eure), but in the 4th century this name was replaced by that of the people, the *Carnutes* [CHARTRAIN], in whose territory it was. The only remains of Roman antiquity are some subterranean aqueducts and

The town is supposed to have been a great centre of Druidical worship; to Druidism succeeded the worship of the gods of the Capitol, and these gave place to Christianity about the end of the 4th century A.D. On the downfall of the Roman empire it passed into the hands of the Frankish kings. About A.D. 600 Thierry II., king of Orléans and Bourgogne, besieged the town, which

was well fortified, and succeeded in taking it by making a breach in the aqueduct and depriving the inhabitants of water. In 858 it was pillaged and burnt by the Northmen; when re-built it was soon after taken again by them under their famous leader Hastings, but given up on the townsmen and the bishop agreeing to pay a certain sum as a ransom. Their neglect to pay this tribute caused another siege and capture of the town in 872. In 911 the townsmen successfully resisted the attacks of the famous Rollo, the first duke of Normandie.

In the middle ages Chartres was the capital of a county which was in the 10th century united with that of Blois and Tours. Towards the end of the 11th century the city was surrounded by ramparts which still remain. The ramparts were pierced by seven gate-entrances, one of which (Porte Guillaume) still retains its warlike appearance, being flanked by two massive towers united by a curtain, and crowned by a projecting gallery with parapets and machicolations.

In the bloody feuds between the Bourguignons and Armagnacs Chartres was taken by the former, and passed under the dominion of the English, who held it till 1432, when it was recovered from them by surprise by Dunois. In 1591 it was taken by Henri IV., who was consecrated in the cathedral three years afterwards. The county of Chartres when bestowed on the Duchess of Ferrara was erected into a duchy; it subsequently came by marriage to the dukes of Nemours, by whom it was resigned to the crown. Louis XIII. bestowed it upon his brother Gaston, duke of Orleans; upon his death Louis XIV. gave it to his brother Philippe, duke of Orleans, from whom the duchy was inherited up to the period of the first French revolution by his lineal descendants. The eldest son of Louis Philippe bore the title of Duke of Chartres at the time of his father's accession to the throne.

The city of Chartres is situated on the brow of a hill, at the foot of which is the river Eure, which flows here in two channels—one within and the other without the ramparts, which are surrounded by a circuit of public walks. Chartres is divided into the upper and lower towns: the upper has some tolerably commodious streets, and contains the principal public edifices; the lower town is ill built and ill laid out; the streets which unite the two are so steep as to be almost inaccessible to carriages. Everything about the place has an air of antiquity: the houses are for the most part old and built of wooden planks; many of them have the gable towards the street and the doorway in the form of a pointed arch, with gothic ornaments. The suburb of Bourgneuf by which the road from Paris enters the town is long and straggling, and consists of cottages with their gables towards the street. There are in Chartres four squares: one in the lower town, that of St.-Pierre, bordered with two rows of trees, and adjacent to the ancient gothic church, from which it takes its name; two in the upper town, namely, the corn-market and the herb-market; and one, the handsomest of all, called La Place des Barricades, outside the walls. The herb-market is adorned by an obelisk erected in memory of General Marceau. The Eure below the town drives a great number of mills.

The finest edifice in Chartres is the gothic cathedral of Notre Dame, which is one of the largest churches in France, and one of the most vast and imposing structures of the middle ages. It was commenced about 1020 by Bishop Fulbert, but dedicated only in 1260 when still unfinished, one of the spires not having been erected till the 16th century. The principal front, which is 164 feet in breadth, presents two square towers surmounted by two lofty octagonal pyramids, and separated by an interval of 55 feet. The old spire, which rises to the height of 374 feet, is of plain architecture, but cased with stone curiously carved like the scales of a fish, and appears to lean towards the spectator on whatever side he stands. The new spire is 413 feet high, built in the florid style, and so much admired as to have become proverbial for its beauty. The lower story of the façade, which is approached by five stone steps, has a triple portal with pointed arches, and adorned with statues. Above the doorways are three arched windows with stained glass, and still higher a superb rose window. The entrances on the north and south sides are also approached by flights of stone steps; that on the south has 17 steps, on the extremities of which are columns and statues. In each of these fronts are triple projecting porticoes with deep doorways between them; over these are niches for statues and a series of five windows, with a circular window above as before. The interior of the church is admirable for the justness of its proportions; it is richly decorated and dimly lighted through above 130 painted glass windows, most of which date from the 13th century, and are so charged with colour as scarcely to allow light enough to penetrate the building to enable persons to read. Among many decorations of the interior must be named the screen that separates the choir from its aisles, the tracery work on which has been compared to 'point-lace in stone.' The choir is beautiful; it is adorned with statues and bas-reliefs of various merit: the Descent from the Cross, a bas-relief by Bridan, is a chef-d'œuvre; and the Presentation of our Saviour in the Temple, by the same sculptor, is much admired. There is a noble group behind the high altar of the Assumption of the Virgin, also by Bridan. The inner dimensions of the cathedral are as follows:—entire length, 436 feet, breadth, 111½ feet; length of transepts, 213 feet, breadth, 39 feet; nave, 246 feet in length; height to the keystone of the vault, 115 feet. The aisles are 22 feet wide and 52 feet high. There are double aisles round the

choir, and the circuit of the church may be made by a gallery formed in the walls above the great windows of the nave and choir. Under the cathedral is a subterranean church, the descent to which is by five different staircases. The cathedral was covered with a metal roof in 1841, the old roof having been destroyed by fire in 1836.

Other remarkable buildings are the church of St-Père and that of St-André, which was not long ago used as a storehouse; the barracks; the public library, which contains 40,000 volumes; the general hospital; and the residence of the prefect. The town gives title to a bishop; and has a fine botanical garden.

Chartres has the best regulated corn-market in France. The measuring and selling the grain, and receiving payment for it, is managed by a corporation of women, who in an hour, at most, effect all the transactions of the market, often comprising the sale of 6000 quintals of wheat, besides what is sold by sample and delivered at the stores. The town has also an important market for wool. Some woollen goods and hosiery are manufactured; a good quantity of leather is made, and there are several dye-houses. The railway from Paris to Brest passes through Chartres.

CHÂTEAURoux, capital of the department of Indre, in France, stands in 46° 48' 50" N. lat., 1° 41' 51" E. long., on a rising ground in a vast plain near the left bank of the Indre, 165 miles S. from Paris by railway through Orleans and Vierzon, and has 14,276 inhabitants, including the whole commune. The town, which was formerly ill built and dirty, has been within the last twenty years greatly improved. The streets are now straight, wide, and well paved; and there are several spacious squares. The principal buildings are—the old castle (built in 950 by a Frank chief, Raoul le Large), which gave origin and name to the town, and part of which now serves for government offices, the town-house, the theatre, the church of the Cordeliers, and the residence of the prefect, which adjoins the old castle. Châteauroux is one of the principal seats of cloth manufacture in the centre of France; its cloths are manufactured from excellent wool, but are more remarkable for strength than for fineness. Cotton hosiery, worsted, tilas, paper, and leather are also manufactured; and there is a good trade in corn, iron, wool, cattle, sheep, &c. The town has tribunals of first instance and of commerce, a college, and a consultative chamber of manufactures. (*Dictionnaire de la France*; Macgregor, *Statistics*; *Annuaire pour l'An 1853*.)

CHÂTELLERAULT. [VIENNE.]

CHATHAM, Kent, a market-town and parliamentary borough, in the hundred of Chatham and Gillingham and lathe of Aylesford, stands on the right bank of the river Medway, in 51° 23' N. lat., 0° 31' E. long., 24 miles W.N.W. from Canterbury, 30 miles E.S.E. from London by road. The Strood station of the North Kent railway, which is two miles from Chatham, is 31 miles from London. In 1851 the population of the parliamentary borough of Chatham was 28,424. The borough returns one member to the Imperial Parliament; it is governed by a head constable under the magistrates of Rochester. The living of Chatham is a perpetual curacy in the archdeaconry and diocese of Rochester.

The town of Chatham includes Brompton, a village connected with the dockyard and naval and military establishments. The High-street in Chatham, about 1½ miles in length, is narrow; and a considerable portion of the town itself is irregular and ill-built. Many of the houses are constructed of timber, probably from the facility of purchasing refuse wood from the dockyard in former times. The water supply is chiefly obtained by wells and pumps from the upper chalk formation: the wells vary in depth from 18 to 120 feet; five of the pumps are public.

From various discoveries made in erecting the fortifications which inclose the naval and military establishments at Chatham it seems probable that the Romans had a cemetery here. Several ancient graves and other excavations have been opened, and Roman bricks, tiles, coins, and weapons found. The name of the town is Saxon, and was written Ceteham or Cætham, which appears to signify 'the village of cottages.' It continued an insignificant place until the formation of the dockyard, to which the town owes its origin.

The parish church was almost entirely rebuilt in 1788. St. John's church was erected in 1821 by the commissioners for building new churches. There are chapels for Wesleyan Methodists, Baptists, Independents, Bible Christians, Irvingites, Swedenborgians, and Unitarians; two National schools, a British school, a Proprietary school, a Ragged school, and a mechanics institution. An hospital for lepers was established in Chatham by Bishop Gundulph in the reign of William the Conqueror. The only portion of the building now

existing is a small chapel; the revenues of the estate are in the hands of the Dean of Rochester. In the High-street is an hospital for ten decayed mariners and shipwrights, which was founded by Sir John Hawkins in 1592, and incorporated by Queen Elizabeth in 1594. A military lunatic asylum provides accommodation for 80 officers and 100 privates. There are several minor charities.

The extensive naval and military establishments are at Brompton, a little distance from the town, and entirely separated from it by a line of fortifications. The dockyard was founded by Queen Elizabeth, previous to the invasion of the Armada, on the site of what is now termed the Ordnance Wharf, and occasionally the Old Dock. It was removed to its present situation in 1622, the demands of the navy requiring increased accommodation. Elizabeth erected Upnor Castle, on the opposite side of the Medway, for the purpose of defending the dockyard and shipping. But this fort proved ineffectual for protection from the attempt of the Dutch, under De Ruyter, who in 1667 having taken Sheerness, dispatched his vice-admiral, Van Ghent, with 17 sail of light ships and 8 fire ships to destroy Chatham. He succeeded in breaking a chain stretched across the Medway, and in spite of the fire from the castle burnt and sunk some ships. Finding the country alarmed, he retired, carrying off a ship of war named the Royal Charles. This event was the cause of additional and stronger fortifications being erected. The dockyard was subsequently considerably enlarged.

From the year 1757 down to 1805, new buildings were erected, and the extensive area occupied by the different establishments was inclosed by a strong line of fortifications on the land side, and protected on the river side by strengthening Upnor Castle, by the erection of a martello tower called Gillingham Fort on the Chatham side, and other defences. Upnor Castle is at present merely a powder magazine.

The naval and military establishments now comprise the dockyard, nearly a mile in length, which has four wet docks capable of receiving vessels of the largest size, and nine building-slips, of which six are for first-rates; metal mills; an extensive arsenal; barracks on a large scale for artillery and engineers, infantry and royal marines; a park of artillery; magazines and store-houses; besides a handsome dock-chapel, and a number of habitations for the civilians who are employed. The principal mast-house is 240 feet long by 120 feet wide. The rope-house is 1128 feet in length, and 47½ feet wide: in it cables 101-fathoms in length and 25 inches in circumference are made. The sail-loft is 210 feet in length. The machinery used in all the departments is of the very best kind. A duplicate of Brunel's block-making machine is kept here, ready for use in case the machine at Portsmouth should get out of order. The engineer barracks are built in a plain and simple style, and are extensive and convenient. Near the dockyard gate is a large naval hospital, which was erected at the suggestion of William IV. when lord high admiral.

After the fire at Devonport dockyard in 1840, which was greatly extended owing to the tarred wooden and paper roofs which covered the building-slips, the admiralty began gradually to replace such roofs with others made of metal. Nearly all the slips at Chatham have been recently either rebuilt or strengthened and repaired. The metal mills are more extensive than at any other of the dockyards. In 1848 the metal mills produced 700 tons of sheet copper, 400 tons of bolt copper, and 800 tons of remanufactured iron per annum. All the old copper sheeting from the various dockyards is re-melted here into sheets.

There are saw-mills at Woolwich, Chatham, and Sheerness; but those at Chatham are the most complete. The Chatham mills could indeed, it is said, cut timber enough for most of the yards. It is merely straight cutting: the machinery employed is not fitted for cutting the curved pieces required in a ship, which are still cut by hand.

There is an establishment at Chatham, founded in 1812, for the instruction of officers and privates of the engineer branch of the army. Men belonging to the Engineers, and to the Sappers and Miners, are here instructed in all that relates to fortification, garrison operations, and field service. Young men intended for officers in the engineering corps, after preliminary training at Addiscombe or Woolwich, receive the practical part of their professional education at the Chatham institution.

The 'Chest' at Chatham was established in the reign of Elizabeth, and was originally a voluntary contribution from the monthly wages of seamen for the support of their maimed and superannuated brethren, but which soon settled into a compulsory payment. On the recommendation of the Commissioners of Naval Inquiry, it was, by the 43 George III. c. 119, removed to Greenwich. Instead of a monthly payment from the wages of seamen the amount is now charged annually on the consolidated fund.

At Rochester Bridge the Medway, which discharges into the same estuary with the Thames, is a large tidal river. The rise is 18 feet at spring and 12 feet at neap tides at Chatham. Above Rochester the high lands approach each bank of the river, forming a kind of amphitheatre about Chatham and Rochester on the east side, and also on the west, closing on the river at Upnor Castle. Below Chatham dockyards the high lands decline, first on the right and then on the left bank, forming a flat marshy country to the spacious outlet of the Medway at Sheerness.

(Hasted, *Kent*; Douglas, *Nenia Britannica*; Pepys, *Diary*; *Communication from Chatham*.)

CHATHAM ISLANDS are a group of islands situated in the Pacific, east of New Zealand, between $43^{\circ} 40'$ and $45^{\circ} 20'$ S. lat., 176° and $177^{\circ} 20'$ W. long. They consist of one large island, two of moderate extent, and several smaller islands. The largest is called Warekauri, and is in the form of a hammer with a short handle, the head of the hammer towards the north being 48 miles long from east to west, and the handle, or southern peninsula, about 36 miles in length. Dieffenbach, by a rough computation, gives the area at 477 nautical miles, or 305,280 acres, of which however 57,600 acres at least are water, being lakes, lagoons, &c., so that the land is not more than 247,680 acres. The southern shores of the southern peninsula are lined with rocky cliffs, but the remainder terminates in a low sandy beach, with the exception of a few headlands along the northern coast, which are formed by low rocky masses. The country rises gradually from the beach for one or two miles, when it extends on an undulating level. The central part of the island is occupied by a large lake called Te Wanga, which is about 25 miles long and between 6 and 7 miles broad. It is surrounded by hills, either wooded or boggy.

The surface of the tract which lies west of the northern part of the Te Wanga Lake is diversified by a considerable number of hills of a pyramidal shape, and consisting of basalt. Of these hills there is none above 800 feet in height. In their vicinity the soil is very fertile, being in its natural state covered with a vegetation of fern and trees, mixed together and appearing like oases in the surrounding bog. The intervening tracts are covered with bog. Wherever the superfluous water has been carried off by a natural outlet a rich vegetation of fern and New Zealand flax (*Phormium tenax*) has sprung up, which gives additional firmness to the soil by the decayed leaves, and yields a rich harvest to the native planter. This is particularly the case on the low hills above the sea-shore. In this part several lakes occur at the back of the low hills which run parallel to the coast. They are surrounded by gently sloping hills, but have generally an outlet for their waters into the sea. The best portion of the island is that south of the lake, which has an undulating surface, is not so boggy as the rest, and is either covered with an open forest of moderate sized trees or with high fern, in which case the land can be brought under cultivation with little labour. The soil is very fertile and the vegetation is vigorous.

On the western side of the island is a large bay, called Waitanga Bay, in which there are five harbours behind some projecting headlands. On the southern shore of the bay is Waitanga harbour, which has excellent anchorage in between 5 and 12 fathoms water. This harbour receives the largest river in the island, the Mangatu, which comes from some hills on the south; though its whole course does not exceed 12 miles, it is navigable for boats for about three miles from its mouth, but it has a bar across its mouth, which is passable for boats only at high-water. On the northern side of Waitanga Bay are four harbours, one of which, Wangaroa, is frequently visited by vessels, and affords complete protection against all winds. The northern shore of the island is much exposed, but contains a sheltered bay called Kaingaroa, which is stated to have good anchorage, in from 10 to 12 fathoms water. Whalers frequently visit Oinga, the south-eastern headland of the island, where the hills offer some protection against wind and sea.

The climate is very mild. In winter (from May to July) the thermometer never rises above 60° , nor descends below 45° , after eight o'clock in the morning. The air is always moist and cool, but never misty, the vapour being carried off by the constant breezes. In winter there are showers of rain for a few hours every week. The prevailing winds are north-east and south-west. The climate appears very favourable to Europeans.

The natives cultivate potatoes, different kinds of turnips, cabbages, taro (*Arum esculentum*), some tobacco, and abundance of pumpkins, which form a great part of their food. There are several kinds of trees, which are of the species found in New Zealand: the karaka-tree (*Corynocarpus laevigatus*) forms the largest part of the forest. No kind of quadruped occurs, except the Norwegian rat. Birds are numerous: in the lakes and on the sea-shores are ducks, snipes, plovers, curlews, and redbills; in the forests the mocking-bird, a little green parroquet, the mako-mako, a singing-bird, and the large New Zealand pigeon. Fish are abundant. Both the spermaceti and black whales are seen in great numbers off the shore.

These islands were discovered in 1791 by Broughton, of his Majesty's ship Chatham, who took possession of them in the name of the king. They were afterwards frequently visited by whalers, and in 1840 a whaling station was established at Oinga. Broughton found them inhabited by a people belonging to the Malay race. They are not so tall, muscular, and well proportioned as the New Zealanders; and their complexion is darker. The natives, of whom a comparatively small number remain, have been reduced to a state of slavery and degradation by two tribes of New Zealanders. The number of the New Zealanders who settled in the Chatham Islands is stated to have been 800: and, by means of the labour of their slaves, a portion of Warekauri was soon brought into cultivation, so that they could furnish supplies for the few vessels which annually resort to the island.

South-east of Warekauri lies Rangihau, or Pitt's Island, which is about 12 miles long and 8 miles broad. It consists principally of

a hill of moderate elevation, having a flat top, whose declivities terminate near the coast. It has no harbour, and is stated to be inhabited by a small number of aboriginal natives. The other islands are mere rocks, and only frequented by sea-birds.

(Dieffenbach, 'Account of the Chatham Islands,' in *London Geographical Journal*, vol. xi.)

CHEADLE, Staffordshire, a market-town and the seat of a Poor-Law Union, in the parish of Cheadle and hundred of Totmonslow South, is situated near the Tean Brook, which flows into the Churnet, in $52^{\circ} 59'$ N. lat., $1^{\circ} 59'$ W. long.; 14 miles N.N.E. from Stafford, and 146 miles N.W. by N. from London by road; Alton station of the North Staffordshire railway, which is 4 miles from Cheadle, is 144 miles distant from London. The population of the town of Cheadle in 1851 was 2728. The town is governed by the county magistrates. The living is a rectory in the archdeaconry of Stafford and diocese of Lichfield. Cheadle Poor-Law Union contains 15 parishes and townships, with an area of 54,631 acres, and a population in 1851 of 18,177.

Cheadle is called Cedla in the Domesday Book. The town is within the moorland district of North Staffordshire, and is situated in the midst of hills formerly barren, but recently covered by plantations of timber-trees. Cheadle is irregularly laid out, and consists of indifferently-built houses.

The old church had some fine examples of the decorated style in its windows, arches, and tracery; but in 1837 it was found necessary to take it down, and a new one was built in its place. A splendid Roman Catholic church built from designs by Mr. Pugin was opened with great ceremony in 1846. The chief portion of the expense of this building was borne by the Earl of Shrewsbury. There are places of worship for Independents and Wesleyan, New Connexion, and Primitive Methodists.

In the town are a Free school, two National schools, and an Infant school. The school-house belonging to the Roman Catholics is a large and fine building. There are a public parochial library and a savings bank. A county court is held in the town.

The chief manufactures of Cheadle are copper works, brass works, and a tape manufactory; a little coal-mining is also carried on. The Caldron Canal passes along the valley of the Churnet two or three miles from the town.

(Communication from Cheadle.)

CHEDUBA. [ARACAN.]

CHELMSFORD, Essex, a county town, and the seat of a Poor-Law Union, in the parish and hundred of Chelmsford, is situated on the river Chelmer, in $51^{\circ} 44'$ N. lat., $0^{\circ} 28'$ E. long.; 29 miles N.E. by E. from London by road, and $29\frac{1}{4}$ miles by the Eastern Counties railway. The population of the town of Chelmsford was 6033 in 1851. The parish is under the management of a Local Board of Health. The living is a rectory in the archdeaconry of Essex and diocese of Rochester. Chelmsford Poor-Law Union contains 31 parishes and townships, with an area of 81,738 acres, and a population in 1851 of 32,253.

Chelmsford is situated nearly in the centre of Essex, on the high road from London to Ipswich. The town derives its name from an ancient ford over the river Chelmer, near its confluence with the river Cann. The manor was formerly in possession of the bishops of London. About the time of Henry I. it became a place of some importance. Maurice, then bishop of London, built a stone bridge over the Cann and diverted to it the public road which previously passed through Writtle, by which means he made Chelmsford the great thoroughfare to Suffolk and Norfolk. The present bridge over the Cann, a handsome stone structure of one arch, was built in 1787. The High-street, which is wide and commodious and contains many good houses, extends from this bridge to the Shire Hall. There are several other streets. The town is well lighted with gas. A tolerably good supply of water has been furnished for a considerable period from a conduit in the market-place, which is fed by pipes from Burgess Wells, near the entrance of the town on the south-east. The fountain was re-constructed in 1841, the expense being defrayed by public subscription. The parish church, dedicated to St. Mary, is a spacious gothic structure, rebuilt in 1424. In June 1800 the roof and a portion of the walls fell in, but the church was afterwards rebuilt. At the west end is a square embattled tower of the 13th century surmounted with a lofty spire. The interior contains many interesting monuments. There are a district church dedicated to St. John, and chapels for Independents, Baptists, Quakers, Irvingites,

and Roman Catholics. The Grammar school, founded by Edward VI., has an income from endowment of 488*l.* a year, and is free to 40 boys, but in 1852 the number of scholars was under 20. There are National, British, and Infant schools, a philosophical society, a mechanics institution with a museum and reading-rooms, a savings bank, and a dispensary. The Shire Hall is a handsome building, having a front of Portland stone. The new jail is built on the radiating principle, and will accommodate 272 prisoners. The county assizes are held at Chelmsford; also quarter sessions and a county court. Besides the stone bridge already noticed, there are a cast-iron bridge over the Cann and two bridges over two branches of the Chelmer, which surround a small island called Mesopotamia. Upon this island a ludicrous mock election of a member of parliament has been long conducted on the occurrence of elections of the county members. On these occasions there are the usual nomination, speech-making, chairing, &c., and the proceedings end with the newly-elected member receiving a ducking in the river.

Chelmsford is chiefly dependent on agriculture for its prosperity. There are here tan-works, corn-mills, coach-works, an organ factory, and works for the manufacture of agricultural implements. The river Chelmer was made navigable from Chelmsford to Maldon (about 15 miles) towards the close of the last century; the basin and wharfs are at Springfield, near to the town: barges of 30 tons are employed in the navigation. The channel is 30 feet wide at the top and 20 feet at the bottom. The market is held on Friday: fairs are held on May 12th and November 12th.

(Morant, *Essex*; Wright, *Essex*; *Communication from Chelmsford*.)

CHELSEA, Middlesex, formerly a village reckoned about 2 miles from London, but now constituting a portion of the suburbs, is on the left bank of the Thames, in the hundred of Ossulston. The population of Chelsea district in 1851 was 56,538. The parish is a rectory in the archdeaconry of Middlesex and diocese of London. Chelsea is the seat of a Poor-Law Union, which is co-extensive with the parish and district.

Chelsea stands on a slight eminence, about 15 feet above the Thames. Sir Thomas More, who had a house here, wrote the name Chelchith. In the 16th century it began to be written Chelsey. Many of the nobility and gentry had residences here, and there were several noted coffee-houses, taverns, and public-houses with gardens, which were much frequented in the 17th and 18th centuries.

The parish church of Chelsea being insufficient for the wants of the rapidly increasing population, a new church was erected in Robert-street, and consecrated in 1824. It is a spacious building, in the pointed style of architecture. The old church is situated near Battersea Bridge; and is an interesting structure, both for the remains of ancient work which it contains, and for its monuments, several of which are to persons celebrated in English history, or in literature. The monument to Sir Thomas More is the most famous. The rapid increase of buildings in and around Chelsea, within the present century, has led to the construction of many new churches. Besides the two churches above named, there are Christ church, in Queen's Road, and St. Jude's in Turk's Row; together with Upper Chelsea church and St. Saviour's, also in Upper Chelsea. The new church and college of St. Barnabas, opened in June 1850, is near the eastern margin of Chelsea. In Park Walk is an Episcopal chapel. There are also a considerable number of chapels for Wesleyans, Independents, Baptists, Presbyterians, and Roman Catholics. Among the educational establishments the chief is St. Mark's Training College, a normal school for schoolmasters belonging to the National Society, which had 72 students in residence in 1852. A training institution for school-mistresses, belonging to the same society, situated in King's Road, had 90 students in residence in 1852. There are several National, British, and Infant schools, and a savings bank.

Chelsea is chiefly lighted by two gas companies, the Westminster and the Imperial. Chelsea Water Works are at Thames Bank. In the Fulham Road is the London and Westminster Cemetery.

The Royal Hospital for invalid soldiers is at Chelsea. In the reign of James I., Dr. Sutcliffe, dean of Exeter, projected a college for the study of polemical divinity, which met with the king's approbation. The foundation stone of the building was laid on May 8th, 1609. In the charter of incorporation it is styled 'King James's College at Chelsey.' During the civil wars it was appropriated by the Parliament to different purposes. Charles II. gave it to the then newly established Royal Society; but not being adapted to their use, it was restored to the king for 1300*l.* in order that the site might be occupied by the Royal Hospital. The architect of the Royal Hospital was Sir Christopher Wren. The foundation-stone was laid on the 16th of February 1682 by the king, who was attended by a great concourse of nobility and gentry. The building was completed in 1690, at an expense it is stated of 150,000*l.* It is of brick, ornamented with stone quoins, cornices, pediments, and columns. The building consists of three courts, two of which are spacious quadrangles; the third, the central one, is open on the south side next the Thames. It consists of three sides of a square, ornamented with porticoes and piazzas, and has a pleasing appearance. The north front is simple in its style, and consists of a centre and wings, in a straight line, with no other ornament than a plain portico. In the centre of the hospital are the chapel and the great dining-hall. The business of

the Royal Hospital at Chelsea is managed by commissioners appointed under the great seal. The establishment consists of a governor and lieutenant-governor, and various subordinate officers. There are usually upwards of 500 invalids in the hospital, who are divided into classes, and regulated by military discipline. In addition to their provision and clothing they receive a weekly pension. There are besides numerous out-pensioners. The body of the late Duke of Wellington lay in state in Chelsea Hospital for a few days previous to the public funeral, which took place on November 18th 1852. On Nov. 13th the pressure of the crowd who thronged to the hospital to see the lying-in-state, was so great, that several persons lost their lives.

The Royal Military Asylum is also in Chelsea. The building is on an extensive plan: the foundation-stone was laid by the Duke of York in 1801, and it was completed in 1805. It is appropriated to the support and education of children (especially orphans) of soldiers and non-commissioned officers. In 1851 there were in the Normal school 40 students, in the Model school 270 scholars, and in the Infant school 80 scholars. The Apothecaries Company of London have a botanical garden at Chelsea. In the centre of it is a statue, by Rysbrack, of Sir Hans Sloane, from whom the company received the freehold of the ground, the consideration paid being an annual presentation of plants to the Royal Society.

A very large steam-boat traffic has become established at Chelsea; it is accommodated by three piers, one of which, erected by the Earl of Cadogan, is a handsome structure. Cremorne House and gardens have passed into the hands of proprietors who have opened them as a place of public amusement. A new bridge in connection with the proposed Battersea Park is in process of erection; the estimates for the bridge amount to 70,000*l.* By the New Reform Bill, introduced by Lord John Russell on February 13th, 1854, it is proposed to form Chelsea and Kensington into an electoral district to return two members to the Imperial Parliament.

(Lysons, *Environs of London*; Faulkner, *Historical Description of Chelsea*; *Communication from Chelsea*.)

CHELTENHAM, Gloucestershire, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish and hundred of Cheltenham, and eastern division of the county, is situated in 51° 54' N. lat., 2° 4' W. long.; distant 8 miles N.E. from Gloucester, 88 miles W. by N. from London by road, and 121 miles by the Great Western railway. The population of the borough and parish, which are co-extensive, was 35,051 in 1851. The town is governed by commissioners. For sanitary purposes the management is in the hands of a Local Board of Health. The borough returns one member to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry of Gloucester, and diocese of Gloucester and Bristol. Cheltenham Union contains 13 parishes and townships, with an area of 24,303 acres, and a population in 1851 of 44,193.

Cheltenham appears to have been of some importance at an early period. British and Roman remains have been found in the neighbourhood. A priory existed here at the commencement of the 9th century. In Queen Elizabeth's reign the inhabitants of Cheltenham petitioned to be relieved from the burden of sending two members to Parliament, and the prayer of the petition was granted. The franchise was re-conferred on the town by the Reform Act. At the close of the 17th century however, Cheltenham was a mere rural village. In 1716 the discovery of the healing properties of a saline spring first attracted visitors to Cheltenham. From that time the place gradually increased till 1788, when it suddenly became a fashionable resort in consequence of George III. having been directed by his physicians to try the waters of Cheltenham, and having derived benefit from them. In the present century the increase has been remarkably rapid. In 1804 the town consisted of one long street, through which a branch of the Chelt flowed, and was crossed at intervals by stopping stones; it then contained 710 houses and 3076 inhabitants; at the Census of 1851 there were found to be 6996 houses, and as above stated, 35,051 inhabitants.

The town is pleasantly situated in a valley along which runs the streamlet from which the town derives its name. The Cotswold hills form a vast amphitheatre, sheltering the town on the north-east, and causing the temperature of the valley to be equable and pleasant. Cheltenham possesses no manufacture, and the houses and public buildings being entirely of recent erection, and constructed especially for the accommodation of visitors, the town is altogether an agreeable place of residence.

Cheltenham consists of a principal street above a mile long, with numerous other streets, squares, crescents, and terraces on each side of it. The different places of public resort, the pump-rooms, hotels, and lodging-houses are considered to be superior to those of most other watering places. The Promenade, Old Well Walk, and other walks, afford pleasant public promenades. There are four spas, the Royal Old Well, the Montpelier Spa, Pittville Spa, and the Cambray Spa. There are also numerous baths. The waters are all saline, and contain as their chief ingredients muriate of soda, sulphate of soda, and sulphate of magnesia.

The parish church, dedicated to St. Mary, is almost the only ancient building in Cheltenham. It is a spacious cruciform edifice, chiefly of the decorated style, with a tower rising from the intersection of the cross, and a very lofty spire. The interior is incumbered and dis-

surrounding by huge gowns and garters. The churchyard is a beautiful one. The other churches are—Trinity, St. John's, St. James's, St. Paul's, and Philip's. The church, and St. Peter's. Christ Church, the most generally admired of these buildings, will accommodate 2000 persons; it is a pleasing edifice of a mixed modern gothic style, with a tower 174 feet high. St. Peter's is a picturesque specimen of the Norman style; the interior has a very chaste appearance. The Wesleyan, Calvinistic, New Connexion, Primitive and Association Methodists, Independents, Baptists, Quakers, Unitarians, Roman Catholics, Jews, and Moravians have places of worship in the town.

The principal educational establishment in Cheltenham is the Proprietary College, situated in the Bath-road. The building, an imposing structure in the Tudor collegiate style, was erected in 1843. It has a frontage of 240 feet; the lecture-room is 40 feet by 32 feet; the principal windows are 35 feet high by 20 feet wide. In 1852 the college was attended by 412 students. The Free Grammar school, in the High-street, was founded in 1578; it has now an income of about 800*l.* a year. There were 175 scholars in 1852. The school possesses 10 scholarships and exhibitions at Oxford University, none of which is less than 60*l.* a year. There are six National schools, three British schools, and four Infant schools. A Church of England Training College has been founded for educating masters and mistresses of infant and parochial schools. The building for male students recently erected contains residences for the principal, vice-principal, assistant-master, and 100 students. The cost of this building (defrayed by subscription, aided by a government grant) was upwards of 10,000*l.* The architect of the building, which has a quaint monastic character, was Mr. Dawkes. For the female establishment a house is rented which accommodates three governesses, a superintendent, matron, and 60 pupils. There were 75 male and 60 female students in residence in 1852.

Cheltenham possesses an hospital, an infirmary, a dispensary, almshouses, parochial charities, and a very large number of benevolent and charitable institutions. There are also a savings bank, a literary and philosophical institute, horticultural, choral, and numerous other societies and clubs. A county court is held in the town. There is a daily market; seven fairs are held during the year.

Of the numerous mansions in Cheltenham and its vicinity, Thirstane House, the seat of Lord Northwick, in the Bath-road, deserves particular mention, on account of its extensive and excellent collection of paintings, including many admirable works by both old and modern masters. It is open to the public under certain regulations.

(Atkyns, *Gloucestershire; Cheltenham Histories and Guides; Communications from Cheltenham.*)

CHEMNITZ. [ACHMN.]

CHEMNITZ, a town in Saxony, the capital of the Erzgebirge circle, is situated at the foot of the Erzgebirge, in a beautiful and well-watered valley which extends about ten miles in every direction. It stands in 50° 50' N. lat., and 17° 55' E. long., and about 976 feet above the level of the Baltic. Chemnitz was for four centuries a free Imperial city. It is now the principal manufacturing town in Saxony. In no place indeed have the English improvements been introduced with such care and skill as in Chemnitz. There are several large spinning and weaving establishments, numerous manufactories for printing cotton goods, and some in which the yarn is dyed red like Turkish yarn. The woollen manufactures, which were formerly very considerable, have much decreased in the last fifty years; but in the town, as well as in its neighbourhood, there are many stocking manufactories. The manufacture of linen-cloth and of spinning machinery also employs many of the inhabitants. Chemnitz carries on a considerable trade, being situated where the road between Prague in Bohemia and Leipzig, and that which unites Bavaria with Dresden, cross one another. Its exports to the United States of North America are of considerable amount. The town contains 28,650 inhabitants, and is well built; the streets are spacious and mostly straight, and many of its houses look more like palaces than dwelling-houses. It is lighted with lamps and is remarkable for the great cleanliness of its streets. The public edifices are in a good style, but none of them particularly distinguished. Among them may be named the Great Church, the Rathaus, or town-hall, and the Gewandhaus, or cloth-hall.

CHEPSTOW, Monmouthshire, a market-town and port, and the seat of a Poor-Law Union, in the parish of Chepstow and upper division of Caldicott hundred, is situated on the right bank of the river Wye, in 51° 38' N. lat., and 2° 39' W. long.; 16 miles S. by E. from Monmouth, 135 miles W. from London by road, and 141½ miles by the Great Western and South Wales railways. The population of Chepstow town was 4295 in 1851. The living is a vicarage in the archdeaconry of Monmouth and diocese of Llandaff. Chepstow Poor-Law Union contains 38 parishes and townships, with an area of 64,980 acres, and a population in 1851 of 19,000.

Chepstow is situated about 2½ miles from the junction of the Wye with the estuary of the Severn. The town was at an early period strongly fortified. The castle is now in ruins, but its remains indicate its former strength and extent. The remains consist of four courts and a central building, and stretch for a considerable distance along a precipitous cliff. The area of the castle is above three acres: but it is narrow in comparison with its great length. The entrance is by a gateway between two large round towers, and has been protected by

an iron door, double portcullises, machicolations, and other defences. Chepstow Castle is said to have been founded shortly after the Conquest by Fitz-Osborne, earl of Hereford, but the greater part of the building is of at least two centuries later date. The castle has endured several sieges. In 1645 it was taken by the parliamentary forces; in 1646 it was retaken by Sir Nicholas Kemys, at the head of a small band of Royalists. Cromwell himself, with a considerable force, endeavoured to regain possession of the castle, but the garrison, refusing to yield, and time pressing, he delegated the conduct of the siege to Colonel Ewer, who obliged the garrison to surrender, though not till their commander, Sir Nicholas Kemys, and 40 of their number were slain, and their stock of provisions was exhausted. Henry Marten, one of the Judges who tried Charles I., was confined for upwards of 20 years in the keep of Chepstow Castle: he was however allowed to have his family with him, and to receive the visits of his friends. He died in the castle and was buried in Chepstow church. The keep is now commonly designated Marten's Tower. One of the ancient gate-houses of the town is still in a tolerably good condition.

Chepstow church is an edifice of Norman erection, and originally formed part of the Benedictine priory of Chepstow. In the interior are some handsome monuments. The church has been lately enlarged, and affords sittings for 1600 persons. The Roman Catholics, Wesleyan Methodists, Independents, Baptists, and Irvingites have places of worship. There are a Free school for 12 boys, a National school, an hospital, and several almshouses: also some parochial charities. The town possesses a literary institution, a horticultural society, a choral society, and a savings bank. A market-house and a theatre are among the public buildings. The railway bridge across the Wye is a remarkable construction, the part on the Gloucestershire side being tubular but open at top, while on the Monmouthshire side the rail runs upon arches: this construction was necessary to avoid impeding the navigation.

The town of Chepstow is built on a hill, which rises with a gentle slope from the river, and has a picturesque appearance. The bridge, erected in 1816, is constructed of iron: it is a substantial and rather handsome structure of five arches, and is 372 feet long. The rise of water at Chepstow bridge at high tide, is 50 feet, being the greatest tidal rise in Europe. On a few occasions it has risen much higher. The river being narrow the rush of water at rise and fall of the tide is extremely fierce. For large vessels the Wye is navigable to Chepstow bridge; barges of from 18 tons to 30 tons can ascend the river as far as Hereford. The number and tonnage of vessels registered as belonging to the port, on 31st December 1852 were as follows:—sailing vessels under 50 tons, 42, tonnage 1154; above 50 tons, 14, tonnage 1309; steam vessels 1 of 17 tons, and 1 of 53 tons. During 1852 there entered and cleared at the port, in the coasting trade—inwards, 396 vessels, tonnage 10,247; outwards, 112 vessels, tonnage 7426; and 1 steam vessel inwards of 65 tons. In the colonial trade—inwards, 1 vessel of 145 tons; in the foreign trade—inwards, 4 vessels, 320 tons.

There are no manufactures in the town or neighbourhood. The town is lighted with gas; the streets are well paved and cleansed. A county court is held at Chepstow. The market days are Wednesday and Saturday; four fairs are held in the course of the year.

Near Chepstow is Hardwick House, the seat of the Bishop of Llandaff. Mathern House, the former residence of the bishops of Llandaff, is near the sea about a mile and a half from Chepstow. Close by Chepstow is Piercefield, the grounds of which are of much celebrity. From the walks are obtained rich and extensive views of the valley of the Wye and the country beyond. Views of equal beauty and nearly equal extent are also obtained from the summit of Wyndcliff, a rock 970 feet high, situated about a mile and a half farther up the Wye. Five miles from Chepstow are the famous and most picturesque ruins of Tintern Abbey. But the whole country around Chepstow is unusually beautiful and interesting.

(Cox, *Monmouthshire; Cliffe, Book of South Wales; Land We Live In*, vol. i.; *Communication from Chepstow.*)

CHER, a department nearly in the centre of France, comprehends that part of the ancient province of Berri called Upper Berri and a portion of Bourbonnais. Its northern boundary is formed by the department of Loiret, on the south it has the department of Allier, on the west the department of Loir-et-Cher and Indre, and on the east the department of Nièvre and the river Loire. It is included between 46° 18' and 47° 40' N. lat., 1° 50' and 3° 5' E. long. Measured north and south its greatest length is 86 miles, and its greatest width east and west 56 miles. The area is 2780 square miles, and the population according to the census of 1851 was 306,261, which gives 110·16 to the square mile, being 64·554 below the average per square mile for the whole of France.

The department consists almost entirely of a vast plain of very unequal fertility. The eastern part, which belongs to the basin of the Loire, is extremely fertile. The northern district (which is called Sancerrois, from its chief town Sancerre) has several ranges of low hills, which sweep in parallel curves from south-east to north-west and west; between them are valleys watered by rivers, which follow the direction of the hills, and here the soil is sandy and in many parts covered with heaths and marshes. In the north-western districts, which form part of the dismal region called Sologne [LOIR-ET-CHER],

the soil consists of a hungry sand that yields little else than heath and broom. In the south and south-west the land is tolerably good, but here and in the centre of the department there is a great number of ponds and marshes. The extent of natural pasturage and moorland throughout the department is very considerable.

The river *Cher*, from which the department is named, rises east of Aubusson in the department of Creuse, on the borders of which, having received the *Tardes* from the left, it crosses the north-west of the department of Allier, and running north separates Allier from Cher, in this part of its course taking in the waters of the *Aumance* from the right; turning from the boundary a few miles south of St.-Amand, it runs north-west through the department of Cher to the neighbourhood of Vierzon, where it receives the *Arnon* from the left and the *Yèvre* from the right, and begins to be navigable. Below Vierzon it turns west and enters the department of Loir-et-Cher, taking in the *Sauldre* a little below *Selles* on the right bank; hence its course is generally west to its junction with the *Loire* a little below *Tours*, after a course of about 200 miles. The *Cher* is subject to floods, which sometimes rise 16 feet above the usual level of its surface, and as the grounds in the lower part of its course along the right bank are low, its inundations are often attended with great destruction, notwithstanding that dykes have been erected along the right bank for 17 miles from its junction with the *Loire*. The *Loire* and the *Allier*, both of which are navigable, form the eastern boundary. The most northern part of the department is drained by the *Grand Sauldre* and *Petit Sauldre*, which to the east and north-east of *Bourges* respectively flow north-west, and unite beyond the western boundary to form the *Sauldre*.

The department is traversed by the *Canal du Duc de Berri*, called also *Canal du Cher*, which runs along the left bank of the *Cher* from *Montluçon* in the department of Allier to *St.-Amand*; hence it enters the valleys of the *Marmande*, the *Yèvre*, and the *Auron*, passing *Bourges*, and joins the *Cher* again at *Vierzon*. A branch joins this canal to the lateral *Canal of the Loire*, which runs from *Digoin* to *Briare*, where the *Canal du Loing* commences, uniting the *Loire* and the *Seine*. The department is crossed by the railroad from *Orléans* to *St.-Etienne*, which passes through *Vierzon* and *Bourges*; it thence runs eastward to *Nevers*, and then south up the valley of the *Allier* to *Moulins* and *Varenne*, in the department of Allier. All this part of the railway is now (March, 1854) open; the section between *Varenne* and *Roanne* when finished will complete the line. A branch railway from *Vierzon* runs south-west to *Châteauroux* in the department of Indre. The common road-way accommodation is by 8 national and 21 departmental roads.

The whole surface of the department contains 1,779,060 acres. Of this area 916,000 acres are capable of cultivation, 274,958 are natural grass-land, 31,820 are under vineyards, 291,100 under woods and forests, and 155,183 under heaths, ponds, and marshes. The common bread-stuffs are grown in sufficient quantity for the consumption. Hemp is extensively cultivated; the annual produce is 14,760 cwt. This department supplies the wine from which the best *Orléans* vinegar is made. The annual yield of the vineyards is only 5,500,000 gallons. Other articles of produce are fruits, flax, chestnuts, truffles, &c. Horses, goats, pigs, and sheep are numerous; the wool of the sheep is esteemed for its fineness. Game, bees, and poultry abound.

Iron and coal mines are worked; and marble, building, and mill stone are extensively quarried. Manganese, lithographic stone, gypsum, porcelain, and fuller's clay are found. There are fifteen blast-furnaces and thirty forges, in which the smelting of the ore and its conversion into malleable iron and steel is effected near the mines, chiefly by means of charcoal supplied from the neighbouring forests. It is probable however that the spread of railroads and the recent lowering of the duty on imported coals have led to the substitution of better fuel in these metallurgic establishments. The other industrial products are coarse cloth, drugget, canvass, nails, cutlery, porcelain, saltpetre, oak-staves, cotton and woollen yarn, &c. The commerce of the department consists of the agricultural and industrial products mentioned, and of fat cattle, goat-skins, timber, and beech-wood toys.

The department is divided into three arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Bourges	10	111	120,146
2. Sancerre	8	75	77,585
3. St.-Amand	11	121	108,530
Total	29	307	306,261

1. In the first arrondissement the chief town is *Bourges*. *Gracey*, an ill-built town, 20 miles N.W. from *Bourges*, has 3075 inhabitants; near it there is a Druidical altar, consisting of a large stone slab inclining to the north supported by three other slabs, and surrounded, except towards the south, by twenty-one huge stones. *St.-Martin-d'Auxigny*, 10 miles from *Bourges*, has 2318 inhabitants. *Méhun-sur-Yèvre* stands in a very fertile district near the *Yèvre*, and on the railroad from *Vierzon* to *Bourges*, and has 3333 inhabitants. The town is very ancient; near it are the ruins of the old castle in which *Charles VII.* lived with *Agnes Sorel*, and in which he subsequently

starved himself to death, July 22, 1461. *Ménétou-Salon* has 2451 inhabitants, who are engaged in the manufacture of brandy and iron; there is an ochre mine near the town. *Kersay*, 50 miles S. from *Orléans*, 19 miles N.W. from *Bourges*, and 30 miles N.E. from *Châteauroux*, with which towns it has communication by railway, stands at the junction of the *Yèvre* with the *Cher*, and has about 6000 inhabitants, including the whole commune. It is well and regularly built, and its site on a navigable river and canal among vine-clad hills and vast meadows is very delightful, and presents a most agreeable contrast with the dismal region, well named *La Tristesse-Lologne*, which lies north of *Vierzon*, and is traversed in coming here from *Orléans*. The houses are mostly covered with slates. *Vierzon* is a place of great and increasing commercial activity. Cloth, serge, iron-ware, hosiery, porcelain, and leather are manufactured; great quantities of the best iron of *Berri* are manufactured at the furnaces and the forges near the town.

2. In the second arrondissement the chief town is *Sancerre*, near the left bank of the *Loire*, an ill-built place, but prettily situated on a hill, the sides of which are covered with vines. It is 28 miles N.E. from *Bourges*, and has 3483 inhabitants, a college, tribunal of first instance, manufactures of hosiery and leather, and a considerable trade in corn, cattle, wool, and marble raised from the neighbouring quarries. *Aubigny*, N.W. of *Sancerre*, is a wretched, ugly, ill-built town, with 2176 inhabitants and a large market for wool. *Henrichemont*, formerly called *Bois-belle*, is a pretty and well-built town a few miles W. from *Sancerre*, with 3018 inhabitants; in the centre of the town is a spacious square in which the four main streets meet; the houses are all built of brick; the town has cloth-factories, tanneries, and a large wool-market. *Ivoy-le-Pré*, 17 miles from *Sancerre*, has blast-furnaces, forges, and iron-foundries, and 2703 inhabitants.

3. In the third arrondissement the chief town is *St.-Amand-Mont-rond*, which has a tribunal of first instance, a college, and 8153 inhabitants, including the whole commune. [AMAND, ST.] *Château-Meillant*, in the south of the department, has a population of 2711, and a very ancient castle. *Châteauneuf-sur-Cher*, on an island formed by the *Cher*, has 2219 inhabitants, who trade in wine, horses, and cattle; there is a wire-drawing factory and an ancient ruined castle in the town. *Dun-le-Roi*, N. of *St.-Amand*, on the right bank of the *Auron*, a feeder of the *Yèvre*, was formerly a very important town defended by walls and a strong citadel; but it seems never to have recovered its capture in the reign of *Charles VII.* by the English, who pillaged the town and burned the suburbs: the population is 4097. Large cattle fairs are held in *Dun-le-Roi*. *Guerche*, on the *Aubois*, a feeder of the *Loire*, has 2090 inhabitants, and smelt-furnaces, which produce metal of the best quality. *Lignières*, in the beautiful valley of the *Arnon*, and near the large pond or rather lake of *Villiers*, has 2200 inhabitants, and an old castle rich in historical associations. *Sancoins*, near the source of the *Aubois*, has 2464 inhabitants, who trade in corn, wood, cattle, gypsum, lithographic stones, &c.

The department forms, together with that of *Indre*, the archiepiscopal see of *Bourges*; it is within the circuit of the High Court and University of *Bourges*, and is included in the 19th Military Division, of which *Bourges* is head-quarters.

CHERBOURG, a sea-port town, naval station, and fortress of the first class, is situated on the north coast of the peninsula of *Cotentin*, in the department of *Manche*, in France, at a distance of 75 miles due S. from the *Needles* and the *Ile of Wight*, 213 miles W. by N. from *Paris*, and has 24,212 inhabitants, including the whole commune. It stands at the mouth of the *Divette*, which falls into the bay lying between *Cape Levi* on the east and *Cape la Hague* on the west. The streets are narrow and dirty; the houses are built of stone and roofed with slates, which are got from quarries near the town. The only objects deserving of mention besides those connected with the harbour are the old tower, which formed part of the ancient fortifications, the church near it, and the *Chapelle-de-Notre-Dame-du-Vœu*, first erected by the empress *Maude* on a spot called *Chantereyne*, outside the town and close to the dockyard; the public library; the collection of pictures in the town-hall; and the theatre.

The commercial port at the mouth of the *Divette* consists of an outer harbour, which communicates with the sea by a channel 656 yards long, 55 yards wide, and with a depth of 20 feet at low water; and of a basin, closed by flood-gates, in which vessels are kept always afloat. The harbour is lined with quays; on the eastern side of the outer harbour is the old arsenal, and east of the jetty which forms the channel is a large bathing establishment.

The naval harbour, which is better than half a mile N.W. from the river's mouth, is excavated out of the solid rock; it has a depth of 52 feet at high water, and is large enough to contain fifteen vessels of the line. To the south of the harbour are dry docks, and round these four slips for building the largest ships, two slips for frigates, besides powder magazines, barracks, forges, furnaces, workshops, a large timber-shed, and various other establishments necessary to a naval arsenal. The naval port is surrounded with strong fortifications, and carefully guarded at all points, and on the hills which surround the town and look down upon the harbour some twelve or fourteen forts and redoubts are built.

The triangular bay opening to the north of these harbours forms the *Cherbourg Roads*, which are capable of holding 400 large vessels,

have good holding-ground, plenty of water even at low tide, and are naturally well sheltered, except from the north winds. To protect the roadstead from these winds, as well as to defend that part of it which is beyond the range of the guns of the forts, a breakwater (digue) has been erected, of which we subjoin a notice taken from the 'Moniteur' on the completion of the work.

"The breakwater of Cherbourg is at present entirely terminated, and from the 1st of January 1854 it must rank amongst the constructions which require only to be kept in perfect repair. This gigantic work, commenced in 1783, suspended during the revolutionary tempest, resumed under the empire, suspended once more during the whole period of the restoration (1814-30), is at length terminated after 70 years' expectation and 41 of constant efforts. For a length of time the success of the undertaking had been called in question; terrible disasters had at certain moments caused apprehensions to be entertained that the sea would remain victorious in this desperate contest against the boldest attempts of human genius; but at present every disquietude of that nature may be set aside, and the only thing now remaining to be done is to consecrate the work of four generations. It is known that the project of the breakwater at Cherbourg was conceived by the illustrious Vauban, who saw the necessity of our navy having in the channel a port accessible for the largest ships of the line, and after successive attempts it (the breakwater) has been established at about 4000 metres (nearly 2½ miles) from the entrance of the commercial port. Its length is 3700 metres i. e. 2 miles 536 yards (the breakwater at Plymouth is only 1800 metres, or 1 mile 208 yards, in length), and it presents a relief of upwards of 20 metres (65½ feet) above the bottom of the sea; 2000 artificial blocks, each of 20 metres cube, of 44,000 kil. (nearly 44 tons) in weight defend against the waves the foundation of the extreme musoirs (or points of the breakwater). The last one and twenty years of this admirable work have been exclusively employed in the construction of the wall in masonry, which has 10 metres 50 centimetres (34 feet) of height above low-water mark, and above the level of the foundation of the musoirs of the two extremities, of the central fort, and of the intermediate fort. The expenses since 1783 up to the present time have amounted to 67,300,000 francs. The law of June 25, 1841, had appropriated to the completion of the breakwater an extraordinary credit of 18 millions: but owing to the care with which the money of the state has been administered, a saving of nearly 1,500,000 francs has been effected out of that sum. Thus a bay previously formidable to sailors offers at present a sure refuge to the largest vessels in the most violent tempests, and the fleets of France could find there a shelter against the sea and the enemy; it is at the same time a safe asylum open to the commercial shipping of all maritime nations."

The breakwater extends with a slight curve (the convex side towards the north) between Isle-Pélée, on the eastern side of the Bay of Cherbourg and a ledge of rocks called La Roche Chavaignac, which stretch out into the sea from the western shore of the bay. The entrances to the harbour, at each extremity of the breakwater, are about 1000 yards wide; the eastern one commanded by strong forts on Isle-Pélée and on the eastern end of the breakwater, and the western entrance by similar forts on the western end of the breakwater and on La Roche Chavaignac. A large and important fort (Le Fort Central), built on the centre of the breakwater, commands all the interior of the harbour, and is capable of commanding respect to a good distance outside of it. Opposite this central fort are the forts and batteries above the naval harbour. On a ridge of rocks at the east end of the harbour, not far from Isle-Pélée, and exactly facing the eastern extremity of the breakwater from the south, is the Fort des Flamands, a third and formidable guardian of the eastern entrance; and a corresponding additional defence of the western entrance is found in Fort Querqueville, which is erected on the coast to the west of La Roche Chavaignac. The fortified arc of coast round the harbour of Cherbourg is little short of eight miles in length; the chord drawn from Fort Querqueville along the breakwater to the eastern coast is rather more than half that distance. At its base the width of the breakwater is 99 yards, on the summit 33 yards; and the depth of water about it varies from 36 to 45 feet. In the central fort there is a lighthouse 65 feet high, in 49° 40' N. lat., 1° 37' W. long.; there are lighthouses also on the fort in Isle-Pélée and on Fort Querqueville, and the harbour is said to be the best lighted in the English Channel.

Cherbourg is a place of considerable commercial activity. The principal industrial articles are cotton-yarn, hosiery, refined sugar, soda, of which about 12,000 tons are produced annually in the neighbourhood; chemical products, and leather. There are also dye-houses, large provision-stores, and a lace-factory, superintended by four nuns, which gives employment to 350 females, 150 of whom are young girls instructed in the process of lace-making. The exports consist of the articles named, and of butter, eggs, peas, vegetables, provisions, cattle, slates, &c.; the imports of coal, fir, hemp, and flax, for the use of the navy, groceries, wine, iron, &c. The town is an entrepôt for colonial produce and salt; several vessels belonging to the harbour are engaged in the Newfoundland fisheries. Cherbourg is the residence of a maritime prefect; has tribunals of first instance, commerce, and naval affairs; and possesses a school of hydrography, an academical society, and a college. A railroad is rapidly approaching completion from the

Paris-Rouen line to Cherbourg through Caen. Electro-telegraphic wires have been for a considerable time laid down between Cherbourg and Paris.

(*Dictionnaire de la France*; Macgregor, *Statistics*; *Paris Monitor*; *Letter from Cherbourg*.)

CHERITON. [GLAMORGANSHIRE.]

CHEROKEES, the name of one of the native Indian tribes of North America. The remaining body of Cherokees now inhabit the district situated between 36° 10' and 37° 2' N. lat., extending west from the boundary of Arkansas state, in 94° 40' to about 100° W. long., and containing in all about 16,000 square miles. The number of the tribe is now about 28,000. The district of country occupied by the Cherokees forms part of the Indian territory appropriated by the United States for the residence of the various communities of native Indians, each tribe occupying a distinct territory, and being governed by its own rulers, under a separate constitution. About a century ago the Cherokees formed a numerous and powerful nation, which was in possession of the southern portion of the Appalachian Mountains and the countries on both sides of the range, so that their hunting-ground extended over a part of the states of Tennessee, North and South Carolina, and Alabama, and over nearly half the state of Georgia. After a British colony had been settled in Georgia (in 1732), the native tribes began to lose ground. The Cherokees however maintained their footing for a long time, even after these countries had obtained their independence. Since 1790 they have sold different portions of their territories to the government of the United States. In 1816 they ceded the country still possessed by them within the state of South Carolina, and some districts in Georgia and Alabama, receiving in consideration of this cession, besides presents and annuities, a tract of country of equal extent west of the Mississippi, to which some families emigrated. They afterwards removed to their present abode in the far west.

The Cherokees are considered the most civilised of the American Indians. They have made considerable progress in agriculture and domestic manufactures, and in the rearing of cattle. They manufacture salt from brine springs, which are numerous in the territory. The cloth required for use by themselves they make, and also such agricultural implements as are employed by them. They have been able of late years to export a considerable amount of produce to New Orleans. They chiefly cultivate cotton and Indian corn. They have a written language; the alphabet, which was invented by a native Cherokee, consists of eighty-five characters. Their language is derived from the same source as that of the Creeks, Chickasaws, Choctaws, Pasiagoulas, and some other tribes; and as all these tribes lived in the neighbourhood of Florida, these languages have obtained the name of the Floridian languages.

The Cherokees have a written constitution, embodying the forms of republican government. The chief or governor of the tribe is elective; he is assisted in the administration of affairs by a general council, elected annually. The general council consists of an upper and a lower house, somewhat corresponding to the Senate and House of Representatives of the United States. There is also a judiciary, observing all the legal forms prescribed by the legislature. The English language has been very generally adopted, and London and Parisian fashions in dress are followed to a considerable extent. The Cherokees receive from the United States government an annuity on account of the lands formerly possessed by them on the east side of the Mississippi River. Christian missionaries of several denominations have laboured amongst the Cherokees with considerable success. Education has made good progress amongst them, and the school system maintained by the tribe is in a very efficient state.

CHERSON (pronounced Kherson), or *Nikolajeff*, a government of European Russia, lies between 46° 12' and 49° 4' N. lat., 29° 10' and 5° 5' E. long. It is bounded N.W. by Podolia, N. by Kieff, N.E. by Tultawa, E. by Ekaterinoslaf, S.E. by Taurida, S. by the Black Sea, and W. by Bessarabia. The area is 28,136 square miles: the population of the province (excluding Odessa, which contains 75,900 inhabitants) is 766,500. Its extreme length from east to west is about 250 miles, and its breadth from north to south about 100 miles for one-third of the length from west to east, and for the other two-thirds almost 180 miles. The province, which consists of an immense plain, lies between the Dnieper and the Dniester. A branch of the Dnieper range traverses it for a short distance on the north-east, and on the south-west a small chain belonging to the outskirts of the Carpathians runs into the country from Podolia. It is only on the north-west and north-east borders that there is some wood, and in the neighbourhood of Elizabetgrad there are considerable forests. The rest of the country is a steppe, beginning at Mirgorod and extending across the whole province, where scarcely a tree is to be seen; the soil is however covered with a luxuriant vegetation of grasses and other plants. In the interior the soil is a gray clay mixed with sand, which is not very well adapted to agriculture, but produces the richest pastures. The Black Sea washes the south of the province from the Dniester to the Dnieper. The principal rivers are the Dnieper and the Dniester, of which the latter forms the boundary between Cherson and Bessarabia. The course of the rivers in the whole province is exceedingly slow, and their water bad. There are very few wells of fresh-water. The climate is very variable; in summer the heat is from 85° to 90° of Fahrenheit.

Thunder storms of tremendous violence sometimes occur. The nights are generally cool. The winter is very cold: most of the rivers freeze over, though but for a short time; and not always so much as to bear a man.

The ground, when by great labour it is cleared of the roots of the grass, and when the saltpetre, which generally appears when the surface is bare of vegetation, is got rid of, will produce from ten to twenty fold. But the inhabitants dislike agriculture, and prefer the breeding of cattle, so that they never raise corn enough for their own consumption. Almost every two years swarms of locusts desolate the country, but they seldom come farther than Cherson, about seventy miles up the Dnieper. Hemp and flax are grown for domestic consumption. Tobacco, mustard, and saffron are articles of commerce. There are several varieties of the vine. The banks of the rivers, especially of the Dnieper, are covered with strong reeds, which are used both for thatch and for fuel. Of tame animals the most common is the sheep. The wool of the native breed is rather coarse, but great numbers of Merinos have been lately imported. Oxen and buffaloes are numerous, and used for draught; the horses (of which many are wild) are slight, but very spirited and swift-footed. Wild animals of all kinds abound, especially wolves and wild-cats. The fields are covered with bustards, gray partridges, ortolans, snipes, &c. Besides locusts the country is infested by large rats, which come from Taurida. There are great numbers of water and other snakes, scolopendras, whose bite is as venomous as that of the tarantula, incredible numbers of lizards, and swarms of gnats. The fisheries on the sea-coast and in rivers are very important. The minerals are—fine potter's clay, freestone, slate, chalk, talc, saltpetre, agates, and garnets. The manufactures are of little importance; the chief are carried on at Odessa. The province is happily situated for trade. The foreign commerce of the country, which is very important and rapidly increasing, will be best described under Odessa, which, though founded only in 1796 by the Duke of Richelieu, is now the staple place for the commerce of all Southern Russia. [ODESSA.]

The other towns which require notice here are Nikolajeff, Elizabetgrad or Elizavetgrad, and Cherson. *Nikolajeff*, population about 12,000 exclusive of the suburbs, is situated near the confluence of the rivers Bug and Ingul. These rivers by their junction below the town form a spacious estuary, in which the Russian Black Sea fleet usually rendezvous during winter. The town covers an extensive area, the houses being in general only one story high, with large plots of ground attached to each dwelling, and the streets being of great width. There are here extensive dockyards, with improved ship-building machinery, nearly all of which is English; an observatory, the governor's house, and barracks for seamen. The Boulevard near the river is covered with shrubbery to the river's brink. *Nikolajeff* was founded in 1790, and is inclosed by walls. The chief buildings in the town are the cathedral, the town-hall, the admiralty-house, with museums and library, schools for pilots and for the daughters of soldiers, and several hospitals. *Elizabetgrad*, or *Elizavetgrad*, population about 10,000, the chief town of the circle of the same name, is situated in a beautiful plain on the banks of the river Ingul, about 180 miles N. from Cherson. The town which was built in 1754 is hexagonal in shape, and is defended by six bastions. Besides a large arsenal within the walls of the town, there are four suburbs. The whole is regularly built; the streets are straight, and of considerable width, and are planted with avenues of trees. In the town are five churches, a large hospital, and numerous magazines. Many of the inhabitants are of Greek or Servian origin, but the majority are Rostolnicks, who observe the rites of the primitive Russo-Greek Church. Much traffic is carried on in the produce of the surrounding districts. There is considerable commercial intercourse with Poland and Moldavia. An annual fair, the largest in the province of Cherson, is held at Elizabetgrad, and is attended by many thousand dealers. Upwards of 30 windmills are in the vicinity of the town. *Elizabetgrad* is the head-quarters of the military colonies on the east side of the river Bug, and has therefore the constant presence of numerous cavalry. *Cherson*, founded in 1778, is on the right bank of the Limán, or estuary of the Dnieper, which is here nearly four miles wide, when its numerous shoals are covered with water. The want of sufficient depth of water for the constant passage of large ships has frustrated the object contemplated in founding this place. It is now a town of little importance, with a comparatively small number of inhabitants. The cathedral contains the tomb of Potemkin, the founder of the town. The small amount of trade carried on in the town is in the hands of the Greeks, who inhabit the Greek suburb. One of the adjacent villages, called Dauphigny, contains a monument erected in honour of John Howard, who died here in 1796.

The inhabitants of the province of Cherson consist of Great Russians, Little Russians (among whom are many Cossaks), Poles, Moldavians, Rascians, Bulgarians, Tartars, Greeks, Armenians, and Jews, all settled; even the Cossaks of the Bug have renounced their nomadic life, follow agriculture, and have fixed habitations. There are in this government numerous foreign colonists, chiefly German, dispersed in fifty or sixty colonies, and possessing in all about 60,000 acres of land. There are also a great many gipsies. The Greek Christians are under the archbishop of Ekaterinoslaf, Cherson, and Taurida, who resides at Ekaterinoslaf, where his cathedral is. In Cherson he has 367 parishes.

CHERTSEY, Surrey, a market-town and the seat of a Poor-Law Union, in the parish of Chertsey and second division of Godley hundred, is situated in 51° 34' N. lat., 0° 30' W. long.; distant 13 miles N. by E. from Guildford, 20 miles W.S.W. from London by road, and 22 miles by the South-Western railway. The population of the town in 1851 was 2743. The living is a vicarage in the archdeaconry of Surrey and diocese of Winchester. Chertsey Poor-Law Union contains 9 parishes and townships, with an area of 44,406 acres, and a population in 1851 of 16,118.

Chertsey stands on a slip of low land between the Thames and the brook which issues from Virginia Water, hence its Anglo-Saxon name Ceort-es-Eye, or Ceort's Isle. A monastery was founded here in 666 by Frithwalde, governor or sub-regulus of Surrey, under Wulfhere, king of Mercia. In 964 King Edgar refounded the monastery for Benedictine monks. Subsequently it became a very wealthy and powerful establishment. Of the abbey buildings scarcely a fragment is now left.

The parish church, a brick building situated in the centre of the town, was, with the exception of the chancel and tower, rebuilt in 1806. There are chapels for Wesleyan Methodists, Independents, and Baptists. An educational foundation, producing about 400*l.* per annum, provides instruction for 180 boys and 180 girls, of whom 30 of each sex, belonging to the parish of Chertsey, are clothed as well as educated. There are National schools for boys and girls, an Infant school, a literary and scientific institution, with reading-room and lecture-room, and a savings bank. An agricultural society is maintained here. A county court is held in Chertsey.

At Chertsey is a stone bridge of seven arches, built in 1785, connecting the county of Surrey with that of Middlesex. The town of Chertsey is irregularly built: the principal street runs east and west; the streets are paved, and are lighted with gas. The market-house is modern. The chief trade of the town is in malt and flour; vegetables are raised in considerable quantities in the vicinity for the supply of the London markets; bricks are made to some extent. The market is on Wednesday for corn and provisions: it is a considerable market for poultry. Fairs are held on the first Monday and Tuesday in Lent for cattle, on May 14th for sheep, and on August 6th and September 25th. A branch of the South-Western railway, three miles in length, goes to Chertsey from the main line at Weybridge. The Porch House, in Guildford-street, Chertsey, was the residence of the poet Cowley. On St. Anne's Hill near the town was the residence of Charles James Fox. In the church is a tablet, erected by his widow, with an inscription to his memory.

(Manning, *Surrey*; Brayley, *Surrey*; *Communication from Chertsey*.)

CHESAPEAKE BAY. [MARYLAND; VIRGINIA.]

CHESHAM, Buckinghamshire, a market-town in the parish of Chesham St. Mary and hundred of Burnham, is situated to the right of the road from London to Aylesbury, in 51° 42' N. lat., 0° 37' W. long., distant 12 miles S.E. from Aylesbury, and 26 miles N.W. from London by road. Berkhamstead, which is 5 miles from Chesham, is 28 miles from London by the North-Western railway. The population of the town of Chesham was 2496 in 1851. The living is a vicarage in the archdeaconry of Buckingham and diocese of Oxford.

Chesham is situated in a pleasant and fertile valley which is watered by the river Chess, a branch of the Colne. The parish church is a commodious cruciform building: the chancel, which is the oldest part, is of the decorated style, the remainder is perpendicular, of the close of the 14th century. There are chapels for Independents and Baptists; National, British, and Infant schools; and a mechanics institute. An almshouse for four poor persons was endowed by Thomas Wedon, who died in 1624. A county court is held in Chesham. Markets are held on Wednesday and Saturday, and fairs on April 21st, July 22nd, and September 28th. Boots and shoes are manufactured to a great extent, chiefly for the London market. Wooden ware in great variety is made. The manufacture of straw plait employs a considerable number of females. There is a silk-mill in the town; and in the neighbourhood are paper-mills.

(Lysons, *Magna Britannia*; Lipscomb, *Buckinghamshire*; *Communication from Chesham*.)

CHESHIRE, a county palatine on the west side of England. The name is formed from the ancient city of Chester, and is an abbreviation of Chestershire, formerly written, in Saxon, Cestre scyre. The boundary-line is very irregular. On the north-west a tract of a peninsular form is included between the estuaries of the Mersey and the Dee; and on the north-east a long narrow tract, containing part of Featherbed Moss and Holme Moss, which belong to the central highlands of England, is included between the Thame and the Etherow, which by their junction form the Mersey. The county is said by some writers to be "like the wing of an eagle stretched forth at length." (King's *Vale Royal of Cheshire*.) The whole county received the name of Vale Royal of England, from the magnificent abbey so called, which was founded by Edward I. on the Weaver. Cheshire lies between 52° 50' and 53° 34' N. lat., 1° 47' and 3° 11' W. long. Its northern boundary is chiefly formed by Lancashire, and partly by Yorkshire and the Irish Sea. The Mersey forms the boundary between Cheshire and Lancashire. On

the E. the county has Derbyshire and Staffordshire; on the S. is Shropshire and a small portion of Flintshire; on the W. are Denbighshire, Flintshire, and the Irish Sea. The greatest length of the county from north-east to south-west, in a straight line, is about 58 miles; the greatest width from north to south about 32 miles: the whole circuit is nearly 200 miles. On the north-western extremity, a line of sea-coast extends for about 8 miles from east-north-east to west-south-west, besides about 20 miles on the estuary of the Mersey, and about 14 miles on the great estuary of the Dee. The area of the county is 707,078 statute acres. The population of the county in 1841 was 395,660, in 1851 it was 455,725. Chester, the county town, is 183 miles north-west from London.

Surface, Hydrography, and Communications.—The surface of Cheshire is in general a nearly uniform level, but there are a few inequalities. Several elevated tracts stretch in a generally northern direction. One is between the Goyt and the Bollin; and a second between the Bollin and the Weaver. A tract of high land extends also from north to south, across Delamere Forest, terminating to the north near Frodsham in a high promontory which overlooks the Mersey, and to the south in the rock on which Beeston Castle stands; the height of this rock is 366 feet above the sea. Alderley Edge, a few miles north-west from Macclesfield, is an isolated hill which rises abruptly out of a level country, and presents one of the richest and most extensive prospects in the county; but Cheshire, from its general flatness, is not commonly remarkable for picturesque beauty. In former times there were numerous forests in Cheshire; one is mentioned in the Domesday Survey of Altricross as being 10 miles in length and three miles in breadth. At present there are only a few large woods. Some at Dunham Massey contain many noble old oaks. Around Delamere Forest, in the hundred of Eddisbury, are several extensive plantations, chiefly of Scotch firs and larches. This forest, so called, is a large sterile tract of whitish sand, partially covered with heath and peat-moss. It occupied 10,000 acres; of which a considerable part has been inclosed and brought into cultivation. The timber supplied by the great profusion of hedge-row trees is principally oak, and furnishes abundance of tanner's bark. A large quantity of fine timber is also produced on the numerous estates of the nobility and gentry; especially on those of the Marquis of Westminster, of the Earl of Stamford and Warrington, and of the Marquis of Cholmondeley.

Cheshire abounds not only with rivers and brooks, but with broad sheets of water called meres, which generally contain fish. The principal are Oak Mere, Pick Mere, Budworth Mere, Rosthern Mere, Mere Mere, Tatton Mere, Chapel Mere, Moss Mere, Broad Mere, Bah Mere, and Comber Mere, which is three-quarters of a mile in length.

The chief navigable rivers are the Dee, the Mersey, and the Weaver. The navigation of these rivers is superintended, and has been greatly improved, by companies incorporated by Acts of Parliament. The source of the *Dee* is in Merionethshire; whence it runs through Denbighshire, by Llangollen to near Overton in Flintshire, where it turns northward to Bangor Iscoed. It becomes the boundary of Cheshire nearly from Worthenbury to Aldford. It then intersects the northern part of the hundred of Broxton to Chester, which it half encircles. From Chester it flows in a straight artificial cut into the estuary of the Dee. A surface of about 2500 acres has been reclaimed from the south-eastern extremity of this estuary. From Bangor bridge the Dee is navigable for barges. At Chester bridge it is 100 yards wide, and vessels of considerable tonnage can pass by the new channel to Chester. The whole length of the course of the Dee is about 55 miles. It supplies salmon, trout, and other kinds of common fish. This river, called in Latin *Dova*, in Welsh *Pifir dwy*, was anciently held in great veneration, and its waters were considered sacred for religious ablution: as such it is celebrated by Drayton, Browne, Spenser, and Milton.

The *Mersey* in its whole course divides Cheshire and Lancashire. It is formed and first receives its name by the confluence (near Stockport) of the Thame and Goyt; the Etherow (which joins the Goyt a little above Stockport) and the Thame rise in the central highlands, north and north-east of Stockport; the Goyt rises near Buxton on the east side of the highlands between Macclesfield and Buxton. Leaving Stockport, the Mersey runs a general west course to Northenden and Ashton. After passing by Carrington, it receives on the right bank the Irwell from Manchester, and on the left, a little below Warburton, the Bollin. It continues with a very winding course through a low, flat country past Warrington, and expands at its junction with the Weaver into a wide estuary which forms the Liverpool channel; and though much obstructed with banks of sand, is rendered safe by the excellent system of pilotage. The Mersey is navigable from its confluence with the Irwell. At Warrington it is 40 yards in width; opposite Liverpool the width is a mile and a quarter, with a considerable depth at low water. The greatest width of the estuary above Liverpool is between Eastham and Frodsham, where it is above three miles wide. Its whole course from Stockport to the outlet of the estuary is about 55 miles. A large marsh at the confluence of the Weaver, extending to Helsby and Frodsham, is subject to occasional inundations. The river and estuary contain congers, plaice, flounders, and shrimps; with annual shoals of smelts, called *sparlings*, remarkable for size and flavour.

The *Weaver* traverses the central parts of Cheshire from south to north. It rises in the north of Shropshire, near the village of Stych, and after receiving several considerable brooks and rivulets, runs by Nantwich, Minshull, and Winsford, to Northwich, where it forms a confluence on the right bank with the Dane, which rises in the same swamp as the Goyt, and a little farther north, with the Peover. It then winds west-north-west and falls into the Mersey below Frodsham. From Winsford to Frodsham it has been rendered navigable by ten locks, the total fall being 50 feet. Vessels of from 20 to 100 tons convey rock-salt down the river and return with coal. The whole course of the Weaver is about 40 miles. Among the less important rivers is the Dane, which is joined by the Wheelock above Northwich. The source of the Bollin is in Macclesfield forest, near that of the Dane. It passes Macclesfield and Wilmslow, is crossed by the Bridgewater Canal, and enters the Mersey near Warburton, after a course of about 23 miles. The Peover rises south of Macclesfield, near Gawsforth, and flows west-north-west to its junction with the Weaver near Northwich.

Several canals intersect the county. The Bridgewater Canal enters Cheshire by crossing the Mersey near Ashton: its length within the county is about 24 miles. The Grand Trunk, or Trent and Mersey Canal, which was commenced in 1766, runs south-east from Preston Brook, by Northwich, Middlewich, and Sandbach, and leaves Cheshire at Church Lawton, on the borders of Staffordshire. Between Preston-on-the-Hill and Dutton, not far from its commencement at Preston Brook, it passes through a tunnel 124 yards in length; at Barnton, through another of 572 yards; at Saltersfield, through one of 350 yards; and finally, at Hermitage, through another of 130 yards. The whole of its line in Cheshire is about 20 miles.

The Chester and Nantwich Canal, which connects these two towns, was completed in 1778. At Chester it forms a junction with the Dee, and with the Dee and Mersey Canal, which runs across the peninsula of Wirral to the Mersey, at Ellesmere Port. Four miles north of Nantwich a branch from the Chester and Nantwich Canal runs to Middlewich, and is called the Middlewich branch. From the point where the Chester and Nantwich Canal and the Middlewich branch unite, the canal which thence runs south to Nantwich and past Audlem into Shropshire is called the Birmingham and Liverpool Junction Canal. The Ellesmere Canal branches off from a point between Nantwich and the point where the Chester and Nantwich Canal is joined by the Middlewich branch, and runs to the neighbourhood of Whitechurch. From Church Lawton the Macclesfield Canal runs past Congleton, Macclesfield, and so on northward to the Peak Forest Canal, which it joins a few miles north of Disley.

The Peak Forest Canal enters Cheshire at Ashton-under-Line, where it crosses the Thame, and passing near Disley, quits the county at Whaley Bridge. It crosses the Goyt below the junction of the Goyt and Etherow, by an aqueduct 100 feet in height, which has three arches, each 60 feet span and 78 feet high.

Several important roads traverse this county. The road from London to Manchester by Derby enters the county near Bosley, and passes through Macclesfield and Stockport. Another branch of the same road enters at Whaley Bridge and leaves the county at Stockport. The road from London to Manchester by Lichfield runs by Church Lawton, Congleton, Wilmslow, and Cheadle. The road from London to Liverpool enters Cheshire at Lawton, and runs to Warrington by two branches, one through Knutsford, the other through Middlewich and Northwich.

Cheshire is well provided with railway accommodation. The main line of the London and North-Western railway enters the southern border of the county a few miles from Betley, and passes northward nearly through the centre of it towards Warrington. The length of the main line in Cheshire is about 27 miles. At Crewe several branches diverge from it. One runs 21 miles north-west to Chester, and thence 15 miles to Birkenhead. Another line runs from Crewe 23 miles north by east to Stockport. Another branch, of which only a few miles are in this county, runs west from Crewe to join the Staffordshire railway near Burslem. From Chester the Chester and Holyhead line runs westward, but it soon passes out of the county, as does also the Chester and Shrewsbury line, which runs southward from Chester. A short line from Manchester to Altringham belongs to Cheshire for about half its extent.

Geology, Mineralogy, &c.—The general character of the Cheshire soils is a clayey or sandy loam; tracts of peat-moss cover a large extent of the eastern portion of the hundred of Macclesfield. Some mosses of smaller extent are at Warmincham and Coppenhall. The latter, which has been almost cleared of peat, contained numerous trunks and branches of trees, chiefly of oak, beech, and fir, apparently broken off at different heights, and partially exhibiting the marks of fire. An ancient road of gravel passed through the moss of Coppenhall.

Cheshire generally belongs to the new red-sandstone formation. The range of high land to the east of Macclesfield is a sandstone rock, which contains beds of coal: this sandstone range is bounded on the east by the limestone of Derbyshire. The high land, which includes Delamere Forest, is also sandstone. The most important mineral productions of Cheshire are fossil or rock-salt, and coal. The rock-salt is obtained near the banks of the Weaver and its tributary streams. It

was first discovered near Northwich in 1670 in searching for coal; it has since been found very extensively in the townships of Wistham, Wistham, Winnington, and others near Northwich. There are salt-works also at Haslebury, Haslebury, and Winsford. The salt is of two kinds, the former being a fine white crystalline salt, the other reddish-brown. The former has been found to be an almost pure muriate of soda; the latter contains a small portion of oxide of iron, from which its colour is derived.

The salt-works are in the neighbourhood of Northwich, where, in addition to brine-springs, The rock-salt is found at a depth of 10 to 15 yards beneath the surface of the earth. The first stratum is from 15 to 25 yards in thickness, extremely solid and hard, resembling brown sugar-candy. Many tons at a time are loosened by blasting with gunpowder. The second stratum is of hard stone, from 25 to 35 yards in thickness. The salt lies beneath the stratum, in a bed above 40 yards thick, generally quite white and clear as crystal. The external surface above these strata is of whitish clay and gypsum. The quantity of salt annually taken from the pits around Northwich, amounts to many thousand tons; besides this quantity of fossil salt many thousand tons are annually manufactured at the same place from brine-springs, which are from 20 to 40 yards in depth.

Coal of a good quality is found in great abundance in the north-east part of the county, especially in the townships of Worth and Poynton, where there are very extensive collieries, which supply the manufactories of Stockport. At Denwell, in the hundred of Wirral, there is also coal. Copper and lead are found at Alderley Edge and the Peckforton Hills; the former place supplies a considerable quantity of cobalt. There are several quarries of excellent freestone in this county, of which those at Runcorn, Manley, and Great Bebbington, are the most important. Limestone is found only at Newbold Astbury. Mowcop Hill, or Molecop, which is partly in Staffordshire, has long been famous for its mill-stones. Marl is found in almost every part of the county, and is generally used for manure. Dr. Woodward ('Cat. Brit. Fossils') speaks of a fibrous stalky substance, a kind of asbestos, as found in great abundance in beds of marl about High Leigh.

Climate, Soil, Agriculture.—The soil and climate of Cheshire are peculiarly well adapted for the growth of grass. The soil is mostly composed of loams of various degrees of tenacity; the climate is moister than the more eastern parts of England. Situated in an extensive plain between the Derbyshire and Welsh mountains, Cheshire is seldom exposed to long droughts. The low meadows along the banks of the rivers are very subject to be flooded, which is one reason for keeping them in grass. Two-thirds at least of the county possess a soil above mediocrity, of which the greater part is in permanent pasture, and produces the excellent cheese known as Cheshire cheese. The arable land is generally that which is thought too sandy for pasture, or of which the grass has deteriorated by neglect. Hence the arable part of a farm in Cheshire is seldom cultivated with that attention which is paid to similar land in those counties where good grass land is scarce. Very few farms consist chiefly of arable land. Everywhere there is a predilection for the dairy.

Dairy farms require considerable buildings, and some have been erected by wealthy proprietors in the best and most substantial manner. The habitations for the family are quite sufficient for their comfort. Many of the cow-houses are constructed on the Dutch plan. Large farms are not common in Cheshire. The average size may be considered as from 50 to 150 acres, that quantity being sufficient for the full employment of a family, and for a dairy of 12 to 20 cows. The rent of land is higher than that of the same quality in other parts of England, which is owing to the smaller outlay with which a dairy farm is managed. The effect of the dairy husbandry may be observed all through the county. Land is ploughed in order to have winter fodder for cattle, and to improve pastures overrun with weeds. Where the land is fit for turnips, which is not often the case, they are raised for the cows. Cabbages have been cultivated with some success on several farms. The cultivation of potatoes has been much encouraged in Cheshire, to supply the demands of Liverpool and the manufacturing districts. The sandy and turfy soils, which are unfit for permanent pasture, are peculiarly fitted for the growth of potatoes. The best potatoes grow on land broken up from grass, which had been laid down in a rich state; in this case no manure is required. Early sorts are raised for the Liverpool market by a slight forcing. Many farms have little or no arable land attached to them. A very rich loam is not considered so good for pastures where cheese is made, as one less fertile, as it is apt to make the cheese heavy. The natural grasses found in the good pastures are chiefly of the kinds which have been most approved of for sowing when arable land is laid down to grass, namely, *Poa pratensis*, *Poa trivialis*, *Festuca pratensis*, or, on sandy loams, *Anthoxanthum odoratum*.

Draining has been introduced extensively, and with the best effect. The abundance of marl found in Cheshire is one of the chief means of improving the poor soils. Marling is a permanent improvement. Lime, and also sand, are put upon strong heavy lands to ameliorate the texture. In the neighbourhood of the salt-mines refuse salt has been successfully used for manure.

Besides the making of Cheshire cheese, the dairy occupations

include the making of butter, which is made from the cream or from the whole milk allowed to separate and become sour. Good butter may be obtained in either way; but that made from fresh cream is always the best. An inferior butter is made from the cream which runs on the whey.
